HISTORIC AMERICAN BUILDINGS SURVEY

Kearny

Location: 1025 – 1035 Belleville Turnpike
Kearny Peninsula, Town of Kearny,
Hudson County, New Jersey

Date of Construction: 1929: several alterations

Architect: The Austin & Son Company

Present Owner: Town of Kearny

Present Use: Vacant

Significance:

The Emark Battery Plant site in Kearny, New Jersey is eligible for the New Jersey and National Register of Historic Places under Criterion A for being associated with events that made a significant contribution to history. The Emark Battery Plant site is associated with Thomas Edison's experimentation and development of the storage battery and starter battery that were used in the Henry Ford Model A vehicles.

The Emark site is significant under Criterion C as a good example of early 20th century Art Deco style applied to industrial buildings. The buildings on site are designed in the Spanish Eclectic style, are Art Deco-style structures that reflect the functionality aesthetic attention, and construction technology.

Project Information:

The Historic American Building Survey (HABS) style recording of the Emark Battery Plant site was undertaken as a part of the Section 106 process for the remediation of the Standard Chlorine Chemical Company (SCCC) Superfund site in Kearny, New Jersey. The U.S. Environmental Protection Agency (USEPA) required the HABS as appropriate mitigation so that the Emark Battery Plant buildings could be demolished, if necessary, as part of the site remediation or redevelopment. The Emark Battery Plant was recorded to HABS III standards, including digital format exterior and interior photography, historic photographs and some of the original architectural drawings.

Introduction:

Thomas A. Edison was one of the most prolific inventors in history. He is best remembered as the inventor of the phonograph, developer of the light bulb, and the creator of the first industrial research laboratory, in Menlo Park, New Jersey. Edison also advanced cement as a building material, particularly in domestic applications, developing new techniques for cement processing and construction. Born in Ohio, Edison moved to New Jersey early in his career and remained closely associated with New Jersey for the remainder of his life.

During the first two decades of the 20th century, Edison founded multiple companies involved in the development and production of batteries in the United States. They include the Edison Manufacturing Company; the Battery Supplies Company (est. 1903); the Edison Storage Battery Company; and the Emark Battery Corporation. Edison National Phonograph Company in 1896, and renamed in 1911, consolidated many of Edison's companies over time, including the Edison Storage Battery Company in 1932, and the Emark Battery Corporation in 1933. Edison established multiple battery factories including a plant in West Orange, New Jersey (ca. 1910) and a chemical plant in Bloomfield, New Jersey.[1] Thomas Edison was focused on his customers' needs and it became part of his organizations culture in Menlo Park, New Jersey and West Orange. The property for the Emark Battery Plant in Kearny, New Jersey was purchased by Edison in 1916, but construction of the plant was not started until 1927, four years before his death.

Edison's development of the battery became another one of his important commodities. Storage batteries were introduced on the commercial market in 1881. For over two decades, the only battery type available was a lead-sulphuric-acid cell, consisting of plates of lead in a dilute sulphuric-acid electrolyte. From the 1890s through the early 20th century, Edison strove to develop a powerful, durable, and light-weight alkaline car battery to become the basis for a successful electric automobile.

Edison's laboratories continually refined the design of such a battery, striving to develop a new alkaline electrolyte that could be used in small quantities and which would be slower to dissolve metals in the battery, creating a long- lasting and light battery in place of the sulphuric acid electrolyte solutions coupled with lead electrodes which were the contemporary standard. Edison's 'type A' battery used a potassium hydrate and lithium hydrate electrolyte and a nickel

[1] Paul Israel *Edison: A Life of Invention* pg. 419

and iron electrode. Edison succeeded in developing a battery that met his expectations in 1910. It did not achieve the success he had hoped in the car market for electric cars, due to Henry Ford's 1909 release of the gasoline-engine Model T. Nevertheless, it was widely used in trucks, commercial and factory vehicles and became one of his most lucrative inventions.[2]

A Brief History of Thomas Edison:

Thomas Edison was born on February 11, 1847, in Milan, Ohio. He was the youngest of seven children of Samuel and Nancy Edison. Thomas's mother, a schoolteacher, was a major influence during his early years. In 1854, the family moved to Port Huron, Michigan and he attended school for only 12 weeks. He was a hyperactive child, prone to distraction, and deemed "difficult" by his teacher. His mother quickly pulled him from school and taught him at home[3]. At age 11, he demonstrated interests in reading books on a wide array of subjects and an appetite for knowledge. His self-education and independent learning would serve him throughout his life.

At age 12, Edison started selling fruit, snacks, and newspapers to passengers along the Grand Trunk Railroad line. Later he began publishing his own small newspaper called the *Grand Trunk Herald.* By age 15 Edison was employed as a telegraph operator and for the next five years, he would travel throughout the Midwest as an itinerant telegrapher, as a sub for those who had enlisted in the Civil War[4]. During this time he read, studied, and experimented with telegraph technology in his spare time becoming proficient with electrical science.

In 1866, Edison moved to Louisville, Kentucky. At age 19, he worked for *The Associated Press* on the night shift. This allowed him to read, experiment, and develop an unrestrictive style of thinking and inquiry through observation and experimentation. Edison excelled at the telegraph; however, as technology advanced his partial deafness, which was caused by an infection at an early age, resulted in fewer employment opportunities[5].

He ventured to Boston and started working for the Western Union Company. Boston was at the center for science and culture and Edison reveled in it. He designed and patented an electronic voting recorder for quickly tallying votes in the legislature. Massachusetts lawmakers were not interested, since they wanted time to change fellow legislators' minds[6].

In 1869, Edison moved to New York City. His first invention in New York was an improved stock ticker called the Universal Stock Printer. This printer synchronized several stock tickers' transactions. At the age of 22, Edison was paid $40,000 for the right by the Gold and Stock Telegraph Company[7]. He quit his job as a telegrapher and started inventing full-time.

In 1870 Edison moved to Newark, New Jersey and set up his first laboratory and manufacturing facility. He employed several machinists for the lab. During this time he developed the

[7] Ibid

quadruplex telegraph for Western Union, which transmitted two signals in two different directions on the same wire. However, Jay Gould, the railroad tycoon, snatched the invention from Western Union, paying Edison more than $100,000 in cash, bonds and stock creating years of litigation in the process.[8]

In 1871 Edison married 16-year old Mary Stilwell. She was an employee for one of his businesses. They were married for 13 years and had three children, Marion, Thomas, and William. She passed away in 1884.

By the early 1870s, Edison's reputation was widely known as a first-rate inventor. He moved his operations to Menlo Park, New Jersey in 1876. He built an independent industrial research facility incorporating machine shops and laboratories. During this time, Western Union encouraged Edison to develop a communication device that would compete with Alexander Graham Bell's telephone.[9] He never did. However, he did develop a method to record sound in December of 1877 called the phonograph. The invention brought him worldwide fame.

In January of 1880, Edison was granted a patent for the light bulb. He developed a company that would deliver electricity to power and light the cities of the world. He founded the Edison Illuminating Company, which was the first investor-owned electric utility, and would later become the General Electric Corporation. In 1881, he left Menlo Park to establish facilities in cities where electrical system were being installed.[10]

In 1882, the Pearl Street generating station provided 110 volts of electrical power to customers in lower Manhattan. In 1886, he married Mina Miller who was 19 years his junior. They had three children, Madeline, Charles, and Theodore. In 1887, the industrial research laboratory in West Orange, New Jersey was built to serve as his primary research laboratory for the Edison lighting companies. He would spend most of his time at this facility developing new lighting technology and power systems. He also perfected the phonograph and developed the motion picture camera and the alkaline storage battery.[11]

He developed a lasting rivalry with Nikola Tesla, who worked with Edison. In 1885 they parted ways and would publicly clash about the use of direct current electricity. Tesla would later work with George Westinghouse, which led to a business feud over electrical power.

During the 1890s, Edison built a magnetic iron-ore processing plant in northern New Jersey that became a commercial failure. He was able to salvage the process into a better method for producing cement. In 1896, Edison was the first person to project a motion picture. He held the first motion picture screening at Koster & Bial's Music Hall in New York City.

Edison's role of inventor developed over the next few decades to an industrialist and business manager. In 1911, Thomas A. Edison Incorporated was established with Edison as president and chairman.

The automobile industry was growing and Edison worked to develop a suitable storage battery that could power an electric car (Historic Photograph 1). Though the gasoline power engine prevailed over the electric car, Edison did design a battery for the self-starter on the Model T for Henry Ford in 1912. The system was used extensively in the auto industry for decades.

Historic Photograph 1 – View of the Edison battery powered electric car, provided by Thomas Edison National Historical Park (date unknown).

During World War I, at the request of the United States government, Edison headed the naval Consulting Board to examine inventions submitted for military use. He worked on several projects, which included submarine detectors and gun location techniques. He only worked on defensive weapons as he deplored violence. In 1927, at the request of Henry Ford and Harvey Firestone, Edison began to find alternatives to rubber for the automobile tires. After experimenting with a variety of substances, he made significant advances in this area.[12]

Edison was 84 when he applied for the last of his 1,093 U.S. patents for an apparatus that would hold objects during the electroplating process. Edison died of complications from diabetes on October 18, 1931, in his Glenmont home in West Orange, New Jersey at the age of 84.

Thomas Edison & Henry Ford:

Henry Ford (1863-1947) began his relationship with Edison as an engineer with the Edison Illuminating company in 1891.[13] In 1893 Ford started experimenting with gasoline engines, and

[12] Gelb, Michael j. and Caldicott, Sarah Miller, *Innovate Like Edison*, (Dutton:New York, 2007)
[13] "Thomas Alva Edison." Bio. A&E Television Networks, 2014. Web. 05 Sep. 2014.

developed a self-propelled vehicle, Ford Quadricycle, in 1896. Ford was introduced to Edison in 1896 at one of Edison's executive meetings.

Ford later resigned, but maintained a friendship and working relationship with Edison. When Ford developed his four cylinder automobile, Edison continued to encourage Ford with his endeavors in the automobile industry.

In 1912, Edison wrote Ford about the future of the storage battery and whether Ford would take a "gamble" with him.[14] Edison indicated that the storage battery had a "barge future."[15] Edison and Ford collaborated to develop an electric car that would operate on the clean energy of the Edison's storage battery. With funding provided by Ford, Edison continued his experiments to improve the storage batteries. In January of 1914, Ford announced plans to develop an electric car with his friend and collaborator Edison.[16] By the end of 1914 the project was discontinued due to technical problems with Edison's battery. However, Edison began designing an electric starter for Ford.[17] In 1927, Edison designed the self-starter for Ford's Model A.

In 1916, Henry Ford purchased 80 acres of "reclaimed meadow land" in Kearny. Ford had an assembly factory constructed for his Ford Tractor. The site also became Ford's headquarters for their exporting business of the Ford tractor and automobile concerns.[18] Two years later Thomas Edison purchased 8.4 acres in 1917 and 8.08 acres in 1918 that would become the Emark property.

Correspondence between Thomas Edison's company and Henry Ford during 1922 indicates that Edison was working on the starter battery for Ford's automobile. The business correspondence includes updated test reports from Thomas A. Edison, Inc. (T.A.E., Inc.) to Ford Motors about the batteries progress, as well as business correspondence that reference manufacturing concerns and legal issues between T.A.E., Inc. and Ford Motors.

Edison and Ford's friendship flourished, however their business relationship may have been stressed. According to the business correspondence, Edison and Ford were not directly involved with their respective company's day to day activities. In a 1920 letter from Charles Edison to Mr. D.J. Jend, Asst. Director of Purchases at the Ford Motor Company, Charles asks Jend what type of relationship is between the companies. Is it "vendor and purchaser?"[19] Charles then remarks, "…you and I know that there <u>is</u> something to the relationship between Emark and Ford Motor more than simply buyers and sellers. Our very entrance into the business proves it."[20] This correspondence is a possible indicator that Emark was starting to supply storage batteries for Ford Motor Company.

Edison's and Ford's relationship spanned many years and was often referenced in newspaper articles and announcements. On December 20, 1927, the New York Times had an article titled, *Edison a Passenger in a New Ford Car*: *Rides out of Kearny Factory in First Model A to be Assembled There*.[21] "Edison was the passenger of the first new Model Fords to be assembled in the Ford Motor companies' eastern plant here in Kearny."

Regardless of their business relationship, Edison and his second wife Mina spent their winter retreat in Fort Myers, Florida. There his friendship with Ford flourished as he continued to work on several projects ranging from electric trains to finding a domestic source for natural rubber.

History of Emark Battery Plant in Kearny, New Jersey:

The first development in the general area was the White Tar Company which purchased two narrow parcels located directly north of the Emark property in 1916 (Block 287, Lots 48 and 49), with a frontage on the Hackensack River. The White Tar Company constructed numerous buildings on their property for the refinement of crude naphthalene for the production of moth repellents, disinfectants, deodorizers and for the manufacture of decorative petroleum candles. This helped to establish the area as a manufacturing/industrial area.

In 1918, Thomas A. Edison and his wife Mina purchased all the parcels of land immediately south of the long narrow parcel owned by White Tar, consisting of Block 287, Lots 50, 51, 52 and 52R). Charles Edison may have selected the site due to the property's location. The Belleville Turnpike and the Hackensack River, respectively, bound the property on the west and east. The site for Edison's Emark Battery Plant was an ideal location because it was located on the main roads that ran east from the Edison plant in West Orange and the Edison factory complex at Silver Lake.[22] Edison's companies made use of the railroads in West Orange, Silver Lake, and western New Jersey. The rail lines were close to the site of the Emark Battery Plant, either directly or through connecting lines.[23]

Thomas Edison would use The Austin Company to build the Emark Battery Plant buildings. The buildings consisted of a Gatehouse, Engineering Building (Building 1), Battery Plant Building (Building 2), Service and Maintenance Building (Building 3) and a Boiler House (Building 4). The buildings were constructed on the site in the late-1920s following a series of conveyances among the Edison's and Edison-owned companies between 1918 and 1925. Ownership of all the parcels (Lots 50, 51, 52 and 52R) was transferred to the Edison Battery Storage Company, a wholly owned subsidiary of Thomas E. Edison, Inc., which in turn conveyed ownership of all the parcels to another Edison company, the Emark Battery Corporation (Emark) in 1929.

In 1927, Charles Edison was appointed the head of the Edison Corporation. Thomas became Chairman of the Board. Thomas disapproved of the lead-acid batteries and they were branded with the "Emark" instead of having his name labeled on the item.[24] In 1927 the construction of

[21] "Edison A Passenger In A New Ford Car" New York Times, December 20, 1927
[22] Hill, George J, MD, *Edison's Environment: Invention and Pollution in the Career of Thomas Edison* (New Jersey: New Jersey Heritage Press, 2007), 270
[23] Ibid., 273
[24] Ibid.

the Emark Battery Plant in Kearny, New Jersey began. The construction of the facility was completed in 1930 and the plant began producing storage batteries for Ford automobiles in 1930. By the 1930s, Emark became one of the ten major divisions for the Thomas A. Edison, Inc.[25]

According to the biographer of Charles Edison, Venable, the Kearny location was designed to manufacture a battery-powered "starter" for Ford's Model A.[26]The Model T was discontinued in 1927 in favor of the Model A. The Model T used a crank whereas the Model A had a battery-power starter.

The Emark Battery Plant was constructed between 1927 and 1929 on the entirety of Block 287, Lot 50 in Kearny, New Jersey. Prior to his death in 1931, Thomas Edison continued to work with batteries to produce electrical running automobiles and trains. In 1933 Emark was merged with Thomas A. Edison, Inc. (Edison, Inc.) which continued operation of the Emark Battery Plant as a division of Edison. The Emark Battery Plant operated continuously on Lot 50 from 1930 until 1953. Even as a successful operation it was never big enough to expand Battery Plant operations onto lots 51, 52 and 52R. In 1946, Koppers Company, Inc. purchased the adjacent vacant Lots 51, 52 and 52R from Edison, Inc. But not the Emark Battery Plant located on Lot 50, which continued to operate for another eight years.

Over time the production of the Emark plant seems to have fluctuated for various reasons. In 1941, the New York Times announced, in an untitled article, that the Emark battery division of Thomas A. Edison, Inc. is "partially shut down as a result of a cancellation of orders by the Ford Company last week."[27] In 1945, the New York Times reported in the article titled *Edison Strike Is Ended* that the "6 week strike at the West Orange, Belleville and Kearny plant of Thomas A. Edison, Inc. ended today when members of local number 407, united electrical workers, voted unanimously to accept proposals agreed upon by company and union representatives. The walkout of the 2000 employees has been crippling productions of the two plants since October 2." "Union leaders said that employees of most shifts would be back at work Monday."[28]

According to the 1948 Thomas A. Edison Inc. Annual Report the automotive division saw a decline in battery and spark plug sales during 1948.[29] The sales and profits of batteries were affected by the fluctuation of lead prices, which caused heavy inventory losses, and a warm winter in the East, where sales were being concentrated. The cold weather wears the battery out faster. There were plans of expanding the automobile battery business to Bremen, Indiana. Because the batteries are heavy and are no longer limited to the eastern area, the plant in Bremen, Indiana could reach 55% of all automobile owners in the United States.[30]

In 1950, sales exceeded the previous years for all the Edison and private brand batteries due to an expanded sales program that included additional sales personnel, increased promotional activities and changes in pricing policy.[31] The 1950 Thomas A. Edison Inc. Annual Report noted that the Automotive Division is now producing batteries for the Armed Forces. The report further noted that sales to the Armed Forces were projected to increase. However, there was also anticipation for a shortage of materials in the future, which could cause a problem for manufacturing. A new plant in Bremen, Indiana started battery production in 1950.

By 1951 Edison batteries made in Kearny, NJ were sold under the Edison name through independent auto parts distributors. However, they were also produced for the Ford Motor Company and for the Firestone Tire and Rubber Company, and bore these company's brand names.[32] Also in 1951, the Bremen, Indiana Battery Plant built up production and was now making Ford, Firestone and Edison batteries. Total battery sales for these two plants were down due to Government restriction on lead, which effected production. According to the 1951, Thomas A. Edison Inc. Annual Report "Although the new sales program introduced in 1950 increased battery sales, potential shortages in lead supplies could decrease battery sales as the year progressed."[33] The report did not specify the effect these sales had on the Kearny facility.

In 1952 the sale of batteries remained the same as 1951 in spite of a decrease in sales to the government, which were far less than the preceding year. Sales increased for the general public of the strictly starting, lighting, and ignition types of batteries produced by the Automobile Division. Lead prices changed 17 times due to the unsettled lead market and lead is the major material cost in the lead-acid battery. [34] The prices ranged from a 19 cent maximum to a 13.5 cents minimum.[35] This type of price range made it difficult to maintain a stabilized profit margin.

In 1953 the Thomas A. Edison Incorporated liquidated the lead-acid automotive battery business.[36] It was described in a New York Times January 22, 1954 article titled, *Rubber Fabricator Buys Kearny Plant*: "The Crown Rubber Company, manufacture of molded rubber products, has purchased the battery manufacturing plant of the Thomas A. Edison Company on the Belleville Turnpike in Kearny, NJ." "The buildings were erected by the Edison Company in 1930 (sic) and were used for the manufacture of automobile storage batteries. The Edison Company plans to complete its removal from the plant by the end of this month." "The rubber company plans to occupy about 40,000 sq. ft. in the property and will lease the remainder of

the space."[37] Crown Rubber Products, Inc., operated a molded rubber product manufacturing facility in Building No. 2 (Battery Plant Building) of the Emark Battery Plant.

In 1959, Crown Rubber sold Lot 50 to Keaton Rubber Company, which, from 1959 to 1962, also operated a molded rubber product manufacturing facility in Building No. 2. From 1954 to 1964, Tantanex Chemical Corp., producers of dye carriers, leased equipment and portions of Lot 50 from Keaton, who operated a chemical dye-carrier manufacturing facility in Building No. 3 (Service & Maintenance Building) and maintained a research laboratory in Building No. 1 (Engineering Building) of the former Emark Battery Plant.

In 1962, Lot 50 was purchased by the Standard Chlorine Chemical Company (SCCC) from Keaton. The sale was announced in the New York Times November 2, 1962 article titled, *Old Edison Plant is Sold in Kearny: Chemical company acquires former battery factory*.[38] Lots 48, 49, 51, 52 and 52R were purchased by the Standard Naphthalene Products (SNP) Company (a subsidiary of SCCC) from the Koppers Company, Inc. SCCC manufactured moth crystals and flakes from dichlorobenzene at the site until 1987.[39] Between 1963 and 1981 SCCC leased the distillation building on Lot 48 from SNP for use in its separation of dichlorobenzenes to produce moth preventatives and, for a limited time, trichlorobenzenes. Raw materials were brought to the site by rail and tank trucks. The Cloroben Chemical Corporation (Cloroben), a subsidiary of the SCCC, operated a small batch formulation and blending operation for various drain cleaners known as "Cloroben" on Lot 50. SCCC ceased all manufacturing operations at the site in 1987. Cloroben ceased manufacturing operations on Lot 50 in 1993; the Emark buildings still remain standing on the property.

The Austin Company:

As discussed earlier, The Austin Company built the Emark Battery Plant buildings. The Austin Company was created by Samuel Austin (1850 – 1936). Samuel Austin began his career as a carpenter in England. He moved to the United States after hearing about the Chicago fire of 1872, expecting the need of craftsman to help rebuild the city. Austin decided to settle in Ohio after visiting a friend. Known for his quality of work, Austin and his son Wilbert J. Austin incorporated as the Samuel Austin & Son Company in 1904 ("Austin and Son"), an engineering and construction firm focused on industrial plan projects.[40] The company's first major construction project was the National Electric Lamp Association in East Cleveland in 1912. During this time, Wilbert developed "The Austin Method," which streamlined the building process by bundling engineering, construction, and design services.[41]

In 1914, Austin and Son introduced four prefabricated building plans for clients to choose. This provided a new level of efficiency to the construction process. In 1916, the company name changed to The Austin Company, Engineers and Builders. Wilbert also developed the

[41] Ibid

"Controlled Conditions" plan, which was an improvement from the hot factories during that period.[42] The plant would become cost effective by controlling the light, noise, temperature, and humidity and creating a better working environment.

In 1917, the Austin Company was growing rapidly and many plants built by them produced and supplied the Allied forces in World War I. In 1920, Austin experimented with steel fabricating techniques using electric welding in order to support the heavy weight required for heavy industry plants instead of riveted steel structures.[43] The Austin Company also built support facilities for many of the nation's airports, such as the Cleveland Municipal Airport that opened in 1925.

Description of Emark Battery Plant:

The former Emark Battery Plant Property is located on the eastern side of the Belleville Turnpike in Kearny, New Jersey (see Site Location Map).[44] This area was not developed until after the 1909 GM Hopkins Map of Hudson County). The proposed boundaries of the historic resource site have been drawn to include only that portion of the former Emark Battery Company parcel (now part of the Standard Chlorine Chemical Company property) that includes standing buildings that were historically associated with the Emark Battery Plant. The boundaries encompass the entirety of tax lot 287, block 50.

Five buildings currently stand on the former Emark Battery Plant site; the Gatehouse (Historic Photograph 2), Engineering Building (Historic Photographs 3 & 4), Battery Plant Building (Historic Photograph 5), the Service and Maintenance Building (Historic Photograph 6) and the Boiler House (Historic Photograph 7). Historic maps, historic photographs, and documentary sources, as well as physical evidence suggest that all five of these structures were built as part of a single construction campaign started in 1927 (this construction date is shown on original plans) by the Thomas A. Edison Company. One of the five buildings, the Gatehouse, is designed in the Spanish Eclectic style. The remaining four buildings are Art Deco-style structures that reflect functionality, aesthetic attention, and construction technology. The Art Deco-style structures include the Engineering Building (Building 1); the Battery Plant Building (Building 2); the Service and Maintenance Building (Building 3); and the Boiler House (Building 4).

According to the 1936 Sanborn map, batteries were manufactured, packed, and shipped in the Battery Plant Building, the largest building on the site. The Engineering Building (Building 1), the first building to the east of the Gatehouse, served as an Office & Laboratory. It is the most ornate of the structures and was constructed of fireproof concrete, with incised Art Deco decoration. The existence of a laboratory on an industrial site is relatively unique to Edison's complexes in this period, reflecting his role in combining research and development with manufacturing. The use of concrete throughout the complex also likely reflects Edison's interest in the building material; however, whether Edison's concrete construction methods or concrete companies were involved in the construction of the buildings on the site is not known.

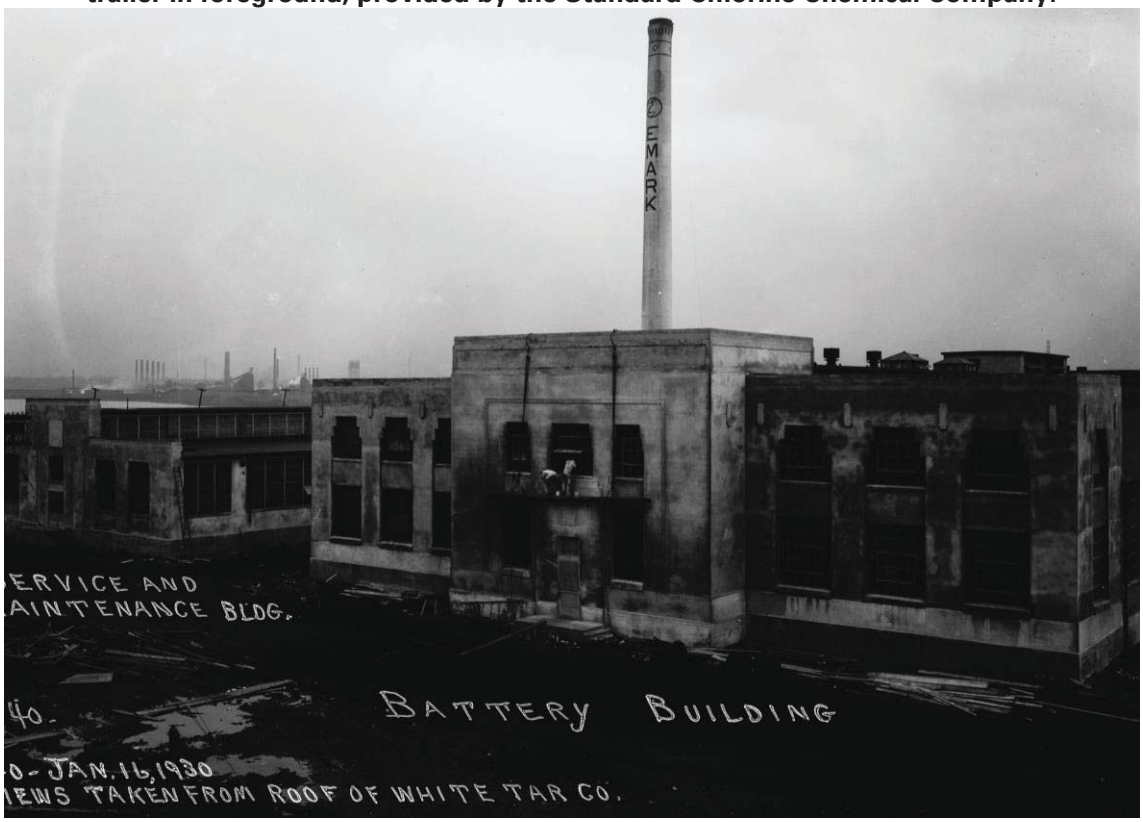
Historic Photograph 2 – March 1, 1930 view of the Gate House, provided by the Standard Chlorine Chemical Company.

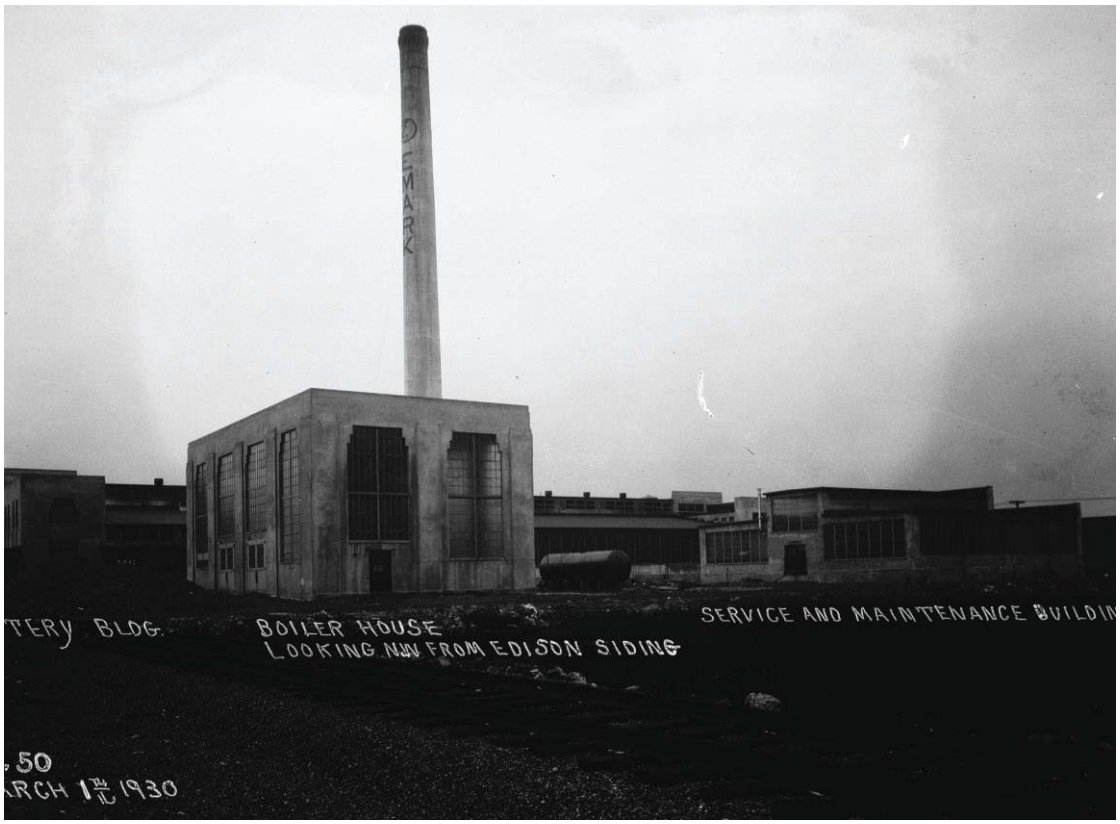
Historic Photograph 3 – March 1, 1930 view of the Engineering Building, provided by the Standard Chlorine Chemical Company.

Historic Photograph 4 – March 3, 1930 view of the Engineering Building with the Austin Company trailer in foreground, provided by the Standard Chlorine Chemical Company.



Historic Photograph 5 – January 30, 1930 view of the Battery Building, provided by the Standard Chlorine Chemical Company.

Historic Photograph 6 – March 1, 1930 view of the Service and Maintenance Building, provided by the Standard Chlorine Chemical Company.



Historic Photograph 7 – March 1, 1930 view of the Boiler House, provided by the Standard Chlorine Chemical Company.

All of the buildings extant on the site today are depicted on a 1936 Sanborn map, and are believed to have been constructed by 1930. Also depicted on the map is a 'sulphuric acid tank,' no longer standing on the site, and a small structure labeled 'storage,' located on the southern edge of the property, south of the Battery Plant Building. The Sanborn map also indicates that a short spur of the Erie Railroad (Newark & Hudson Branch) ran on an east-west orientation along the southern property line. Furthermore, an underground 'Pipe Tunnel' is depicted, connecting the Engineering Building with the Battery Plant Building.

Historic photographs provided by the Standard Chlorine Chemical Company dating to March 1930 show that the appearance of the site and buildings has not changed dramatically since that date. There have been some alterations shown in the photographs, including the cement entry wall designed in the Art Deco style, that no longer stand today, having been replaced with a metal fence. Furthermore, the Boiler House is shown on the photographs with a tall brick smokestack bearing the word `Emark': this feature no longer stands. Most of the buildings on the site currently exhibit cracking or spalling of the concrete or stucco facing, and some of the windows are broken. However, overall, the exteriors of the buildings standing on the property retain a high degree of historic integrity. The interiors of the buildings are in various states of dilapidation and disrepair. In the Battery Plant Building most of the roof has collapsed in.

The present landscape of the property consists of an asphalt driveway, oriented east-west along the northern edge of the historic property line; the remainder of the site is largely asphalt paved. Historic photographs show that the driveway maintained its configuration, and was edged in fieldstones, while the rest of the site was either paved or covered in grass.

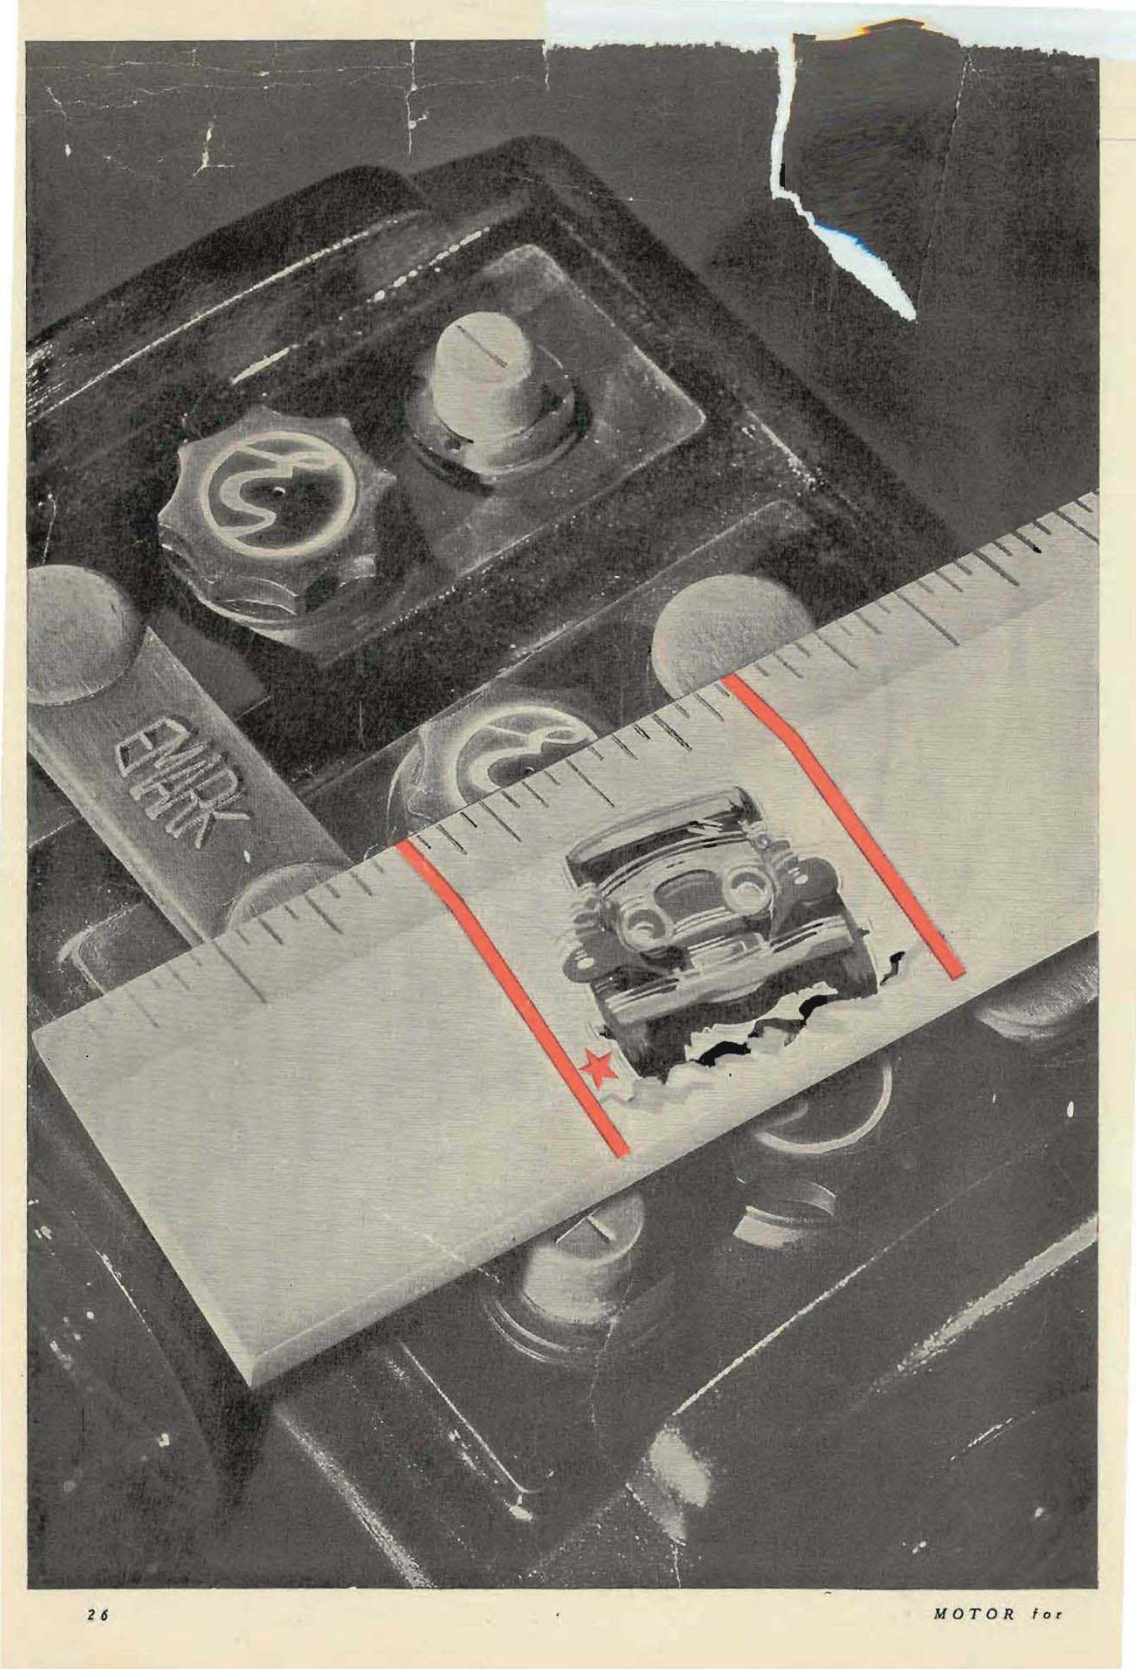
HISTORIC ADVERTISEMENTS



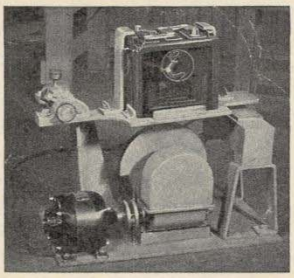
Page 1 – View of 2 page Ad in MOTOR Magazine for Emark car battery, provided by Standard Chlorine Chemical Company Archives.

More actual battery value for your dollar . . . in

EMARK POWER-MEASURED BATTERY *with Positive End Zones*

Dollar for dollar . . . value for value . . . Emark delivers more dependable service than you have ever been able to get from a battery before.

Produced by the Emark Battery Corporation . . . a division of Thomas A. Edison, Incorporated . . . this new battery is the master achievement of a vast organization . . . an outstanding personnel . . . extensive laboratories . . . enormous resources.



★

POWER-MEASURED BY THE BUMP TEST

Conceived by THOMAS A. EDISON

Up and down . . . iron to iron . . . BANG! BANG! BANG! Emark Batteries are Power-Measured against service more severe than they would encounter in a car.

Every condition the battery will meet in actual service is anticipated before the Emark Power-Measured Battery leaves the factory. Laboratory tests magnify the constant joggling of rough roads . . . demands made by freezing winter weather . . . cross-country driving in blazing heat . . . short runs with frequent starts . . . all conditions are measured and provided for in this new battery.

Positive End Zones . . . the aim of engineers ever since the invention of the storage battery . . . is another exclusive Emark feature. Because of this long-hoped-for battery development Emark Power-Measured Batteries have longer life and greater capacity.

Because they are Power-Measured . . . because of Positive End Zone construction . . . because the finest materials are combined with the most modern manufacturing methods . . . Emark leads in battery values.

Emark AAA is an extra quality battery with Positive End Zones. The thirteen plate size retails for only $10.95.

Edison Battery Property (Standard Chlorine Chemical Company): Base Form

Description:

General Historical Background

Following the development of the first railroads through the area in the 1860s and 1870s, eastern Kearny was transformed from undeveloped marshlands to a center of industry. The Mile End Thread Mills, Marshall Linen Thread Mills, and the Nairn Manufacturing Company, a linoleum factory, were among the large industries established in Kearny between the mid-1870s and the mid-1880s (Stinson 1915: 371).

The portion of eastern Kearny located south of the Pennsylvania Railroad (Northeast Corridor), along the west side of the Hackensack River became the site of multiple industrial facilities. The parcel located immediately south of the Northeast Corridor Line, now known as the Diamond Shamrock property, was first developed in 1916 by the Martin-Dennis Company, which produced sodium bichromate and potassium dichromate, chemicals used in the preparation of Tanolin, a leather tanning agent. A 1936 Sanborn map shows over a dozen buildings on the Martin-Dennis property (Sanborn 1936). In 1916, the White Tar Company purchased a long narrow parcel directly south of the Diamond Shamrock property, and constructed several buildings on the site for the refinement of crude naphthalene for the production of moth repellents, disinfectants, and deodorizers.

The Thomas A. Edison Company purchased the land directly south of the White Tar Company property in 1917 (*NYT* 1917). The property was bounded on the west and east by the Belleville Turnpike and the Hackensack River, respectively. Buildings were not constructed on this site until the mid 1920s, when the company (Thomas A. Edison Company's subsidiary, the Emark Battery Corporation) began production of batteries there.

The Koppers Gas & Coke Company purchased the White Tar Company property (north of the Edison property) in 1942, and continued production of naphthalene products (ATSDR 2005: 3). Later, the Koppers Company purchased the Edison site and merged it with the parcel to the north to create the Tar Products Division-Meadows Plant. From 1959 to 1962, Tantanex Chemical Corp., producers of dye carriers, operated on the site. Following 1962, the property was owned by Standard Chlorine and Standard Naphthalene companies, which remained in operation until 1993 (ATSDR 2005: 1). The site has not been in active industrial use since that time.

This survey form solely addresses the portion of the Standard Chlorine Chemical Company property that was formerly part of the Thomas A. Edison Company/ Emark Battery Company property, including the southwestern portion of the present Standard Chlorine Chemical Company property. The remaining (northern) portion of the Standard Chlorine Chemical Company property, formerly owned by the White Tar Company, is addressed on a separate survey form.

A site visit was conducted on June 26, 2007, however, photography was prohibited. Therefore, the only photographs of the structures attached are aerial photographs (Figure 2), photographs taken from public rights-of-way (Figure 4), and historic photographs (Figures 5-7). Views of the site from surrounding public roads and rights of way are limited.

Thomas A. Edison Company and Emark Battery Corporation

Thomas A. Edison (1847-1931), one of the most prolific inventors in history, is best remembered as the inventor of the phonograph, developer of the light bulb, and the creator of the first industrial research laboratory, in Menlo Park. Edison also advanced cement as a building material, particularly in domestic applications, developing new techniques for cement processing and construction. Born in Ohio, Edison moved to New Jersey early in his career and remained closely associated with New Jersey for the rest of his life.

The battery represents another commodity which Edison was important in developing. Storage batteries were introduced on the commercial market in 1881. For over two decades, the only battery type available was a lead-sulphuric-acid cell, consisting of plates of lead in a dilute sulphuric-acid electrolyte. From the 1890s through the early 20th century, Edison strove to develop a powerful, durable, and light-weight alkaline car battery to become the basis for a successful electric automobile. Edison's laboratories continually refined the design of such a

CONTINUATION SHEET

Historic Sites #:

battery, striving to develop a new alkaline electrolyte that could be used in small quantities and which would be slower to dissolve metals in the battery, creating a long-lasting and light battery. In place of the sulphuric acid electrolyte solutions coupled with lead electrodes which were the contemporary standard, Edison's 'type A' battery used a potassium hydrate and lithium hydrate electrolyte and a nickel and iron electrode. Edison succeeded in developing a battery that met his expectations in 1910. It did not achieve the success he had hoped in the car market, however, due to Henry Ford's 1909 release of the gasoline-engine Model T. Nevertheless, it was widely used in trucks and commercial and factory vehicles and became one of his most lucrative inventions (IEEE 2007).

During the first two decades of the 20th century, Edison founded multiple companies involved in the development and production of batteries in the United States, including the Edison Manufacturing Company; the Battery Supplies Company (est. 1903); the Edison Storage Battery Company; and the Emark Battery Corporation. Edison also operated multiple battery companies in Germany. Thomas A. Edison, Incorporated, organized as the National Phonograph Company in 1896, and renamed in 1911, consolidated many of Edison's companies over time, including the Edison Storage Battery Company in 1932, and the Emark Battery Corporation in 1933. Edison established multiple battery factories, including a plant in West Orange (ca. 1910) and a chemical plant in Bloomfield (Israel 2000: 419). The Kearny battery factory, while purchased by Edison in 1916, was not developed and put into production until 1927, four years before his death.

Site History and Description

The former Edison Battery Company Property is located on the eastern side of the Belleville Turnpike in Kearny. The proposed boundaries of the potential historic resource site have been drawn to include only the portion of the former Edison Battery Company parcel (now part of the Standard Chlorine Chemical Company property) that include standing buildings that were historically associated with the Thomas A. Edison Company. The boundaries encompass the entirety of tax lot 287, block 50 (see Figures 1 and 2).

Five buildings currently stand on the former Edison Battery Company site. Historic maps, historic photographs, and documentary sources, as well as physical evidence suggest that all five of these structures were built as part of a single construction campaign of 1927 (this construction date is shown on a 1936 Sanborn map; see Figure 3) when the property was first developed by the Thomas A. Edison Company. The five buildings, with the exception of the Gate House, a small structure designed in the Spanish Eclectic style, are Art Deco-style structures that reflect functionality, aesthetic attention, and construction technology (see Figures 4-7). The Art Deco-style structures include a Laboratory; a Battery Manufacturing Building; a Service and Maintenance Building; and a Boiler House. According to the 1936 Sanborn map, batteries were manufactured, packed, and shipped in the Battery Manufacturing Building, the largest building on the site. The Office & Laboratory, the first building one encounters after the Gate House, upon entering the site, is the most ornate of the structures; constructed of fireproof concrete, with incised Art Deco decoration. The existence of a laboratory on an industrial site may be relatively unique to Edison's complexes in this period, reflecting of his role in combining research and development with manufacturing. The use of concrete throughout the complex also likely reflects Edison's interest in the building material; however whether Edison's concrete construction methods or concrete companies were involved in the construction of the buildings on the site is not known.

All of the buildings extant on the site today, are depicted on a 1936 Sanborn map, and are believed to have been built in 1927. Also depicted on the map is a 'sulphuric acid tank,' no longer standing on the site, and a small structure labeled 'storage,' located on the southern edge of the property, south of the Battery Manufacturing Building. The Sanborn map also indicates that a short spur of the Erie Railroad (Newark & Hudson Branch) ran on and east-west orientation along the southern property line. Furthermore, an underground 'Pipe Tunnel' is depicted, connecting the Office & Laboratory Building with the Battery Manufacturing Building.

Historic photographs on file at the National Parks Service, dating to March, 1930, show that the appearance of the site and buildings has not changed dramatically since that date. There have been some alterations, including the following: the cement entry wall designed in the Art Deco style, shown in the photographs, no longer stands today, having been replaced with a metal fence. Furthermore, the Boiler House is shown on the photographs with a tall brick smokestack bearing the word 'Emark;' this feature no longer stands. Most of the buildings on the site exhibit cracking or spalling of the concrete or stucco facing, and some of the windows are broken. However,

CONTINUATION SHEET

Historic Sites #:

overall, the exteriors of the buildings standing on the property retain a high degree of historic integrity. The interiors, with the exception of the Office & Laboratory Building, were not accessible. The present landscape of the property consists of a driveway, oriented east-west along the northern edge of the historic property line; the remainder of the site is largely paved. Historic photographs show that the driveway maintained its former configuration, and was edged in fieldstones, while the rest of the site was either paved or covered in grass.

Significance

The former Edison Battery Property complex appears to meet the criteria for State/National Register eligibility. The complex appears eligible under Criterion A, for its association with Thomas A. Edison and his development of the battery. It also appears eligible under Criterion C, as an example of the Art Deco style applied to industrial buildings.

BUILDING ATTACHMENT

Historic Sites #:

Common Name: Gatehouse (Standard Chlorine Chemical Company)
Historic Name: Gatehouse (Edison Battery Property)
Present Use: Vacant
Historic Use: Industrial
Construction Date: 1927 **Source:** Historic maps; Historic photographs (NPS Archives)
Alteration Date(s): **Source:**
Designer: Not known **Physical Condition:** Good
Builder: Not known **Remaining Historic Fabric:** High
Style: Spanish Colonial Revival
Form: Other **Stories:** One
Type: Other **Bays:** Three
Roof Finish Materials: Tile, Spanish
Exterior Finish Materials Concrete Block, Modern

Exterior Description:
The Gatehouse is a small single-story square-plan building constructed of concrete, with a hipped roof clad in Spanish tile (see Figure 4, Photo 1; and Figure 5). The front façade faces the driveway of the complex and is characterized by a central doorway with a window on either side. A window is also located in the center of each of the other facades of the building. The windows throughout the structure contain nine-light sash. The exterior of the building exhibits some spalling and cracking, and small modern lights and electrical fixtures have been appended to the side of the building, however, overall, the structure retains a high degree of physical integrity.

Interior Description:
Interior not accessible.

Setting:
The building is located on the east side of the Belleville Turnpike on the western edge of the Standard Chlorine Chemical Company property. The driveway for the facility runs east-west immediately north of the structure, and a metal entry gate abuts the front (north) façade of the Gatehouse.

Exterior Description:
See continuation sheet.

Interior Description:
Interior appears to have been extensively remodeled in the late 20th century.

Setting:
The structure is immediately surrounded by low trees and moderate vegetative growth, and is situated in a paved parking and driving area roughly 200 feet east of Belleville Turnpike. It is located south of the main driveway of the complex, and is located east of the Gatehouse.

Survey Name: Portal Bridge Capacity Enhancement Project DEIS Date: October 24, 2007
Surveyor: M. McDonald
Organization: AKRF for NJ TRANSIT and Amtrak

CONTINUATION SHEET

Historic Sites #:

Edison Battery Property: Laboratory and Office Building Form

Exterior Description:

The Office & Laboratory building is a boxy two-story rectangular-plan building built ca. 1927 in the Art Deco style (see Figure 4, Photo 1; and Figure 6). It is constructed of concrete and has a high simple plinth and a shallow parapet around its flat roof.

Each of the building's four facades exhibit similar characteristics. They are symmetrically fenestrated, with central entries on the front (north), and west facades. On the latter facades, the entry bays are wider and contain paired windows at second-story level. Windows throughout the building are rectangular, with slightly shouldered lintels. Stylized fluted pilasters are placed between every two bays along the façades. A wide frieze band runs continuously around the building's cornice line. This frieze contains shallowly incised ornamentation consisting of floral and geometric patterns. Similar panels of incised patterning are located above the windows and doorways. Flanking the doorways are bulky pilasters suggesting amortized buttress. The bulk of these features and of the low bulky concrete walls flanking the steps that lead to the doorways, exhibit a vaguely Egyptian quality, suggested also by the pyramidal caps that surmount the pilasters. The latter are also decorated with vertical panels of incised patterning depicting scrolls and geometric shapes. Recessed square panels are located between first and second story windows.

The front (north) façade of the building has nine bays, symmetrically arranged. The central bay contains a doorway on the first story surmounted by a paired window. The doorway contains a modern glass double-door surmounted by a large square transom. The windows along the second story of the front façade have two-light fixed sash; a recessed area beneath the windows shows where longer original window openings (as shown in historic photographs) have been blocked. First-story windows on the front façade contain three-light fixed sash surmounted by a blind panel that was formerly a fourth light.

Similarly, occupying the windows along the side (west) façade contain three-light fixed sash, surmounted by a blind panel that was formerly a fourth light. The east façade of the building appears to contain some of the original awning sash windows, though the former location of the upper light has been blocked throughout the façade.

BUILDING ATTACHMENT

Historic Sites #:

Common Name: Battery Manufacturing Building (Standard Chlorine Chemical Company)
Historic Name: Battery Manufacturing Building (Edison Battery Property)
Present Use: Vacant
Historic Use: Industrial
Construction Date: 1927 **Source:** Historic maps; Historic photographs (NPS Archives)
Alteration Date(s): **Source:**
Designer: Not Known **Physical Condition:** Fair
Builder: Not Known **Remaining Historic Fabric:** High
Style: Art Deco
Form: Other **Stories:** Two
Type: Other **Bays:** Nine
Roof Finish Materials: Built-up Tar
Exterior Finish Materials Concrete Block, Modern

Exterior Description: The large rectangular-plan building is two-stories in height, has a flat roof, and is constructed of concrete parged with stucco (see Figure 4, Photo 2; and Figure 6, Photo 6; and Figure 7). The tripartite front (north) façade has a projecting three-bay central section flanked by recessed three-bay wings. It exhibits elements of the Art Deco and Second Egyptian Revival styles. It has a minimally stepped roof parapet, projecting and stepped wall segments, a recessed square panel above the central doorway, and stepped windows along the upper story. Windows contain multi-light iron casement and sash. Three windows on the structure have been blocked. The rear section of the building is constructed of stucco-parged concrete block, with continuous window panels on the upper portions of the side facades.

Interior Description:
Interior not accessible.

Setting:
The building is located east of the Office & Laboratory Building, in the southwestern portion of the Standard Chlorine Chemical Company property. The driveway for the facility runs east-west immediately north of the structure. The building is surrounded on each side by asphalt pavement.

BUILDING ATTACHMENT

Historic Sites #:

Common Name: Service and Maintenance Building (Standard Chlorine Chemical Company)
Historic Name: Service and Maintenance Building (Edison Battery Property)
Present Use: Vacant
Historic Use: Industrial
Construction Date: 1927 **Source:** Historic maps; Historic photographs (NPS Archives)
Alteration Date(s): **Source:**
Designer: Not known **Physical Condition:** Fair
Builder: Not known **Remaining Historic Fabric:** High
Style: Art Deco
Form: Other **Stories:** One
Type: Other **Bays:** Five
Roof Finish Materials: Built-up Tar
Exterior Finish Materials Concrete Block, Modern

Exterior Description: The Service and Maintenance Building is similar in design to the neighboring Battery Building, though smaller (see Figure 7). The single-story flat-roofed concrete building is parged with stucco. The tripartite front (north) façade is symmetrical and has a single-bay central section flanked by shorter two-bay wings. The central entry, accessed by a double-entry stair with metal railing, is surmounted by a square panel and flanked by simple pilasters. The windows have chamfered upper edges and contain multi-light casement sash. The rear section of the building features large continuous multi-light fixed and awning-sash windows along the side facades. The central section is higher than the the wings, creating a tiered effect. The concrete structure exhibits some cracking, and a few of the window panes are broken, however, overall it appears to retain high integrity.

Interior Description:
Interior not accessible.

Setting:
The building is located east of the Battery Building, in the southwestern portion of the Standard Chlorine Chemical Company property. The driveway for the facility runs east-west immediately north of the structure. The building is surrounded on each side by asphalt pavement.

BUILDING ATTACHMENT

Historic Sites #:

Common Name: Boiler House (Standard Chlorine Chemical Company)
Historic Name: Boiler House (Edison Battery Property)
Present Use: Vacant
Historic Use: Industrial
Construction Date: 1927 **Source:** Historic maps; Historic photographs (NPS Archives)
Alteration Date(s): **Source:**
Designer: Not known **Physical Condition:** Fair
Builder: Not known **Remaining Historic Fabric:** Medium
Style: Art Deco
Form: Other **Stories:** One
Type: Other **Bays:** Four
Roof Finish Materials: Built-up Tar
Exterior Finish Materials Concrete Block, Modern

Exterior Description: The Boiler House is a small rectangular-plan building constructed of concrete parged with stucco (see Figure 7). While the Boiler House is clearly a part of the same design as the other structures on the former Edison Battery property, the single-story flat-roofed structure has little or no ornamentation, with the exception of shallow pilasters or buttresses along each façade, similar in character to those on the front façade of the Service & Maintenance Building. Unlike the other buildings on the property, all of the windows have been sealed with concrete block. Historic photographs dating to 1930 show that the Boiler House originally had large windows with stepped upper corners, as well as a tall brick smokestack with 'Emark' (the name of the company) spelled on it vertically in brick. The smokestack is no longer extant.

Interior Description:
Interior not accessible.

Setting:
The building is located east of the Battery Building, and south of the Service & Maintenance Building, in the rear (southeastern portion of the former Edison Battery property. The building is surrounded on each side by asphalt pavement.

NOTE TO PURCHASER

THE MATERIAL SUPPLIED BY THE WESTINGHOUSE ELEC. & MFG. IS ACCORDING TO CONTRACT AND IS NOT MODIFIED BY ANYTHING SHOWN ON THIS DIAGRAM. TYPICAL MACHINE AND TRANSFORMER CONNECTIONS ARE SHOWN. SEE DIAGRAM FURNISHED WITH APPARATUS FOR DETAIL CONNECTIONS. DIAGRAM MUST NOT BE USED TO DETERMINE LOCATION OF APPARATUS, WIRE OR CONDUITS. SWITCHBOARD CONNECTIONS ARE SHOWN AS VIEWED FROM REAR OF BOARD. APPARATUS PERPENDICULAR TO THE PANEL IS SHOWN WITH PART NEAREST TO PANEL AS THE TOP PART OF SYMBOL. ALL APPARATUS IS SHOWN IN THE DE-ENERGIZED POSITION. AUXILIARY SWITCHES ARE SHOWN FOR OPEN POSITION OF THE MAIN DEVICE. CURRENT AND POTENTIAL TRANSFORMER SYMBOLS ARE SUCH THAT TERMINALS OF THE SAME INSTANTANEOUS POLARITY ARE AS INDICATED AT THE RIGHT.

This Is the Story of EMARK

A LIFETIME EFFORT

Early 1930s Emark promotional material
Source: Thomas Edison National Historical Park

Batteries, Emark's sole product, reflect Thomas Edison's lifetime work with power generation, distribution, and storage. In the early twentieth century, he worked extensively on developing storage batteries that—in contrast to the earlier "primary" batteries—could be charged and discharged multiple times. Although Edison's efforts to develop a successful storage battery to power an electric car were unsuccessful, batteries ultimately became a lucrative product for Edison and his successor company for use in rail and marine signals, industrial trucks, mining equipment, and—as evidenced by Emark—in cars.

"... this new battery is the master achievement of a vast organization... extensive laboratories.... Every condition the battery will meet in actual service is anticipated before the Emark Power-Measured Battery leaves the factory."

1932 advertisement for the Emark Battery Corporation
Source: Collection of property owner

In the early 1930s, Emark lead-acid batteries were acclaimed for two reasons:

- Power-Measured to test under various road and weather conditions.
- Positive End Zones with extra capacity provided by an additional positive plate not used in typical batteries of the time.

MODERN PLANT, MODERN EQUIPMENT

1930 photographs of the Emark Engineering Building (left) and Battery Plant Building (above) Source: Collection of property owner

THE EMARK BATTERY CORPORATION · a Thomas A. Edison, Inc. subsidiary formed in the late 1920s to produce automotive starter batteries for the Ford Motor Company. The facility, located at 1025–1035 Belleville Turnpike in the Town of Kearny, operated from 1930 until 1953.

"... the elimination of all waste has been pursued. Waste motions, waste effort, waste time and waste material—all are strikingly absent."

"No Place for Experts," *Factory and Industrial Management*, New York, NY: McGraw-Hill Publishing Company, February 1932.

Designed and built by one of the country's top industrial design firms (The Austin Company of Cleveland, Ohio), the Emark complex featured Art Deco architecture and a modern automated production line.

"The battery... passes all Ford specifications with flying colors... we will have no expensive advertising—no service stations—no sales dept expense—as we will sell only to Ford...."

May 7, 1927 letter from TAE, Inc. President Charles Edison to his parents, Thomas and Mina
Source: Thomas A. Edison Papers, Rutgers University (Courtesy of the Charles Edison Fund and Thomas Edison National Historical Park)

The Emark Battery Corporation—perhaps better than any other site in New Jersey—represents the close relationship between two of the twentieth century's greatest innovators: Thomas Edison and Henry Ford. For many years, these two men shared business interests and a close friendship.

In 1927, when Ford introduced his Model A, Thomas A. Edison, Inc. was prepared to take advantage of the economic opportunities by producing batteries for the Ford Motor Company, building on land the Edisons had bought in close proximity to Ford's Kearny automotive assembly plant.

Although Emark later produced replacement batteries for other car companies, Emark remained focused on the Ford Motor Company as their primary customer, appropriate for a company whose very existence, location and production were based on the Edison-Ford relationship.

THIS IS THE STORY OF

EMARK

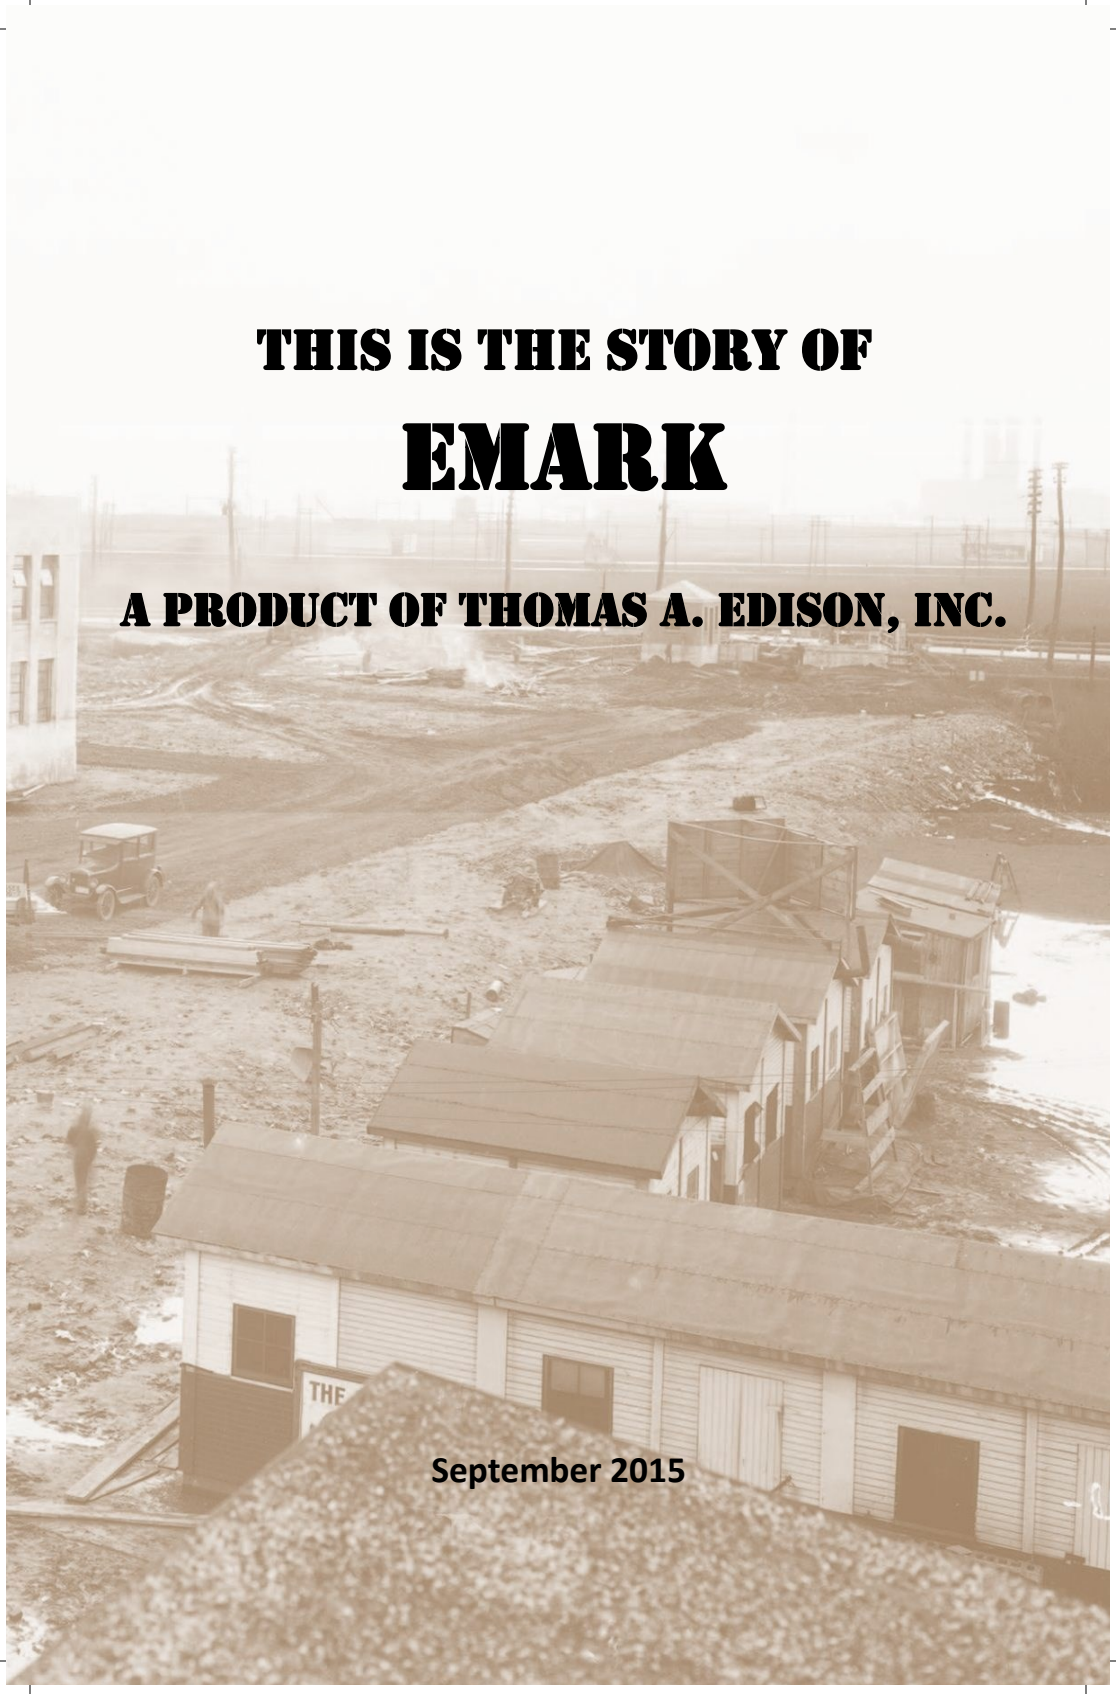
A PRODUCT OF THOMAS A. EDISON, INC.



September 2015

INTRODUCTION

"This is the Story of Emark, A Product of Thomas A. Edison, Inc." were the words used in the 1930s to proudly advertise the Emark Battery Corporation. Once a source of pride, the Emark complex by 2014 consisted of five vacant and deteriorating concrete buildings at 1025-1035 Belleville Turnpike in the Town of Kearny, Hudson County, New Jersey. Although similar to hundreds of other old industrial buildings that have outlived their usefulness, these particular five buildings have a special historic significance related to two important American innovators: Thomas Edison and Henry Ford.

At the time of this booklet's publication, it was anticipated that the five early twentieth century buildings would be demolished by the owner. The proposed new development on the site required a Remedial Investigation/Focused Feasibility Study (RI/FFS) for the Standard Chlorine Chemical Company (Standard Chlorine) Superfund Site. Consequently, the United States Environmental Protection Agency (USEPA) requested compliance with the requirements of Section 106 of the National Historic Preservation Act (NHPA) and its implementing regulations in order to support remedial investigations and activities to be conducted on the site.

The five Emark buildings were evaluated by the New Jersey State Historic Preservation Officer as eligible for inclusion in the National Register of Historic Places.[1] To mitigate the adverse effect of the anticipated demolition of National Register-eligible historic resources, SCCC Site Performing Parties Group c/o Key Environmental, Inc. and Langan Engineering and Environmental Services, Inc. retained the cultural resources firm of ARCH[2], Inc. to prepare this public education booklet. The goal is to promote understanding and appreciation of the site's historic significance.

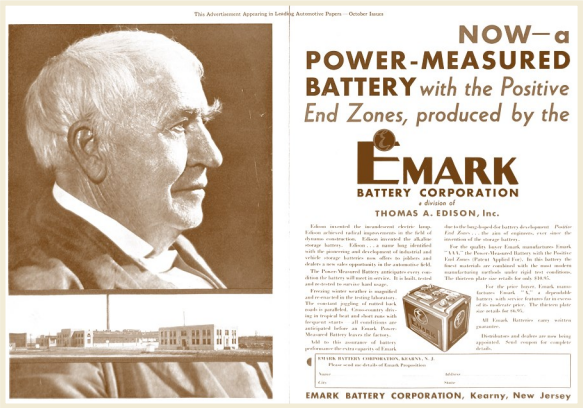
Why Was Emark Important?

Built in 1927-1929 for the Emark Battery Corporation, a subsidiary of Thomas A. Edison (TAE), Inc., the Emark buildings were used from 1930 until 1953 to produce automotive starter batteries, primarily for the Ford Motor Company.

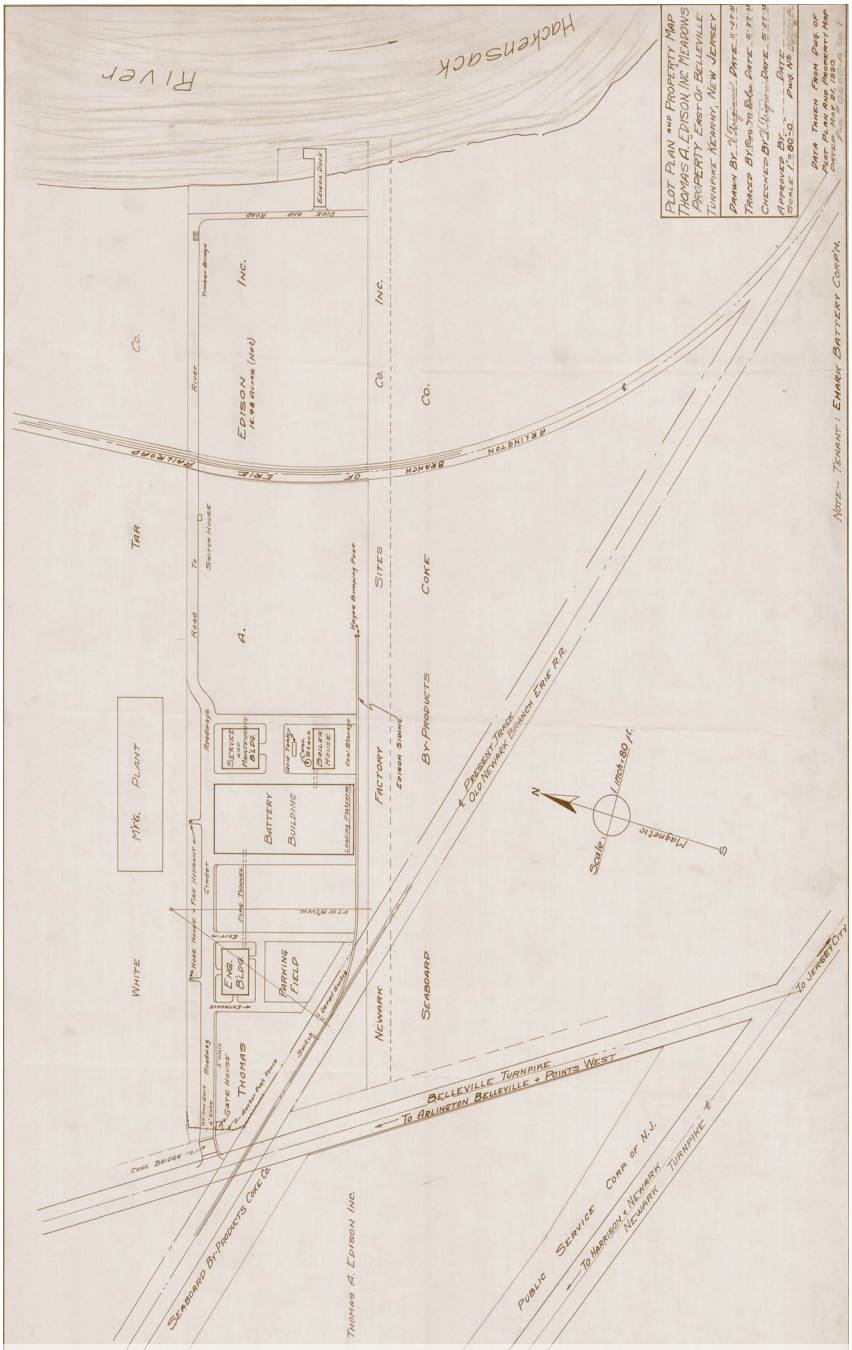
Despite the fact that Emark capitalized on Edison's reputation in their promotional material, Thomas Edison had limited direct involvement in the company. He had retired before Emark was formed by his son Charles, and he passed away in 1931, only a year after Emark started producing batteries. In addition, the type of battery produced by Emark (a lead-acid battery) was not Thomas Edison's favorite battery. In fact, he had spent years working on an alternative to lead-acid, resulting in his invention of nickel-iron-alkaline batteries.



Early 1930s Emark advertisement that proudly displays its Thomas Edison connection.

Source: Thomas Edison National Historical Park

Nevertheless, Thomas Edison laid the foundation for Emark through his lifetime work with batteries, his close relationship with Henry Ford, and his emphasis on a modern facility that included research and development as well as the modern production techniques championed by his friend and colleague Henry Ford. These factors, critical for understanding Emark's historic significance, certainly justify Emark's proud promotion of their Thomas Edison roots.



May 21, 1930 Plot Plan and Property Map showing the Emark site and buildings.

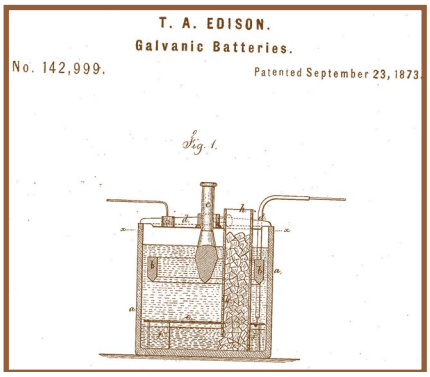
Edison's lifetime work with batteries

Batteries, Emark's sole product, reflect Thomas Edison's lifetime work with electric power generation, distribution, and storage. He worked with batteries as a young telegrapher; in his development of electric pens, phonographs, telephones, doorbells, fans, and sewing machines; in his efforts to develop central stations for the generation and distribution of electricity; and ultimately for vehicles.



An early battery patent by Thomas Edison, September 23, 1873.

Source: Thomas A. Edison Papers, Rutgers University

By the late nineteenth century, Edison was working to develop a "storage" battery that—in contrast to the earlier "primary" battery—could be charged and discharged multiple times.

In the early twentieth century, Edison's experimental work with storage batteries was one of his major initiatives, requiring an extensive amount of his time, energy, and financial resources. His primary goal was to develop an electric car that was solely powered by a rechargeable storage battery. In order to do so, he needed a storage battery other than the commonly used lead batteries, because lead is heavy and would require a large and heavy battery to power a car.

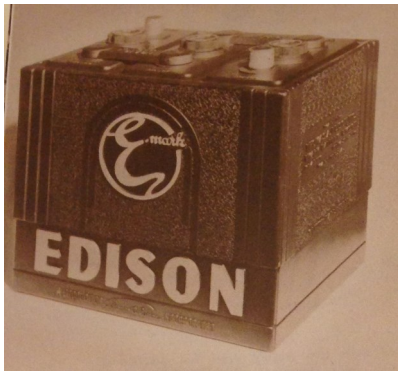
Typical of Edison's earlier work to perfect the incandescent light bulb, he experimented with many different materials and chemical combinations.[2] As later described in a TAE, Inc. report, Edison was determined "to ferret out 'Nature's secret of a good storage battery.'"[3]

Edison's work resulted in his invention of nickel-iron-alkaline storage batteries. These batteries were used in many applications, including to power trucks, which could operate in urban areas where batteries could be more easily re-charged. However, these batteries were not effective for use as the main power source in cars, which were driven longer distances.[4]

In 1911, Edison's business incorporated as Thomas A. Edison, Inc. This entity, which was eventually taken over by Edison's son Charles, built upon Edison's extensive work with batteries. A 1947 company booklet highlighted their ten "most important" products, including three batteries:[5]

***Nickel-Iron-Alkaline Storage Batteries**, used in electric locomotives, railroad signals, industrial trucks, shuttle cars for mines, and miners' lamps.*

***Primary Batteries**, used in railroad signals, stationary marine signals, and alarm systems.*



***Lead-acid Storage Batteries,** produced by Emark and used in automotive applications.*

This is the story of EMARK

A PRODUCT OF
THOMAS A. EDISON, Inc.

THE POWER MEASURED BATTERY with POSITIVE END ZONES

It is the purpose of this folder to give the car owner the FACTS about automobile storage battery construction . . . to show why the Emark resources, organization and strict manufacturing standards producing the new Power Measured Battery with POSITIVE END ZONES assures the best battery value per dollar.

HERE ARE THE FACTS:

FACT 1
MATERIALS USED

CASES

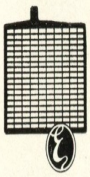
Strength and durability are needed in storage battery cases. **Emark uses extra weight material for all battery cases and covers.**

LEAD PARTS

Emark connectors and post straps have extra weight and capacity to take care of the heaviest discharges without voltage loss. Emark **does not skimp on lead.**

SEPARATORS

Only vertical grain Douglas Fir separators are used in Emark Batteries. This tough-fibre wood is uniform in structure and porosity and adds to battery life. Results of tests by U. S. Bureau of Standards show very desirable qualities in Douglas Fir for separators.



GRIDS

Battery life depends largely upon the purity of the lead used in the construction. **Emark grids are rigidly inspected to avoid construction flaws** - only carefully refined lead is used in **their making.**

ACTIVE MATERIALS

Unless active materials are held to a rigid standard, battery capacity and life will vary greatly. **All active materials used in Emark Batteries are standardized by constant laboratory inspection and control.**

FACT 2
POWER MEASURED

FOR WINTER WEATHER

Winter weather demands are magnified and re-enacted by Emark Laboratory tests to assure perfect winter performance.

FOR TROPIC HEAT

The demands of cross-country driving in tropic heat are anticipated by the temperature control test.

FOR JOGGLING OF RUTTED ROADS

The Bump Test conceived by Thomas A. Edison gives Emark more severe service than a battery could ever encounter in a car.

FOR SHORT RUNS AND FREQUENT STARTS

The demands of city traffic are anticipated by the Razzle-Dazzle Test conceived by Thomas A. Edison. Short charges - discharges - open circuits - repeated over and over thousands of times.

FOR ALL CONDITIONS

In addition to laboratory tests Emark batteries are field-tested in thousands of cars under all conditions.

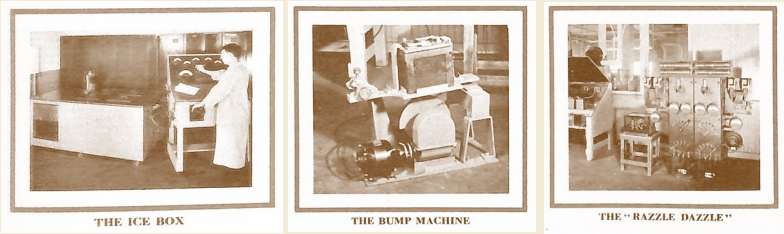
Early 1930s Emark advertisement.

Source: Thomas Edison National Historical Park

What was special about Emark batteries?

The Emark Battery Corporation promoted two aspects of its batteries:

- Power-Measured, to highlight the various tests that the batteries were put through. Three of these tests were featured in early 1930s promotional material (see below, left to right): "the ice box" to simulate winter, "the bump machine" to simulate rutted rural roads, and the "razzle dazzle" to simulate the frequent starts and stops of city driving.



1930s promotional material.

Source: Thomas Edison National Historical Park

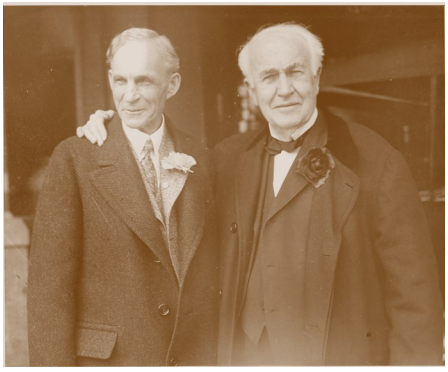
- Positive End Zones, with extra capacity provided by seven positive and six negative plates in contrast to the typical batteries with six positive and seven negative plates. This feature, although prominently advertised by Emark, was dropped in April 1935, after only a few years of production.[6]

Why was the company called Emark?

When the Kearny facility closed in the 1950s, Charles Edison reminisced that TAE, Inc. had used the trade name of Emark to honor his father's wish that "during his lifetime, [he] never wanted his name on a lead-acid battery. His favorite battery was, quite naturally, the nickel-iron-alkaline type which he pioneered and perfected."[7]

Edison and Ford: Friends and Colleagues

The Emark Battery Corporation complex—perhaps better than any other site in New Jersey—represents the close relationship between two of the twentieth century's greatest innovators: Thomas Edison and Henry Ford. For many years, these two men collaborated with each other, developed a mutual respect, and shared business interests and a close friendship. In the late 1920s, after years of Edison research on batteries—in part funded by Henry Ford—the Edison company created Emark for the sole purpose of producing starter batteries for the Ford Motor Company based on Ford specifications and on land close to a Ford automotive assembly plant.



Henry Ford (left) and Thomas Edison, 1927.
Source: Thomas Edison National Historical Park

Early Struggle Between Gasoline-Powered and Electric Cars

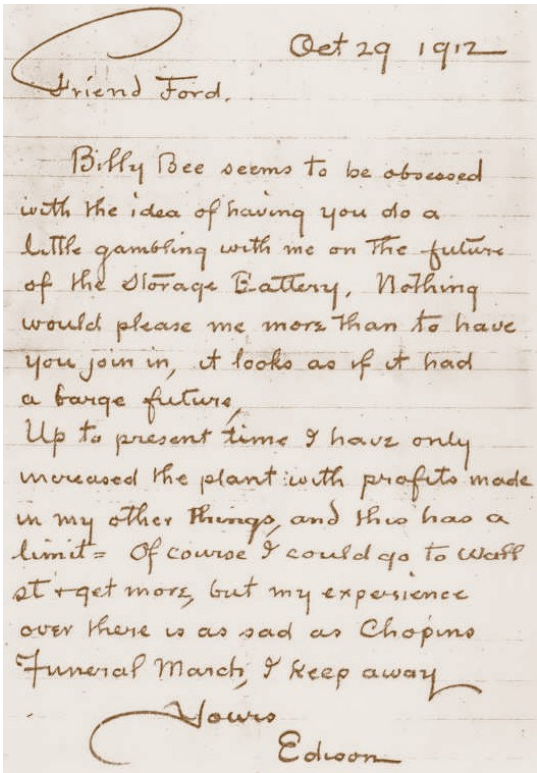
Edison's and Ford's paths first crossed in 1891 when Henry Ford began working at the Edison Illuminating Company in Detroit. By 1893, he was the company's chief engineer; three years later he met Thomas Edison at a company event. Young Henry Ford admired Thomas Edison and was encouraged by Edison's enthusiasm for Ford's work to develop a gasoline-powered vehicle.[8]

In the early twentieth century, as Edison worked on developing a successful storage battery to power an electric car, Henry Ford was hard at work developing gasoline-powered cars. In 1906, he introduced his Model N car; in 1908, he began producing his popular Model T.[9]

In 1912, after having successfully developed the Model T—as well as having successfully fought off a multi-year patent infringement lawsuit—Henry Ford did what one historian called "arguably the biggest turnaround in American business."[10] He teamed up with Thomas Edison in a joint effort to develop an affordable electric car that operated on the clean energy of an Edison storage battery. Thomas Edison continued his experiments to improve storage batteries, now with funding from Henry Ford, one of the country's wealthiest men.

Thomas Edison's electric car, 1910.

Source: Thomas Edison National Historical Park



Oct 29 1912

Friend Ford,

Billy Bee seems to be obsessed with the idea of having you do a little gambling with me on the future of the Storage Battery, Nothing would please me more than to have you join in, it looks as if it had a large future,

Up to present time I have only increased the plant with profits made in my other things, and this has a limit = Of course I could go to Wall St + get more, but my experience over there is as sad as Chopins Funeral March, I keep away

Yours

Edison

On January 9, 1914, Henry Ford publicly announced his plans to develop an electric car that would be available for $500-700, complimenting his collaborator and friend Thomas Edison as "the biggest man in the world today."[11]

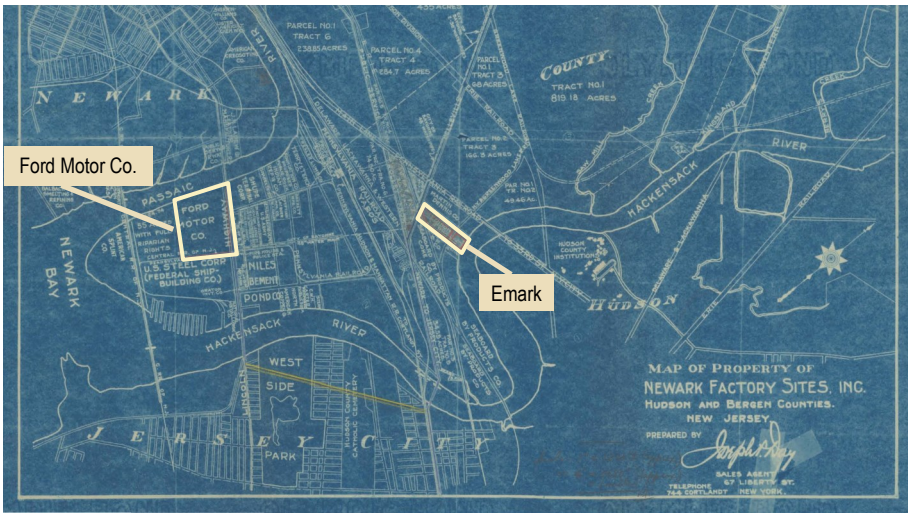
October 29, 1912 letter from Thomas Edison to Henry Ford asking for funding; Edison describes going to Wall Street "as sad as Chopin's Funeral March."

Source: The original letter is in The Henry Ford's Benson Research Center and a copy is available in the Thomas A. Edison Papers, Rutgers University digital edition, (X001C8BR; TAEM 0:0).

Unfortunately, their plans never came to fruition, in part due to continued technical problems with Edison's batteries. By the end of 1914, the project had fallen apart; however, the two men's friendship and business ties continued throughout the rest of Edison's life.

Kearny Meadows

In April 1916, Henry Ford bought eighty acres of "reclaimed meadow land" in Kearny to construct "factories for making and assembling the new Ford tractor, and headquarters for the export business of the Ford tractor and automobile concerns."[12] Within two years, Thomas Edison had bought the future Emark property: 8.4 acres in 1917 and 8.08 acres in 1918.[13]

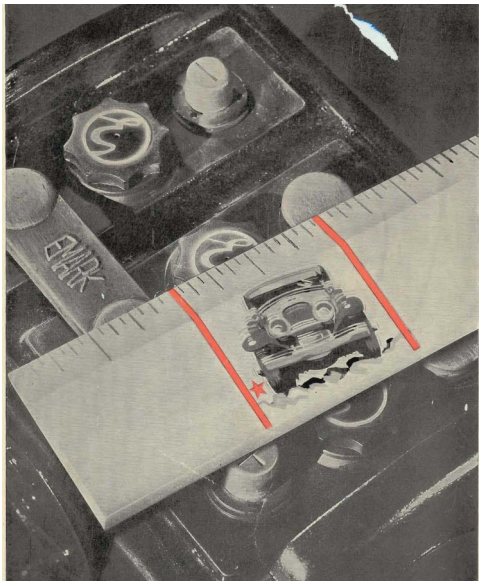


Ca. 1925 map showing the proximity of the Ford and Edison parcels.
Source: Collection of property owner

Emark's Beginning

When Edison and Ford's joint effort to develop an electric car failed, Ford focused solely on gasoline-powered cars, using the prevalent lead-acid starter batteries that were produced by Edison's competitors.[14] Throughout the 1920s, however, Thomas Edison and TAE, Inc. continued to experiment on starter

batteries.[15] Realizing that nickel-iron-alkaline batteries did not provide the needed initial burst of energy to start a car, TAE, Inc. turned to lead-acid starter batteries[16] to supply Ford's new Model A, introduced in 1928.[17]



1930s Emark advertisement.
Source: Collection of property owner

On May 7, 1929, Charles Edison wrote to his parents about the plans to produce batteries for the Ford Motor Company:

> *the battery...passes all Ford specifications with flying colors...we will have no expensive advertising—no service stations—no sales dept expense—as* ***we will sell only to Ford*** [emphasis added]. *Also we will save on freight & packing & make many other economies if we locate close to Ford on the meadows that are not open to our competitors...the land we already own on the meadows is the engineers' ideal location.*[18]

In December 1930, Charles Edison wrote to an executive in the Ford Motor Company, alluding to the fact that there is "something rather vague about the whole status of Emark's relations to the Ford Motor Company." Edison proceeds:

> *Of course, you and I know that there is something to the relationship between Emark and Ford Motor more than simply buyers and sellers. Our very entrance into the business proves it. But this is where the vagueness comes in. How much more? What are the limits etc.? Figuratively, is Emark a member of the family, a guest, a servant in the house, a distant relation, or what?*[19]

The underlying reality that Charles Edison was alluding to is the friendship between his father and Henry Ford, which was the foundation upon which the Emark Corporation was built.

Ongoing Importance of Ford Motor Company

As Charles Edison later recalled, it was not long after Emark started producing batteries before finances forced them to expand beyond selling batteries to the Ford Motor Company.[20] As a result, Emark sold replacement batteries for other cars via distributors and wholesalers (also called "jobbers"). Although replacement batteries became a significant part of Emark's

business, the monthly reports of the Emark managers almost solely focused on their relationship with Ford. These reports discuss Emark's ongoing goal to gain a higher percentage of Ford's battery business; Ford's pressure for lower per unit costs; Ford's strikes or shut-downs and their ripple effects on Emark; and even technical challenges associated with new Ford models. In the late 1930s, for example, Ford's new model placed the battery under the hood rather than "keeping it under the floor boards in a carrier slung from the chassis." This change resulted in higher temperatures for the batteries and ultimately led to problems with cracking in the Emark battery cases.[21]

Personal Ties

Throughout their lives, Edison and Ford had many personal ties, from joint travels to purchasing adjacent properties in Fort Myers, Florida for their winter homes. In the late 1920s, shortly before Edison's death, the two men went to the site of Edison's Menlo Park research lab (now in Edison, NJ) to identify features that Ford could salvage for his historic village in Dearborn, Michigan.[22] In 1938, following Edison's death, Henry Ford and his son Edsel traveled back to Menlo Park to check on the construction of the beautiful 130-foot Art Deco Edison Memorial Tower.[23]

Henry Ford talking to Thomas Edison at the Menlo Park site, 1928.
Source: The Henry Ford Museum

The relationship between Edison and Ford involved many facets, but is perhaps best exemplified in New Jersey by Emark, an Edison company whose very existence, location, and production were based on their relationship.

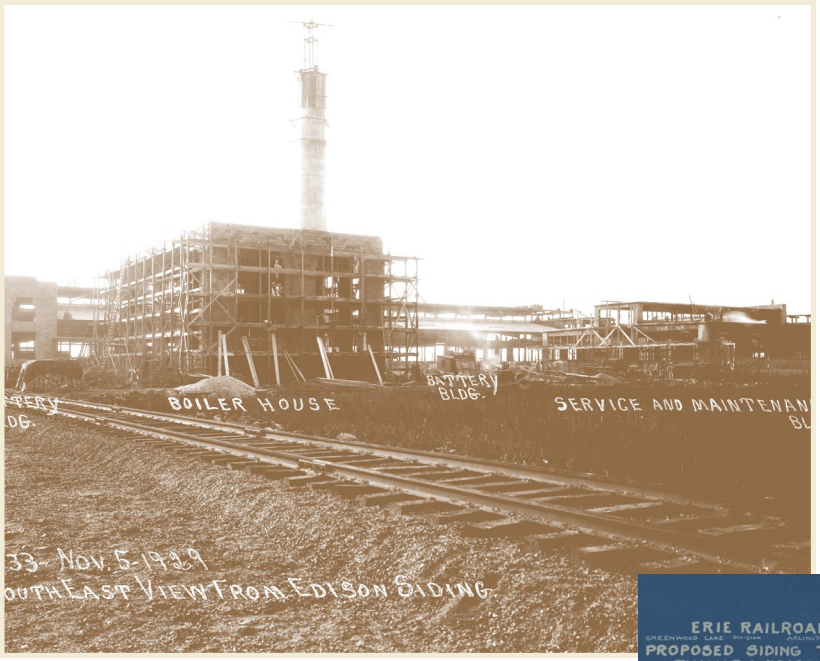
A MODERN FACILITY

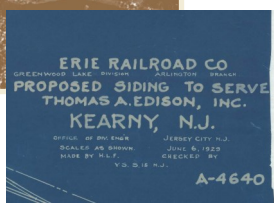
The Emark complex was built to be a modern, efficient industrial complex, one that took advantage of Kearny's excellent location, reflected the latest thinking in terms of architectural design and planning, and—true to Thomas Edison's thinking—included a research and development facility.

Kearny: An Ideal Location for Industry

In March 1928 Henry Ford inspected the Ford Motor Company's Kearny plant, praising the area:

> I...am impressed with the development of the Port of Newark. Newark is certain to become one of the great commercial centres of the United States, largely through development of the port.[24]





Above: 1929 photograph of the Emark site and rail siding.

Right: 1929 title block for the architectural blueprint of the Erie Railroad Company's siding to serve Emark.

Source: Collection of property owner

The Emark site had several major transportation advantages besides proximity to the Ford plant.[25] It was located at the intersection of the two main roads from Essex County, the Belleville Turnpike and Newark Avenue; it was situated along the Hackensack River and thus provided the opportunity for an Edison Dock; it was in close proximity to Edison's main laboratory in West Orange as well as to New York City; and finally, it had excellent rail service that ran right through the Edison property.[26]

1930 photograph of the eastern end of the Emark site, showing the Edison Dock and the Hackensack River.

Designing a Modern Facility

An important part of the plant design was allocation of the second floor of the Engineering Building for research and quality control testing. Starting with Menlo Park in the 1870s, Thomas Edison had established a model for modern research and development.

1930 photograph of The Austin Company's sign at the entrance to the Emark site.
Source: Collection of property owner

To design and build the Emark facility, TAE, Inc. chose one of the country's top industrial designers, The Austin Company from Cleveland, Ohio. In early 1930, as Emark batteries began rolling off the assembly line in Kearny, The Austin Company was advertising in a national magazine promoting their role in "*1930—Modernization Year in Industry*."[27]

Emark's modernity is reflected in the use of Art Deco architecture, a style popular in the 1920s for its geometric angular design that became synonymous with modernity. In addition, The Austin Company, which had strong ties to the automotive industry, understood the need to design a complex that—in the true spirit of Henry Ford—relied on the efficiency of an assembly line to maximize production. Thomas Edison admired Ford's emphasis on efficiency, as was evidenced following a major fire in 1914 at Edison's West Orange laboratory. To help him rebuild, Edison borrowed one of Henry Ford's Efficiency Engineers.[28]

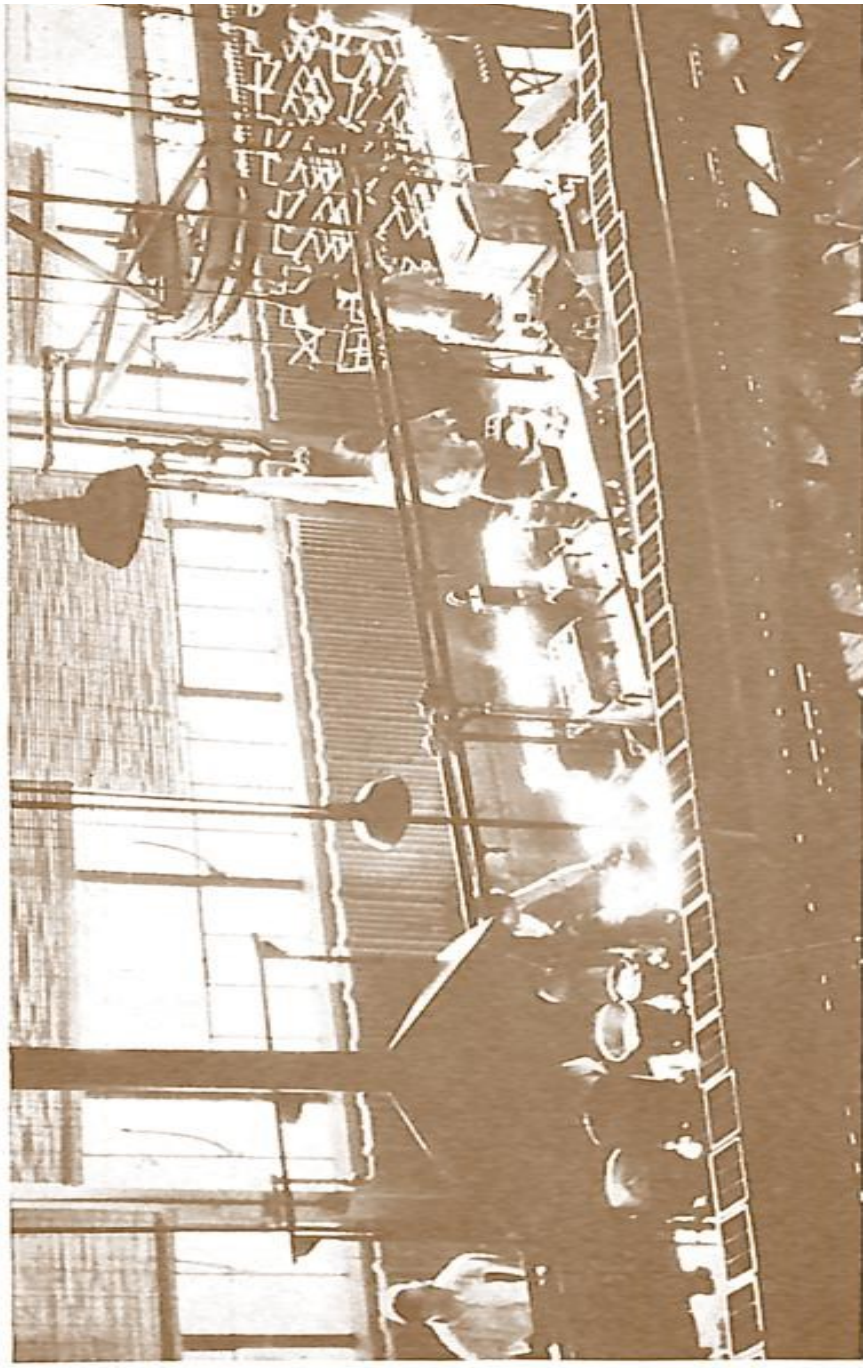
Source: Collection of property owner



Emark assembly line as depicted in "No Place for Experts," *Factory and Industrial Management* magazine, February 1932.

Source: Thomas Edison National Historical Park

A 1932 article in the *Factory and Industrial Management* magazine, which included one of the few known photographs of the Emark assembly line (see opposite page), praised Emark's modernity and efficiency:

"Every operation has been studied to secure maximum production at minimum expense.

---

modern plant, modern equipment, methods and processes.

Instead of men servicing conveyors, here conveyors serve the workers. Parts move through this plant, with almost uncanny regularity, from operation to operation.

...machine pasting gives absolute uniformity of plates—which greatly helps to eliminate battery failure.

Operations are so planned that various groups take their places throughout the plant in sequence according to schedule...neither men nor machines are idle. Thus, one of the hidden costs of operation finds no place at Emark.

The various lead parts...are made on automatic equipment especially designed here.

...the elimination of all waste has been pursued. Waste motions, waste effort, waste time and waste material—all are strikingly absent.

Refusing to accept the statement that lead could not be piped from point to point in the plant, Mr. Martin went ahead and did it...Thus molten lead is available at required points throughout the plant by the mere opening of a valve."

Emark timeline

1930

Battery production begins.

1933

TAE, Inc. Operating Committee discusses the possibility of merging Emark with TAE, Inc. The merger results in the new name of "Edison-Emark Battery Division."

1935

Emark eliminates the positive end zone feature, removing the words "positive end zone" from the battery cases and from advertisements.

Emark stops distribution in the South and the Midwest due to high costs.

1936

Emark and Ford agree Emark would get 50% of Ford's business in exchange for Emark dropping their price 10 cents per battery.

1937

Sales reports show large increases due to the cold snap, but labor strikes among suppliers hurt Emark.

Emark annual sales of 550,000 batteries, one of the highest years in its early development.

1938

Emark reports that "Automobile production is still in the dumps and we are there with them."

1939

Car production increases from 1938.

Emark begins discussing having regional facilities to compete with other battery companies.

1940

Increasing cost of materials causes Emark managers to negotiate with Ford to keep the per unit cost down in exchange for Emark receiving a higher percentage of Ford's business.

1941

187 employees work at Emark.

1942

To compete in other regions of the country, Emark opens a plant in Cairo, Illinois. Kearny becomes known as Emark Division-Plant #1 and Cairo as Plant #2.

With increasing rubber shortages due to World War II, the War Production Board restricts any use of rubber—even reclaimed rubber—for use in battery cases.

Emark begins producing batteries for Ford jeeps to be sold to the Army Ordnance Department.

1943

Emark begins producing boat batteries.

1944

Emark receives several contracts to supply batteries to the Navy Department.

1947

TAE, Inc. discontinues use of the name "Emark" and the Kearny facility becomes part of the company's Automotive Division.

1952

214 employees work at the Kearny facility.

1953

TAE Inc. stops all production at the Kearny facility.

1954

Crown Rubber Products, Inc. acquires property.

1959

Keaton Rubber Company acquires property.

1962

Standard Chlorine Chemical Company acquires property.

Conclusion

A crumbling industrial complex that only served its original purpose for 23 years may on the surface not seem that noteworthy. Yet, the story behind the Emark complex has tremendous significance.

The Emark story is the tale of the close relationship between two of America's greatest twentieth century innovators, Thomas Alva Edison and Henry Ford. Although the company history is short, that history provides an insight into the closeness of these two men as well as to each of their natures. Through Emark, you witness Edison's lifetime work with batteries and his emphasis on research and development. Through Emark, you also witness Ford's push for efficient production and how his approach was emulated by other industrial leaders such as Thomas Edison.

Emark was a business built upon a personal relationship. In January 1931, Charles Edison, Thomas' son and the President of TAE, Inc., wrote to Henry Ford, stating:

> *I want to express my very real appreciation for your recent action in regard to Emark. Father was 'tickled skinny.'*[29]

We don't know exactly what action Henry Ford took, but this warm note of thanks symbolizes the close personal and professional relationship that led to Thomas Edison's company forming Emark for the sole purpose of supplying Henry Ford's nearby assembly plant. With two such prominent men involved, the story of Emark certainly serves as a source of pride in New Jersey's history.

NOW—a POWER-MEASURED BATTERY with the Positive End Zones, produced by the

EMARK BATTERY CORPORATION
a division of
THOMAS A. EDISON, Inc.

Edison invented the incandescent electric lamp. Edison achieved radical improvements in the field of dynamo construction. Edison invented the alkaline storage battery. Edison . . . a name long identified with the pioneering and development of industrial and vehicle storage batteries now offers to jobbers and dealers a new sales opportunity in the automotive field.

The Power-Measured Battery anticipates every condition the battery will meet in service. It is built, tested and re-tested to survive hard usage.

Freezing winter weather is magnified and re-enacted in the testing laboratory. The constant joggling of rutted back roads is paralleled. Cross-country driving in tropical heat and short runs with frequent starts — all conditions are anticipated before an Emark Power-Measured Battery leaves the factory.

Add to this assurance of battery performance the extra capacity of Emark due to the long-hoped-for battery development—*Positive End Zones* . . . the aim of engineers, ever since the invention of the storage battery.

For the quality buyer Emark manufactures Emark "AAA," the Power-Measured Battery with the Positive End Zones (Patent Applied For). In this battery the finest materials are combined with the most modern manufacturing methods under rigid test conditions. The thirteen plate size retails for only $10.95.

For the price buyer, Emark manufactures Emark "A," a dependable battery with service features far in excess of its moderate price. The thirteen plate size retails for $6.95.

All Emark Batteries carry written guarantee.

Distributors and dealers are now being appointed. Send coupon for complete details.

Overview and Core Curriculum Standards

The Emark complex—perhaps better than any other site in New Jersey—represents the close relationship between two of the twentieth century's greatest innovators: Thomas Edison and Henry Ford. For many years, these two men collaborated with each other, developed a mutual respect, and shared business interests and a close friendship. In the late 1920s, after years of Edison research on batteries—in part funded by Henry Ford—Thomas A. Edison, Inc. created Emark for the sole purpose of producing starter batteries for the Ford Motor Company. Located at 1025-1035 Belleville Turnpike, Town of Kearny, Hudson County, New Jersey, the complex consisted of five concrete buildings that were used to produce batteries from 1930 until 1953.

The following three lesson plans related to the Emark site can be used to teach New Jersey history and to foster local pride:

Lesson 1 **Geography and the Location of the Emark Battery Corporation**
(6 resources provided)

Lesson 2 **Thomas Edison and Batteries**
(6 resources provided)

Lesson 3 **Thomas Edison and Henry Ford**
(6 resources provided)

These lessons are designed to address and fulfill specific standards and goals laid out in the New Jersey Core Curriculum Content Standards for Social Studies and Science (Lesson 2) at:
www.state.nj.us/education/aps/cccs/ss/
http://www.state.nj.us/education/aps/cccs/science/

The specific standards addressed are:

6.1 US History: America in the World *(Lessons 1, 2, 3)*

All students will acquire the knowledge and skills to think analytically about how past and present interactions of people, cultures and the environment shape the American heritage. Such knowledge and skills enable students to make informed decisions that reflect fundamental rights and core democratic values as productive citizens in local, national and global communities.

6.3 Active Citizenship in the 21st Century *(Lessons 1, 2, 3)*

All students will acquire the skills needed to be active, informed citizens who value diversity and promote cultural understanding by working collaboratively to address challenges that are inherent in living in an interconnected world.

Within each standard, these lessons pertain to strands:
B: Geography, People and the Environment

C: Economics, Innovation and Technology
D: History, Culture and Perspectives

4-PS3-2: Make observations and provide evidence that energy can be transferred from place to place by sound, like, heat and electric currents. *(Lesson 2)*
Make observations to produce data to serve as the basis for evidence for an explanation of a phenomenon or test a design solution.

Disciplinary Core Ideas:
PS3.A: Definitions of Energy
PS3.B: Conservation of Energy and Energy Transfer

4-PS3-4: Apply scientific ideas to design, test and refine a device that converts energy from one form to another. *(Lesson 2)*
Apply scientific ideas to solve design problems.

Disciplinary Core Ideas:
PS3.B: Conservation of Energy and Energy Transfer
PS3.D: Energy in Chemical Processes and Everyday Life

Lesson 1:
Geography and the Location of the Emark Battery Corporation

Grade: 4

Class Duration: 1 class period

Core Curriculum Standards: Social Studies 6.1, 6.3

Lesson Objectives:

1. Students will learn about Kearny's historic development.
2. Students will understand and explain how geographic features affected development.
3. Students will learn about the importance of different forms of transportation (rail, water, automotive) and how they affected industries.

Background Information:
With the exception of copper mining operations and farming, the area around present-day Kearny was relatively undeveloped until the middle of the 19th century. In 1873, the Erie Railroad was laid through the area and connected Kearny to New York, Newark, and Jersey City. The water and rail transportation routes, combined with the prospering industrial areas of nearby Newark and Jersey City, made Kearny a suitable area for residential, commercial, and industrial development.

In 1901, the *Industrial Directory of New Jersey* promoted Kearny for its location on the Erie Railroad as well as its frontage on the Passaic River, where "vessels of fair size come to the wharves." In addition, the *Industrial Directory* stated that "the town is naturally a part of Newark, and enjoys all the conveniences of trolley transportation."

In the 1920s, the two largest employers in Kearny were the Ford Motor Company and Western Electric. In 1940-41, the *Industrial Directory* indicated that some of Kearny's major advantages were "the new high level bridges on Route 25 (Lincoln Highway) over both rivers [which] afford a direct and short route to the Holland Tunnel and Manhattan." By this time, Kearny was served by the Central Railroad of New Jersey, the Lehigh Valley Railroad, the Pennsylvania Railroad, the Erie Railroad, and the Delaware, Lackawanna, and Western Railroad.

The Emark Battery Corporation was located in an industrial area of Kearny that consisted of land reclaimed from salt marshes in the late nineteenth century. The Emark property was located between the Belleville Turnpike (to the west) and the Hackensack River (to the east). In addition, the site is bisected by a branch of the Erie Railroad.

In March 1928 Henry Ford inspected the Ford Motor Company's Kearny assembly plant, praising the area:

> I...am impressed with the development of the Port of Newark. Newark is certain to become one of the great commercial centers of the United States, largely through development of the port.
>
> Source: *The New York Times*, March 18, 1928, 21

Resources:

- Resource 1: Late Twentieth Century Map of the Kearny Area Showing the Emark Site
- Resource 2: 1844 Historic Map of Kearny and the Emark Battery Corporation Site
- Resource 3: 1931 Historic Map Showing the Emark Battery Corporation and the Ford Assembly Plant
- Resource 4: 1931 Historic Plot Plan and Property Map of the Emark Battery Corporation Complex
- Resource 5: 1930 Historic Photos of Emark Battery Corporation Buildings
- Resource 6: Excerpts from a May 7, 1929 Letter from Charles Edison to his Parents, Thomas and Mina Edison, Regarding the Emark Battery Site

Activities:

- Briefly discuss the geography of New Jersey and Thomas Edison's work in the state. Using readily available maps of Hudson County and the Town of Kearny, New Jersey, identify where the Emark Battery Corporation site and the Ford Assembly Plant were located within Kearny.
- Divide students into cooperative groups and distribute a site plan of the Emark Battery Corporation complex and its surrounding area (Resource 1) as well as the two historic maps (Resources 2 & 3). Ask students to identify by circling or marking:
    - Railroads
    - Rivers (Passaic and Hackensack)
    - Highways
    - Major cities
    - Any other resources nearby that could help the Emark Battery Corporation
- Share with the students the 1931 Historic Plot Plan and Property Map (Resource 4) as well as the historic photographs of the Emark buildings (Resource 5). Ask them to describe what they think happened in each building. Ask them what features of these buildings are different from those of office or industrial buildings built today.
- Share the letter excerpt (Resource 6) from Charles Edison to Thomas and Mina Edison (his parents) regarding the Emark Battery Corporation site and the importance of its location. Have students assume the role of Charles Edison and write a letter to Thomas Edison explaining the importance of this location and, using the map, include detailed reasons why this site was chosen.

Resource 6: Excerpts from a May 7, 1929 Letter from Charles Edison to his Parents, Thomas and Mina Edison, Regarding the Emark Battery Site

May 7/29

Dear Mother and Father,

…the battery…passes all Ford specifications with flying colors…we will have no expensive advertising—no service stations—no sales dept expense—as ***we will sell only to Ford*** [emphasis added]. *Also we will save on freight & packing & make many other economies if we locate close to Ford on the meadows that are not open to our competitors…*

…We have considered using buildings at Orange and at Silver Lake and elsewhere but every time it gets back to the fact that if we are to get low costs <u>*all*</u> <u>*the*</u> <u>*way*</u> *thru, the land we already own on the meadows is the engineers ideal location…*

C

Lesson 2:
Thomas Edison and Batteries

Grade: 4

Class Duration: 1 class period

Core Curriculum Standards: Social Studies 6.1, 6.3; Science 5.1, 5.2

Lesson Objectives:

1. Students will understand the importance of batteries for storing energy, and see examples of how they are used (both historically by Thomas Edison and in our modern society).
2. Students will learn about the work habits that helped make Thomas Edison so successful.
3. Students will demonstrate how a battery works by creating a Potato Battery.

Background Information:

Batteries, Emark's sole product, were an important part of Thomas Edison's life. He worked with them as a young telegrapher; in his development of small appliances such as electric pens, phonographs, telephones, doorbells, fans, and sewing machines; in his generation and distribution of electricity; and in vehicles.

Although people often think of Edison's work with the light bulb, he worked with all aspects of electrical energy, from generating electricity to distributing it to houses and businesses, to storing energy in the form of batteries.

By the late nineteenth century, Edison was working to develop a "storage" battery that—in contrast to the earlier "primary" battery—could be charged and discharged multiple times.

We can learn a lot about Thomas Edison through his work with batteries, including:

- Edison believed in hard work (see his quotations in Resource 3).
- Edison did not give up easily. In order to develop a new product, he conducted lots of experiments, always keeping good records of his experiments.
- Similar to his experiments to perfect the incandescent light bulb, Edison experimented with many materials for his storage battery. His company later described him as having been determined "to ferret out Nature's secret of a good storage battery."
- Edison believed in having a research facility in order to develop, test, and improve his products.
- 100 years ago, in the early twentieth century, Edison was working hard to develop an all-electric car powered by a storage battery. He did succeed in developing a storage battery that was used to power trucks, which could operate in urban areas where they could more easily re-charge their batteries. However, he was never successful in developing a storage battery that was effective for use in cars, which were often driven longer distances at times over bumpy rural roads.

Resources:

- Resource 1: Historic Photographs of Products in which Thomas Edison Used Batteries
- Resource 2: Historic Photographs of Products in which Thomas Edison Used Batteries (Teacher's Information)
- Resource 3: Thomas Edison Quotations
- Resource 4: Historic Photographs of the Testing Machines Used at Emark
- Resource 5: Historic Photographs of the Testing Machines Used at Emark
- (Teacher's Information)
- Resource 6: Potato Battery Experiment

Activities:

- Ask students to generate a list of items in their school and homes that require batteries to work. Show historic photographs of how Thomas Edison used batteries (Resources 1 & 2). See if they recognize the items and discuss whether or not these items are still used today. If so, do they still use batteries?
- Ask students to brainstorm about a new invention that could use a battery. Have them pretend that they are Thomas Edison and answer the following questions:
    - What is the new invention? What does it do? Ask them to draw the invention.
    - What materials will they try in order to build the new invention?
    - How long do they think it will take to develop the new invention? A day? Week? Month? Year? or Longer? Share Thomas Edison quotations (Resource 3). Thomas Edison believed in hard work and in not giving up!
    - What kind of tests will they need to see if their product is successful? Share with the students the photographs of the testing machines used at Emark (Resources 4 & 5). Ask them what they think the tests were used for. Then, encourage them to give their own tests fun names.
- Have students build a Potato Battery Experiment (Resource 6).

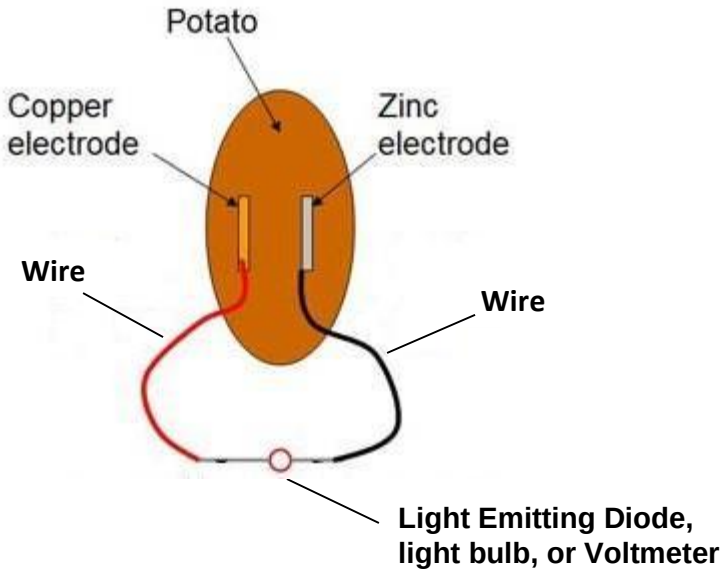
Resource 6: Potato Battery Experiment

What is a Battery?

- What is a battery? A battery is a combination of chemistry and electricity. In a battery, a chemical reaction produces electricity. In some kinds of batteries, a second kind of reaction in the same battery can receive and store electricity so the battery can give electricity back later.
- A battery has:
    - two electrodes, called a positive electrode and a negative electrode. The electrodes are metals.
    - an electrolyte between the two electrodes. An electrolyte is something that can react chemically with the electrodes and that electricity can flow through. The electrolyte contains ions.
- Electric Circuit: For electricity to flow, there needs to be an electric circuit. Electric current has to be able to flow all the way around a path from a starting point around a circuit and back to the starting point.
- There are two kinds of batteries:
    - A primary (non-rechargeable) battery can only be used once, to produce electricity, and then the ingredients are not good for being a battery any more. Most batteries for toys are this kind of battery.
    - A storage (rechargeable battery): A storage battery can be used to give you electricity like a primary battery, and then you can connect it in the other direction to a source of electricity, and "fill it back up" and use it again. The chemical reactions are reversible (can go in both directions) and the battery can be charged and discharged many times. Batteries in cell phones, computers, and cars are this kind of battery.
- What kinds of storage batteries exist?
    - Lead-acid battery (made at Emark)
    - Nickel-iron-alkaline battery (invented by Edison and still used)
    - Many other kinds (used for cell phones, computers, modern electric cars)
- What is a lead-acid battery? A lead-acid battery is one of the oldest known kinds of rechargeable battery (discovered in the 1850s). Today it is used in almost all cars to power the starter motor and other electronics in the car. The battery contains:
    - lead (a grey, heavy metal)
    - sulphuric acid (a widely used, corrosive acid)
- What happens in a lead-acid battery when it produces electricity?
    - At one electrode, the metal electrode corrodes, which is like rusting (Lead turns into lead sulphate)
    - At the other electrode, hydrogen gas is produced (Hydrogen gas can burn or even explode)
- What are features of lead-acid batteries?
    - Good: Low cost; can supply large current for short times
    - Bad: Is heavy for the amount of electricity stored

Resource 6 (continued): Potato Battery Experiment

Experiment about batteries (Potato Battery or Lemon Battery)

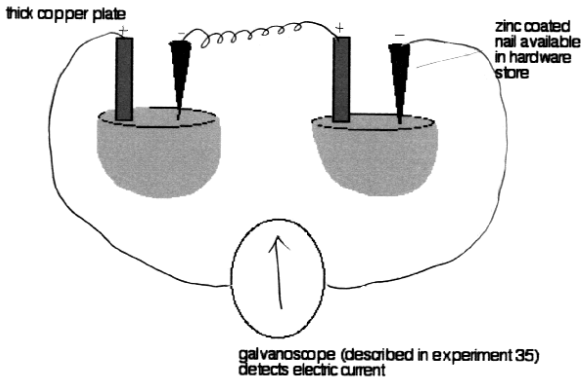


- Equipment needed:
  - Zinc-coated (galvanized) nail (= one electrode)
  - Copper (stiff copper wire, or penny) (= other electrode)
  - Potato or lemon (= electrolyte)
  - Copper wire or wire with alligator clips (to make circuit)
  - LED (light emitting diode) or tiny light bulb or voltmeter (to show what is happening)

- Procedure: Connect as shown
- What makes a Potato Battery or Lemon Battery work, or not work? One metal is one electrode, the other metal is the other electrode, and the potato or lemon is the electrolyte. The reaction at one electrode is corrosion, like rusting. If the light is on, or the LED is on, or the voltmeter shows more than about a Volt of voltage, it is working correctly. Here are some things that can go wrong, and what they indicate, or questions to ask yourself:
  - What happens if you don't have two different metals? Try using the same metal at both ends (both electrodes copper, or both electrodes zinc). Do you get any electricity through the light or LED? (Using the same metal for both electrodes means there is no difference between the two electrodes so there is nothing to make electricity flow. It should fail to light the bulb or LED or make a voltage reading at the voltmeter.)
  - What happens if you don't connect the battery to anything such as a light or LED? (Nothing. There is no circuit, so no current flows, so nothing happens.)
  - What happens if you connect the LED, light bulb or voltmeter in the opposite direction? (If it is a light bulb, the result will be the same, because a light bulb works in either direction. If it is a voltmeter, the voltmeter will display a number that is positive for one direction of connection, negative for the other direction

of connection. If it is an LED, it should light for one direction but not for the other direction, because a LED only works for one direction. A LED will not be harmed by being connected in the wrong direction.)

- What happens if you have a large potato and move the two electrodes as far away from each other as possible in the potato (or lemon)? Does the ability of the battery to light the light or LED decrease? (It should decrease, because distance between the electrodes makes it harder for electricity to flow through the electrolyte.)
- What happens if you put the two electrodes in a container of pure water, instead of in a potato or lemon? Does it still work as a battery? (It should not work, because water by itself is not a good enough electrolyte.)
- Look at the electrodes after using the battery. Has one of them changed color, or does it look corroded? (It should have a different color or look corroded, at least if the battery has been on for a while. The chemical reaction that happens inside a primary battery is like corrosion. Rusting of iron and steel is a common example of corrosion.)
- What does the use of pure water, the use of dissimilar metals, and the distance between electrodes say about what are the right conditions for making a potato battery or lemon battery?
- Series connection: Connect two batteries in series as shown. Does the light shine more brightly when two cells are connected in series? (It should.) If a voltmeter, does the voltage read approximately twice the number for one cell? (It should.) (An automobile starter battery usually has about six cells in series, because an automobile needs about 12 Volts.) Depending on the LED, it might be necessary to connect two batteries like this in order to get the LED to light up.



Voltmeter

Helpful information is available online, including YouTube videos on topics such as “how to make a potato or lemon battery” and “how to jumpstart a car battery” (which is a lead-acid battery).

Lesson 3:
Thomas Edison and Henry Ford

Grade: 4

Class Duration: 1 class period

Core Curriculum Standards: Social Studies 6.1, 6.3

Lesson Objectives:
1. Students will identify major inventions by Thomas Edison.
2. Students will identify major work by Henry Ford.
3. Students will understand how Thomas Edison and Henry Ford worked together.

Background Information:
Henry Ford, 16 years younger than Thomas Edison, met Edison in the 1890s after Ford started working for the Edison Illuminating Company in Detroit. Ford admired Edison and thought of him as a hero.

In the early twentieth century—after Ford had started his own company and successfully introduced a gasoline-powered car—the two men became close friends. In 1912-14, they worked together on an unsuccessful attempt to develop an electric car that was powered by an Edison storage battery.

Thomas Edison continued with his experiments to improve storage batteries, with funding from Henry Ford, one of the country's wealthiest men. However, the new goal was to develop a storage battery that could start a gasoline-powered car.

In April 1916, Henry Ford bought eighty acres of land in Kearny in order to build an automobile assembly plant. In 1917-1918, Edison purchased land in Kearny near Ford's property.

In 1928, when Ford introduced his Model A automobile, Edison's company (by then run by his son Charles) was ready to take advantage of the financial opportunities by producing starter batteries for the Ford Motor Company.

On May 7, 1929, Charles Edison wrote to his parents, Thomas and Mina, about the plans to produce batteries for Ford, explaining that:

> *the battery is developed. It passes all Ford specification with flying colors...we will have no expensive advertising—no service stations—no sales dept expense—as* ***we will sell only to Ford*** [emphasis added]. *Also we will save on freight & packing & make many other economies if we locate close to Ford on the meadows that are not open to our competitors...the land we already own on the meadows is the engineers' ideal location.*
>
> Source: Letter from Charles Edison to Mina Edison, 7 May 1929 (TAED X018A3), Courtesy of the Charles Edison Fund and Thomas Edison National Historical Park. Online at The Edison Papers, Rutgers University, http://edison.rutgers.edu/.

As Charles Edison later recalled, it was not long after the company started producing batteries that for financial reasons they had to expand beyond just selling batteries to Ford Motor Company. As a result, Emark sold replacement batteries to other car companies and to automotive suppliers. However, the Ford Motor Company remained as their most important customer.

The relationship between these two men involved many facets, from business to personal, but is perhaps best exemplified in New Jersey by Thomas A. Edison Inc.'s Emark Battery Corporation, a company whose very existence, location, and production were based on their relationship.

Brief Biography of Thomas Edison (1847-1931)

Thomas Alva Edison was born on February 11, 1847 in Milan, Ohio. His family moved to Michigan when he was 7 years old. He went to school for a short time and then was educated by his mother at home. He loved to read and always worked hard. He liked to take things apart and see how they worked and then decided to start inventing things himself. Edison, who was called Al when he was a child, had Scarlet Fever when he was young and this affected his hearing.

At age 12, Al went to work on the railroad selling newspapers on the train. He spent a lot of time on the train and eventually started doing science experiments in one of the baggage cars. Al also printed his own newspaper, *The Weekly Herald*, which he sold on the train. Then he became very interested in the telegraph and learned how to send coded messages over a wire to someone far away using Morse Code. At age 15, he travelled around to different cities to work on the telegraph.

Edison took a job in Boston and invented an automatic vote counter that legislators could use to count votes. Unfortunately, this invention was not well received so Edison kept trying to invent something else. He moved to New York City and found a way to improve the stock ticker that keeps track of the changing stock prices and by 1870 was producing the ticker at a factory in Newark, New Jersey. He also found a way to improve the telegraph.

Thomas Edison married Mary Stilwell in December, 1871 and they had three children: Marion, Thomas, Jr., and William. They moved from Newark to Menlo Park, New Jersey (now part of Edison Township), where Edison built his most famous laboratory. Edison is often called "the Wizard of Menlo Park" because of his work at this laboratory where he invented the phonograph and perfected the incandescent light bulb.

Edison's wife, Mary, passed away in 1884. Thomas married Mina Miller in February, 1886 and they had three children: Madeleine, Charles and Theodore. They lived in Glenmont, a large home in West Orange, NJ, where Edison built a much larger laboratory and continued to invent. While working in this laboratory, he invented the first successful motion picture camera, improved the phonograph, and invented an alkaline storage battery. Edison earned half of his 1093 patents while working in West Orange.

Thomas Edison was awarded a Congressional Gold Medal in 1928 for all of his work and inventions during his lifetime. Thomas Edison died on October 18, 1931 at the age of 84.

Brief Biography of Henry Ford (1863-1947)

Henry Ford was born on July 30, 1863 on a farm in Dearborn, Michigan. He was the oldest of six children and went to a one-room schoolhouse and helped work on the farm. Henry was always tinkering and liked to take watches apart to see how they worked.

At age 16, Henry went to Detroit and became an apprentice to a machinist. Then he got a job working for a company that built steamship engines. He became a certified machinist in 1882 and went to work for the Westinghouse Company, where he worked on steam engines.

Then Henry went to work at the Edison Illuminating Company (Thomas Edison's company) and was promoted to Chief Engineer after only two years. He spent his spare time working on inventing a horseless carriage or automobile. In 1896, he succeeded with his Quadricycle which he then sold so he would have money to keep working on improvements. Henry left his job at Edison's company and in 1903 formed The Ford Motor Company. Ford wanted to make cars that were affordable for everyone. He set up an assembly line for building the cars to save time and money. On October 1, 1908, Ford introduced the Model T, his vision of a better, cheaper "motorcar for the multitude."

Henry Ford married Clara Bryant in April, 1888, and they had one son named Edsel. Henry Ford died on April 7, 1947 at the age of 83.

Resources:

- Resource 1: Locations of Edison's Work Sites and Residences in New Jersey
- Resource 2: Locations of Ford Motor Company Facilities in New Jersey
- Resource 3: 1927 Photograph of Henry Ford and Thomas Edison
- Resource 4: 1928 Photograph of Henry Ford Talking to Thomas Edison at Edison's Abandoned Menlo Park Laboratory Site
- Resource 5: Venn Diagram Template
- Resource 6: Venn Diagram Template (Teacher's Copy with Suggested Responses)

Activities:

- Divide the class into two groups. Using on-line biographies and children's books, have one group gather facts about Thomas Edison and the other group gather facts about Henry Ford. Have students share all information learned with the class.
- Have the students mark-up a map of New Jersey to show towns where Henry Ford or Thomas Edison either had a facility or lived. Ask them to see how many towns had facilities representing both men (Resources 1 & 2).
- Discuss any facts known about Thomas Edison and Henry Ford. Tell students that these two men were alive at the same time and were friends. Show historic pictures (Resources 3 & 4) of Thomas Edison and Henry Ford together.
- Create a Venn Diagram (Resources 5 & 6) about Edison and Ford and discuss.

Thomas Edison and Henry Ford

Resource 6: Venn Diagram Template (Teacher's Copy with Suggested Responses)

Edison

Born in Ohio on Feb 11, 1847
Moved to Michigan when 7 years old
Had Scarlet Fever and had trouble hearing
Started working at age 12
Worked on railroad selling newspapers
Became a telegraph operator
Lived in Boston and NYC
Built a laboratory in Menlo Park, NJ
Invented the phonograph and electric light system
Built another lab in West Orange, NJ
Invented motion picture camera and alkaline storage battery
Had 3 children with first wife and 3 children with second wife
Earned 1093 patents
Awarded a Congressional Gold Medal in 1928
Died October 18, 1931

Both

Liked to take things apart and see how they work
Spent time inventing
Liked to camp and be outdoors
Friends with each other
Worked on developing an electric car
Married

Ford

Born in Michigan on July 30, 1863
Became an apprentice to a machinist at age 16
Worked at Edison Illuminating Co
Became Chief Engineer after 2 years
Invented Quadricycle in 1896
Started Ford Motor Co in 1903
Model T was introduced in 1908 and was a success
Had one son
Used assembly line so that cars could be more affordable
Started Ford Foundation to donate to education and research projects
Had Edison's Menlo Park Lab recreated in Greenfield Village, MI
Ford made war equipment during WWII
Died April 7, 1947
