APPENDICIES

1. Introduction

This report documents the levels of PCBs (polychlorinated biphenyls) measured in edible seafood species caught in New Bedford Harbor and surrounding Buzzards Bay in southeastern Massachusetts in 2025. This seafood monitoring program is part of the ongoing PCB cleanup program for the New Bedford Harbor (NBH) Superfund Site and was a collaborative effort involving the MA Department of Marine Fisheries (DMF), the MA Department of Environmental Protection, (MassDEP), and the U.S. Environmental Protection Agency Region I (EPA).

Due to the identification of high PCB levels in area seafood, the MA Department of Public Health in 1979 promulgated regulations restricting seafood consumption in three closure areas in and around NBH as shown on Figure 1 (MADPH, 1979). NBH was subsequently listed as a Superfund site in 1983. Per the 1998 Record of Decision (ROD) (EPA, 1998) for the Site, as modified by six Explanation of Significant Differences (ESDs), over 1 million cubic yards (cy) of *in situ* contaminated sediment has been removed by dredging to meet the sediment cleanup levels. Consistent with the 1998 ROD, this seafood monitoring program will aid in the evaluation of the overall effectiveness of the harbor cleanup, as well as assist in the implementation of institutional controls and seafood consumption restrictions.

2. Seafood Monitoring Program Design

Based on previous investigations and risk assessments performed at the NBH Site, a variety of species were selected for this monitoring program that are considered locally caught seafood; are generally available for field collection; and which bracket potential worse case tissue levels **(**MassDEP, 2025**)**. In previous sampling rounds, these species include lobster (*Homarus americanus*), blue crabs (*Carcinus maenas*), quahog (i.e., hard shelled clam, *Mercenaria mercenaria*), alewife (*Alosa pseudoharengus*), American eel (*Anguilla rostrata*), black sea bass (*Centropristes striatus*), winter flounder (*Pseudopleuronectes americanus*), and scup (*Stenotomus chrysops).* The goal of this seafood monitoring program is to acquire annual collections of either a subset or all of these species in sufficient numbers from all three closure areas to enable statistical comparisons between them, but with the understanding that some species may not necessarily be caught in sufficient numbers every year. Typically, more species are collected in the year prior to the Superfund Five Year Review (FYR) process than in non-FYR years, last done in 2024.

To meet this goal, the monitoring design calls for five composite samples for each species from each of the three closure areas. Based on previous site sampling experience, modifications have been made to the original sampling approach such as the types of species readily available and the number of organisms per sample (e.g., for bluefish and striped bass). The species collected for 2025 were bluefish, pre-spawn quahog, conch, oyster, and striped bass, as well as surface water.

Each composite sample consisted of legally harvestable organisms. The bluefish composited sample consisted of 1 to 15 organisms per location. The quahog and conch composited sample consisted of 14 organisms per location. The oyster composited sample

consisted of 14 or 17 organisms per location. The striped bass samples consisted of one organism per location.

In addition to comparing the results of this monitoring to past and future seafood monitoring results, the results of this seafood monitoring program will be compared to the current U.S. Food and Drug Administration's (FDA's) criteria for PCBs in commercial seafood of 2 parts per million (ppm). It was exceedances of the FDA criteria in NBH seafood which prompted promulgation of the state's seafood closure areas in 1979 (the FDA criteria at that time was 5 ppm). In addition to comparisons to the current FDA level, and as explained in the 1998 ROD, EPA will compare the results of the seafood monitoring program to a risk-based site-specific threshold of 0.02 ppm PCBs. Consistent with CERCLA and the NCP, the selected remedy for the Site (EPA, 1998, Section X) uses this health-based seafood criteria of 0.02 ppm PCBs based on local patterns of seafood consumption which involve more frequent consumption of local PCB-contaminated seafood than that is assumed by the FDA standard.

3. 2025 Field Collection

The 2025 DMF on-site field sampling program included the collection of bluefish, conch, oyster, quahog, striped bass, and surface water. The Sampling Report for species collected in 2025 by DMF is in Appendix C (MA DMF, 2025).

The bluefish were collected in June and September (Figure 2) using hook and line. The bluefish samples consisted of 1 to 15 organisms per location. The conchs were collected in October (Figure 3) using conch pots. The composited conch sample consisted of 14 organisms per location. The oysters were collected in May (Figure 4) by hand. The oysters samples consisted of 14 to 17 organisms per location. The quahogs were collected pre-spawn in May (Figure 5) using a rake or diver. The quahog composited sample consisted of 14 organisms per location. The striped bass were collected in June (Figure 6) using hook and line. The striped bass samples consisted of one organism per location. The surface water samples were collected in May (Figures 4 and 5). Water samples were collected at the same locations as the quahog and oyster samples. Water samples were collected at mid-level depth, except if the water depth was less than six feet, then the samples were collected at the surface to avoid turbidity in the samples.

Complete collection information including the dates collected, identification information, species, station identification, latitude and longitude, and collection method are included on the Field Collection Forms in Appendix C. All fish/shellfish samples were delivered frozen to Pace Analytical Services (formerly Alpha Woods Hole Labs (Alpha) in Mansfield, MA for analysis. The surface water samples were kept on ice (but not frozen) in a container maintained at 4^{o} C.

4. Analytical Chemistry

The seafood samples were analyzed for 209 PCB congeners by GC/MS-SIM (gas chromatography/mass spectrometry-selective ion monitoring) based on EPA Methods 680 and 8270D. The total number of PCB congeners analyzed in 2025 increased by 61 as

compared to previous years (2017 to 2024) when 148 PCB congeners were analyzed, or an increase of 41.2% in the number of congeners. However, the increase in the number of PCB congeners analyzed only accounted for an approximate 2.3% increase to the total reported PCB concentrations when comparing 209 to 148 congeners from the 2025 dataset (see Appendix D), and it was determined to be acceptable for comparisons with the previous years of data. In the sampling rounds between 2003 to 2016, 136 PCB congeners were analyzed. From 2017 to 2024, an additional twelve PCB congeners did not significantly add to the total concentrations, thus allowing comparisons with previous years of data. The 136, 148, and 209 congeners measured included the eighteen National Oceanic and Atmospheric Administration (NOAA) list congeners and the twelve World Health Organization (WHO) 1998 list of dioxin-like congeners. Two congeners, BZ #105 and #118, appear on both lists. The NOAA congener list was used by the MA DMF in its analysis of Area III lobsters from 1988 - 1998, while Aroclors had been used previous to this. The NOAA list typically represents approximately 45% of the total PCB in marine tissue (NOAA, 1993).

The congeners quantitated in this effort are listed in the New Bedford Harbor Superfund Site Quality Assurance Project Plan Revision 19 **(**MassDEP, 2025a**).** The WHO 1998 congeners were included to enable the evaluation of risks to human health due to the presence of any dioxin-like PCB congeners, if deemed necessary.

Tissue from the collected specimens was filleted, sub-sampled and/or composited as necessary for sample homogenization, extraction and analysis. The first step in the analytical process for the quahog, conch and oyster samples was the compositing of four to fifteen individual samples from each location; these were combined to form one composite sample per location and were homogenized using a tissuemizer. The first step in the analytical process for the bluefish and striped bass was to take the tissue for each sample location and homogenize using a tissuemizer. Bluefish fillets were processed with the skin on. Striped bass fillets with the skin off were processed as individual samples. From each group, approximately five grams of wet sample tissue were collected. This sample tissue was then extracted using EPA Method 3570 Microscale Solvent Extraction (MSE) techniques (spin extraction with acetone/methylene chloride in a sealed vessel).

The extracts were concentrated. The lipid portion of the extract was removed and separated from the PCB portion, which was cleaned up prior to analysis. Following sample cleanup, extracts were dried and concentrated using the Kuderna-Danish (K-D) method, brought up to final volume and analyzed. Extract cleanup was performed using Alumina Column Cleanup. Gel Permeation Chromatography (GPC), Sulfuric Acid Cleanup, and/or Silica Gel Cleanup are also employed as appropriate, based on the sample extracts and tissue species.

Sample analysis using GC/MS-SIM allowed identification and quantitation of congeners using all PCB congeners from BZ1 to BZ209. The identification of the specific congeners was accomplished by comparing their mass spectra with the electron impact spectra of the calibration standards. Congener concentrations were determined using mean relative response factors from a multi-level calibration curve. Response factors for congeners were determined relative to internal standard technique. A multi-point curve was used for the individual congeners to demonstrate the linear range of the instrument.

Continuing calibrations assured linearity remained for the duration of the analysis. Laboratory SOPs are available in the Quality Assurance Project Plan Revision 19 (MassDEP, 2025a) should further details on chromatographic conditions, quality control criteria, and other elements of the analysis be needed. While lipid content was reported, the wet weight PCB concentrations reported herein are not lipid normalized.

The data validation summary for the laboratory analysis is presented in Appendix B (WSP, 2026).

5. Results and Discussion

As with previous studies of sediments, water column, seafood, and air at the NBH Site, the current data set demonstrates a generally decreasing trend (north to south) of PCB levels in locally caught seafood. In other words, tissue PCB levels decrease proportionally with the distance from the primary source of PCBs to the upper harbor (the Aerovox facility). Figures 7 to 13 graphically summarize the current data, and Tables 1 to 7 tabulate the totals and averages of the congener sample results.

PCBs are a group of similar organic molecules featuring a "figure-eight" structure of two bonded benzene rings with chlorine atoms attached at up to ten different attachment sites. Theoretically, up to 209 different PCB congeners (or molecular variations) are possible, yet only about 120 of these are found in the natural environment. Furthermore, NOAA has demonstrated that 18 specific congeners are the most pervasive and generally make up almost half of the PCB mass in marine tissues. In addition, WHO considers the twelve specific dioxin-like congeners to present the greatest risk to human health. As noted above in Section 4, two congeners, BZ #105 and BZ #118, are included in both the NOAA and the WHO congener sets.

Overall, the current data set indicates continued levels of PCBs in NBH area seafood above the 1998 ROD's site-specific target level of 0.02 ppm. The bluefish samples range between 0.27 ppm and 46 ppm, and all locations are above the site-specific target level of 0.02 ppm. The conch samples range between 0.033 ppm and 0.4 ppm, and all locations are above the site-specific target level of 0.02 ppm. The oyster samples range between 2.8 ppm and 11 ppm, and all locations are above the site-specific target level of 0.02 ppm. The quahog samples range between 0.12 ppm and 0.71 ppm for Area I; between 0.024 ppm and 0.19 ppm for Area II; and between 0.0047 ppm and 0.016 ppm for Area III. All quahog samples from Areas I and II locations are above the site-specific target level of 0.02 ppm. All quahog samples from Area III are below the site-specific target level of 0.02 ppm. The striped bass samples range between 4 ppm and 100 ppm in Area I are above the site-specific target level of 0.02 ppm. All bluefish samples in Area I and one sample in Area II were above the FDA level of 2 ppm ranging from 8.7 ppm to 46 ppm in Area I and 2.3 ppm in Area II. There were no quahog or conch samples above the FDA level of 2 ppm. All oyster samples were above the FDA level of 2 ppm ranging from 2.8 ppm to 11 ppm. All striped bass samples were above the FDA level of 2 ppm ranging from 4.0 ppm to 100 ppm.

The surface water (total) samples range between 0.013 ppb to 0.84 ppb in Area I; 0.00025 ppb to 0.014 ppb in Area II; and non-detect to 0.00032 ppb in Area III. The site-

specific target level for surface water is the Ambient Water Quality Criteria (AWQC) of 0.03 ug/l (or ppb). The AWQC was met at all locations in Areas II and III, and in three of eight locations in Area 1.

It should be noted that these PCB levels do not apply to seafood caught by the harbor's commercial fishing fleet (except for any quahog and conch collected commercially in Areas 2 and 3) as this seafood is caught significantly further offshore than the three PCB closure areas at the New Bedford Harbor Superfund Site. However, these results do indicate the need to continue the outreach program to inform and educate the local communities and recreational sport fishermen about the fish consumption regulations and advisories.

The seafood sampling program has been on-going since 2002. These reports can be found at the EPA's web site at www.epa.gov/new-bedford-harbor under "Technical Documents".

Notes for 2025 Report Tables:

[1] = summation of 209 PCB congener results (1/2 sample quantitation limit [SQL] used for non-detected results)
[2] = summation of detected 209 PCB congeners
[3] = summation of 18 NOAA PCB congener results (1/2 SQL used for non-detected results)
[4] = summation of 12 WHO PCB congener results (1/2 SQL used for non-detected results)
[5] = summation of 12 WHO and 18 NOAA PCB congener results (1/2 SQL used for non-detected results)

U = not detected (ND); value represents SQL
J = estimated value
J1 = concentration of detected congeners contributes < 50% of total congener result
J2 = concentration of detected congeners contributes > 50% of total congener result
J3 = concentration of detected congeners contributes > 90% of total congener result
J4 = concentration of detected congeners contributes > 99% of total congener result
mg/kg = milligrams per kilogram (wet weight)
ng/L = nanograms per liter
ND = No PCB congeners detected above the SQL

Notes for 2025 Appendix Tables:

[1] = summation of 209 PCB congener results (1/2 sample quantitation limit [SQL] used for non-detected results)
[2] = summation of detected 209 PCB congeners
[3] = summation of 18 NOAA PCB congener results (1/2 SQL used for non-detected results)
[4] = summation of 12 WHO PCB congener results (1/2 SQL used for non-detected results)
[5] = summation of 12 WHO and 18 NOAA PCB congener results (1/2 SQL used for non-detected results)

U = not detected (ND); value represents SQL
J = estimated value
J1 = concentration of detected congeners contributes < 50% of total congener result
J2 = concentration of detected congeners contributes > 50% of total congener result
J3 = concentration of detected congeners contributes > 90% of total congener result
J4 = concentration of detected congeners contributes > 99% of total congener result
R = result was rejected during validation
mg/kg = milligrams per kilogram (wet weight)
ng/L = nanograms per liter
ND = No PCB congeners detected above the SQL

Seafood Contaminant Survey Monitoring 2025 Sampling
January 7, 2026

Data Validation Summary
Massachusetts Department of Environmental Protection
New Bedford Harbor Superfund Site
Seafood Contaminant Survey Monitoring 2025 Sampling
New Bedford, Massachusetts

INTRODUCTION

Tissue and water samples were collected as part of the New Bedford Harbor Superfund Site Seafood Contaminant Survey Monitoring. Samples were collected by the Massachusetts Department of Marine Fisheries (MADMF) and/or WSP. Samples were submitted to Pace Analytical Services (formerly Alpha Analytical Laboratory) located in Mansfield, Massachusetts, for processing and analysis. Tissue samples were analyzed for percent lipids and polychlorinated biphenyls (PCBs) by gas chromatography/ mass spectrometry (GC/MS) Selected Ion Monitoring (SIM). Water samples were analyzed for polychlorinated biphenyls (PCBs) by GC/MS SIM.

A summary of samples and methods can be found in Table 1. The 2025 QAPP called for analyzing both fillet and stomach samples for the striped bass, however, the stomach samples were inadvertently not analyzed by the laboratory. The following table outlines the associated Sample Delivery Group (SDG), species, sample collection date, and sample collection location for the samples included in this report:

SDG	Species/Sample Type	Sample Date	Sample Location
L2527183	Water	May 2025	New Bedford Harbor
L2527188	Oyster	May 2025	New Bedford Harbor
L2528431	Water	May 2025	New Bedford Harbor
L2528436	Quahog	May 2025	New Bedford Harbor
L2529218	Water	May 2025	New Bedford Harbor
L2529228	Quahog	May 2025	New Bedford Harbor
L2533169	Quahog	May 2025	New Bedford Harbor
L2533180	Water	May 2025	New Bedford Harbor
L2559311	Bluefish + Conch	September 2025	New Bedford Harbor
L2563561	Bluefish + SB	October 2025	New Bedford Harbor
L2565619	Conch	October 2025	New Bedford Harbor

The data packages were validated using U.S. Environmental Protection Agency (USEPA) Region 1 - EPA New England Environmental Data Review Program Guidance and Data Review Supplement (USEPA, 2018), National Functional Guidelines for Superfund Organic Data Review (USEPA, 2017), Alpha Analytical Laboratory Standard Operating Procedure (SOP) 2162 (Alpha, 2017), and the Massachusetts Department of Environmental Protection (MADEP) Quality Assurance Project Plan (QAPP), Seafood Contaminant Survey, New Bedford Harbor Superfund Site, Revision 19.0 (MADEP, 2025). Data were validated following Stage 2A and/or Stage 2B checks (USEPA, 2009) as specified in the QAPP. In accordance with the QAPP, Stage 2A data validation was performed on 95 percent of the samples, and Stage 2B data validation was performed on 5 percent of the samples. For the 2025 sampling events, Stage 2B validation was performed on the following Bluefish samples (SDG L2529228):

<u>Quahog</u>

- NBH25-SF-A-1
- NBH25-SF-B-2
- NBH25-SF-G-2

- NBH25-SF-H-2
- NBH25-SF-I-3

Data qualifications were completed, if necessary, in accordance with the guidelines or the professional judgment of the project chemist. The following qualifiers as reported by the laboratory or applied during data validation are included in the final data set:

J = The reported concentration is considered an estimated value

J- = The reported concentration is considered an estimated value with potential low bias

J+ = The reported concentration is considered an estimated value with potential high bias

U = The target compound was not detected above the method detection limit or was qualified as not detected during data validation

UJ = The target compound was not detected and the associated detection limit is estimated

R = The result was rejected and considered not usable.

For Stage 2A data validation, data were evaluated for the following parameters:

* Collection and Preservation
Holding Times
* Data Completeness
* Initial Calibration (for Stage 2A only if problems noted in case narrative)
Continuing Calibration (for Stage 2A only if problems noted in case narrative)
* Blanks
* Surrogate Standards
Standard Reference Material (SRM)
Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD)
Matrix Spike/Matrix Spike Duplicates (MS/MSD)
Laboratory Duplicates
* Internal Standards (for Stage 2A only if problems noted in case narrative)
* Instrument Tune (for Stage 2A only if problems noted in case narrative)
* Target Compound Quantitation (for Stage 2A only if problems noted in case narrative)
* Miscellaneous

* - all criteria were met for this parameter

For Stage 2B data validation, the above checks were completed along with evaluations of initial calibrations, continuing calibrations, instrument tuning, and internal standards using summary forms provided in the data package.

DATA VALIDATION SUMMARY

In general, laboratory performance is considered acceptable. With the exception of the R qualified results, all results are usable as qualified. A summary of analytical results can be found in Table 2. The following qualifying statements have been applied to the 2025 data.

<u>Holding Times</u>

PCB (L2528431) – The extraction hold time was exceeded for the re-analysis of samples in this data set. Re-extracted results were refuse flagged and initial run results were utilized.

PCB (L2529218) – The following dissolved PCB samples were received at the laboratory beyond the 24-hour hold time for filtration:

- NBH25-SW-J-3- DISSOLVED
- NBH25-SW-I-3- DISSOLVED
- NBH25-SW-A-1- DISSOLVED
- NBH25-SW-H-2- DISSOLVED
- NBH25-SW-B-2- DISSOLVED
- NBH25-SW-G-2- DISSOLVED

Associated results were qualified estimated (UJ/J) due to hold time exceedance. Qualified results are listed in Table 3 with reason code HT.

Initial and Continuing Calibration

PCB (L2529228) – The continuing calibration standard associated with samples NBH25-SF-I-3, NBH25-SF-A-1, NBH25-SF-H-2, NBH25-SF-B-2, NBH25-SF-G-2, and AII-E-BF had percent recoveries for the following compounds outside of quality control limits

- Cl2-BZ#9
- Cl2-BZ#7
- Cl2-BZ#6
- Cl2-BZ#5
- Dichlorobiphenyls

Results for these congeners were qualified as estimated (UJ/J). Qualified results are listed in Table 3 with reason code CCV%D.

Standard Reference Material

PCB (L2533169) – The SRM recoveries associated with samples NBH25-SF-D-1, NBH25-SF-E-1, and NBH25-SF-B-3 were outside quality control limits for the following congeners:

- Cl4-BZ#74 (176)
- CL4-BZ#66 (152)

Results for NBH25-SF-D-1, NBH25-SF-E-1, and NBH25-SF-B-3 were qualified as estimated (J+) with reason code LCSH.

PCB (L2559311) – The SRM recoveries associated with samples All-A-BF, All-B-BF, All-C-BF, AII-D-BF, AIII-A-BF, AIII-B-BF, AIII-C-BF, AIII-D-BF, AIII-E-BF, and NBH25-SF-D3 were outside quality control limits for the following congeners:

- Cl3-BZ#31 (194)
- Cl3-BZ#28 (159)
- Cl4-BZ#52 (200)

- Cl4-BZ#49 (226)
- Cl4-BZ#44 (191)
- Cl4-BZ#74 (308)
- Cl4-BZ#70 (226)
- Cl4-BZ#66 (262)
- Cl4-BZ#56 (270)
- Cl5-BZ#118 (184)
- Cl6-BZ#146 (226)
- Cl6-BZ#153 (161)
- Cl5-BZ#105 (157)
- Cl6-BZ#138 (175)
- Cl7-BZ#187 (154)
- Cl7-BZ#183 (189)
- Cl6-BZ#126 (174)
- Cl7-BZ#177 (155)
- Cl7-BZ#180 (182)

Detections for these congeners in associated samples were qualified as estimated (J+) with reason code LCSH.

The SRM recoveries associated with AII-A-BF, AII-B-BF, AII-C-BF, AII-D-BF, AIII-A-BF, AIII-B-BF, AIII-C-BF, AIII-D-BF, AIII-E-BF, and NBH25-SF-D3 were outside quality control limits and less than 10 percent for the following congener:

- Cl5-BZ#82 (0)

Associated results for this congener were rejected (R) with reason code LCSL.

PCB (L2565619) – The SRM recoveries associated with samples NBH25-1-BF-1, NBH25-1-BF-2, NBH25-1-BF-3, NBH25-1-BF-4, NBH25-1-BF-5, NBH25-1-BF-6, NBH25-1-BF-7, NBH25-1-SB-A, NBH25-1-SB-B, NBH25-1-SB-C, NBH25-1-SB-D, NBH25-1-SB-E, NBH25-1-SB-F, NBH25-SF-A-2, NBH25-SF-B-2, NBH25-SF-C-2, NBH25-SF-D-2, NBH25-SF-E-2, NBH25-SF-A-3, NBH25-SF-B-3, NBH25-SF-C-3, and NBH25-SF-E-3 were outside quality control limits for the following congeners:

- Cl3-BZ#18 (285)
- Cl3-BZ#28 (302)
- Cl3-BZ#31 (326)
- Cl4-BZ#44 (299)
- Cl4-BZ#49 (350)
- Cl4-BZ#52 (304)
- Cl4-BZ#56 (394)
- Cl4-BZ#66 (463)
- Cl4-BZ#70 (350)
- Cl4-BZ#74 (515)
- Cl5-BZ#105 (259)
- Cl5-BZ#110 (223)
- Cl5-BZ#118 (326)
- Cl5-BZ#82 (292)

- Cl5-BZ#92 (252)
- Cl5-BZ#99 (197)
- Cl6-BZ#128 (295)
- Cl6-BZ#138 (319)
- Cl6-BZ#146 (321)
- Cl6-BZ#151 (201)
- Cl6-BZ#153 (262)
- Cl7-BZ#177 (267)
- Cl7-BZ#180 (288)
- Cl7-BZ#183 (279)
- Cl7-BZ#187 (226)

Detections for these congeners in associated samples were qualified as estimated (J+) with reason code LCSH.

Laboratory Control Sample/Laboratory Control Sample Duplicate

PCB (L2527188) – The LCS/LCSD associated with oyster samples NBH25-OY-AVX, NBH25-OY-MANO, and NBH25-OY-P265 had percent recoveries greater than the control limit of 40-140 for the following congener:

- Cl2-BZ#13 (141/142)

Detections for this congener in the associated samples were qualified as estimated (J+) with reason code LCSH.

PCB (L2528436) – The LCS/LCSD associated with quahog samples NBH25-SF-C-1, NBH25-SF-B-1, NBH25-SF-C-2, NBH25-SF-D-2, NBH25-SF-F-2, and NBH25-SF-D-3 had percent recoveries greater than the control limit of 40-140 for the following congener:

- Cl2-BZ#13 (141/142)

Detections for this congener in the associated samples were qualified as estimated (J+) with reason code LCSH.

Matrix Spike

PCB (L2527188) – The MS associated with oyster sample NBH25-OY-P265 had percent recoveries greater than the 40-140 control limits for the following congeners:

- Cl3-BZ#26 (155)
- Cl3-BZ#31 (179)
- Cl3-BZ#28 (179)
- Cl4-BZ#47 (198)
- Cl4-BZ#74 (141)
- Cl4-BZ#70 (145)
- Cl4-BZ#66 (160)
- Cl5-BZ#101/#90 (193)
- Cl6-BZ#147/#149 (153)

Detections for these congeners in scup sample NBH25-OY-P265 were qualified estimated (J+) with reason code MSH and may represent a potential high bias.

The MS associated with oyster sample NBH25-OY-P265 had percent recoveries greater than the 40-140 control limits for the following congeners:

- Cl4-BZ#52 (273)
- Cl4-BZ#49 (278)
- Cl5-BZ#99 (213)
- Cl5-BZ#110 (234)
- Cl5-BZ#118 (251)
- Cl5-BZ#153 (245)

The native sample result for these congeners was greater than 5x the spiked solution concentration. No qualification actions were made for these congeners in sample NBH25-OY-P265.

PCB (L2533169) – The MS associated with oyster sample NBH25-SF-D-1 had percent recoveries greater than the 40-140 control limits for the following congeners:

- Cl4-BZ#52 (141)

Detections for these congeners in scup sample NBH25-SF-D-1 were qualified estimated (J+) with reason code MSH and may represent a potential high bias.

PCB (L2563561) – The MS associated with bluefish sample NBH25-1-BF-1 had percent recoveries less than the 40-140 control limits for the following congeners:

- Cl3-BZ#31 (36)
- Cl3-BZ#28 (18)
- Cl4-BZ#52 (0)
- Cl4-BZ#49 (0)
- Cl5-BZ#101/#90 (0)
- Cl5-BZ#99 (0)
- Cl5-BZ#110 (0)
- Cl5-BZ#118 (18)
- Cl6-BZ#138 (36)

The native sample result for these congeners was greater than 5x the spiked solution concentration. No qualification actions were made for these congeners in sample NBH25-1-BF-1.

<u>Laboratory Duplicates</u>

PCB (L2565619) – The laboratory duplicate associated with conch sample NBH25-SF-A-2 had an RPD greater than the control limit of 30 for the following congener:

- Cl6-BZ#157 (34)

Detections of this congener in conch sample NBH25-SF-A-2 were qualified estimated (J) with reason code LD.

PCB (L2559311) – The laboratory duplicate associated with bluefish sample All-A-BF had an RPD greater than the control limit of 30 for the following congeners:

- Cl5-BZ#99 (33)
- Cl7-BZ#176 (70)
- Cl7-BZ#174 (44)
- Trichlorobiphenyls (42)

Detections of these congeners in bluefish sample All-A-BF were qualified estimated (J) with reason code LD.

PCB (L2529228) – The laboratory duplicate associated with quahog sample NBH25-SF-J-3 had an RPD greater than the control limit of 30 for the following congeners:

- Tetrachlorobiphenyls (48)

Detections of this congener in quahog sample NBH25-SF-J-3 were qualified estimated (J) with reason code LD.

Sensitivity

Laboratory reporting limits were found to be acceptable for tissue and surface water samples.

NOTES:
B = biological FS = field sample
L = liquid
ug/kg = microgram per kilogram
ng/L = nanograms per liter
U = not detected at the reported detection limit
UJ = estimated value at the reporting limit
J = estimated value
J+ = estimated value biased high
R = rejected result

B = biological FS = field sample
L = liquid
ug/kg = microgram per kilogram
ng/L = nanograms per liter
U = not detected at the reported detection limit
UJ = estimated value at the reporting limit
J = estimated value
J+ = estimated value biased high
R = rejected result

NOTES:
B = biological FS = field sample
L = liquid
ug/kg = microgram per kilogram
ng/L = nanograms per liter
U = not detected at the reported detection limit
UJ = estimated value at the reporting limit
J = estimated value
J+ = estimated value biased high
R = rejected result

NOTES:
B = biological FS = field sample
L = liquid
ug/kg = microgram per kilogram
ng/L = nanograms per liter
U = not detected at the reported detection limit
UJ = estimated value at the reporting limit
J = estimated value
J+ = estimated value biased high
R = rejected result

NOTES:
B = biological FS = field sample
L = liquid
ug/kg = microgram per kilogram
ng/L = nanograms per liter
U = not detected at the reported detection limit
UJ = estimated value at the reporting limit
J = estimated value
J+ = estimated value biased high
R = rejected result

NOTES:
B = biological FS = field sample
L = liquid
ug/kg = microgram per kilogram
ng/L = nanograms per liter
U = not detected at the reported detection limit
UJ = estimated value at the reporting limit
J = estimated value
J+ = estimated value biased high
R = rejected result

Seafood Monitoring - Field Sampling Activities for the New Bedford Harbor Superfund Site 2025 Annual Report

Ross Kessler, Marine Fisheries Biologist
Massachusetts Division of Marine Fisheries
November 17, 2025

The Massachusetts Division of Marine Fisheries (MDMF) under an agreement with the Massachusetts Department of Environmental Protection (MassDEP) collects legal-sized fish and shellfish from the three New Bedford Harbor fish closure areas. During the collection period, these samples are delivered to MassDEP approved Laboratories for analysis. MassDEP provides the results of the analyses to EPA to monitor and support the site remediation project. This report describes MDMF's field activities in 2025 in accordance with the Seafood Monitoring and Field Sampling Work Plan and makes recommendations for the upcoming 2026 field season based on results obtained during the previous field season.

Sample Sites

The three Fish Closure Areas are identified in Attachment 1 - Figure 1 from the EPA Record of Decision for the Upper and Lower Operable Unit, New Bedford Harbor Superfund Site, New Bedford, Massachusetts, dated September 25, 1998. These three Fish Closure Areas were designated by the Massachusetts Department of Public Health in 1979. Area 1 includes the waters of the Acushnet River and the New Bedford/Fairhaven Inner Harbor north of the Hurricane Barrier. Area 2 comprises the waters of the Outer Harbor and Clarks Cove south of the Hurricane Barrier and north of a line drawn from Wilbur Point in Fairhaven to Ricketsons Point in Dartmouth. Area 3 is that portion of Buzzards Bay south of the line drawn from Wilbur Point in Fairhaven to Ricketsons Point in Dartmouth and north of a line drawn from Rocky Point on West Island in Fairhaven to the Wampanoag Ledge (formerly Negro Ledge) C3 buoy then to Mishaum Point in Dartmouth.

There are five original sample stations in each of the three fish closure areas in the waters of the City of New Bedford and the Towns of Dartmouth and Fairhaven. Station locations within each area vary for different species as what may be suitable habitat for one species may not be suitable for another (Attachment 1 – Figures 1 - 6).

2025 Field Collections

Attachment 2 – Collection Sheets 1 - 5 contain data on the harvest dates, collection identification information, species, station identification information, location by latitude and longitude, and collection method.

Quahog (*Mercenaria mercenaria*)
Marine Fisheries collected pre-spawn quahog and water samples from all stations in Areas 1, 2, and 3 by rake and SCUBA (Figure 2 and Collection Sheet 1).

Channeled whelk (*Busycon canaliculatum)* and knobbed whelk *(Busycon carica)*
Channeled and knobbed whelk (conch) were collected from all ten stations in Areas 2 and 3 from September - October using baited conch pots (Figure 3 and Collection Sheet 3).

American Oyster (*Crassostrea virginica*)
Marine Fisheries collected pre-spawn oyster and water samples from 3 stations in Areas 1 walking along the shoreline at low tide (Figure 4 and Collection Sheet 2).

Bluefish (*Pomatomus saltatrix*)
Bluefish were caught using hook and line in Areas 1-3 (Figure 5 and Collection Sheet 4).

Striped Bass (*Morone saxatillis*)
Striped bass were caught using hook and line in Area 1 (Figure 6 and Collection Sheet 5).

Planning for 2026 Field Collections

As per the Sampling Plan, the following collections will be made. Pre-spawn quahogs will be collected from Areas 1, 2, and 3. Pre-spawn oysters will be collected from Area 1. Water collections will be made with quahog and oyster collections. Whelk will be collected from Areas 2 and 3. Bluefish will be captured in Areas 1-3. Striped bass will be caught in Areas 1-3.

Notes

As noted in this report, the feature formerly known as 'Negro Ledge' in Buzzards Bay has been renamed, 'Wampanoag Ledge.' Steps should be taken to refer to this bathymetric feature accordingly.

Memorandum

From: Paul Craffey
To: File
Date: April 22, 2026
Subject: PCB Congener Calculations 136 vs 148 and 148 vs 209

Introduction

A trend of the various species for PCB concentrations for the New Bedford Harbor Superfund Seafood Monitoring program can be developed using the existing years of available data sets. To ensure that a trend is as accurate as possible, the same specific congeners were analyzed each year so a comparison can be made between the various years of data. Between the years 2003 to 2016, 136 PCB congeners were analyzed for each sample. For the years 2017 to 2024, there were 148 PCB congeners analyzed in each sample. In the year 2025, all 209 PCB congeners were analyzed in each sample. The purpose of this memo is to determine what, if any, the impact of additional congeners had on the trend reporting.

136 vs 148 Congeners

In the year 2017, the following additional PCB congeners were analyzed: BZ#20, #68, #73, #88, #90, #111, #112, #121, #125, #160, #164, and #204. These additional PCB congeners represent an 8.7% increase in the number of PCB congeners. Despite the increase in the number of PCB congeners, there was only a 1.9 % increase for conchs and 0.7 % increase in quahogs in PCB concentrations (Ref. 1). Given the small increase in the PCB concentration relative to the increase in the number of PCB congeners, after 2017 the trend was calculated with the 148 congeners and not the 136-congener subset.

148 vs 209 Congeners

In 2025, the total number of congeners was increase to 209, with 61 new congeners. This is a 41.2% increase in the number of congeners (61/148 x 100). The percent increase in PCB concentrations for bluefish (average 2.4% increase, range of 1.9% to 2.7%), conch (average 1.5% increase, range of 0% to 2.2%), oysters (average 3.2% increase, range of 3.1% to 3.4%), quahogs (average 2% increase, range of 0% to 3.2%), and striped bass (average 2.5% increase, range of 2.4% to 2.6%) are shown on Tables 1 to 5. In comparing the 148 vs. 209 congeners, there is an average of 2.3% increase in total PCB concentrations for the five species analyzed. This increase in PCB concentration values is not a significant change in the total PCB concentration results. So, the analysis with 209 congeners can be compared to the previous years of analysis with the 148 congeners.
