Kim Stan Landfill Superfund Site Remedial Action Update and Public Availability Session October 2008

The U.S. Environmental Protection Agency is continuing work on Phase 3 of its Remedial Action Plan for this Site. Phase 3 includes construction of an impermeable cap over the landfill materials and the installation of a leachate collection trench along the toe of the cap. When construction is completed, collected leachate (contaminated groundwater) will be funneled from the collection trench into the pipeline constructed during Phase 2 of the Remedial Action Plan. The pipeline will transport the leachate to the Low Moor Publicly-Owned Treatment Works (POTW).

EPA expects cap construction to continue until the winter weather makes construction too difficult and currently expects all Phase 3 construction to be completed by September 2009.
