Table 12
Phase 2 Reach Floodplain Soil Analytical Results
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) Yellow highlighted values represent detection of the compound at a concentration above the human health PAL; underlined values represent detection of the compound at a concentration above the ecological PAL.
(b) Comparison of the data to the PALs is for informational purposes only and is not an indication of risk.
(c) Bold font indicates detected concentration.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Project Action Limits (PALs):
A blank cell for the PAL indicates no PAL is available.
See Table 51 for additional details.

Analytes:
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
SVOCs - semi-volatile organic compounds
TAL - target analyte list
TCL - target compound list
VOCs - volatile organic compounds

Units:
mg/kg - milligrams per kilogram
ng/g - nanograms per gram
pg/g - picograms per gram
ug/kg - micrograms per kilogram

Qualifiers:
B - Indicates the analyte is detected in the associated blank as well as in the sample.
E - Indicates compounds whose concentrations exceed the calibration range of the instrument.
J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J- -The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential low bias.
J+ - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential high bias.
JN - The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
TB - Trip blank contamination.
UJ - The analyte was not detected above the reported detection limit. However, the reported detection limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
U - The analyte was analyzed for but was not detected above the reported detection limit.
R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Sample Type:
N - normal
FD - field duplicate

Table 13
Depositional Area Soil Analytical Results
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) Yellow highlighted values represent detection of the compound at a concentration above the human health PAL; underlined values represent detection of the compound at a concentration above the ecological PAL.
(b) Comparison of the data to the PALs is for informational purposes only and is not an indication of risk.
(c) Bold font indicates detected concentration.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Project Action Limits (PALs):
A blank cell for the PAL indicates no PAL is available.
See Table 51 for additional details.

Analytes:
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
SVOCs - semi-volatile organic compounds
TAL - target analyte list
TCL - target compound list
VOCs - volatile organic compounds

Units:
mg/kg - milligrams per kilogram
ng/g - nanograms per gram
pg/g - picograms per gram
ug/kg - micrograms per kilogram

Qualifiers:
B - Indicates the analyte is detected in the associated blank as well as in the sample.
E - Indicates compounds whose concentrations exceed the calibration range of the instrument.
J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J- -The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential low bias.
J+ - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential high bias.
JN - The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
TB - Trip blank contamination.
UJ - The analyte was not detected above the reported detection limit. However, the reported detection limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
U - The analyte was analyzed for but was not detected above the reported detection limit.
R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Sample Type:
N - normal
FD - field duplicate

Table 14
Phase 2 Reach Floodplain Soil Analytical Results Statistics
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) The number of samples shown and the calculation of summary statistics treated the parent and field duplicate as individual samples.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Project Action Limits (PALs):
A blank cell for the PAL indicates no PAL is available.
See Table 51 for additional details.

Analytes:
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
TAL - target analyte list
TCL - target compound list
SVOCs - semi-volatile organic compounds
VOCs - volatile organic compounds

Units:
mg/kg - milligrams per kilogram
ng/g - nanograms per gram
pg/g - picograms per gram
ug/kg - micrograms per kilogram

Table 15
Depositional Area Soil Analytical Results Statistics
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) The number of samples shown and the calculation of summary statistics treated the parent and field duplicate as individual samples.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Project Action Limits (PALs):
A blank cell for the PAL indicates no PAL is available.
See Table 51 for additional details.

Analytes:
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
TAL - target analyte list
TCL - target compound list
SVOCs - semi-volatile organic compounds
VOCs - volatile organic compounds

Units:
mg/kg - milligrams per kilogram
ng/g - nanograms per gram
pg/g - picograms per gram
ug/kg - micrograms per kilogram

Table 16
Low Flow Surface Water Analytical Results
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) Yellow highlighted values represent detection of the compound at a concentration above the human health PAL; underlined values represent detection of the compound at a concentration above the ecological PAL.
(b) Comparison of the data to the PALs is for informational purposes only and is not an indication of risk.
(c) Bold font indicates detected concentration.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Project Action Limits (PALs):
A blank cell for the PAL indicates no PAL is available.
See Table 51 for additional details.

Analytes:
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
TAL - target analyte list
TCL - target compound list
VOCs - volatile organic compounds

Units:
deg C - degrees celcius
mg/L - milligrams per liter
mv - millivolt
NTU - nephelometric turbidity unit
pg/L - picograms per liter
su - standard units
ug/L - micrograms per liter
us/cm - microsiemens per centimeter

Qualifiers:
J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+ - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential high bias.
UJ - The analyte was not detected above the reported detection limit. However, the reported detection limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
U - The analyte was analyzed for but was not detected above the reported detection limit.

Sample Type:
N - normal
FD - field duplicate

Table 17
High Flow Surface Water Analytical Results
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) Yellow highlighted values represent detection of the compound at a concentration above the human health PAL; underlined values represent detection of the compound at a concentration above the ecological PAL.
(b) Comparison of the data to the PALs is for informational purposes only and is not an indication of risk.
(c) Bold font indicates detected concentration.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Project Action Limits (PALs):
A blank cell for the PAL indicates no PAL is available.
See Table 51 for additional details.

Units:
pg/L - picograms per liter
ug/L - micrograms per liter

Qualifiers:
J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+ - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential high bias.
UJ - The analyte was not detected above the reported detection limit. However, the reported detection limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
U - The analyte was analyzed for but was not detected above the reported detection limit.

Sample Type:
N - normal
FD - field duplicate

Table 18
Low Flow Surface Water Analytical Results Statistics
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) The number of samples shown and the calculation of summary statistics treated the parent and field duplicate as individual samples.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Project Action Limits (PALs):
A blank cell for the PAL indicates no PAL is available.
See Table 51 for additional details.

Analytes:
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
TAL - target analyte list
TCL - target compound list
SVOCs - semi-volatile organic compounds
VOCs - volatile organic compounds

Units:
mg/kg - milligrams per kilogram
ng/g - nanograms per gram
pg/g - picograms per gram
ug/kg - micrograms per kilogram
ug/L - micrograms per liter

Table 19
High Flow Surface Water Analytical Results Statistics
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) The number of samples shown and the calculation of summary statistics treated the parent and field duplicate as individual samples.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Project Action Limits (PALs):
A blank cell for the PAL indicates no PAL is available.
See Table 51 for additional details.

Analytes:
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
TAL - target analyte list
TCL - target compound list
VOCs - volatile organic compounds

Units:
pg/L - picograms per liter
ug/L - micrograms per liter

Table 20
Time Zero Mussel Tissue Sample Analytical Results
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) Bold font indicates detected concentration.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) Total PAHs, total HMW PAHs, and total LMW PAHs were calculated as the sum of all or select detected concentrations of the following: acenaphthene (LMW), acenaphthylene (LMW), anthracene (LMW), fluorene (LMW), 2-methylnaphthalene (LMW), naphthalene (LMW), phenanthrene (LMW), benzo(a)anthracene (HMW), benzo(b)fluoranthene (HMW), benzo(k)fluoranthene (HMW), benzo(g,h,i)perylene (HMW), benzo(a)pyrene (HMW), chrysene (HMW), dibenzo(a,h)anthracene (HMW), fluoranthene (HMW), indeno(1,2,3-cd)pyrene (HMW), and pyrene (HMW); if no PAHs in a group were detected, the maximum reporting detection limit for any individual PAH in that group was used.
(d) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(e) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(f) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Analytes:
PAH - polycyclic aromatic hydrocarbons
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
TAL - target analyte list
TCL - target compound list

Units:
% - percent
mg/kg - milligrams per kilogram
ng/g - nanograms per gram
pg/g - picograms per gram
ug/kg - micrograms per kilogram

Qualifiers:
J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J- -The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential low bias.
J+ - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential high bias.
JN - The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ - The analyte was not detected above the reported detection limit. However, the reported detection limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
U - The analyte was analyzed for but was not detected above the reported detection limit.

Sample Type:
N - normal

Text Type:
Bold font indicates detected concentration.

Table 21
Phase 1 and 2 Reach Mussel Tissue Sample Analytical Results
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) Bold font indicates detected concentration.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) Total PAHs, total HMW PAHs, and total LMW PAHs were calculated as the sum of all or select detected concentrations of the following: acenaphthene (LMW), acenaphthylene (LMW), anthracene (LMW), fluorene (LMW), 2-methylnaphthalene (LMW), naphthalene (LMW), phenanthrene (LMW), benzo(a)anthracene (HMW), benzo(b)fluoranthene (HMW), benzo(k)fluoranthene (HMW), benzo(g,h,i)perylene (HMW), benzo(a)pyrene (HMW), chrysene (HMW), dibenzo(a,h)anthracene (HMW), fluoranthene (HMW), indeno(1,2,3-cd)pyrene (HMW), and pyrene (HMW); if no PAHs in a group were detected, the maximum reporting detection limit for any individual PAH in that group was used.
(d) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(e) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(f) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Analytes:
PAH - polycyclic aromatic hydrocarbons
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
TAL - target analyte list
TCL - target compound list

Units:
% - percent
mg/kg - miligrams per kilogram
ng/g - nanograms per gram
pg/g - picograms per gram
ug/kg - micrograms per kilogram

Qualifiers:
J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J- -The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential low bias.
J+ - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential high bias.
JN - The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ - The analyte was not detected above the reported detection limit. However, the reported detection limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
U - The analyte was analyzed for but was not detected above the reported detection limit.

Sample Type:
N - normal
FD - field duplicate

Text Type:
Bold font indicates detected concentration.

Table 22
Time Zero Mussel Tisue Sample Analytical Results Compared to Ecological PALs
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) Yellow highlighted values represent detection of the compound at a concentration above the ecological PAL.
(b) Comparison of the data to the PALs is for informational purposes only and is not an indication of risk.
(c) Bold font indicates detected concentration.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Project Action Limits (PALs):
A blank cell for the PAL indicates no PAL is available.
See Table 51 for additional details.

Analytes:
PAH - polycyclic aromatic hydrocarbons
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
TAL - target analyte list
TCL - target compound list

Units:
mg/kg - milligrams per kilogram
ng/g - nanograms per gram
pg/g - picograms per gram
ug/kg - micrograms per kilogram

Qualifiers:

J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J- -The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential low bias.
J+ - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential high bias.
JN - The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ - The analyte was not detected above the reported detection limit. However, the reported detection limit is approximate and may or may not represent the actual limit of detection necessary to accurately and precisely measure the analyte in the sample.
U - The analyte was analyzed for but was not detected above the reported sample detection limit.

Sample Type:

Table 23
Phase 1 and 2 Reach Mussel Tissue Sample Analytical Results Compared to Ecological PALs
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) Yellow highlighted values represent detection of the compound at a concentration above the ecological PAL.
(b) Comparison of the data to the PALs is for informational purposes only and is not an indication of risk.
(c) Bold font indicates detected concentration.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Project Action Limits (PALs):
A blank cell for the PAL indicates no PAL is available.
See Table 51 for additional details.

Analytes:
PAH - polycyclic aromatic hydrocarbons
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
TAL - target analyte list
TCL - target compound list

Units:
mg/kg - milligrams per kilogram
ng/g - nanograms per gram
pg/g - picograms per gram
ug/kg - micrograms per kilogram

Qualifiers:
J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J- -The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential low bias.
J+ - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential high bias.
JN - The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ - The analyte was not detected above the reported detection limit. However, the reported detection limit is approximate and may or may not represent the actual limit of detection necessary to accurately and precisely measure the analyte in the sample.
U - The analyte was analyzed for but was not detected above the reported sample detection limit.

Sample Type:
N - normal
FD - field duplicate

Table 24
Phase 1 Reach Mussel Tissue Analytical Results Statistics
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) The number of samples shown and the calculation of summary statistics treated the parent and field duplicate as individual samples.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) Total PAHs, total HMW PAHs, and total LMW PAHs were calculated as the sum of all or select detected concentrations of the following: acenaphthene (LMW), acenaphthylene (LMW), anthracene (LMW), fluorene (LMW), 2-methylnaphthalene (LMW), naphthalene (LMW), phenanthrene (LMW), benzo(a)anthracene (HMW), benzo(b)fluoranthene (HMW), benzo(k)fluoranthene (HMW), benzo(g,h,i)perylene (HMW), benzo(a)pyrene (HMW), chrysene (HMW), dibenzo(a,h)anthracene (HMW), fluoranthene (HMW), indeno(1,2,3-cd)pyrene (HMW), and pyrene (HMW); if no PAHs in a group were detected, the maximum reporting detection limit for any individual PAH in that group was used.
(d) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(e) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.'
(f) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Analytes:
PAH - polycyclic aromatic hydrocarbons
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
TAL - target analyte list
TCL - target compound list

Units:
% - percent
mg/kg - milligrams per kilogram
ng/g - nanograms per gram
pg/g - picograms per gram
ug/kg - micrograms per kilogram

Table 25
Phase 2 Reach Mussel Tissue Analytical Results Statistics
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) The number of samples shown and the calculation of summary statistics treated the parent and field duplicate as individual samples.

Sums & TEQs
(a) The homolog group sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) Total PAHs, total HMW PAHs, and total LMW PAHs were calculated as the sum of all or select detected concentrations of the following: acenaphthene (LMW), acenaphthylene (LMW), anthracene (LMW), fluorene (LMW), 2-methylnaphthalene (LMW), naphthalene (LMW), phenanthrene (LMW), benzo(a)anthracene (HMW), benzo(b)fluoranthene (HMW), benzo(k)fluoranthene (HMW), benzo(g,h,i)perylene (HMW), benzo(a)pyrene (HMW), chrysene (HMW), dibenzo(a,h)anthracene (HMW), fluoranthene (HMW), indeno(1,2,3-cd)pyrene (HMW), and pyrene (HMW); if no PAHs in a group were detected, the maximum reporting detection limit for any individual PAH in that group was used.
(d) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(e) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(f) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Analytes:
PAH - polycyclic aromatic hydrocarbons
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
TAL - target analyte list
TCL - target compound list

Units:
% - percent
mg/kg - milligrams per kilogram
ng/g - nanograms per gram
pg/g - picograms per gram
ug/kg - micrograms per kilogram

Table 26
Phase 1 Reach Mussel Tissue Counts Above Ecological PAL
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) The number of samples shown and the calculation of summary statistics treated the parent and field duplicate as individual samples.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Project Action Limits (PALs):
A blank cell for the PAL indicates no PAL is available.
See Table 51 for additional details.

Analytes:
PAH - polycyclic aromatic hydrocarbons
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
TAL - target analyte list
TCL - target compound list

Units:
mg/kg - miligrams per kilogram
ng/g - nanograms per gram
pg/g - picogram per gram
ug/kg - micrograms per kilogram

Table 28
Phase 2 Reach Sediment Analytical Results
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) Yellow highlighted values represent detection of the compound at a concentration above the human health PAL; underlined values represent detection of the compound at a concentration above the ecological PAL.
(b) Comparison of the data to the PALs is for informational purposes only and is not an indication of risk.
(c) Bold font indicates detected concentration.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Project Action Limits (PALs):
A blank cell for the PAL indicates no PAL is available.
See Table 51 for additional details.

Analytes:
AVS/SEM - acid-volatile sulfide/simultaneously extracted metals
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
SVOCs - semi-volatile organic compounds
TAL - target analyte list
TCL - target compound list
TOC - total organic carbon
VOCs - volatile organic compounds

Units:
% - percent
mg/kg - milligrams per kilogram
ng/g - nanograms per gram
pg/g - picograms per gram
ug/kg - micrograms per kilogram
umol/g - micromoles per gram

Qualifiers:
B - Indicates the analyte is detected in the associated blank as well as in the sample.
E - Indicates compounds whose concentrations exceed the calibration range of the instrument.
J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J- -The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential low bias.
J+ - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential high bias.
JN - The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ - The analyte was not detected above the reported detection limit. However, the reported detection limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
U - The analyte was analyzed for but was not detected above the reported detection limit.
R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Sample Type:
N - normal
FD - field duplicate

Table 29
Pine Tree Brook Sediment Analytical Results
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) Yellow highlighted values represent detection of the compound at a concentration above the human health PAL; underlined values represent detection of the compound at a concentration above the ecological PAL.
(b) Comparison of the data to the PALs is for informational purposes only and is not an indication of risk.
(c) Bold font indicates detected concentration.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Project Action Limits (PALs):
A blank cell for the PAL indicates no PAL is available.
See Table 51 for additional details.

Analytes:
AVS/SEM - acid-volatile sulfide/simultaneously extracted metals
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
SVOCs - semi-volatile organic compounds
TAL - target analyte list
TCL - target compound list
TOC - total organic carbon
VOCs - volatile organic compounds

Units:
% - percent
mg/kg - milligrams per kilogram
ng/g - nanograms per gram
pg/g - picograms per gram
ug/kg - micrograms per kilogram
umol/g - micromoles per gram

Qualifiers:
B - Indicates the analyte is detected in the associated blank as well as in the sample.
E - Indicates compounds whose concentrations exceed the calibration range of the instrument.
J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J- -The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential low bias.
J+ - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential high bias.
JN - The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ - The analyte was not detected above the reported detection limit. However, the reported detection limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
U - The analyte was analyzed for but was not detected above the reported detection limit.
R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Sample Type:
N - normal
FD - field duplicate

Table 30
Phase 2 Reach Sediment Analytical Results Statistics
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) The number of samples shown and the calculation of summary statistics treated the parent and field duplicate as individual samples.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Project Action Limits (PALs):
A blank cell for the PAL indicates no PAL is available.
See Table 51 for additional details.

Analytes:
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
TAL - target analyte list
TCL - target compound list
SVOCs - semi-volatile organic compounds
VOCs - volatile organic compounds

Units:
mg/kg - milligrams per kilogram
ng/g - nanograms per gram
pg/g - picograms per gram
ug/kg - micrograms per kilogram

Table 31
Pine Tree Brook Sediment Analytical Results Statistics
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) The number of samples shown and the calculation of summary statistics treated the parent and field duplicate as individual samples.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Project Action Limits (PALs):
A blank cell for the PAL indicates no PAL is available.
See Table 51 for additional details.

Analytes:
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
TAL - target analyte list
TCL - target compound list
SVOCs - semi-volatile organic compounds
VOCs - volatile organic compounds

Units:
mg/kg - milligrams per kilogram
ng/g - nanograms per gram
pg/g - picograms per gram
ug/kg - micrograms per kilogram

Table 32
Fish Tissue Analytical Results
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) Bold font indicates detected concentration.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Analytes:
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
TAL - target analyte list
TCL - target compound list

Units:
% - percent
ng/g - nanograms per gram
ng/kg - nanograms per kilogram
mg/kg - miligrams per kilogram
ug/kg - micrograms per kilogram

Qualifiers:
B - Indicates the analyte is detected in the associated blank as well as in the sample.
J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J- -The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential low bias.
J+ - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential high bias.
R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria.
The presence or absence of the analyte cannot be verified.
UJ - The analyte was not detected above the reported detection limit. However, the reported detection limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
U - The analyte was analyzed for but was not detected above the reported detection limit.

Sample Type:
N - normal

Table 33
Fillet Tissue Analytical Results Compared to Human Health PALs
Phase 2 Data Evaluation Summary Memorandum
Lower Neponset River
Boston and Milton, Massachusetts

Notes:
(a) Yellow highlighted values represent detection of the compound at a concentration above the human health PAL; underlined values represent detection of the compound at a concentration above the ecological PAL.
(b) Comparison of the data to the PALs is for informational purposes only and is not an indication of risk.
(c) Bold font indicates detected concentration.

Sums and TEQ:
(a) The homolog groups sums for PCBs and PCDD/Fs were calculated by summing the detected congeners in each group; if no congeners in a group were detected, the maximum reporting detection limit for any individual congener in that homolog group was used.
(b) The concentration of total PCB congeners was calculated as the sum of detected congeners in each sample.
(c) PCDD/F TEQ and PCB Toxic Equivalency (TEQ) values were calculated by summing the detected compounds in each group that have been multiplied by their specific Toxic Equivalency Factors (TEFs); see Table 51 for more details. For any sample that did not have any detected compounds, the resulting TEQ is shown as a zero.
(d) For coelution of dioxin-like (DL) and non-DL congeners, TEF is applied to the full reported concentration.
(e) Calculated total values are inclusive of Estimated Maximum Possible Concentration (EMPC) results.

Project Action Limits (PALs):
A blank cell for the PAL indicates no PAL is available.
See Table 51 for additional details.

Analytes:
PCB - polychlorinated biphenyl
PCDD/F - polychlorinated dibenzodioxins/furans
TAL - target analyte list
TCL - target compound list

Units:
ng/g - nanograms per gram
ng/kg - nanograms per kilogram
mg/kg - miligrams per kilogram
ug/kg - micrograms per kilogram

Qualifiers:
B - Indicates the analyte is detected in the associated blank as well as in the sample.
J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J- -The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential low bias.
J+ - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample with a potential high bias.
R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.
UJ - The analyte was not detected above the reported detection limit. However, the reported detection limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
U - The analyte was analyzed for but was not detected above the reported detection limit.

Sample Type:
N - normal
