Notes:

Only analytes detected in at least one sample are presented.

(1) B – Analyte was detected in an associated blank sample; J – Estimated.

(2) The maximum detected concentration was used for the screening.

(3) Maximum detected concentrations from site-specific background locations (BKSB0001-BKSB0007, BKSB0011-BKSB0013, BSBESB01-BSBESB10).

(4) All compounds were screened against the lower of the EPA (2016b) Regional Screening Level (RSL) for residential soil (THQ = 0.1; Target Cancer Risk = $10^{-6}$) and New Jersey Residential Direct Contact Soil Remediation Standards (NJ RDCSRS) (NJDEP, 2011a).

n – Non-cancer.

c – Cancer.

L – Based on blood lead modeling.

Surrogate/form – Surrogate/chemical form used in the absence of chemical-specific screening value.

(5) Rationale codes:

Selection reason: ASL – Above screening level.

Deletion reason: BSL – Below screening level.

EN – Essential human nutrient.

Notes:

Only analytes detected in at least one sample are presented.

(1) B – Analyte was detected in an associated blank sample; J – Estimated; + – Value is the average of a parent sample and a field duplicate sample.

(2) The maximum detected concentration was used for the screening.

(3) Maximum detected concentrations from site-specific background locations (BKSB0001-BKSB0007, BKSB0011-BKSB0013, BSBESB01-BSBESB10).

(4) All compounds except EPH were screened against the lower of the EPA (2016b) Regional Screening Level (RSL) for residential soil (THQ = 0.1; Target Cancer Risk = $10^{-6}$) and New Jersey Residential Direct Contact Soil Remediation Standards (NJ RDCSRS) (NJDEP, 2011a). EPH compounds were screened on a sample-specific basis in accordance with the New Jersey Protocol for Addressing Extractable Petroleum Hydrocarbons (NJDEP, 2010a).

n – Non-cancer.

c – Cancer.

L – Based on blood lead modeling.

Surrogate/form – Surrogate/chemical form used in the absence of chemical-specific screening value.

(5) Rationale codes:

Selection reason: ASL – Above screening level.

Deletion reason: BSL – Below screening level.

EN – Essential human nutrient.

EPH – Petroleum hydrocarbon fractions were screened on a sample-specific basis; see text.

LDF – Low detection frequency (<5%).

Notes:

Only analytes detected in at least one sample are presented.

(1) B – Analyte was detected in an associated blank sample; J – Estimated; + – Value is the average of a parent sample and a field duplicate sample.

(2) The maximum detected concentration was used for the screening.

(3) Maximum detected concentrations from site-specific background locations (BKSB0001-BKSB0007, BKSB0011-BKSB0013, BSBESB01-BSBESB10).

(4) All compounds except EPH were screened against the lower of the EPA (2016b) Regional Screening Level (RSL) for residential soil (THQ = 0.1; Target Cancer Risk = $10^{-6}$) and New Jersey Residential Direct Contact Soil Remediation Standards (NJ RDCSRS) (NJDEP, 2011a). EPH compounds were screened on a sample-specific basis in accordance with the New Jersey Protocol for Addressing Extractable Petroleum Hydrocarbons (NJDEP, 2010a).

n – Non-cancer.
c – Cancer.
L – Based on blood lead modeling.
Surrogate/form – Surrogate/chemical form used in the absence of chemical-specific screening value.

(5) Rationale codes:

Selection reason: ASL – Above screening level.
Deletion reason: BSL – Below screening level.
EN – Essential human nutrient.
EPH – Petroleum hydrocarbon fractions were screened on a sample-specific basis; see text.

Notes:

Only analytes detected in at least one sample are presented.

(1) B – Analyte was detected in an associated blank sample; J – Estimated; + – Value is the average of a parent sample and a field duplicate sample.

(2) The maximum detected concentration was used for the screening.

(3) Maximum detected concentrations from site-specific background locations (BKSB0001-BKSB0007, BKSB0011-BKSB0013, BSBESB01-BSBESB10).

(4) All compounds except EPH were screened against the lower of the EPA (2016b) Regional Screening Level (RSL) for residential soil (THQ = 0.1; Target Cancer Risk = $10^{-6}$) and New Jersey Residential Direct Contact Soil Remediation Standards (NJ RDCSRS) (NJDEP, 2011a). EPH compounds were screened on a sample-specific basis in accordance with the New Jersey Protocol for Addressing Extractable Petroleum Hydrocarbons (NJDEP, 2010a).

n – Non-cancer.
c – Cancer.
L – Based on blood lead modeling.
Surrogate/form – Surrogate/chemical form used in the absence of chemical-specific screening value.

(5) Rationale codes:

Selection reason: ASL – Above screening level.
Deletion reason: BSL – Below screening level.
EN – Essential human nutrient.
EPH – Petroleum hydrocarbon fractions were screened on a sample-specific basis; see text.

(1) B – Analyte was detected in an associated blank sample; J – Estimated.

(2) The maximum detected concentration was used for the screening.

(3) Maximum detected concentrations from site-specific background locations (BKSB0001-BKSB0007, BKSB0011-BKSB0013, BSBESB01-BSBESB10).

(4) All compounds were screened against the lower of the EPA (2016b) Regional Screening Level (RSL) for residential soil (THQ = 0.1; Target Cancer Risk = $10^{-6}$) and New Jersey Residential Direct Contact Soil Remediation Standards (NJ RDCSRS) (NJDEP, 2011a).

n – Non-cancer.

c – Cancer.

L – Based on blood lead modeling.

Surrogate/form – Surrogate/chemical form used in the absence of chemical-specific screening value.

(5) Rationale codes:

Selection reason: ASL – Above screening level.

Deletion reason: BSL – Below screening level.

EN – Essential human nutrient.

Notes:

Only analytes detected in at least one sample are presented.

(1) B – Analyte was detected in an associated blank sample; J – Estimated; + – Value is the average of a parent sample and a field duplicate sample.

(2) The maximum detected concentration was used for the screening.

(3) Maximum detected concentrations from site-specific background locations (BKSB0001-BKSB0007, BKSB0011-BKSB0013, BSBESB01-BSBESB10).

(4) All compounds except EPH were screened against the lower of the EPA (2016b) Regional Screening Level (RSL) for residential soil (THQ = 0.1; Target Cancer Risk = 10-6) and New Jersey Residential Direct Contact Soil Remediation Standards (NJ RDCSRS) (NJDEP, 2011a). EPH compounds were screened on a sample-specific basis in accordance with the New Jersey Protocol for Addressing Extractable Petroleum Hydrocarbons (NJDEP, 2010a).

n – Non-cancer.
c – Cancer.
L – Based on blood lead modeling.
Surrogate/form – Surrogate/chemical form used in the absence of chemical-specific screening value.

(5) Rationale codes:

Selection reason: ASL – Above screening level.
Deletion reason: BSL – Below screening level.
EN – Essential human nutrient.
EPH – Petroleum hydrocarbon fractions were screened on a sample-specific basis; see text.
LDF – Low detection frequency (<5%).

Notes:

Only analytes detected in at least one sample are presented.

(1) B – Analyte was detected in an associated blank sample; J – Estimated; + – Value is the average of a parent sample and a field duplicate sample.

(2) The maximum detected concentration was used for the screening.

(3) Maximum detected concentrations from site-specific background locations (BKSB0001-BKSB0007, BKSB0011-BKSB0013, BSBESB01-BSBESB10).

(4) All compounds except EPH were screened against the lower of the EPA (2016b) Regional Screening Level (RSL) for residential soil (THQ = 0.1; Target Cancer Risk = 10-6) and New Jersey Residential Direct Contact Soil Remediation Standards (NJ RDCSRS) (NJDEP, 2011a). EPH compounds were screened on a sample-specific basis in accordance with the New Jersey Protocol for Addressing Extractable Petroleum Hydrocarbons (NJDEP, 2010a).

n – Non-cancer.

c – Cancer.

L – Based on blood lead modeling.

Surrogate/form – Surrogate/chemical form used in the absence of chemical-specific screening value.

(5) Rationale codes:

Selection reason: ASL – Above screening level.

Deletion reason: BSL – Below screening level.

EN – Essential human nutrient.

EPH – Petroleum hydrocarbon fractions were screened on a sample-specific basis; see text.

Notes:

Only analytes detected in at least one sample are presented.

(1) B – Analyte was detected in an associated blank sample; J – Estimated; + – Value is the average of a parent sample and a field duplicate sample.

(2) The maximum detected concentration was used for the screening.

(3) Maximum detected concentrations from site-specific background locations (BKSB0001-BKSB0007, BKSB0011-BKSB0013, BSBESB01-BSBESB10).

(4) All compounds except EPH were screened against the lower of the EPA (2016b) Regional Screening Level (RSL) for residential soil (THQ = 0.1; Target Cancer Risk = 10-6) and New Jersey Residential Direct Contact Soil Remediation Standards (NJ RDCSRS) (NJDEP, 2011a). EPH compounds were screened on a sample-specific basis in accordance with the New Jersey Protocol for Addressing Extractable Petroleum Hydrocarbons (NJDEP, 2010a).

n – Non-cancer.

c – Cancer.

L – Based on blood lead modeling.

Surrogate/form – Surrogate/chemical form used in the absence of chemical-specific screening value.

(5) Rationale codes:

Selection reason: ASL – Above screening level.

Deletion reason: BSL – Below screening level.

EN – Essential human nutrient.

EPH – Petroleum hydrocarbon fractions were screened on a sample-specific basis; see text.

Notes:

Only analytes detected in at least one sample are presented.

(1) B – Analyte was detected in an associated blank sample; J – Estimated; + – Value is the average of a parent sample and a field duplicate sample.

(2) The maximum detected concentration was used for the screening.

(3) Maximum detected concentrations from project background locations.

(4) All compounds were screened against the lower of the EPA (2016b) Regional Screening Level (RSL) for residential soil (THQ = 0.1; Target Cancer Risk = 10-6) and New Jersey Residential Direct Contact Soil Remediation Standards (NJ RDCSRS) (NJDEP, 2011a).

n – Non-cancer.
c – Cancer.
L – Based on blood lead modeling.
Surrogate/form – Surrogate/chemical form used in the absence of chemical-specific screening value.
NC – No criterion available.

(5) Rationale codes:

Selection reason: ASL – Above screening level.
Deletion reason: BSL – Below screening level.
EN – Essential human nutrient.

(4) All compounds were screened against the EPA (2016b) Regional Screening Level (RSL) for tap water (THQ = 0.1, Target Cancer Risk = 10-6).
n – Non-cancer. L – Based on blood lead modeling.
c – Cancer. Surrogate/form – Surrogate/chemical form used in the absence of chemical-specific screening value.
(5) Rationale codes:
Selection reason: ASL – Above screening level.
Deletion reason: BSL – Below screening level.
EN – Essential human nutrient.

Notes:

Exposed Surface Area (SA) = Head + Forearms + Hands + Lower Legs + Feet (US EPA, 2014).

Forearms assumed to represent 45% of the arm and the lower legs assumed to represent 40% of the legs (US EPA, 2004a, 2011a).

Body weight and surface areas (total, heads, arms, hands, legs, feet) from US EPA's 2011 Exposure Factors Handbook (Tables 7-1, 7-2, and 8-1) (US EPA, 2011a).

Notes:
Only COPCs identified in surface water are presented.
EPD – Effective predictive domain.
MW – Molecular weight (g/mole).
Kp – Stratum corneum (sc) permeability constant (cm/hr).
B – Ratio of permeability of chemical in stratum corneum to permeability in viable epidermis (unitless).
$D_{sc}$ – Effective diffusivity for chemical transfer through the skin (cm²/hr).
$\tau_{event}$ – Lag time per event (hr/event).
b & c – parameters used to calculate time to reach steady state.
t* – Time to reach steady state (hr).
FA – Fraction absorbed (unitless).
$DA_{event}$ – Absorbed dose (mg/cm²-event).
$l_{sc}$ – Apparent thickness of stratum corneum (cm). 0.001
CF – Conversion Factor (L/cm³). 0.001
$C_w$ – Water concentration (*i.e.* , surface water exposure point concentration).
Equations are provided in Part E, Supplemental Guidance for Dermal Risk Assessment of the Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual (US EPA, 2004a)

$$B = K_p \frac{\sqrt{MW}}{2.6} \qquad D_{sc} = 10^{(-2.8-0.0056\,MW)} \times l_{sc}$$

$$c = \frac{1+3B+3B^2}{3(1+B)} \qquad \tau_{event} = \frac{l_{sc}^2}{6D_{sc}}$$

$$b = \frac{2(1+B)^2}{\pi} - c \qquad \begin{array}{l} If\ B \le 0.6\ then\ t^* = 2.4\tau_{event} \\ If\ B > 0.6\ then\ t^* = 6\tau_{event}\left(b - \sqrt{b^2 - c^2}\right) \end{array}$$

$$If\ t_{event} \le t^*\ then\ DA_{event} = 2\,FA \times K_p \times C_w \sqrt{\frac{6\tau_{event} \times t_{event}}{\pi}}$$

$$If\ t_{event} > t^*\ then\ DA_{event} = FA \times K_p \times C_w \times \left[\frac{t_{event}}{1+B} + 2\tau_{event}\left(\frac{1+3B+3B^2}{(1+B)^2}\right)\right]$$

Notes:

(1) The oral absorption efficiency is from EPA (2004a, Exhibit 4-1) or the EPA RSLs (US EPA, 2016b).

(2) Literature sources of Dermal Absorption Fractions for Soil are discussed in Section 7 of the report text.

(3) EPA (2016b) cites the following sources for toxicity values (Cancer Slope Factor, Reference Dose, Unit Risk, and Reference Concentration):

EPA Integrated Risk Information System (IRIS)
Health Effects Assessment Summary Tables (HEAST)
Agency for Toxic Substances and Disease Registry (ATSDR)
Provisional Peer-reviewed Toxicity Values (PPRTVs)

(4) Lead does not have toxicity factors; lead risk will be evaluated with a blood lead model.

(5) RfD for manganese based on non-diet is recommended in the EPA RSL User Guide, which subtracts the manganese contribution from the diet and uses a modifying factor of 3 (US EPA, 2016e).

(6) The RfD for Aroclor 1254 was used for other highly chlorinated Aroclors, including Aroclor 1248 and Aroclor 1260.

(7) The RfD for benzo(a)pyrene was obtained from the IRIS January 2017 toxicological review (US EPA, 2017a).

(8) Multiple uncertainty factors were considered in the derivation of this RfD.

(9) The RfDs for the non-ortho and mono-ortho PCB compounds are based on 2,3,7,8-tetrachlorodibenzo-p-dioxin and a toxicity equivalency factor (US EPA, 2016e).

(10) The RfDs for the trimethylbenzenes were obtained from the IRIS September 2016 toxicological review (US EPA, 2016g).

Notes:

Data inadequate – Data are inadequate to assess carcinogenic potential.

(1) The oral absorption efficiency was obtained from EPA (2004a, Exhibit 4-1) or EPA RSLs (US EPA, 2016b).

(2) EPA (2016b) cites the following sources for toxicity values (Cancer Slope Factor, Reference Dose, Unit Risk, and Reference Concentration):

EPA Integrated Risk Information System (IRIS) — California EPA (CalEPA)

Provisional Peer-reviewed Toxicity Values (PPRTVs) — Health Effects Assessment Summary Tables (HEAST)

(3) Mutagen – Compounds with mutagenic modes of action are flagged in this column. Information is obtained from the EPA RSL table (US EPA, 2016b).

(4) The toxicological value for chromium (VI) was obtained from NJDEP (2009).

(5) The CSFs for the PAH compounds are based on benzo(a)pyrene and a toxicity equivalency factor, as listed in IRIS (US EPA, 2016e).

(6) The CSF for benzo(a)pyrene was obtained from the IRIS January 2017 toxicological review (US EPA, 2017a).

(7) The CSF for trichloroethylene is based on specific CSFs for kidney cancer [9.3E-03 $(mg/kg\text{-}day)^{-1}$], liver cancer [1.6E-02 $(mg/kg\text{-}day)^{-1}$], and non-Hodgkin's lymphoma [2.2E-02 $(mg/kg\text{-}day)^{-1}$] (US EPA, 2011c).

(8) The CSFs for the non-ortho and mono-ortho PCB compounds are based on 2,3,7,8-tetrachlorodibenzo-p-dioxin and a toxicity equivalency factor (US EPA, 2016e).

(9) The CSF for benzo(j)fluoranthene is based on benzo(a)pyrene and a potency equivalency factor from CalEPA (CalOEHHA, 2009). This value pre-dates EPA's CSF for benzo(a)pyrene published in January 2017 (EPA, 2017a).

Notes:
NA – Not Available.
(a) The mutagen risks were calculated for COPCs identified as having a mutagenic mode of action. The mutagen risks for separate age groups are added together to calculate the total risk.
(b) To calculate cancer risks for trichloroethylene (TCE), the standard cancer and mutagen equations needed to be combined. Since TCE requires the use of different toxicity values for cancer and mutagen equations, toxicity value adjustment factors for cancer (CAF) and mutagens (MAF) are used, in accordance with US EPA guidance (US EPA, 2016e). The calculation of these adjustment factors and TCE intake values are presented at the bottom of this spreadsheet.

## COMPOSITION-SPECIFIC EXTRACTABLE PETROLEUM HYDROCARBON (EPH) SOIL REMEDIATION CRITERION (SRC) CALCULATOR FOR NON-#2 FUEL OIL/DIESEL OIL PETROLEUM HYDRCARBON MIXTURES (Version 2.0, August 9, 2010)

**DATA ENTRY CELLS**

ENTER ALL CONCENTRATIONS AS MILLIGRAMS/KILOGRAM (mg/kg)
FOR NON DETECT VALUES, ENTER "0" or "ND" (without the quotation marks)
REMEMBER TO ENTER ACTUAL SAMPLE IDENTIFICATION IN PLACE OF "SAMPLE 1", ETC.
REMEMBER TO INDICATE WHETHER THE SAMPLE IS "RESIDENTIAL" (R) OR "NON-RESIDENTIAL" (N) [OR USE DROP-DOWN LIST]
ALL DATA MUST BE ENTERED FOR EACH SAMPLE FOR THE EPH CRITERION TO BE CALCULATED
CLICK ON THE "CALCULATE EPH SRC" BUTTON TO CALCULATE THE SAMPLE-SPECIFIC EPH SOIL REMEDIATION CRITERION
IF YOU CHANGE ANY INPUT DATA, YOU MUST CLICK ON "CALCULATE EPH SRC" AGAIN TO RECALCULATE THE SOIL REMEDIATION CRITERION
IF THE RESULTS FROM THE GC ANALYSIS INDICATE AN EPH CONCENTRATION LESS THAN 1,700 mg/kg, IT IS NOT NECESSARY TO USE THIS CALCULATOR

Notes:

Only the analytes with screening levels are presented.

The maximum concentration of each TIC reported in each sample analysis was used.

The maximum detected concentration was used for the screening.

Rationale codes:

Selection reason: ASL – Above screening level.

Deletion reason: BSL – Below screening level.

LDF – Low detection frequency (<5%).

Benzo(ghi)fluoranthene was removed from this list because it does not have an RSL.

(1) 1,2,4-Trimethylbenzene and 1,3,5-trimethylbenzene were retained as COPCs in the NFA, because they are COPCs in the SFA area.

Notes:

EPA criteria: May 2016 VISL Target Sub-Slab and Exterior Soil Gas Conc., TCR = 1E-06 or THQ = 1, Commercial scenario.

- = No criterion listed.

No Inh. Tox – No inhalation toxicity information available; therefore, no criterion calculated.

U – Non-detect.

J – Estimated Value.

Shading – Value exceeds criterion.

Notes:

EPA criteria: May 2016 VISL Target Sub-Slab and Exterior Soil Gas Conc., TCR = 1E-06 or THQ = 1, Commercial scenario.

- = No criterion listed.

No Inh. Tox – No inhalation toxicity information available; therefore, no criterion calculated.

U – Non-detect.

J – Estimated Value.

Shading – Value exceeds criterion.

Notes:

EPA criteria: May 2016 VISL Target Sub-Slab and Exterior Soil Gas Conc., TCR = 1E-06 or THQ = 1, Commercial scenario.

- = No criterion listed.

No Inh. Tox – No inhalation toxicity information available; therefore, no criterion calculated.

U – Non-detect.

J – Estimated Value.

Shading – Value exceeds criterion.

Notes:

EPA criteria: May 2016 VISL Target Sub-Slab and Exterior Soil Gas Conc., TCR = 1E-06 or THQ = 1, Commercial scenario.

- = No criterion listed.

No Inh. Tox – No inhalation toxicity information available; therefore, no criterion calculated.

U – Non-detect.

J – Estimated Value.

Shading – Value exceeds criterion.

Notes:

EPA criteria: May 2016 VISL Target Sub-Slab and Exterior Soil Gas Conc., TCR = 1E-06 or THQ = 1, Commercial scenario.

- = No criterion listed.

No Inh. Tox – No inhalation toxicity information available; therefore, no criterion calculated.

U – Non-detect.

J – Estimated Value.

Shading – Value exceeds criterion.

Notes:

EPA criteria: May 2016 VISL Target Sub-Slab and Exterior Soil Gas Conc., TCR = 1E-06 or THQ = 1, Commercial scenario.

- = No criterion listed.

No Inh. Tox – No inhalation toxicity information available; therefore, no criterion calculated.

U – Non-detect.

J – Estimated Value.

Shading – Value exceeds criterion.

EPA criteria: May 2016 VISL Target Sub-Slab and Exterior Soil Gas Conc., TCR = 1E-06 or THQ = 1, Commercial scenario.

- = No criterion listed.

No Inh. Tox – No inhalation toxicity information available; therefore, no criterion calculated.

U – Non-detect.

J – Estimated Value.

Shading – Value exceeds criterion.

Notes:

EPA criteria: May 2016 VISL Target Sub-Slab and Exterior Soil Gas Conc., TCR = 1E-06 or THQ = 1, Commercial scenario.

- = No criterion listed.

No Inh. Tox – No inhalation toxicity information available; therefore, no criterion calculated.

U – Non-detect.

J – Estimated Value.

Shading – Value exceeds criterion.

EPA – Environmental Protection Agency; NJDEP – New Jersey Department of Environmental Protection; THQ – Target Hazard Quotient; VI – Vapor Intrusion; VISL – Vapor Intrusion Screening Level .
- = No criterion listed.
No Inh. Tox – No inhalation toxicity information available; therefore, no criterion calculated.
U – Non-detect.
J – Estimated Value.
Shading – Value exceeds criterion.

Notes:
EPA – Environmental Protection Agency; NJDEP – New Jersey Department of Environmental Protection; THQ – Target Hazard Quotient; VI – Vapor Intrusion; VISL – Vapor Intrusion Screening Level.
- = No criterion listed.
No Inh. Tox – No inhalation toxicity information available; therefore, no criterion calculated.
U – Non-detect.
J – Estimated Value.
Shading – Value exceeds criterion.
**Bold – Detected concentration.**

Notes:
EPA – Environmental Protection Agency; NJDEP – New Jersey Department of Environmental Protection; THQ – Target Hazard Quotient; VI – Vapor Intrusion; VISL – Vapor Intrusion Screening Level.
- = No criterion listed.
No Inh. Tox – No inhalation toxicity information available; therefore, no criterion calculated.
U – Non-detect.
J – Estimated Value.
Shading – Value exceeds criterion.
**Bold – Detected concentration.**

Notes:

EPA – Environmental Protection Agency; NJDEP – New Jersey Department of Environmental Protection; ppbv – Parts Per Billion by Volume; THQ – Target Hazard Quotient; TIC – Tentatively Identified Compound; VI – Vapor Intrusion; VISL – Vapor Intrusion Screening Level.

- = No criterion listed.

No Inh. Tox – No inhalation toxicity information available; therefore, no criterion calculated.

U – Non-detect.

J – Estimated Value.

JN – Estimated Value.

Shading – Value exceeds criterion.

Notes:

EPA – Environmental Protection Agency; NJDEP – New Jersey Department of Environmental Protection; ppbv – Parts Per Billion by Volume; THQ – Target Hazard Quotient; TIC – Tentatively Identified Compound; VI – Vapor Intrusion; VISL – Vapor Intrusion Screening Level.

- = No criterion listed.

No Inh. Tox – No inhalation toxicity information available; therefore, no criterion calculated.

U – Non-detect.

J – Estimated Value.

JN – Estimated Value.

Shading – Value exceeds criterion.

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use
guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates
