1. INTRODUCTION

The United States Environmental Protection Agency tasked the Weston Solutions, Inc. (WESTON[®]), Superfund Technical Assessment and Response Team (START) to assist EPA On-Scene Coordinator (OSC) Ramon Mendoza in performing a site assessment at an alley (owned by the City of Chicago) and a railroad spur (owned by Burlington Northern Santa Fe Railway [BNSF]) located adjacent to the H. Kramer and Company (H. Kramer) facility in the Pilsen neighborhood of Chicago, Cook County, IL (the Site, **Figure 1-1**). The objective of the site assessment was to determine the impact of present and historical industrial sources of heavy metal air emissions on Site soil. For an assessment of the impact of present and historical industrial sources of heavy metal air emissions on soil on residential properties in the Pilsen community, see “Site Assessment Report for Pilsen Soil Site: Downwind Residential Area” (WESTON START, March, 2014).

Under Technical Direction Document (TDD) No. S05-0001-1211-002, EPA requested that WESTON START document and photograph current Site conditions, conduct X-ray fluorescence (XRF) screening, collect and analyze soil samples, and evaluate the potential for imminent and substantial threats to the public health, welfare, or the environment posed by Site-related conditions. In December 2012, May 2013, and August 2013, WESTON START conducted three site assessment field sampling events.

This site assessment report is organized into the following sections:

- **Introduction** – Provides a brief description of the scope of site assessment activities.
- **Site Background** – Details the Site description and summarizes previous environmental investigations in the vicinity of the Site.
- **Site Assessment Activities** – Discusses methods and procedures used during the site assessment.
- **Analytical Results** – Discusses analytical results for samples collected during the site assessment.
- **Soil Lithology** – Summarizes the soil characteristics at the Site.

- **Threats to Human Health and the Environment** – Identifies Site conditions that may warrant a removal action under the National Oil and Hazardous Substances Pollution Contingency Plan (NCP).
- **Summary and Conclusions** – Summarizes the site assessment conclusions.
- **References** – Provides a list of references used to prepare this site assessment report.

Figures and tables are presented after the conclusions section. This site assessment report contains four appendices. **Appendix A** provides photographic documentation of Site conditions and activities at the time of the site assessment. **Appendix B** provides soil boring logs. **Appendix C** provides the laboratory analytical and data validation reports for samples collected during the site assessment. **Appendix D** provides supplemental soil data analysis by EPA's Field Environmental Decision Support (FIELDS) group.

2. SITE BACKGROUND

2.1 SITE DESCRIPTION

The Site consists of a railroad spur owned by BNSF and an alley owned by the City of Chicago. **Figure 2-1** presents the Site features. The Site is located in the Lower West Side (Pilsen) area of the City of Chicago. The alley is approximately 460 feet (ft) long and 18 ft wide (approximately 8,280 square feet [ft²] in area) and is roughly paved with asphalt over 25% of its length from the east side. The remaining 75% of the alley is bare soil. The alley connects South Loomis Street and South Throop Street, south of West 21st Street and north of West Cermak Road. The alley is bordered to the north by H. Kramer, the east by South Throop Street, to the south by commercial and industrial businesses, and to the west by the railroad spur then South Loomis Street. According to a historical Sanborn fire insurance map, the alley existed since at least 1914.

The section of the railroad spur investigated in this site assessment is approximately 19,600 ft². The railroad spur consists of an unused rail track and bare soil. The western portion of the railroad spur is located in the northeast region of a property occupied by the Benito Juarez Community Academy (Juarez), located at 1450-1510 West Cermak Road. The railroad spur curves to the south, crosses South Loomis Street, and extends along the west boundary of H.

Kramer, a 6.5-acre active brass and bronze smelter located at 1345 West 21st Street. The eastern portion of the railroad spur is bordered by a tire service company to the west (Tire Grading Company, 1358 West Cermak Road), a metal processing company to the east (Wheeling Metal Processing Company, 1338 West Cermak Road), and West Cermak Road to the south. According to a historical Sanborn fire insurance map, the railroad spur existed since at least 1914.

Two schools are located within a ¼-mile-radius of the Site: Juarez and the Manuel Perez Jr. Elementary School (Perez). Two City of Chicago parks are located within a ½-mile-radius of the Site, Dvorak Park and Throop Park. In 2010, approximately 40,983 people lived within 1 mile of the Site (EPA 2014). The Chicago Sanitary and Ship Canal is located approximately 0.45 miles to the south. According to National Oceanic and Atmospheric Administration (NOAA) meteorological data collected from 1928 to 2013, the predominant wind direction in the Chicago, Illinois area is from the southwest. **Figure 2-2** presents a projected wind direction swath superimposed over the southwest region of the Site.

Among the suspected present and historical industrial sources of lead air emissions in the Site area are H. Kramer and the Midwest Generation Fisk Station coal-fired power plant (Fisk Station). H. Kramer is a corporation that owns and operates a secondary nonferrous metals facility manufacturing primarily brass and bronze ingots, where a portion of the facility's production capacity is devoted to lead-containing metal alloys. In general, the secondary production of lead begins with the recovery of old scrap from worn-out, damaged, or obsolete products and new scrap that is made of product wastes and smelter-refinery drosses, residues, and slags. Secondary lead processing results in the generation of air emissions and solid-phase wastes. Reverberatory and blast furnaces used in smelting account for the vast majority of the total lead emissions. Other emissions from secondary smelting include oxides of sulfur and nitrogen, antimony, arsenic, copper, and tin. The solid-phase wastes generated by secondary processing include emission control dust and slag. Slag produced during lead processing is composed of iron, calcium, and silicon oxides, aluminum, and potentially several other metals in smaller amounts including antimony, arsenic, beryllium, cadmium, chromium, cobalt, copper, lead, manganese,

mercury, molybdenum, silver, and zinc. For a detailed description of secondary lead processing, see EPA's *Profile of the Nonferrous Metals Industry* (EPA 1995). H. Kramer is listed in the EPA Toxic Release Inventory (TRI) System. TRI facilities are legally required to report to EPA and EPA has tracked both fugitive and stack emissions from H. Kramer from 1987 to 2013. Fugitive emissions are emissions that could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening, and often occur during leaks from pressurized equipment or during material transfer. From 1987, approximately 54,366 pounds of lead, 832,567 pounds of zinc, and 6,782 pounds of copper have been released via fugitive and stack emissions (EPA 2013a). The Fisk Station is a 66-acre former coal-fired power plant located at 1111 West Cermak Road. The plant ceased electricity generation operations in August 2012. Fisk Station is also listed in the EPA TRI System (EPA, 2013b). From 1998 to 2012, approximately 1,197 pounds of lead, 236 pounds of zinc, 373 pounds of copper, and 805 pounds of mercury have been released via fugitive and stack emissions.

2.2 PREVIOUS ENVIRONMENTAL INVESTIGATIONS

This section presents summaries of previous environmental investigations conducted in the vicinity of the Site related to the Pilsen neighborhood, H. Kramer, and Fisk Station.

2.2.1 PERRO Surface Soil Investigation

In March 2005, the Pilsen Environmental Rights & Reform Organization (PERRO) collected 12 surface soil samples in the Site Area around the vicinity of H. Kramer (Subra Company 2005). Lead was detected in soil samples collected from eight locations above the 2012 EPA Removal Management Level (RML) with a hazard quotient (HQ) of 3 for residential soil of 400 milligram per kilogram (mg/kg). Lead concentrations ranged from 440 to 37,000 mg/kg. Copper was detected in one soil sample above the 2012 EPA RML HQ 3 for residential soil of 9,300 mg/kg, with a concentration of 14,000 mg/kg. Zinc was detected in one soil sample above the 2012 EPA RML HQ 3 for residential soil of 23,000 mg/kg, with a concentration of 100,000 mg/kg.

2.2.2 H. Kramer Enrollment in the IEPA SRP

In June 2005, the Illinois Environmental Protection Agency (IEPA) Site Assessment Unit (SAU) identified heavy metal contamination, particularly lead, on the H. Kramer property and in the nearby vicinity. Lead concentrations in 15 of the 17 samples collected by the SAU exceeded 1,000 mg/kg. In September 2005, H. Kramer entered the IEPA Site Remediation Program (SRP). Remedial action was implemented via in situ treatment or excavation in areas where lead or cadmium exceeded the Toxicity Characteristic Leaching Procedure (TCLP) concentrations set forth in Title 40 of the *Code of Federal Regulation* (CFR) Part 261, Subpart C, 261.24 (b), thereby representing materials that meet the definition of hazardous waste by virtue of the characteristic of toxicity.

On September 7, 2005, approximately 5 to 7 cubic yards (yd³) of soil were removed from an area measuring 22 ft by 10 ft, and approximately 0.75 ft deep. The excavation area was then backfilled with clean, imported gravel. Additionally, a small amount of soil located on top of the sidewalk near the northeastern corner of the H. Kramer property was removed.

In the fall of 2011, in situ stabilization of shallow soils was conducted where TCLP lead concentrations exceeded levels set forth in 40 CFR Part 261, Subpart C, 261.24 (b). A total of 2,769 yd³ of impacted soils were stabilized in treatment cells with a mixture of kiln dust and phosphorus. Confirmation samples of the treated soils were collected at a rate of one sample per 250 yd³. All samples confirmed that stabilization was achieved.

In December 2011 and March 2012, H. Kramer submitted to IEPA a Remedial Action Completion Report and an Addendum to the Remedial Action Completion Report, respectively. On March 29, 2012, IEPA granted H. Kramer a No Further Remediation (NFR) Letter, signifying a release from further responsibilities pursuant to Section 58.10 of the Illinois Environmental Protection Act (415 ILCS 5/1 et seq.). Requirements outlined in the NFR included, but were not limited to, the following: (1) the remediation site should be restricted to industrial/commercial land use; (2) a safety plan should be developed to address possible worker exposure in the event that any future excavation and construction activities may occur within the

contaminated soil that exists beneath the engineered barriers; (3) an asphalt barrier must remain over the contaminated soils, and must be properly maintained to inhibit inhalation and ingestion of the contaminated media; (4) a concrete cap barrier must remain over the contaminated soils, and must be properly maintained as an engineered barrier to inhibit inhalation and ingestion of the contaminated soil.

2.2.3 Pilsen IEPA Air Monitoring Study

In January 2010, IEPA placed an air monitoring station on the roof of Perez Elementary School to sample ambient air concentrations of lead in the area. Air samples at the Perez monitor were collected once every six days. In 2010, lead was detected in 11 of the approximately 60 samples at concentrations above the National Ambient Air Quality Standard (NAAQS) of 0.15 microgram per cubic meter ($\mu\text{g}/\text{m}^3$), averaged over three months. IEPA installed a second air monitoring station at Juarez to the west of H. Kramer and Perez. According to IEPA, results from the second air monitoring station indicated that H. Kramer was the primary contributor to the elevated ambient air lead levels in the area. As a result, IEPA requested that the Illinois Attorney General initiate legal action against H. Kramer relative to its contribution to a violation of the lead NAAQS. EPA addressed this issue in a 2011 enforcement action (see Section 2.2.6).

2.2.4 NEIC Pilsen Investigations

In March 2011, EPA Region 5 requested EPA's National Enforcement Investigations Center (NEIC) to examine particulate matter from H. Kramer and Fisk Station and total suspended particulate (TSP) matter collected in ambient air on glass fiber filters from area air monitoring stations to determine if material from either facility was present on the TSP filters. As described in **Section 2.2.3**, in January 2010, IEPA began operating a source-oriented TSP air monitoring station at Perez. This station is in the predominantly downwind direction of H. Kramer. In March 2011, a second TSP air monitoring site was established at Juarez.

On August 21, 2011, NEIC submitted a report to EPA Region 5 entitled "Characterization of Lead-Bearing Particulate Matter," presenting analytical results of filters containing the highest and lowest concentrations of lead collected at the Perez air monitoring site from January 2010 to

January 2011, as well as baghouse dust samples collected at H. Kramer (EPA NEIC 2011). Analytical results indicated cadmium, copper, tin, and zinc were co-contaminants of the lead-bearing particulate matter collected on the TSP filters. These co-contaminants were metals used in alloys produced at H. Kramer and were also found in similar proportions in H. Kramer baghouse dust samples. Lead-bearing, micrometer (μm) sized (1–10 μm) aggregates of zinc-oxide crystallites were common in ambient air in the Pilsen neighborhood on at least six days in 2010, and were similar to the predominant baghouse dust particles from H. Kramer. The report concluded that H. Kramer's furnaces were likely the primary source of lead-bearing airborne particulate matter in the Pilsen neighborhood based on the location of its facility, wind direction, and analytical results of TSP filters and baghouse dust from its facility. However, the Fisk Station could not be excluded as a possible contributing source of lead contamination at the Perez air monitoring site because particulate matter similar to coal fly ash was observed on the filters collected from Perez. For more information, refer to EPA NEIC (2011).

On August 24, 2012, NEIC submitted a second report to EPA Region 5 entitled "Additional Characterization of Lead-Bearing Particulate Matter," presenting additional analytical results of lead-bearing particulate matter on TSP filters from the Juarez and Perez air monitoring stations and in coal and fly ash collected from the Fisk Station and Midwest Generation's Crawford Station coal-fired power plant (Crawford Station), in addition to any contribution from H. Kramer. In all, nine TSP filter samples collected at the Juarez air monitoring station and 32 TSP filter samples collected at the Perez air monitoring station were selected for analysis, along with baghouse dust samples from H. Kramer and coal and fly ash samples from both the Fisk and Crawford Stations. Relative elemental abundances were determined by laser ablation-inductively coupled plasma-mass spectrometry (LA-ICP-MS). Coal and fly ash from Crawford and TSP filters collected at Perez and Juarez air monitoring stations were analyzed by scanning electron microscopy with energy dispersive spectrometry (SEM/EDS) to characterize individual particles for elemental composition, morphology, and size. Analytical results of TSP filters were compared against each other and with facility sample results. The three key main findings from these analyses are summarized as follows:

- 1) H. Kramer was indicated as the major contributor of airborne lead-bearing particulate matter in the Pilsen neighborhood, both during and outside the NAAQS exceedance period of October 2010 to February 2011.
- 2) Spherical Calcium-Aluminum-Silicon-oxide particles and correlations of rare earth elements (REE) on TSP filters collected at Perez and Juarez were consistent with coal fly ash. Fisk Station was the coal-generated power plant located closest to the air monitoring sites. The next closest power plant, Crawford, was approximately seven times farther away. No other likely sources of spherical Calcium-Aluminum-Silicon-oxide particles were identified in the surrounding area. Furthermore, spherical Ca-Al-Si-oxide particles were the most common on TSP filters collected during the 24-hour collection periods when the predominant wind direction put Fisk Station upwind of the collection site.
- 3) Fisk Station contributed insignificant quantities of lead-bearing particulate matter relative to H. Kramer during (and outside) the NAAQS exceedance period of October 2010 to February 2011.

For details supporting these conclusions, refer to EPA NEIC (2012).

2.2.5 H. Kramer 2011 Litigation and Emission Control Implementation

In 2011, the United States brought three claims against H. Kramer. First, the United States alleged that H. Kramer violated the Illinois State Implementation Plan by causing or allowing the emission of lead into the air to cause air pollution and/or to prevent the attainment or maintenance of the revised NAAQS for lead. Second, the United States alleged that H. Kramer failed to maintain and operate the rotary furnaces at the facility in a manner consistent with good air pollution control practice, as required by the Standards of Performance for New Stationary Sources. Third, the United States alleged that H. Kramer failed to operate and maintain all furnace melting operations in a manner consistent with good air pollution control practices as required by the National Emissions Standards for Hazardous Air Pollutants.

Negotiations between EPA, IEPA, the Attorney General's Office, Department of Justice (DOJ),

and H. Kramer resulted in an Agreed Preliminary Injunction Order being filed in state court on September 2, 2011. Pursuant to the order, H. Kramer made significant repairs to the facility, including pollution control upgrades, cleanup, and paving of the facility's yard, and reduction in the production of two lead alloys. A final Consent Decree was filed in federal court and executed on March 28, 2013. More specifically, the decree required installation and operation of two new baghouses to better control emissions from the rotary furnaces located in the south foundry building. A construction permit was issued in January 2012 for H. Kramer to install the two new baghouses.

2.2.6 City of Chicago Metal Concentrations in Ambient Surface Soils Study

In June 2001 and January 2002, the U.S. Geological Survey (USGS), in cooperation with the City of Chicago, Department of Environment, collected soil samples from 57 areas near residential, commercial, and industrial land use areas to assess the concentration of metals and polynuclear aromatic hydrocarbons in ambient surface soils within the City of Chicago (USGS 2003). Ambient soils are defined as those soils whose chemical composition is affected by ubiquitous natural and anthropogenic processes rather than the site-specific disposal of waste materials. Soil samples were collected from the upper 6 inches of the soil horizon (from 0 to 6 inches in an undisturbed soil horizon or from the upper 6 inches of a soil horizon where it may be covered by gravel) using a dedicated stainless steel spoon or trowel.

The mean concentration of arsenic, mercury, calcium, magnesium, phosphorus, copper, molybdenum, zinc, and selenium was from two to six times higher in Chicago soil than soils in agricultural areas within 500 kilometers of Chicago, and concentrations of lead were approximately 20 times higher than in soil from the surrounding area. Inter-element correlation coefficients for the inorganic analytes were calculated to provide additional insight into the sources of the inorganic constituents. The sets of elements showing strong mutual correlations can indicate causative factors for the observed concentrations and distribution of these elements. Although the bulk of the compositional trends in Chicago soils are explainable by varying proportions of dolomite and shale, which likely are soil parent material, the elevated (in comparison to surrounding agricultural soils) concentrations of arsenic, copper, lead, mercury,

molybdenum, nickel, phosphorus, selenium, and zinc indicate a potential anthropogenic source of these elements. Lead (concentration factor of 20.4), zinc (7.4), and mercury (4.5) are enriched relative to background soils and all seem likely to indicate substantial and widespread anthropogenic modifications to the trace-element character of the soil. Sampling results for copper, lead, zinc, and mercury are presented as follows:

Constituent	No. of Samples Collected	No. of Detections	Arithmetic Mean (mk/kg)	Standard Deviation (mk/kg)	Range of Detected Concentrations (mg/kg)
Copper	57	57	150.5	373.7	9-2,780
Lead	57	57	395	494.2	13-1,910
Zinc	57	57	396.6	410.8	79-1,690
Mercury	57	56	0.6	1.9	<0.02-13.1

The high correlation between lead and zinc ($R^2 = 0.91$) suggests that the two elements have been added to soils largely from the same material or process rather than as independently distributed constituents (USGS 2003). Mercury shows low correlation with all other constituents, including organic carbon ($R^2 = 0.135$). In many natural settings, mercury and organic carbon are highly correlated so the lack of correlation in Chicago soil suggests an anthropogenic addition largely independent of natural processes.

3. SITE ASSESSMENT ACTIVITIES

In December 2012, May 2013, and August 2013, EPA and WESTON START conducted a site assessment to determine the impact of present and historical industrial sources of heavy metal air emissions at the locations of the Site.

To fulfill these objectives, the following site assessment activities were conducted:

- December 19, 2012: Alley field sampling event.
- May 6, 2013: Railroad spur field sampling event.
- August 12-15, 2013: Little Italy reference area residential property field sampling event.

All sampling activities were conducted in Level D personal protective equipment (PPE) in accordance with the approved site-specific health and safety plan. Fresh sampling gloves were donned before sampling activities began at each new location, and for each sample to avoid

cross-contamination. Non-disposable equipment that could potentially cross-contaminate samples (e.g., Geoprobe[®] cutting shoe) was decontaminated between each sampling location using analconox wash and a potable water rinse. Specific sampling activities are discussed in the following sections. Figures and tables are presented after the References section (Section 8). **Appendix A** provides photographic documentation of Site conditions and activities at the time of the site assessment, and **Appendix B** provides soil boring logs.

3.1 ALLEY SITE ASSESSMENT ACTIVITIES

On December 19, 2012, EPA and WESTON START conducted a field sampling event at the alley. The December 19, 2012, field sampling event was conducted in accordance with the “Field Sampling Plan for the Pilsen Area Soil Site Assessment,” dated December 17, 2012. It was also conducted in overall accordance with the Quality Assurance Project Plan for the Region 5 START III Contract, dated June 2006. EPA received a permit from the City of Chicago for soil boring activities between December 18 and 20, 2012. The alley was divided into 10 sections of roughly equal surface area. Within each section, WESTON START subcontractor Cabeno Environmental Field Services, LLC (Cabeno), of Joliet, IL, used a Geoprobe[®] drill rig to advance two soil borings to a depth up to 4 ft below ground surface (bgs). Twenty soil borings were conducted (AY-01 through AY-20; **Figure 3-1**). The soil from each 4-ft core was inspected and observations were recorded in a soil boring log in accordance with the Unified Soil Classification System (USCS) (**Appendix B**). Documentation was recorded regarding any fill materials, odors, discoloration, or staining suggesting potential contamination.

The 0- to 6-, 6- to 12-, 12- to 24-, 24- to 36-, and 36- to 48-inch bgs intervals from each soil boring were placed into disposable polyethylene bags, homogenized, and screened by EPA FIELDS for total metals using a handheld Innov-X Delta XRF analyzer. WESTON START collected a total of 23 samples (21 investigative and two field duplicates) as follows:

- Ten composite samples were collected from the 10 sections of the alley, one composite from each section. Composite soil samples consisted of an aliquot of soil from both borings in a section, taken from the depth interval showing the highest total lead XRF screening concentration

- One additional composite sample was collected at location AY-03, consisting of soil aliquots collected from 0 to 6 inches bgs from location AY-03 and three step-out locations 5 ft to the west, south, and east of AY-03 (AY-03W, AY-03S, and AY-03E).
- Ten grab soil samples were also collected from the alley. One grab soil sample was collected from one of the two borings within each of the 10 sections at the depth interval showing the highest total lead XRF screening concentration.

Soil samples were submitted under chain-of-custody to STAT Analysis Corporation in Chicago, IL, for at least one of the following analyses:

- Total Resource Conservation and Recovery Act (RCRA) metals (silver, arsenic, barium, cadmium, chromium, mercury, lead, and selenium) plus antimony, copper, tin, and zinc.
- Total lead
 - Coarse-grained fraction (grain size > 250 μm).
 - Fine-grained fraction (grain size < 250 μm).
- Bioavailable lead.
- TCLP RCRA metals.
- pH.
- Moisture content.

Table 3-1 presents a summary of the sampling, including the sampling identification, sampling location, and analytical parameters.

3.2 RAILROAD SPUR SITE ASSESSMENT ACTIVITIES

EPA tasked WESTON START with conducting additional site assessment activities based on analytical results from the alley soil samples. On May 6 2013, EPA and WESTON START conducted a field sampling event at the railroad spur. The May 6 2013, field sampling event was conducted in accordance with the document entitled “Field Sampling Plan for the Pilsen Area Soil Site Assessment, Revision 2,” dated April 30, 2013. It was also conducted in overall accordance with the Quality Assurance Project Plan for the Region 5 START III Contract, dated June 2006. EPA FIELDS used a Geoprobe[®] drill rig to advance 16 soil borings to 2 ft bgs (RR-01 through RR-16; **Figure 3-1**). The soil from each 2-ft core was inspected and observations

were recorded in a soil boring log in accordance with the USCS (**Appendix B**). Documentation was recorded noting any fill materials, odors, discoloration, or staining suggesting potential contamination. The 0- to 6-, 6- to 12-, and 12- to 24-inch bgs intervals of each soil boring were placed into disposable polyethylene bags, homogenized, and screened by WESTON START for total metals using EPA's Innov-X Alpha Series XRF analyzer.

Thirteen composite soil samples (12 investigative and one field duplicate) were collected from 13 locations on the railroad spur. Composite samples consisted of aliquots collected from two or three adjacent borings, from either 0 to 6 or 6 to 24 inches bgs. Composite samples consisted of aliquots collected from the same depth interval. No samples were collected from locations RR-03, RR-05, or RR-09 as a result of relatively lower XRF lead screening values. Soil samples were submitted under chain-of-custody to STAT Analysis Corporation in Chicago, IL, for at least one of the following analyses:

- Select total metals (antimony, copper, cadmium, chromium, mercury, lead, tin, and zinc).
- Total lead, fine-grained fraction (grain size < 250 μm).
- Bioavailable lead.
- pH.

3.3 LITTLE ITALY REFERENCE AREA SITE ASSESSMENT ACTIVITIES

In August 2013, EPA and WESTON START conducted a field sampling event in the Little Italy residential neighborhood (Little Italy reference area). The August 2013 field sampling event was conducted in accordance with the document entitled "Field Sampling Plan for the Pilsen Area Soil Site Assessment, Revision 2, Amendment 1," dated July 5, 2013, and with EPA's "Superfund Lead-Contaminated Residential Sites Handbook" (EPA 2003). It was also conducted in overall accordance with the Quality Assurance Project Plan for the Region 5 START III Contract, dated June 2006. Data collected from this area served as a reference of soil suspected to be less impacted by industrial sources, such as H. Kramer and Fisk Station due to an increased distance from these sources. The Little Italy reference area is approximately 110 acres and located approximately 1.2 miles north of the Site. The Little Italy reference area is bound to the north by West Lexington Street, to the east by South Ada Street, to the south by West Taylor

Street, and to the west by South Laflin Street (**Figure 1-1**).

WESTON START advanced soil borings to 24-inches bgs using a 2-, 3-, or 4-inch stainless steel soil auger. Two to five-point composite samples were collected from 0- to 2-, 0- to 6-, 6- to 12-, 12- to 18-, and 18- to 24-inch bgs depth intervals from either the front yard or backyard of residents in the Little Italy reference area. Composite samples were placed into disposable polyethylene bags and mixed. Samples were not collected from gardens, drip zone areas, or areas near painted surfaces. WESTON START described each soil sampling interval in accordance with the USCS. Soil descriptions were recorded in the Site logbook to create a detailed record of the lithology and potential contaminant characteristics of each sampling location. Documentation was recorded noting any fill materials, odors, discoloration, or staining suggesting potential contamination. The 0- to 2-, 0- to 6-, 6- to 12-, 12- to 18-, and 18- to 24-inch bgs intervals of each soil boring were then screened by the by WESTON START for total metals using EPA's Innov-X Alpha Series XRF analyzer. Sampled intervals were transferred directly into laboratory-provided glass sample jars and placed on ice. Any unused soil was returned to the location from which it was collected. All boring locations in residential locations were filled to the original grade with commercially available fill dirt, and then seeded with grass seed.

EPA and WESTON START collected 16 soil samples (14 investigative and two field duplicates) from 11 residential properties located within the Little Italy reference area (**Table 3-1, Figure 3-2**). The 0- to 6-inch bgs composite sample was submitted for analytical laboratory analysis at all locations. If XRF screening showed the 0- to 2-inch bgs composite sample was an order of magnitude different in lead concentration from the 0- to 6-inch bgs composite sample, both composites were submitted for analytical laboratory analysis. At approximately 30% of the locations, a composite sample was collected from below 6 inches bgs and submitted for analytical laboratory analysis. Submitted composite samples collected from below 6 inches bgs had a range (low, medium, and high) of XRF lead concentrations.

Soil samples were submitted under chain-of-custody to STAT Analysis Corporation in Chicago, IL, for the following analyses:

- Select total metals (antimony, copper, cadmium, chromium, mercury, lead, tin, and zinc).
- Total lead, fine-grained fraction (grain size < 250 µm).

4. ANALYTICAL RESULTS

4.1 ALLEY SAMPLING RESULTS

TCLP Metals (Toxicity)

TCLP metal analytical results were compared to the screening criteria in 40 CFR, Part 261, Subpart C 261.24 (b) to determine if the samples were considered hazardous. TCLP metals results from the four soil samples collected from the alley location are presented on **Table 4-1** and **Figures 4-1** and **4-2**, and are summarized as follows:

- Soil samples PA-AC03(0-6)-121912, PA-AC04(0-6)-121912, and PA-AY05(6-12)-121912 contained TCLP lead at concentrations of 12, 12, and 9.6 milligrams per liter (mg/L), respectively. These TCLP lead concentrations exceed the TCLP lead regulatory limit of 5.0 mg/L. According to 40 CFR Part 261, Subpart C, 261.24 (b), these samples represent materials that meet the definition of hazardous waste by virtue of the characteristic of toxicity.

Total Metals

Total metal analytical results were compared to the EPA RMLs for residential soil, HQ 3. Total metal results from the 23 soil samples collected from the alley location are presented on **Table 4-1**, in **Figures 4-1** and **4-2** (for contaminants of concern), and are summarized as follows:

- Antimony was detected in soil samples PA-AC03(0-6)-121912, PA-AC06(0-6)-121912, PA-AY04(6-12)-121912, PA-AY05(6-12)-121912, PA-AY09(12-24)-121912, and PA-AY13(12-24)-121912 at estimated concentrations ranging from 110 to 640 mg/kg. Antimony was detected in soil sample PA-AY07(12-24)-121912 at a concentration of 1,200 mg/kg. These concentrations exceed the RML for antimony of 94 mg/kg.
- Arsenic was detected in soil sample PA-AY05(6-12)-121912 at an estimated concentrations of 73 mg/kg, respectively. Arsenic was detected in PA-AY04(6-12)-121912 and PA-AY07(12-24)-121912 at concentrations ranging of 86 and 93 mg/kg, respectively. These concentrations exceed the RML for arsenic of 61mg/kg.
- Copper was detected in soil samples PA-AY05(6-12)-121912, PA-AY07(12-24)-121912, PA-AY18(6-12)-121912, and PA-AY19(12-24)-121912 at concentrations

- ranging from 12,000 to 33,000 mg/kg, exceeding the RML for copper of 9,400 mg/kg.
- Lead was detected in 21 of 23 soil samples (all samples except PA-AC09(0-6)-121912 and PA-AC10(0-6)-121912) in concentrations exceeding the RML for lead of 400 mg/kg. Total lead concentrations exceeding the RML ranged from 570 to 16,000 mg/kg.
 - Fine-grained lead was detected in 22 of 23 soil samples (all samples except PA-AC10(0-6)-121912) in concentrations exceeding the RML for lead of 400 mg/kg. Fine-grained lead concentrations exceeding the RML ranged from 1,000 to 9,300 mg/kg.

Lead Bioavailability

Lead bioavailability ranged from 30.2% to 99.5% in the 23 samples collected from the alley.

4.2 RAILROAD SPUR AREA SAMPLING RESULTS

TCLP Metals (Toxicity)

Soil samples PA-RR04,06(0-6)-050613, and PA-RR07,08(6-24)-050613 contained TCLP lead at concentrations of 12 and 13 mg/L, respectively. These TCLP lead concentrations exceed the TCLP lead regulatory limit of 5.0 mg/L. Therefore, according to 40 CFR Part 261, Subpart C, 261.24 (b), these samples represent materials that meet the definition of hazardous waste by virtue of the characteristic of toxicity.

Total Metals

Total metal analytical results were compared to the EPA RMLs for Residential Soil, HQ of 3. Total metal results from the 13 soil samples collected from the alley location are presented on **Table 4-2** and in **Figure 4-3** (for contaminants of concern), and are summarized as follows:

- Copper was detected in soil sample PA-RR04,06(0-6)-050613 at a concentration of 11,000 mg/kg, exceeding the RML for copper of 9,400 mg/kg.
- Lead was detected in 13 of 13 soil samples at concentrations exceeding the RML for lead of 400 mg/kg. Total lead concentrations ranged from 940 to 11,000 mg/kg.
- Fine-grained lead was detected in 13 of 13 soil samples in concentrations exceeding the RML for lead of 400 mg/kg. Total lead concentrations ranged from 900 to 23,000 mg/kg.

- Zinc was detected in soil sample PA-RR04,06(0-6)-050613 at a concentration of 78,000 mg/kg, exceeding the RML for zinc of 70,000 mg/kg.

Lead Bioavailability

Lead bioavailability was analyzed in soil sample PA-RR04,06(0-6)-050613, which contained 78.3% bioavailable lead.

4.3 LITTLE ITALY REFERENCE AREA RESULTS

Total Metals

Total metal analytical results were compared to the EPA RMLs for Residential Soil, HQ of 3. Total metal results from the 16 soil samples collected from the Little Italy reference location are presented on **Table 4-3** and in **Figure 4-4**, and are summarized as follows:

- Lead was detected in two of 16 soil samples at concentrations exceeding the RML for lead of 400 mg/kg. Total lead concentrations were 760 to 930 mg/kg in these two samples.
- Fine-grained lead was detected in three of 16 soil samples at concentrations exceeding the RML for lead of 400 mg/kg. Fine-grained lead concentrations ranged from 520 to 1,400 mg/kg among these samples.
- No other metals were detected in samples above EPA RMLs for Residential Soil, HQ of 3.

4.4 EPA FIELDS XRF QUALITY ASSURANCE ANALYSIS

EPA FIELDS and WESTON START used the EPA's Innov-X Delta and Alpha Series XRF devices in accordance with EPA standard operating procedure (SOP) 302A, "Standard Operating Procedure of Analysis of Metals in Soil using X-Ray Fluorescence." EPA FIELDS and WESTON START conducted an instrument standardization procedure each time the XRF device was activated to verify that the XRF device was operating and performing within manufacturer specifications. EPA FIELDS used simple linear regression and regression diagnostics to find the "best fitting" linear relationship between XRF measurements of lead concentrations in soil samples and their corresponding analytical laboratory concentrations using SAS[®] software. This relationship is quantified in a model (equation). The data included all field sampling events

conducted by EPA and WESTON START in 2012 and 2013, including those performed during the Pilsen downwind residential property site assessment presented in “Site Assessment Report for Pilsen Soil Site: Downwind Residential Area” (WESTON START March, 2014). The EPA FIELDS model equation shows a significant relationship between the lead XRF concentrations and its corresponding laboratory measurement ($P < 0.05$). The EPA FIELDS coefficient of determination (denoted by R^2) for the regression model was 0.92. The EPA FIELDS regression model did not violate the assumptions of no extreme residuals, normal distribution of residuals, and homoscedasticity of residuals. See **Appendix D** for more detail on the development and results of the EPA FIELDS regression model.

4.5 COMPARISON BETWEEN AREAS OF LEAD, FINE-GRAINED LEAD, ZINC, COPPER, TIN, AND CADMIUM CONCENTRATIONS

EPA FIELDS used SAS[®] statistical software to compare cadmium, copper, lead, fine-grained lead, tin, and zinc analytical laboratory concentrations between the Site, the Little Italy reference area, and City of Chicago background (USGS 2003). Of samples collected from the Site and the Little Italy reference area, only samples collected from the 0- to 6-inch bgs interval were used in these comparisons. Note that fine-grained lead samples collected by WESTON START were sieved using a 250 μm sieve and all samples collected by USGS (2003) were sieved using a 180 μm sieve. Data were not normally distributed (shown by the Shapiro-Wilk test for normality) and therefore were ranked to perform nonparametric analyses. SAS[®] statistical software was used to compare the areas using one-way analysis of variance (ANOVA) on the ranked data with the general linear models (GLM) procedure. The Type III Sums of Squares result was used since the areas had an unbalanced number of samples. The Least Squares Means Tukey-Kramer Multiple Comparisons test was used to determine differences between the areas. The Least Squares Means Tukey-Kramer Multiple Comparisons test was selected because it accommodates unequal sample sizes and is the most robust test for pairwise comparisons.

There was a significant difference between the three areas for cadmium, copper, lead, tin, and zinc ($p\text{-value} < 0.05$). **Appendix D** presents the methodology and boxplots for each metal for each area. The results of the Least Squares Means Tukey-Kramer Multiple Comparisons test are shown as follows:

Areas	Significant Difference (p-value < 0.05)					
	Cadmium	Copper	Lead	Fine-Grained Lead	Tin	Zinc
Site & Little Italy Reference Area	Yes	Yes	Yes	Yes	Yes	Yes
Site & City of Chicago Background	Yes	Yes	Yes	Yes	Yes	Yes
Little Italy Reference Area & City of Chicago Background	Yes	No	No	No	Yes	No

Comparison between the Site and the Little Italy Reference Area

Concentrations of cadmium, copper, lead, fine-grained lead, tin, and zinc in Site soil were significantly higher than the Little Italy reference area. These results may suggest the Little Italy reference area, which is located approximately 1.2 miles north of H. Kramer, has not been impacted by the same historic emitters of heavy metals, including H. Kramer. See **Appendix D** for more detail on the EPA FIELDS ANOVA analysis.

Comparison between the Site and the City of Chicago Background

Concentrations of cadmium, copper, lead, fine-grained lead, tin, and zinc concentrations in the Site soil were significantly higher than the City of Chicago background concentrations. These results may suggest the Site has been more impacted by historic emitters of heavy metals than the background soils in the City of Chicago. See **Appendix D** for more detail on the EPA FIELDS ANOVA analysis.

Comparison between the Little Italy Reference Area and the City of Chicago Background

Concentrations of cadmium and tin in the Little Italy reference area soil were significantly lower than the City of Chicago background concentrations. Concentrations of copper, lead, fine-grained lead, and zinc were not significantly different in the Little Italy reference area soil and the City of Chicago background concentrations. See **Appendix D** for more detail on the EPA FIELDS ANOVA analysis.

4.6 COMPARISON OF LEAD, ZINC, AND COPPER RELATIVE ABUNDANCES

EPA FIELDS qualitatively compared the relative abundances of lead, zinc, and copper between the Site, City of Chicago background (USGS 2003), Little Italy reference area, and two H.

Kramer baghouse samples. **Appendix D** presents a graphical depiction of the relative abundances of zinc, lead, and copper in samples collected from the City of Chicago background (USGS 2003), Little Italy reference area, Site, and H. Kramer baghouse. Two sets of H. Kramer baghouse results were analyzed. The first set of H. Kramer baghouse data were provided by H. Kramer's consultant Conestoga-Rovers & Associates and TRC Environmental Corporation (2005). The second set of H. Kramer baghouse data was provided by WESTON START, who submitted baghouse samples collected by the EPA Air and Radiation Division (ARD) to STAT Analysis Corporation in Chicago, IL on July 10, 2013 for total metals analysis.

Zinc, lead, and copper were present in the City of Chicago background samples at approximately 42, 42, and 16 %, respectively. Similarly, zinc, lead, and copper were present in Little Italy reference area samples at approximately 44, 47, and 9 %, respectively. A higher relative abundance of zinc and a lower relative abundance of lead were present in surface soil samples collected from the Site at approximately 66, 16, and 17 % zinc, lead, and copper, respectively. An even higher relative abundance of zinc and lower relative abundance of lead were present in H. Kramer baghouse samples at approximately 92, 7, and 1 % zinc, lead, and copper, respectively for samples analyzed by H. Kramer (2005) and 90, 5, and 5 % zinc, lead, and copper, respectively for baghouse samples analyzed by WESTON START. Based on the higher abundance of zinc (22-24 % higher) and lower relative abundance of lead (26-31 % lower) in Site soils compared to the City of Chicago background and the Little Italy reference area, the Site appears to have been impacted by a release of zinc. H. Kramer baghouse samples contained 90-92 % zinc and approximately 832,567 pounds of zinc have been released via fugitive and stack emissions since 1987 (EPA 2013a). While this analysis does not attribute a release of lead to H. Kramer, within the City of Chicago, detections of lead and zinc have been found to be highly correlated ($R^2 = 0.91$), suggesting that two elements have been added to soil largely from the same material or process rather than independently distributed constituents (USGS 2003).

5. SOIL LITHOLOGY

In general, soils on the alley and the railroad spur properties consisted of silty, sandy, and gravelly fill materials. Some to trace wood chips, cinders, and pieces of glass, brick, plastic, and

slag were observed in numerous borings across the property. In particular, slag was observed in soil borings advanced at the following locations: AY-01, AY-03, AY-07, AY-10, AY-11, AY-14, AY-17, AY-18, and RR-02. Slag is a solid-phase waste generated by secondary lead processing (EPA 1995). Soils in the Little Italy reference area consisted sandy and gravelly silts and clays. Little to trace fill materials including wood chips, cinders, and pieces of glass, plastic, brick were observed in soil at the following properties: 489, 491, 492, 493, 494, 500, and 501.

6. THREATS TO HUMAN HEALTH AND THE ENVIRONMENT

Factors to be considered in determining the appropriateness of a potential removal action at a Site are delineated in the NCP at 40 CFR 300.415(b)(2). A summary of the factors applicable to this Site is presented as follows:

- **Actual or potential exposure of nearby human populations, animals, or the food chain to hazardous substances, pollutants, or contaminants.**

Hazardous substances, pollutants, and contaminants were documented in surface and subsurface soil samples collected during the site assessment. Soil samples PA-AC03(0-6)-121912, PA-AC04(0-6)-121912, and PA-AY05(6-12)-121912 collected from the alley contained TCLP lead at concentrations of 12, 12, and 9.6 mg/L, respectively. Soil samples PA-RR04,06(0-6)-050613 and PA-RR07,08(6-24)-050613 contained TCLP lead at concentrations of 12 and 13 mg/L, respectively. These TCLP lead concentrations exceed the TCLP lead 40 CFR Part 261, Subpart C, 261.24 (b) regulatory limit of 5.0 mg/L, indicating these soils are hazardous for the characteristic of toxicity. In addition, antimony, arsenic, copper, lead, and zinc were detected in Site soil above EPA RMLs for residential soil, HQ 3.

Mercury was not detected above the EPA RML of 30 mg/kg in any sample collected from the Site. In addition, meteorological data collected from 1928 to 2013 suggests that the predominant wind direction in the Chicago, IL area is from the southwest. As a result, the Site may not be as heavily impacted by the Fisk Station, which has released 805 pounds of mercury into the air from stack emissions from 1998 to 2012 and is located southeast of the Site.

Analytical laboratory concentrations of cadmium, copper, lead, fine-grained lead, tin, and zinc in Site soil samples were significantly higher (p-value < 0.05) than in the samples collected from the Little Italy reference area and the City of Chicago background. These results suggest the Site has been more greatly impacted by historic emitters of heavy metals. In addition, based on the higher abundance of zinc (24-25 % higher) and lower relative abundance of lead (27-33 % lower) in Site soils compared to the City of Chicago background and the Little Italy reference area, the Site appears

to have been impacted by a release of zinc. The Site is located adjacent to H. Kramer, from which approximately 54,366 pounds of lead, 832,567 pounds of zinc, and 6,782 pounds copper have been released via fugitive and stack emissions since 1987 (EPA 2013a).

The Site is located in an industrial, commercial, and residential area of the Pilsen neighborhood in the City of Chicago. Two schools are located within a ¼-mile radius of the Site, Juarez and Perez. School children may use the Site as a walkway, commuting to and from Juarez. In 2010, approximately 40,983 people lived within 1 mile of the Site.

Potential migration pathways and exposure mechanisms include human and animal activities, surface drainage, and wind dispersion. Potential receptors include nearby residents and workers at the adjacent industrial and commercial businesses. Direct contact with hazardous substances is possible, and the close proximity of residential areas to the Site greatly increases the likelihood of exposure of human populations. Exposure could cause imminent endangerment of human health and the environment.

- **High levels of hazardous substances, pollutants, or contaminants in soils largely at or near the surface that may migrate.**

In general, Site soils consisted of silty, sandy, and gravelly fill materials. Some to trace wood chips, cinders, and pieces of glass, brick, plastic, and slag were observed in numerous borings across the Site. In particular, slag was observed in soil borings advanced at the following locations: AY-01, AY-03, AY-07, AY-10, AY-11, AY-14, AY-17, AY-18, and RR-02. Slag is a solid-phase waste generated by secondary lead processing (EPA 1995). H. Kramer owns and operates a secondary nonferrous metals facility manufacturing primarily brass and bronze ingots.

Site assessment analytical results document high levels of hazardous substances in soils at or near the surface. Surface soil samples PA-AC03(0-6)-121912, PA-AC04(0-6)-121912, and PA-RR04,06(0-6)-050613 were collected from 0 to 6 inches bgs and contained TCLP lead at concentrations exceeding TCLP lead 40 CFR Part 261, Subpart C, 261.24 (b) regulatory limit of 5.0 mg/L. In addition, arsenic, antimony, copper, lead, and zinc were detected in surface soil collected from 0 to 6 inches bgs above EPA RMLs for residential soil, HQ 3. Based on site assessment sampling results, the Site's unrestricted nature, and a lack of an impermeable barrier of the Site, hazardous substances in soils at or near the surface pose a threat of migration.

- **Weather conditions that may cause hazardous substances, pollutants, or contaminants to migrate or be released**

Cook County, IL, receives a substantial amount of precipitation, and temperatures are normally below freezing during the winter, with regular snowfall. In the winter, the average temperature is 25.1°F and the average daily minimum temperature is 17.3°F. In the summer, the average temperature is 71.7°F, and the average daily maximum temperature is 81.7°F. The average total annual precipitation is 38.65 inches and the

average seasonal snowfall is 32.6 inches. These weather conditions may cause water, wind, and freeze-thaw erosion of Site soils. Eroded soils may migrate via wind and/or surface water runoff to nearby residences or to the Chicago Shipping and Sanitary Canal to the south.

7. SUMMARY AND CONCLUSIONS

The EPA tasked WESTON START with evaluating the potential impacts of possible aerial deposition of heavy metals from historic industrial activity in the vicinity of the Site. The Site is an alley (owned by the City of Chicago) and railroad spur (owned by BSNF railway) located adjacent to H. Kramer in an industrial, commercial, and residential area of the Pilsen neighborhood in the City of Chicago. Two schools are located within a ¼-mile radius of the Site, Juarez and Perez. School children may use the Site as a walkway, commuting to and from Juarez. In 2010, approximately 40,983 people lived within 1 mile of the Site.

On December 19, 2012, the EPA and WESTON START advanced 20 soil borings and submitted 23 samples for analytical laboratory analysis from the alley, located adjacent to the H. Kramer facility to the south. Three samples contained TCLP lead concentrations that exceeded the TCLP lead regulatory limits. Therefore, these samples represent materials that meet the definition of hazardous waste by virtue of the characteristic of toxicity. Antimony, arsenic, copper, lead, and fine-grained lead were detected at concentrations above EPA RMLs for residential soil, HQ 3.

On May 6, 2013, EPA and WESTON START advanced 16 soil borings and submitted 13 samples for analytical laboratory analysis from the railroad spur, located west and south of the H. Kramer property. Two samples contained TCLP lead concentrations that exceeded the TCLP lead regulatory limits. Therefore, these samples represent materials that meet the definition of hazardous waste by virtue of the characteristic of toxicity. Copper, lead, fine-grained lead, and zinc were detected in concentrations were detected in concentrations above EPA RMLs for residential soil, HQ 3.

Site soils generally consisted of silty, sandy, and gravelly fill materials. Some to trace wood chips, cinders, and pieces of glass, brick, plastic, and slag were observed in numerous borings across the Site. In particular, slag was observed in soil borings advanced at the following

locations: AY-01, AY-03, AY-07, AY-10, AY-11, AY-14, AY-17, AY-18, and RR-02. Slag is a solid-phase waste generated by secondary lead processing (EPA 1995). H. Kramer owns and operates a secondary nonferrous metals facility manufacturing primarily brass and bronze ingots.

In August 2013, EPA and WESTON START conducted a field sampling event in the Little Italy reference area. Data collected from this area served as a reference for soil suspected to be less impacted by heavy metal emitters such as H. Kramer and the Fisk Generating Station. Within the Little Italy reference area, lead was detected in two of 16 soil samples in concentrations exceeding the EPA RMLs for residential soil, HQ 3, for lead of 400 mg/kg. Total lead concentrations were 760 and 930 mg/kg among these two samples. Fine-grained lead was detected in three of 16 soil samples at concentrations exceeding the RML for lead of 400 mg/kg. Fine-grained lead concentrations ranged from 520 to 1,400 mg/kg among these samples.

EPA FIELDS used SAS[®] statistical software to compare analytical laboratory concentrations of cadmium, copper, lead, fine-grained lead, tin, and zinc from samples collected from 0 to 6 inches bgs at the Site, the Little Italy reference area, and the City of Chicago background (USGS 2003). Analytical laboratory concentrations of cadmium, copper, lead, fine-grained lead, tin, and zinc in Site soil samples were significantly higher (p -value < 0.05) than in the samples collected from the Little Italy reference area and the City of Chicago background. These results may suggest the Little Italy reference area, which is located approximately 1.2 miles north of H. Kramer, and the City of Chicago background, have not been impacted to the same degree by emitters of heavy metals, including H. Kramer. EPA FIELDS also compared the relative abundances of lead, zinc, and copper between the Site, City of Chicago background, Little Italy reference area, and two H. Kramer baghouse datasets. Based on the higher relative abundance of zinc (24-25 % higher) and lower relative abundance of lead (27-33 % lower) in Site soils compared to the City of Chicago background and the Little Italy reference area, the Site appears to have been impacted by a release of zinc. While this analysis does not attribute a release of lead to H. Kramer, within the City of Chicago, detections of lead and zinc have been found to be highly correlated ($R^2 = 0.91$), suggesting that two elements have been added to soil largely from the same material or process rather than independently distributed constituents (USGS 2003).

Based on the presence of slag in Site soil borings, analytical laboratory results for Site soil samples, and EPA FIELDS comparisons to the Little Italy reference area and City of Chicago background (USGS 2003), the Site appears to have been impacted by an industrial release of cadmium, copper, tin, zinc, and lead. H. Kramer is immediately adjacent to the Site. H. Kramer has released approximately 54,366 pounds of lead, 832,567 pounds of zinc, and 6,782 pounds copper via fugitive and stack emissions since 1987 (EPA 2013a). The close proximity of the Site to H. Kramer may explain the higher surface soil metal concentrations.

Mercury was not detected above the EPA RML of 30 mg/kg in any sample collected from the Site. In addition, meteorological data collected from 1928 to 2013 suggests that the predominant wind direction in the Chicago, Illinois area is from the southwest. As a result, the Site may not have been as heavily impacted by the Fisk Station, which has released 805 pounds of mercury into the air from stack emissions from 1998 to 2012, and is located in predominantly crosswind direction southeast of the Site.

2011 and 2012 investigations conducted by NEIC also support the position that H. Kramer and not the Fisk Station contributed to a higher degree to heavy metal contamination at the Site. On August 21, 2011, NEIC submitted a report to EPA Region 5 presenting analytical results of filters containing the highest and lowest concentrations of lead collected at the Perez air monitoring site from January 2010 to January 2011, as well as baghouse dust samples collected at H. Kramer (EPA NEIC 2011). Analytical results indicated cadmium, copper, tin, and zinc were co-contaminants of the lead-bearing particulate matter collected on the TSP filters. These co-contaminants are metals used in alloys produced at H. Kramer and were also found in similar proportions in H. Kramer baghouse dust samples. Lead-bearing, μm -sized (1–10 μm) aggregates of zinc-oxide crystallites were common in ambient air in the Pilsen neighborhood on at least six days in 2010, and were similar to the predominant baghouse dust particles from H. Kramer. The report concluded that H. Kramer's furnaces were likely the primary source of lead-bearing airborne particulate matter in the Pilsen neighborhood based on the location of its facility, wind direction, and analytical results of TSP filters and baghouse dust from its facility. However, the Fisk Station could not be excluded as a possible contributing source of lead contamination at the

Perez air monitoring site because particulate matter similar to coal fly ash was observed on the filters collected from Perez. On August 24, 2012, NEIC submitted a second report to EPA Region 5 presenting additional analytical results of lead-bearing particulate matter on TSP filters from the Juarez and Perez air monitoring stations and in coal and fly ash collected from the Fisk Station and Midwest Generation's Crawford Station, in addition to any contribution from H. Kramer. The three key main findings from these analyses are summarized as follows: 1) H. Kramer was indicated as the major contributor of airborne lead-bearing particulate matter in the Pilsen neighborhood, both during and outside the NAAQS exceedance period of October 2010 to February 2011; 2) the Fisk Station released particles consistent with coal fly ash in the Pilsen neighborhood; and 3) Fisk Station contributed insignificant quantities of lead-bearing particulate matter relative to H. Kramer during (and outside) the NAAQS exceedance period of October 2010 to February 2011.

Based on the Site's unrestricted nature and a lack of an impermeable barrier, hazardous substances in soils at or near the surface pose a threat of migration. Potential migration pathways and exposure mechanisms include human and animal activities, surface drainage, and wind dispersion. Potential receptors include nearby residents and workers at the adjacent industrial and commercial businesses. Direct contact with hazardous substances is possible, and the close proximity of residential areas to the Site greatly increases the likelihood of exposure of human populations. Exposure could cause imminent endangerment of human health and the environment.

APPENDIX C
LABORATORY ANALYTICAL REPORTS
AND DATA VALIDATION REPORTS

**PILSEN AREA SOIL SITE
CHICAGO, ILLINOIS
DATA VALIDATION REPORT**

Date: January 14, 2013

Laboratory: STAT Analysis Corporation (STAT), Chicago, Illinois

Laboratory Project #: 12120653

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON®) Superfund Technical Assessment and Response Team (START)

WESTON Work Order #: 20405.012.001.2038.00

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for 23 soil samples collected for the Pilsen Area Soil Site that were analyzed for the following parameters and U.S. Environmental Protection Agency (U.S. EPA) methods:

- Total Metals by SW-846 Methods 6020 and 7471A
- Coarse and Fine Grained Lead by SW-846 Method 6020
- Lead Bioaccessibility Assay by Method 9200 and SW-846 Method 6020
- Toxicity Characteristic Leaching Procedure (TCLP) Metals by SW-846 Methods 1311, 6020, and 7470A
- pH by SW-846 Method 9045C
- Percent Moisture by ASTM D2974

A level II data package was requested from STAT. The data validation was conducted in general accordance with the U.S. EPA “Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review” dated January 2010. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

TOTAL METALS BY U.S. EPA SW-846 METHODS 6020 AND 7471A

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
PA-AC05(0-6)-121912	12120653-001	Soil	12/19/2012	12/28/2012 – 1/2/2013
PA-AC06(0-6)-121912	12120653-002	Soil	12/19/2012	12/28/2012 – 12/31/2012
PA-AY09(12-24)-121912	12120653-003	Soil	12/19/2012	12/29/2012 – 1/8/2013
PA-AY12(6-12)-121912	12120653-004	Soil	12/19/2012	12/29/2012 – 1/8/2013

PA-AC03(0-6)-121912	12120653-021	Soil	12/19/2012	12/29/2012 – 1/8/2013
PA-AC04(0-6)-121912	12120653-022	Soil	12/19/2012	12/28/2012 – 12/31/2012
PA-AC03HS(0-6)-121912	12120653-023	Soil	12/19/2012	12/28/2012 – 12/31/2012

2. Holding Times

The samples were analyzed within the required holding time limit of 28 days from sample collection to analysis for mercury and 180 days from sample collection to analysis for all other metals.

3. Blank Results

Method blanks were analyzed with the metals analyses. There was some minor contamination below the reporting limits and one detection above the reporting limit in the blanks. However, the sample results were much greater than the blank concentrations and no qualifications were required.

4. Laboratory Control Sample (LCS) Results

The LCS recoveries were within the quality control (QC) limits except for as follows. Tin and antimony were detected high in one or more of the LCSs analyzed. Detected tin and antimony results in the samples that correspond with the LCSs outside QC limits were flagged “J” as estimated.

5. **Matrix Spike (MS) and MS Duplicate (MSD) Results**

STAT analyzed site specific MS/MSD samples. The percent recoveries and relative percent differences (RPD) were within QC limits except for as follows.

In some instances, the recoveries were poor due to the spike amount being much lower than the sample concentrations. No qualifications are required in these instances.

In the spike of sample PA-AY05(6-12)-121912, the following compounds were detected high: arsenic and chromium. In sample PA-AY05(6-12)-121912, detected results for arsenic and chromium were flagged “J” as estimated due to potential matrix interference.

In the spike of sample PA-AC03(0-6)-121912, the following compounds were detected high: arsenic and silver. In sample PA-AC03(0-6)-121912, detected results for arsenic and selenium were flagged “J” as estimated due to potential matrix interference.

6. **Field Duplicate Results**

There are two field duplicates identified with a “D” suffix in the sample identification. RPDs were calculated for detected metals. The RPDs ranged from 0 to 67 percent. Only one RPD was above a standard QC limit of 50 for chromium in sample PA-AC02(0-6)-121912D. In general, field duplicate results were acceptable and there was little heterogeneity associated with metals, other than chromium.

7. **Overall Assessment**

The metals data are acceptable for use as qualified based on the information received.

COARSE AND FINE GRAINED LEAD BY U.S. EPA SW-846 METHOD 6020 AND LEAD BIOACCESSIBILITY ASSAY BY METHODS 9200 AND 6020

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed

PA-AC04(0-6)-121912	12120653-022	Soil	12/19/2012	1/3/2013
PA-AC03HS(0-6)-121912	12120653-023	Soil	12/19/2012	1/3/2013

2. Holding Times

The samples were analyzed within the required holding time limit of 180 days from sample collection to analysis.

3. Blank Results

Method blanks were analyzed with the metals analyses. The blanks were free of lead contamination above the reporting limits. There were some detections of lead below the reporting limits; however, the sample results were much greater and no qualifications were required.

4. LCS Results

The LCS recoveries were within the QC limits.

5. MS and MSD Results

EA Group analyzed site specific MS/MSDs; however, the recoveries were poor due to the spike amount being much lower than the sample concentrations. No qualifications are required in these instances.

6. Field Duplicate Results

There are two field duplicates identified with a "D" suffix in the sample identification. RPDs were calculated for detected metals. The RPDs ranged from 0 to 84 percent. Only one RPD was above a standard QC limit of 50 for coarse lead in sample PA-AC02(0-6)-121912D. In general, field duplicate results were acceptable and there was little heterogeneity associated with metals, other than coarse lead in sample PA-AC02(0-6)-121912 and its duplicate.

7. Overall Assessment

The lead data are acceptable for use as qualified based on the information received.

TCLP METALS BY U.S. EPA SW-846 METHODS 1311, 6020, AND 7470A

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
PA-AY05(6-12)-121912	12120653-019	Soil	12/19/2012	12/31/2012 – 1/2/2013
PA-AC03(0-6)-121912	12120653-021	Soil	12/19/2012	12/31/2012 – 1/2/2013
PA-AC04(0-6)-121912	12120653-022	Soil	12/19/2012	12/31/2012 – 1/2/2013
PA-AC03HS(0-6)-121912	12120653-023	Soil	12/19/2012	12/31/2012 – 1/2/2013

2. Holding Times

The samples were analyzed within the required holding time limit of 28 days from sample collection to analysis for mercury and 180 days from sample collection to analysis for all other metals.

3. Blank Results

Method blanks were analyzed with the metals analyses. The blanks were free of lead contamination above the reporting limits. Some metals were detected below the reporting limit; however, the sample results were much greater or non-detect and no qualifications were applied.

4. LCS Results

The LCS recoveries were within the QC limits.

5. MS and MSD Results

STAT analyzed a site specific MS and MSD. The percent recoveries and RPDs were within QC limits except for as follows. Lead had poor recovery; however, the recoveries were poor due to the spike amount being much lower than the sample concentrations. No qualifications are required in this instance.

6. Overall Assessment

The TCLP metals data are acceptable for use based on the information received.

GENERAL CHEMISTRY PARAMETERS (pH by SW-846 Method 9045D and Percent Moisture by ASTM D2974)

1. Samples

PA-AY04(6-12)-121912	12120653-015	Soil	12/19/2012	12/28/2012 – 12/29/2012
PA-AY16(12-24)-121912	12120653-016	Soil	12/19/2012	12/28/2012 – 12/29/2012
PA-AY18(6-12)-121912	12120653-017	Soil	12/19/2012	12/28/2012 – 12/29/2012
PA-AY19(12-24)-121912	12120653-018	Soil	12/19/2012	12/28/2012 – 12/29/2012
PA-AY05(6-12)-121912	12120653-019	Soil	12/19/2012	12/28/2012 – 12/29/2012
PA-AY07(12-24)-121912	12120653-020	Soil	12/19/2012	12/28/2012 – 12/29/2012
PA-AC03(0-6)-121912	12120653-021	Soil	12/19/2012	12/28/2012 – 12/29/2012
PA-AC04(0-6)-121912	12120653-022	Soil	12/19/2012	12/28/2012 – 12/29/2012
PA-AC03HS(0-6)-121912	12120653-023	Soil	12/19/2012	12/28/2012 – 12/29/2012

2. Holding Times

The holding times were acceptable.

3. Blank Results

Method blanks were analyzed with the moisture analyses. The blanks were free of target analyte contamination above the reporting limits.

4. LCS Results

An LCS was analyzed with the moisture analyses. The LCS recovery was within the laboratory-established QC limits.

5. Laboratory Duplicate Results

Laboratory duplicates were analyzed with the moisture and pH analyses. The RPDs were within the QC limits.

6. Field Duplicate Results

The RPDs for field duplicate result was less than a standard QC limit of 50 percent which is acceptable.

7. Overall Assessment

The general chemistry parameters are acceptable for use based on the information received.

**PILSEN AREA SOIL SITE
CHICAGO, ILLINOIS
DATA VALIDATION REPORT**

Date: May 28, 2013

Laboratory: STAT Analysis Corporation (STAT), Chicago, Illinois

Laboratory Project #: 13050282

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON®) Superfund Technical Assessment and Response Team (START)

Analytical TDD and Work Order #: S05-0001-1211-003/20405.016.001.2038.00

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for 33 soil samples collected for the Pilsen Area Soil Site that were analyzed for the following parameters and U.S. Environmental Protection Agency methods:

- Total Metals by SW-846 Methods 6020 and 7471A
- Fine Grained Lead by SW-846 Method 6020
- Bioavailability Lead by EPA Method 9200 and SW-846 Method 6020
- Toxicity Characteristic Leaching Procedure (TCLP) Lead by SW-846 Methods 1311 and 6020
- pH by SW-846 Method 9045C
- Moisture Content by ASTM D2974

A level II data package was requested from STAT. The data validation was conducted in general accordance with the EPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review" dated January 2010. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

**TOTAL METALS AND FINE GRAINED LEAD BY EPA SW-846 METHODS 6020 AND 7471A
AND BIOAVAILABLE LEAD BY EPA METHOD 9200 AND SW-846 METHOD 6020**

1. Samples

Attachment A summarizes the samples for which this data validation is being conducted. It includes but the laboratory sample identification, the WESTON START sample identification, and the date and time of sample collection.

2. Holding Times

The samples were analyzed within the required holding time limit of 28 days for mercury and 180 days from sample collection to analysis for all other metals.

3. **Blank Results**

Method blanks were analyzed with the metals analyses. The blanks contained no metals contamination above the reporting limits. There were detections of some metals below the reporting limits in the blanks. However, the sample results were much greater or contained no detections of these metals. No qualifications were required.

4. **Laboratory Control Sample (LCS) Results**

The LCS recoveries were within the quality control (QC) limits except for as follows.

In one LCS, antimony was detected high. Detected antimony results associated with this LCS were flagged “J” as estimated.

5. **Matrix Spike (MS) and MS Duplicate (MSD) Results**

STAT analyzed several site-specific MS/MSDs. The percent recoveries and relative percent differences (RPD) were within QC limits except for as follows.

In many instances of QC limits not being met, the sample concentration was more than four times the spike amount. In these instances, no qualifications were required.

In the MS and MSD of sample PA-RR14,15,16(0-6)-050613, the antimony recovery was low. The antimony result in this sample was flagged “J” as estimated.

In the MS and MSD of sample PA-351-01(0-6)-050713, the copper recovery was high and the antimony recovery was low. The copper result in this sample was flagged “J” and the quantitation limit for antimony was flagged “UJ” as estimated.

6. **Field Duplicate Results**

There are two field duplicate samples associated with this work order that are identified by a “D” suffix in the sample name.

The field duplicate results were evaluated by calculating the RPDs between the investigative and field duplicate sample results. There is no established QC limit for RPD for field duplicates; however, 50 RPD is generally used for evaluation. The RPDs for detected metals were below 50 which is acceptable.

7. **Overall Assessment**

The metals data are acceptable for use as qualified based on the information received.

TCLP METALS BY EPA SW-846 METHODS 1311 AND 6020

1. Samples

Attachment A summarizes the samples for which this data validation is being conducted. It includes but the laboratory sample identification, the WESTON START sample identification, and the date and time of sample collection.

2. Holding Times

The samples were analyzed within the required holding time limit of 180 days from sample collection.

3. Blank Results

Method blanks were analyzed with the metals analyses. Some of the blanks contained some minor lead contamination. However, the TCLP lead results were much greater than the blank results and no qualifications were required.

4. LCS Results

The LCS recoveries were within the QC limits.

5. MS and MSD Results

STAT analyzed two site-specific MS/MSD samples. The percent recoveries and RPDs were within QC limits except for as follows.

6. Field Duplicate Results

There are two field duplicate samples associated with this work order that are identified by a "D" suffix in the sample name.

The field duplicate results were evaluated by calculating the RPDs between the investigative and field duplicate sample results. There is no established QC limit for RPD for field duplicates; however, 50 RPD is generally used for evaluation. The RPD for one of the field duplicates was below 50 which is acceptable. The RPD for field duplicate PA-RR01,02(6-24)050613D had a high RPD of 134 indicating sample heterogeneity associated with TCLP lead in this sample.

7. **Overall Assessment**

The TCLP lead data are acceptable for use as qualified based on the information received.

GENERAL CHEMISTRY PARAMETERS (pH by SW-846 Method 9045C and Moisture Content by ASTM D2974)

1. **Samples**

Attachment A summarizes the samples for which this data validation is being conducted. It includes but not limited to the laboratory sample identification, the WESTON START sample identification, and the date and time of sample collection.

2. **Holding Times**

The holding time for pH is “as soon as possible” and the holding time for moisture is 28 days. The holding time for moisture was met. For pH, the samples were analyzed approximately 6- 7 days from sample collection. No qualifications were applied.

3. **Blank Results**

Method blanks were analyzed with the moisture analyses and were all non-detect for moisture which is acceptable.

4. **LCS Results**

LCSs were analyzed with the moisture analyses. The LCS recoveries were within the QC limits.

5. **Laboratory Duplicates**

Laboratory duplicates were analyzed with the pH and moisture analyses. The RPDs were within QC limits.

6. **Field Duplicate Results**

There are two field duplicate samples associated with this work order that are identified by a “D” suffix in the sample name.

The field duplicate results were evaluated by calculating the RPDs between the investigative and field duplicate sample results. The RPDs were below 50 which is acceptable.

Data Validation Report
Pilsen Area Soil Site
STAT Analysis Corporation
Laboratory Project #: 13050282

7. **Overall Assessment**

The pH and moisture data are acceptable for use as qualified based on the information received.

**PILSEN AREA SOIL SITE
CHICAGO, ILLINOIS
DATA VALIDATION REPORT**

Date: July 31, 2013

Laboratory: STAT Analysis Corporation (STAT), Chicago, Illinois

Laboratory Project #: 13070526

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON®) Superfund Technical Assessment and Response Team (START)

Analytical TDD and Work Order #: S05-0001-1211-003/20405.016.001.2038.00

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for 5 solid samples collected for the Pilsen Area Soil Site. The samples are source samples from a baghouse and have been held under custody by NEIC/USGS/EPA since collection in Colorado. The chain-of-custody for the samples state that the samples are less than 75 microns in particle size. The samples were analyzed for the following parameters and U.S. Environmental Protection Agency methods:

- Total Metals by SW-846 Methods 6020 and 7471A
- Moisture Content by ASTM D2974

A level II data package was requested from STAT. The data validation was conducted in general accordance with the EPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review" dated January 2010. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

TOTAL METALS BY EPA SW-846 METHODS 6020 AND 7471A

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
BH-1 N105006-05 Split B	13070526-001	Solid	Unknown	7/17/2013
BH-2 N105006-06 Split B	13070526-002	Solid	Unknown	7/17/2013
BH-4 N105006-08 Split B	13070526-003	Solid	Unknown	7/17/2013
BH-4 N105006-09 Split B	13070526-004	Solid	Unknown	7/17/2013
BH-5 N105006-07 Split B	13070526-005	Solid	Unknown	7/17/2013

2. Holding Times

The collection dates of the samples are unknown. However, the holding times for metals are 28 days for mercury and 180 days from sample collection to analysis for all other metals. Due to the long holding times for these analyses, it is assumed that they were likely not exceeded and no qualifications are necessary.

3. Blank Results

Method blanks were analyzed with the metals analyses. The blanks contained no metals contamination above the reporting limits. There were detections of lead, tin, and mercury below the reporting limits in the blanks. However, the sample results were much greater or contained no detections of these metals. No qualifications were required.

4. Laboratory Control Sample (LCS) Results

The LCS recoveries were within the quality control (QC) limits.

5. Matrix Spike (MS) and MS Duplicate (MSD) Results

STAT did not analyze a site-specific MS/MSD. Therefore matrix interferences could not be evaluated. No qualifications were applied.

6. Overall Assessment

The metals data are acceptable for use as qualified based on the information received.

GENERAL CHEMISTRY PARAMETERS (Moisture Content by ASTM D2974)

1. Samples

The following table summarizes the samples for which this data validation is being conducted.

Samples	Lab ID	Matrix	Date Collected	Date Analyzed
BH-1 N105006-05 Split B	13070526-001	Solid	Unknown	7/15/2013
BH-2 N105006-06 Split B	13070526-002	Solid	Unknown	7/15/2013
BH-4 N105006-08 Split B	13070526-003	Solid	Unknown	7/15/2013
BH-4 N105006-09 Split B	13070526-004	Solid	Unknown	7/15/2013
BH-5 N105006-07 Split B	13070526-005	Solid	Unknown	7/15/2013

2. Holding Times

The holding time for moisture is 28 days. The collection dates of the samples are unknown. Due to the long holding time for this analysis, it is assumed that they were likely not exceeded and no qualifications are necessary.

3. Blank Results

The method blank was non-detect for moisture which is acceptable.

4. LCS Results

The LCS recoveries were within the QC limits.

5. Laboratory Duplicates

The RPD was within QC limits for the laboratory duplicate.

6. Overall Assessment

The moisture data are acceptable for use based on the information received.

RE: VP1049, Pilsen Superfund

STAT Project No 13070526

Dear Tonya Balla:

STAT Analysis received 5 samples for the referenced project on 7/10/2013 9:37:00 AM. The analytical results are presented in the following report.

All analyses were performed in accordance with the requirements of 35 IAC Part 186 / NELAC standards. Analyses were performed in accordance with methods as referenced on the analytical report. Those analytical results expressed on a dry weight basis are also noted on the analytical report.

All analyses were performed within established holding time criteria, and all Quality Control criteria met EPA or laboratory specifications except when noted in the Case Narrative or Analytical Report. If required, an estimate of uncertainty for the analyses can be provided. A listing of accredited methods/parameters can also be provided.

Thank you for the opportunity to serve you and I look forward to working with you in the future. If you have any questions regarding the enclosed materials, please contact me at (312) 733-0551.

Sincerely,

Thomas M. Bauer
General Manager

The information contained in this report and any attachments is confidential information intended only for the use of the individual or entities named above. The results of this report relate only to the samples tested. If you have received this report in error, please notify us immediately by phone. This report shall not be reproduced, except in its entirety, unless written approval has been obtained from the laboratory. This analytical report shall become property of the Customer upon payment in full. Otherwise, STAT will be under no obligation to support, defend or discuss the analytical report.

**PILSEN AREA SOIL SITE
CHICAGO, ILLINOIS
DATA VALIDATION REPORT**

Date: September 4, 2013

Laboratory: STAT Analysis Corporation (STAT), Chicago, Illinois

Laboratory Project #: 13080639

Data Validation Performed By: Lisa Graczyk, Weston Solutions, Inc. (WESTON®) Superfund Technical Assessment and Response Team (START)

Analytical TDD and Work Order #: S05-0001-1211-003/20405.016.001.2038.00

This data validation report has been prepared by WESTON START under the START III Region V contract. This report documents the data validation for 43 soil samples collected for the Pilsen Area Soil Site that were analyzed for the following parameters and U.S. Environmental Protection Agency methods:

- Total Metals by SW-846 Methods 6020 and 7471A
- Fine Grained Lead by SW-846 Method 6020
- Moisture Content by ASTM D2974

A level II data package was requested from STAT. The data validation was conducted in general accordance with the EPA "Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review" dated January 2010. The Attachment contains the results summary sheets with the hand-written qualifiers applied during data validation.

TOTAL METALS AND FINE GRAINED LEAD BY EPA SW-846 METHODS 6020 AND 7471A

1. Samples

Attachment A summarizes the samples for which this data validation is being conducted. It includes the laboratory sample identification, the WESTON START sample identification, and the date and time of sample collection.

2. Holding Times

The samples were analyzed within the required holding time limit of 28 days for mercury and 180 days from sample collection to analysis for all other metals.

3. **Blank Results**

Method blanks were analyzed with the metals analyses. The blanks contained no metals contamination above the reporting limits. There were detections of metals below the reporting limits in the blanks. However, the sample results were much greater or contained no detections of these metals. No qualifications were required.

4. **Laboratory Control Sample (LCS) Results**

The LCS recoveries were within the quality control (QC) limits except for as follows.

In one LCS, antimony was detected high. Detected antimony results were flagged “J” as estimated.

5. **Matrix Spike (MS) and MS Duplicate (MSD) Results**

STAT analyzed several site-specific MS/MSDs. The percent recoveries and relative percent differences (RPD) were within QC limits except for as follows.

In many instances of QC limits not being met, the sample concentration was more than four times the spike amount. In these instances, no qualifications were required.

In the MS and/or MSD of sample PA-499-01(0-6)-081413, antimony, tin, and mercury had low recoveries. In this sample, the mercury and tin results were flagged “J” and the quantitation limit for antimony was flagged “UJ” as estimated due to potential matrix interference.

In the MS and MSD of sample PA-515-01(0-6)-081613, antimony and mercury had low recoveries and tin had a high recovery. In this sample, the antimony, mercury and tin results were flagged “J” as estimated due to potential matrix interference.

In the MS and MSD of sample PA-516-01(6-18)-081613, antimony had a low recovery and tin had a high recovery. In this sample, the quantitation limit for antimony was flagged “UJ” as estimated due to potential matrix interference. Note that tin did not required qualification because it was not detected in the sample and the high MS/MSD recoveries indicate a high bias.

6. **Field Duplicate Results**

There are five field duplicate samples associated with this work order that is identified by a “D” suffix in the sample name.

The field duplicate results were evaluated by calculating the RPDs between the investigative and field duplicate sample results. There is no established QC limit for RPD for field duplicates;

however, 50 RPD is generally used for evaluation. Most of the RPDs for detected metals were below 50 which is acceptable.

There were only two instances where the RPD exceeded 50; chromium in sample PA-491-01(6-18)-081213D and mercury in sample PA-516-01(0-6)-081613D. These two discrepancies are minor and in general the field duplicate results agreed well with the investigative sample results.

7. **Overall Assessment**

The metals data are acceptable for use as qualified based on the information received.

GENERAL CHEMISTRY PARAMETER (Moisture Content by ASTM D2974)

1. **Samples**

Attachment A summarizes the samples for which this data validation is being conducted. It includes the laboratory sample identification, the WESTON START sample identification, and the date and time of sample collection.

2. **Holding Times**

The holding time for moisture is 28 days. The holding time for moisture was met.

3. **Blank Results**

Method blanks were analyzed with the moisture analyses and were all non-detect for moisture which is acceptable.

4. **LCS Results**

LCSs were analyzed with the moisture analyses. The LCS recoveries were within the QC limits.

5. **Laboratory Duplicates**

Laboratory duplicates were analyzed with the moisture analyses. The RPDs were within QC limits.

6. **Field Duplicate Results**

There are five field duplicate samples associated with this work order that are identified by a "D" suffix in the sample name.

Data Validation Report
Pilsen Area Soil Site
STAT Analysis Corporation
Laboratory Project #: 13070839

The field duplicate results were evaluated by calculating the RPDs between the investigative and field duplicate sample results. The RPDs were below 50 which is acceptable.

7. Overall Assessment

The moisture data are acceptable for use based on the information received.

RE: Pilsen Soil Site, Pilsen, Chicago, IL

STAT Project No: 13080639

Dear Tonya Balla:

STAT Analysis received 43 samples for the referenced project on 8/16/2013 4:42:00 PM. The analytical results are presented in the following report.

All analyses were performed in accordance with the requirements of 35 IAC Part 186 / NELAC standards. Analyses were performed in accordance with methods as referenced on the analytical report. Those analytical results expressed on a dry weight basis are also noted on the analytical report.

All analyses were performed within established holding time criteria, and all Quality Control criteria met EPA or laboratory specifications except when noted in the Case Narrative or Analytical Report. If required, an estimate of uncertainty for the analyses can be provided. A listing of accredited methods/parameters can also be provided.

Thank you for the opportunity to serve you and I look forward to working with you in the future. If you have any questions regarding the enclosed materials, please contact me at (312) 733-0551.

Sincerely,

Catia Giannini
Project Manager

The information contained in this report and any attachments is confidential information intended only for the use of the individual or entities named above. The results of this report relate only to the samples tested. If you have received this report in error, please notify us immediately by phone. This report shall not be reproduced, except in its entirety, unless written approval has been obtained from the laboratory. This analytical report shall become property of the Customer upon payment in full. Otherwise, STAT will be under no obligation to support, defend or discuss the analytical report.

Lab Order: 13080639

CASE NARRATIVE

Sample report lists:

Fraction A: Results on "as received" basis that the results are corrected for percent moisture.

Fraction B: Fine Grained (less than 250 μm sieve size)

The soils were air dried and sieved for particle size.

The total metals Matrix Spike/Matrix Spike Duplicate (MS/MSD) prepared from sample PA-515-01(0-6)-081613 (13080639-040) (Prep Batch 71453) had recoveries outside control limits. The sample, MS and MSD were redigested in batch 71524. Results are still outside control limits and reported from batch 71524.

Please refer to Analytical QC Summary Report for other QC outliers.

APPENDIX D
EPA FIELDS SUPPLEMENTAL DATA ANALYSIS

Pilsen-Kramer Site
Comparison of Abundance of Metals
Bar Graph

Linda Jacobson, Research Associate
John Canar, Environmental Scientist

24 February 2014

Introduction

Soil samples were collected near the H. Kramer site and surrounding areas by the USGS; the EPA; and Conestoga-Rovers & Associates (CRA) and TRC Environmental Corporation (TRC). The USGS samples were taken in the surrounding area. The EPA samples were taken in 2012 and 2013 and were subset into Little Italy and Railroad/Alley. The samples taken by CRA and TRC were taken at the H. Kramer baghouse and are detailed in the 2005 report (Report to Illinois EPA Regarding Soil Sampling at H. Kramer Co., Inc. and Vicinity.pdf). The EPA also collected samples at the H. Kramer baghouse in 2013. Zinc, Lead, and Copper from these sampling events were compared in this bar graph.

Methods and Analysis

The bar graph (below) shows the percent of Zinc, Lead, and Copper for the samples collected by the USGS in the Chicago area, the samples collected by the EPA in the Little Italy area from 0 to 6 inches, the samples collected by the EPA in the Railroad/Alley area from 0 to 6 inches, the samples taken by the EPA in the H. Kramer baghouse, and the samples taken by CRA and TRC in the H. Kramer baghouse. The percents of metals for the USGS Chicago area samples and the H. Kramer baghouse samples taken by CRA and TRC are from the “Comparison of Abundance of Metals” graph in the 2005 report. For the EPA samples taken in the Little Italy area, the percent of Zinc was obtained by dividing the sum of the Zinc laboratory concentrations in the Little Italy area by the total of the Zinc, Lead, and Copper laboratory concentrations for the Little Italy area. This was repeated to obtain the percents of Lead and Copper for the Little Italy area. The Zinc, Lead, and Copper percents were obtained for the EPA samples taken in the Railroad/Alley area and the H. Kramer baghouse using the same method. The percents were graphed in a stacked column graph.

Please contact the FIELDS Group via John Canar (canar.john@epa.gov) about this document.

Comparison of Abundance of Metals

Pilsen-Kramer Site (Superfund Removal Program) Simple Linear Regression and Diagnostics Results (2012-2013 Sampling Events)

Prepared by
John Canar
FIELDS Group, US EPA, Region V

29 January 2014

Introduction

Simple linear regression and regression diagnostics were used to find the “best fitting” linear relationship between XRF measurements of Lead levels in soil samples and their corresponding laboratory measurements using the SAS[®] software. This relationship is quantified into a model (equation) of XRF measurements of Lead and its corresponding laboratory measurement. The statistical methods employed were drawn from SAS[®] literature and three regression texts: Statistical Methods in Water Resources, 1992; and Applied Regression Analysis and Other Multivariate Methods, 1978 and 1988. (See “References” section for a complete list of regression resources.) The data set used for this analysis was provided by Weston Solutions, the USEPA contractor for the Pilsen-Kramer Superfund site. The data include all sampling events from and including 2012 and 2013. This site is under the direction of Ramon Mendoza, USEPA OSC.

The steps used to perform simple linear regression were:

1. Plot the data;
2. Compute the least squares regression statistics;
3. Examine adherence to the assumptions of regression using residual plots; and
4. Employ regression diagnostics (Helsel and Hirsch, 1992).

Data

A total of 192 soil samples with corresponding XRF values were submitted for laboratory analysis and were used in the below regression.

Results

There was a statistically significant linear regression relationship between XRF Lead values and their corresponding Laboratory values (results not shown). However, regression diagnostics found that some of the assumptions of regression were violated. These violations included extreme residuals, heteroscedasticity, and non-normality of the residuals (see Figures 1 and 2). (The null hypothesis of each of the four tests in Figure 2 is that the residuals are from a normal distribution. If using an alpha value of 0.05, one would not reject the null hypothesis for all four tests.) The heteroscedasticity of the residuals meant that a data transformation would likely overcome this violation of one of the statistical assumptions of regression. Hence, the natural log of the XRF Lead values and their corresponding Laboratory value were taken.

There was a statistically significant linear regression relationship between natural log of XRF Lead values and their corresponding natural log of Laboratory values (results not shown). However, regression diagnostics found that some of the assumptions of regression were violated. These violations included extreme residuals and non-normality of the residuals (see Figures 3 and 4). However, the heteroscedasticity now appears much less apparent. To overcome these violations, four observations with Studentized residual values greater than 2.5, a value used as a rule of thumb for extreme values, were removed from the data set. The new data set was regressed and the linear regression was significant (results not shown). The assumption of a lack of extreme residuals and normality of the residuals was violated (results not shown). One observation with an extreme residual was removed from the data set and the new data set was regressed. The regression results were significant but the assumption of a lack of extreme residuals and normality of the residuals was violated (results not shown). Another observation with an extreme residual was removed, the new dataset was regressed, and again the violations occurred. This was performed four more times until all the assumptions of regression were met. Figure 5 shows the statistically significant linear regression relationship between the natural log of XRF Lead values and their corresponding natural log of Laboratory values. Figures 6 and 7 demonstrate that the assumptions of regression were met. Figure 6 shows that the residuals were homoscedastic and none of the Studentized residuals were greater than 2.5. The White test also found that the variance of the residuals were homogenous (results not shown). Figure 7 shows that the residuals were normally distributed. Normality of residuals is required in order to test the hypothesis that “the slope coefficient (β_1) is significantly different from zero” (Helsel and Hirsch, 1992). In other words, in order to demonstrate a linear relationship between the two variables, XRF and Laboratory, the slope coefficient must be significant. A visualization of the linear relationship between the natural log of Lead XRF and Laboratory values in soil is shown in Figure 8.

The parameters of the best linear fit equation for the relationship of the natural log of Lead XRF and Laboratory values in soil are:

$$\text{Adjusted LN Lead} = 0.37986 + (0.99751) * (\text{LN XRF Lead value})$$

However, as this equation is in natural log space, the antilog of the adjusted Lead value must be taken. For example, for an XRF Lead reading of 400ppm (5.99ppm in natural log space), the Adjusted LN XRF Lead value is 6.36ppm. The antilog of this value is 576ppm. Hence, an XRF

Lead reading in soil of 400 ppm is equivalent to an adjusted XRF Lead value of 576ppm in soil. For 800ppm, the adjusted value is 1,150ppm; for 1,200ppm, the adjusted value is 1,724ppm.

Pilsen-Kramer Superfund Site Comparisons of Cadmium, Copper, Lead, Tin, and Zinc levels

USEPA FIELDS Group

John Canar, Environmental Scientist

Linda Jacobson, Research Associate

Chuck Roth, Life Scientist

Introduction

Soil samples were collected by the USEPA and its contractor, Weston Solutions, near the H. Kramer property as well as at locations up to a mile and a half away from the property. These samples were analyzed for metals in an accredited laboratory. Additionally, split samples were performed on these samples in order to evaluate Lead levels for sieved samples (<250um). The metals focused on for this study were Cadmium, Copper, Lead, Tin, and Zinc because these metals are more indicative of the metals found on the H. Kramer site. The purpose of this analysis was to compare the Cadmium, Copper, Lead, Tin, and Zinc results in the Railroad/Alley area near the H. Kramer site, to the local reference area such as Little Italy, and to the USGS – Chicago Department of Environment surface metals sampling data (Kay et al., 2003). The USGS – Chicago Department of Environment samples were sieved (<180um).

Methods

The USEPA-Weston samples were taken at discrete locations in intervals of six inches to a foot below ground surface (bgs) to a maximum depth ranging from 6 to 48 inches bgs. The samples from the 0-6 inches bgs interval were used in this analysis. Samples were taken in front and back yards, alleys, and in soil areas with railroad tracks. The samples taken in gardens and drip zones were not used in this analysis due to garden soil being amended, mixed and often imported and drip zones being likely to contain Lead from Lead-based paint. The samples were separated into two areas called Railroad/Alley and Little Italy (see Figure 1). Little Italy is considered the local reference area. Little Italy was selected as it was mostly crosswind/upwind from the H. Kramer smelter and, compared to the Pilsen-Kramer area, had a more limited industrial past and

was similar in terms of age. Figure 2 is a representation of the historic wind rose for the Pilsen-Kramer area and environs. Note that “arms” in the figure represent the direction from which the wind blows; the lengths represent the proportion of the time the wind came from each direction (i.e., the frequency). Hence, for this wind rose, the predominant winds are from the west and the south.

The Railroad/Alley and Little Italy areas were compared for Cadmium, Copper, Lead, sieved Lead, Tin, and Zinc. Additionally, the same metals from the USGS – Chicago Department of Environment (USGS) sampling event were also compared. This comparison was phrased in the form of a question: Is there a difference in metal levels in the Railroad/Alley area compared to background data in the Little Italy area and for levels found in the Chicago area? If metal levels in the Railroad/Alley were higher than those in Little Italy or the Chicago area (the USGS – Chicago Department of Environment data), then this would indicate contamination. In order to answer this question, a statistical procedure called ANOVA (analysis of variance) is performed to test the hypothesis that the metal levels in each area are the same. Hence, one is testing whether Zinc levels, for instance, are the same for the Railroad/Alley data, the Little Italy data, and the Chicago area data. If that hypothesis is rejected, meaning that the levels of Zinc are not the same in these areas, then a multiple comparison procedure is performed. Since an ANOVA does not tell you which areas are different from each other, a multiple comparison procedure is performed to answer this question. The paragraph below explains how this is done using statistical software.

Since the data were not normally distributed for any of the metals (shown by the Shapiro-Wilk test; results not shown), and therefore violated the assumption of normality, the data were ranked to perform a nonparametric analysis. SAS[®] statistical software was used to compare the areas using one-way ANOVA on the ranked data with the general linear models (GLM) procedure. The Type III Sums of Squares result was used since the areas had an unbalanced number of samples. The Least Squares Means Tukey-Kramer Multiple Comparisons test was used to determine differences between the areas including the USGS dataset. The Least Squares Means Tukey-Kramer Multiple Comparisons test was selected because it accommodates unequal sample sizes and is the most robust test for pairwise comparisons (SAS, 2011).

Results and Discussion

There was a significant difference between the three areas for Cadmium, Copper, Lead, sieved Lead, Tin, and Zinc (shown by one-way ANOVA on ranked data; results not shown). The results of the Least Squares Means Tukey-Kramer Multiple Comparisons test are shown in Table 1. Boxplots of the Cadmium, Copper, Lead, sieved Lead, Tin, and Zinc data for each area are shown in Figures 3, 5, 7, 9, 11 and 13. Boxplots of the ranks of these metals are shown in Figure 4, 6, 8, 10, 12, and 14. (The boxplots of the ranks better display comparisons by area as the Railroad/Alley metal values have a tendency to obscure the differences due to the very high

metal concentrations.)

From Table 1, one can see that Copper, Lead, sieved Lead, and Zinc levels in the following areas were statistically different from each other: Little Italy & Railroad/Alley and Railroad/Alley & USGS. Specifically, Little Italy and the USGS dataset had lower levels of Copper, Lead, sieved Lead, and Zinc than those in the Railroad/Alley. Little Italy, the local reference area, was significantly lower than the other areas since it was farthest away from H. Kramer and was expected to not have been impacted by the power plant. This supports our expectation that Little Italy was not impacted by H. Kramer.

Little Italy and the USGS dataset did not have significantly different levels of Copper, Lead, sieved Lead, and Zinc. For Cadmium and Tin, Little Italy and Railroad/Alley were statistically different than the USGS dataset with the latter having lower metal levels. However, there were extremely high proportions of non-detects for these two metals (70% and 94%, respectively) in the USGS – Chicago Department of Environment dataset. Although the full detection limit was used for these non-detects, these values were extremely low, 2ppm and 50ppm, respectively. This likely led to a statistical difference for Tin that otherwise would not have been.

A cumulative representation of these statistical differences is shown in Figure 15. The colored ovals represent areas with metal values that are not statistically different from each other (as measured by the Tukey-Kramer multiple comparisons test). For example, the levels of Zinc are not significantly different for LI and USGS. (Where LI is Little Italy and USGS is the USGS dataset.) In contrast, LI and USGS have significantly lower Zinc levels than RR (Railroad/Alley). This pattern is repeated for Copper, Lead, and sieved Lead. These results also demonstrate that there were no statistical differences whether one evaluated the unsieved Lead results or the sieved Lead results. For Cadmium and Tin, the USGS dataset has lower metal levels than LI and RR. In general the figure demonstrates, when viewing from left to right, that the USGS dataset and Little Italy often have significantly lower metal levels than the RR areas. This is especially pronounced for three of the five metals: Copper, Lead, sieved Lead, and Zinc. As stated above, the significant proportion of non-detect values with very low detection limits in the USGS dataset likely led to the statistical differences with the LI and RR data for Tin.
