## **1.0 INTRODUCTION**

### **1.1 SITE NAME, LOCATION, AND DESCRIPTION**

The New Bedford Harbor Superfund Site, located in Bristol County, Massachusetts, extends from the shallow northern reaches of the Acushnet River estuary south through the commercial harbor of New Bedford and into 17,000 adjacent areas of Buzzards Bay (Figure 1). Industrial and urban development surrounding the harbor has resulted in sediments becoming contaminated with high concentrations of many pollutants, notably polychlorinated biphenyls (PCBs) and heavy metals, with contaminant gradients decreasing from north to south. From the 1940s into the 1970s two electrical capacitor manufacturing facilities, one located near the northern boundary of the site and one located just south of the New Bedford Harbor hurricane barrier, discharged PCB wastes either directly into the harbor or indirectly via discharges to the City's sewerage system. The Site has been divided into three areas – the upper, lower and outer harbors – consistent with geographical features of the area and gradients of contamination. The Site is also defined by three state-sanctioned fishing closure areas extending approximately 6.8 miles north to south and encompassing approximately 18,000 acres in total.

The City of New Bedford, located along the western shore of the Site, is approximately 55 miles south of Boston. During most of the 1800s, New Bedford was a world renowned center of the whaling industry and attracted a large community of immigrants from Portugal and the Cape Verde islands. Including the neighboring towns of Acushnet, Fairhaven and Dartmouth, the combined 2000 population was approximately 151,000. New Bedford is currently home port to a large offshore fishing fleet and is a densely populated manufacturing and commercial center. By comparison, the eastern shore of New Bedford Harbor is predominantly residential or undeveloped. A large (approximately 70 acre) salt marsh system has formed along almost the entire eastern shore of the upper harbor.

The Acushnet River's 16.5 square mile (43 km<sup>2</sup>) drainage basin (VHB, 1996) discharges to New Bedford Harbor in the northern reaches of the Site, contributing on average relatively minor (except during high periods of runoff) volumes of fresh water to the tidally influenced harbor. Numerous storm drains, combined sewer overflows (CSOs) and industrial discharges as well as smaller brooks and creeks also discharge directly to the Site. The upper and lower harbors are areas of net groundwater discharge and are generally described as a shallow, well-mixed estuary.

The upper harbor comprises approximately 187 acres, with current sediment PCB levels ranging from below detection to approximately 4,000 parts per million (ppm). Prior to the removal of the most contaminated hot spot sediments in 1994 and 1995 as part of EPA's first cleanup phase, sediment PCB levels were reported higher than 100,000 ppm in the upper harbor. The boundary between the upper and lower harbor is the Coggeshall Street Bridge where the width of the harbor narrows to approximately 100 feet. The lower harbor comprises approximately 750 acres, with sediment PCB levels ranging from

below detection to over 100 ppm. The boundary between the lower and outer harbor is the 150 foot wide opening of the New Bedford hurricane barrier, constructed in the mid-1960s. Sediment PCB levels in the outer harbor are generally low, with only localized areas of PCBs in the 50-100 ppm range near the Cornell-Dubilier plant and the City's sewage treatment plant's outfall pipes. The southern extent of the outer harbor and the Site is an imaginary line drawn from Rock Point (the southern tip of West Island in Fairhaven) southwesterly to Negro Ledge and then southwesterly to Mishaum Point in Dartmouth.

## 1.2 SITE HISTORY AND ENFORCEMENT ACTIVITY

Identification of PCB-contaminated sediments and seafood in and around New Bedford Harbor was first made in the mid 1970s as a result of EPA region-wide sampling programs. Total PCB usage in New Bedford at this time was around two million pounds per year (Nelson et al., 1996). In 1978, the manufacture and sale of PCBs was banned by the federal Toxic Substance Control Act (TSCA). In 1979, the Massachusetts Department of Public Health promulgated regulations prohibiting fishing and lobstering throughout the Site due to elevated PCB levels in area seafood. Elevated levels of heavy metals in sediments (notably cadmium, chromium, copper and lead) were also identified during this time frame. Due to these concerns, the Site was proposed for the Superfund National Priorities List (the NPL) in 1982, and finalized on the NPL in September 1983. Pursuant to 40 CFR 300.425(c)(2), the Commonwealth of Massachusetts nominated the Site as its priority site for listing on the NPL.

EPA's site-specific investigations began in 1983 and 1984 with the Remedial Action Master Plan (Weston, 1983) and the Acushnet River Estuary Feasibility Study (NUS, 1984). Site investigations continued throughout the rest of the 1980s and early 1990s, including a pilot dredging and disposal study in 1988 and 1989 (Otis et al., 1990), which field tested different dredging and disposal techniques for upper harbor sediments. Site investigations also included extensive physical and chemical computer modeling of the Site (Battelle, 1990). These Site studies are summarized in more detail in the ROD for the hot spot areas of the Site (EPA, 1990) and in the 1990 Feasibility Study for the Site (Ebasco, 1990).

Collectively, these investigations identified the Aerovox facility as the primary source of PCBs to the Site. PCB wastes were discharged from Aerovox's operations directly to the upper harbor through open trenches and discharge pipes, or indirectly throughout the Site via CSOs and the City's sewage treatment plant outfall. Secondary inputs of PCBs were also made from the Cornell-Dubilier Electronics, Inc. (CDE) facility just south of the New Bedford hurricane barrier.

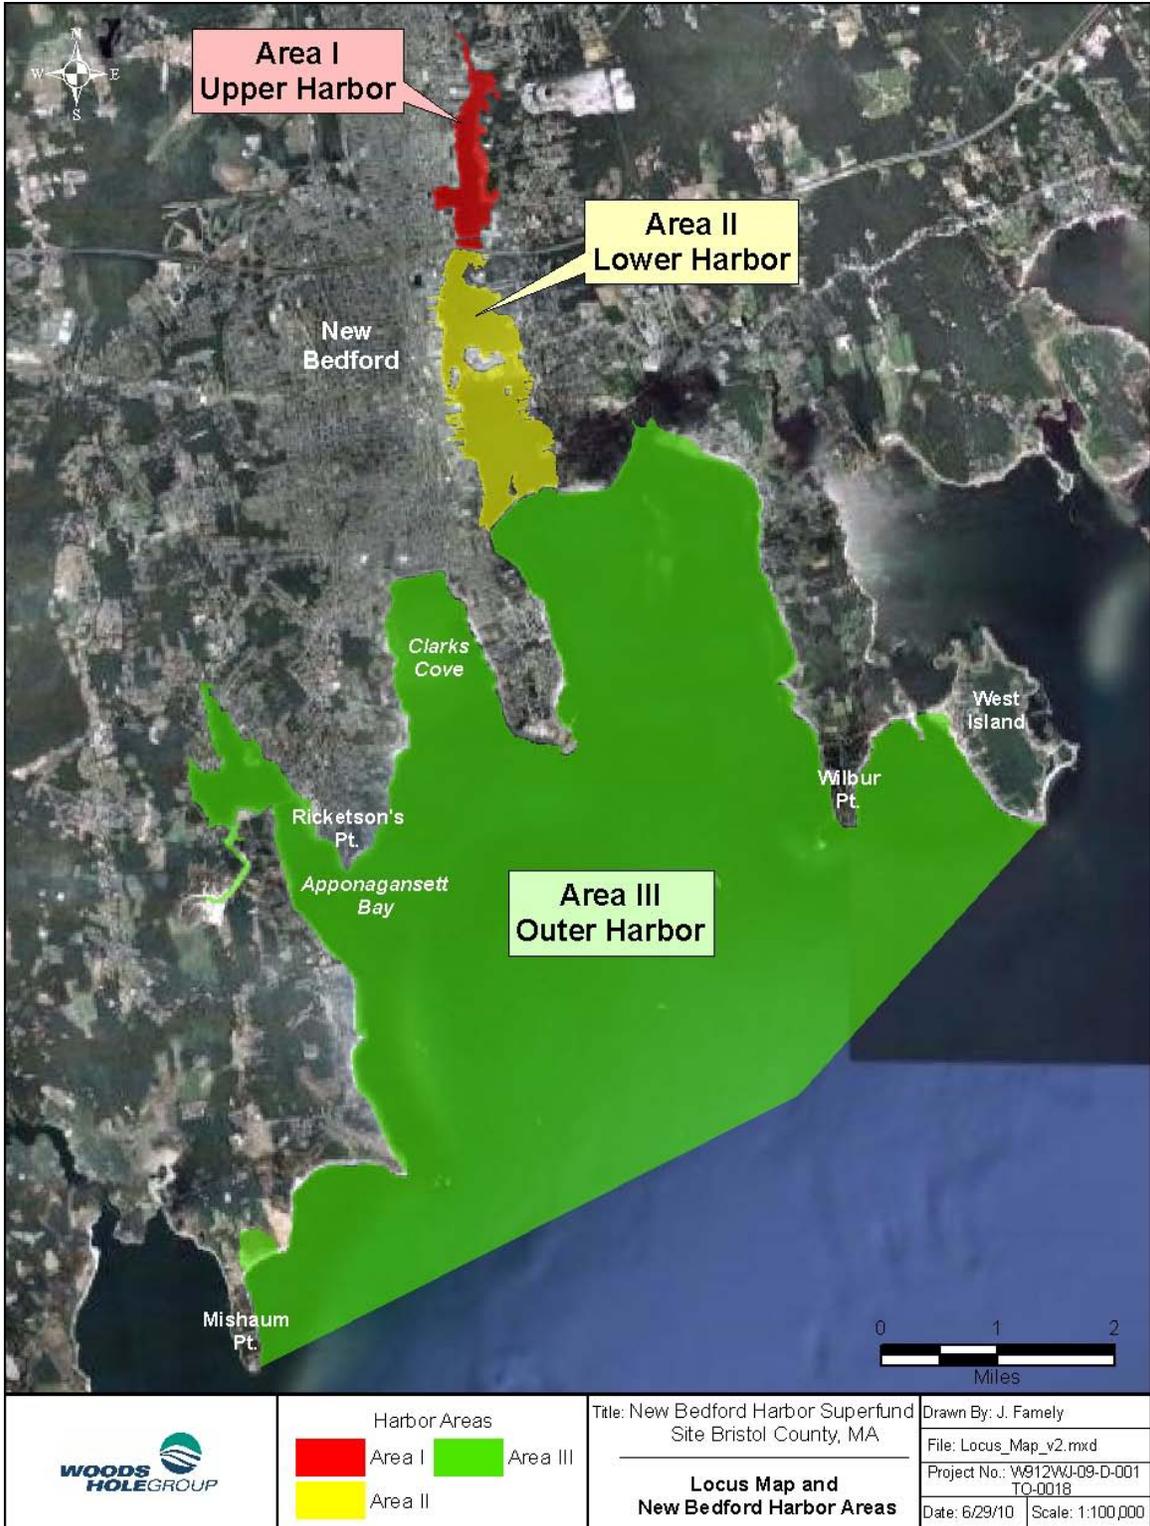

Figure 1. Site Map

In April 1990, EPA issued the ROD for the hot spot operable unit of the Site. The hot spot ROD called for dredging and on-site incineration of the Site's most highly PCB-contaminated sediments located adjacent to the Aerovox facility. The ROD specified a 4,000 ppm PCB level to define the sediments to be dredged (sediments below this 4,000 ppm threshold were to be left in place). Dredging of these sediments – about 14,000 cubic yards (cy) in volume and 5 acres in area – began in April 1994 and was completed in September 1995. However, due to a vehement and congressionally-supported reversal in local support for on-site incineration during the initial mobilization stage, EPA suspended the incineration component of the hot spot remedy (EPA, 1995). The dredged hot spot sediments were therefore placed in interim storage in a shoreline confined disposal facility (CDF) near Sawyer Street in New Bedford, and ultimately transported in 1999 to an offsite TSCA landfill.

In September 1998, EPA issued ROD 2, the ROD for the upper and lower harbor operable unit (EPA, 1998). ROD 2 called for the dredging of approximately 450,000 cy of PCB-contaminated sediments, and disposal in four shoreline CDFs. Two localized areas of PCB-contaminated sediment located just south of the hurricane barrier were also included in ROD 2 (as illustrated by Figure 22 of ROD 2). Both areas are in the general vicinity of the pilot sub-aqueous cap installed by EPA in 2005. Further investigation of the outer harbor area of the Site is underway, as part of operable unit three (OU-3), to determine whether additional remediation is appropriate for this area.

On August 15, 2002 EPA issued a change to the 1998 harbor cleanup plan using a process known as an Explanation of Significant Difference (ESD) (EPA 2002). This ESD, which follows an earlier ESD issued in September 2001, eliminates CDF "D", the largest of the four CDFs (confined disposal facilities), and instead sends the dredged sediment slated for it to an offsite landfill. This ESD as well as other site information is available for review at the New Bedford Free Library (reference section), at EPA's Boston Records Center and on-line at the New Bedford Harbor Superfund Site website at [www.epa.gov/ne/nbh](http://www.epa.gov/ne/nbh).

### 1.3 PURPOSE AND SCOPE OF STUDY

In order to assess the effectiveness of the New Bedford Superfund remediation efforts, a long term environmental monitoring plan has been developed by the US Environmental Protection Agency's Research Laboratory, Atlantic Ecology Division in Narragansett, Rhode Island (AED). The plan incorporates an intensive sampling and analysis effort for the purpose of quantifying the long-term environmental effects of reduced PCB levels in the sediments and water column of the New Bedford Harbor estuary as a result of remediation efforts. The four previous sampling rounds for this program include the "baseline" sampling event conducted in October 1993 (LTM I), a second event (LTM II) conducted immediately after removal of the "hot spot" sediments in OU#2 during October of 1995, a third event conducted in 1999 (LTM III), and a fourth event conducted in 2004 by Battelle (LTM IV). The fifth event was conducted in 2009 (LTM V). This Summary Report describes the field and laboratory components of the LTM V

program, and presents the LTM V data. Sample collection was completed in September of 2009 by Woods Hole Group, Inc., the prime contractor for this work.

The typical suite of analyses for LTM assessments historically included water quality measurements, sediment analyses for PCB congeners, metals (arsenic, cadmium, chromium, copper, lead, mercury, nickel, selenium), acid volatile sulfides (AVS), total organic carbon (TOC), grain size, sediment toxicity testing, and benthic biology assessments. Sediment analyses for metals, AVS, and toxicity were not pursued in LTM V due to budgetary constraints.

## **2.0 METHODS**

### **2.1 QUALITY ASSURANCE**

Quality Assurance (QA) for this project is presented in detail in the Quality Assurance Project Plan (QAPP) developed for the LTM V survey (Woods Hole Group, 2009a).

### **2.2 FIELD METHODS**

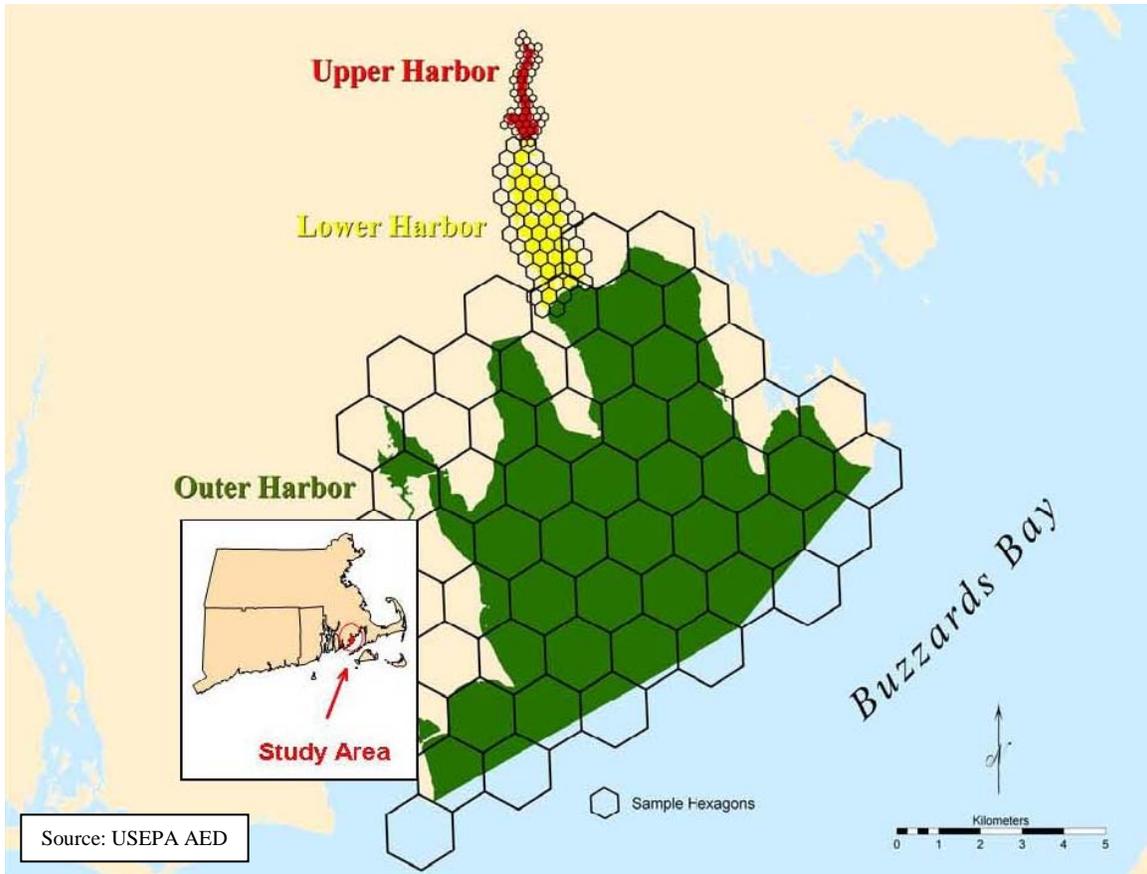

Detailed accounts of field sampling events and methods are provided in the NBH LTM V Field Sampling Report (Woods Hole Group, 2009b).

The field sampling program followed the guidelines and protocols (Strobel, 2000) developed for the Environmental Monitoring and Assessment Program (EMAP), an EPA program developed to monitor and assess the status and trends of national ecological resources over multiple spatial and temporal scales. Sampling was conducted at 79 separate stations located in three distinct geographical areas of New Bedford Harbor.

- **Area I:** Woods Street to the Coggeshall Street Bridge (27 stations)
- **Area II:** Coggeshall Street Bridge to the Hurricane Barrier (29 stations)
- **Area III:** Hurricane Barrier to the edge of Fishing Closure Area 3 (23 stations)

A hexagonal sampling grid was established by EPA AED within each of the three sampling areas (Figure 2). In order to obtain representative samples, the hexagonal sampling grid was proportionally adjusted to scale with the progressively larger sampling areas. The hexagons in Area I (Upper Harbor) have a radius (center to side mid-point) of 88m; the hexagons in Area II (Lower Harbor) have a radius of 175m; the hexagons in Area III (Outer Harbor) have a radius of 793m.

The target sampling stations and as-sampled stations are shown in Figures 3 through 5. As-sampled stations are displayed in green and mostly overlap target stations (yellow).

**Figure 2. LTM Sampling Areas and Sampling Hexagons**

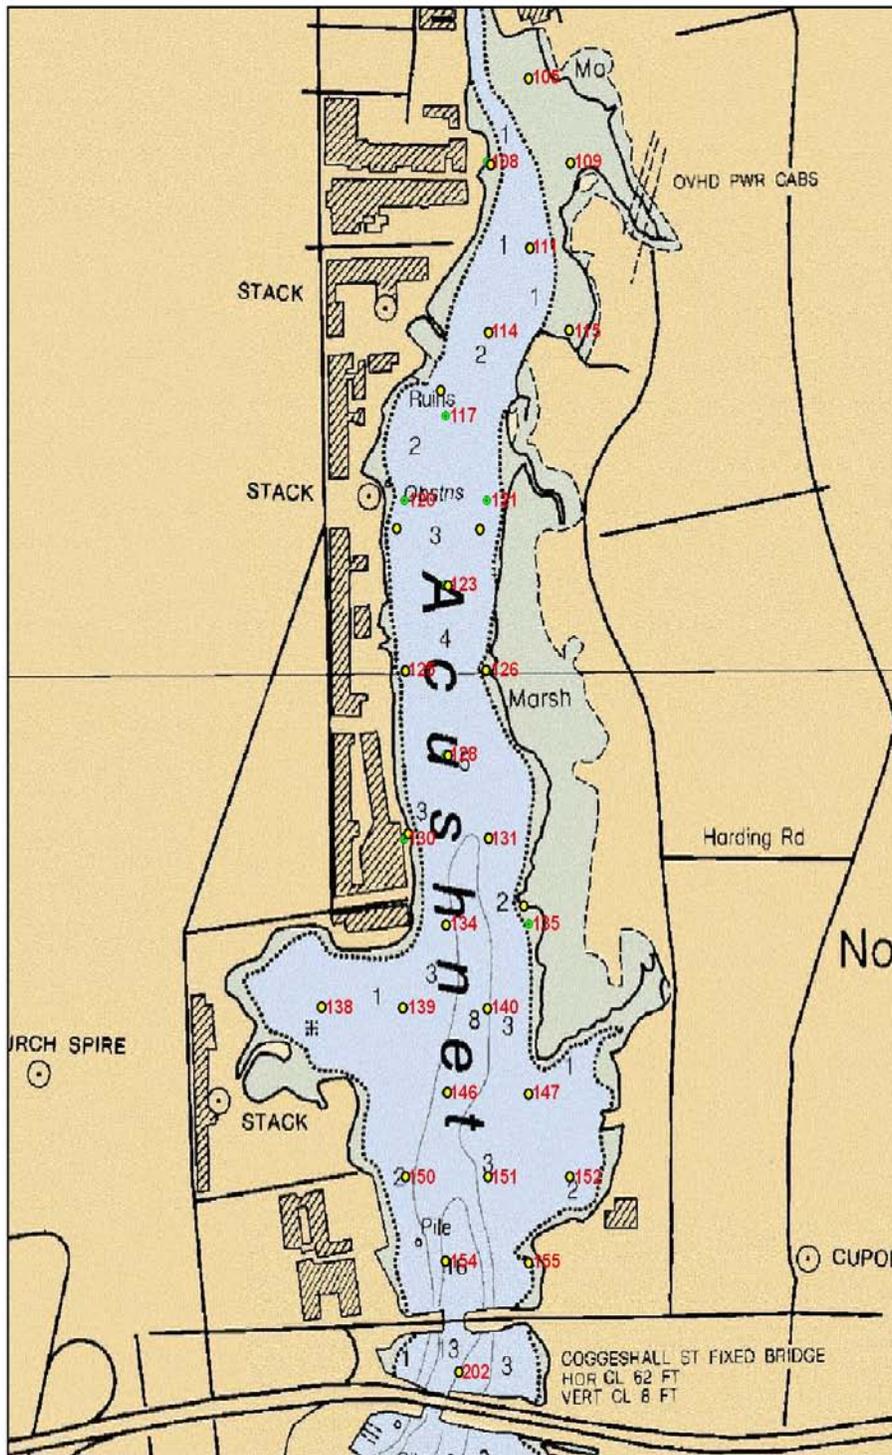

Figure 3. Area I Sampling Stations (Stations 105 – 202)

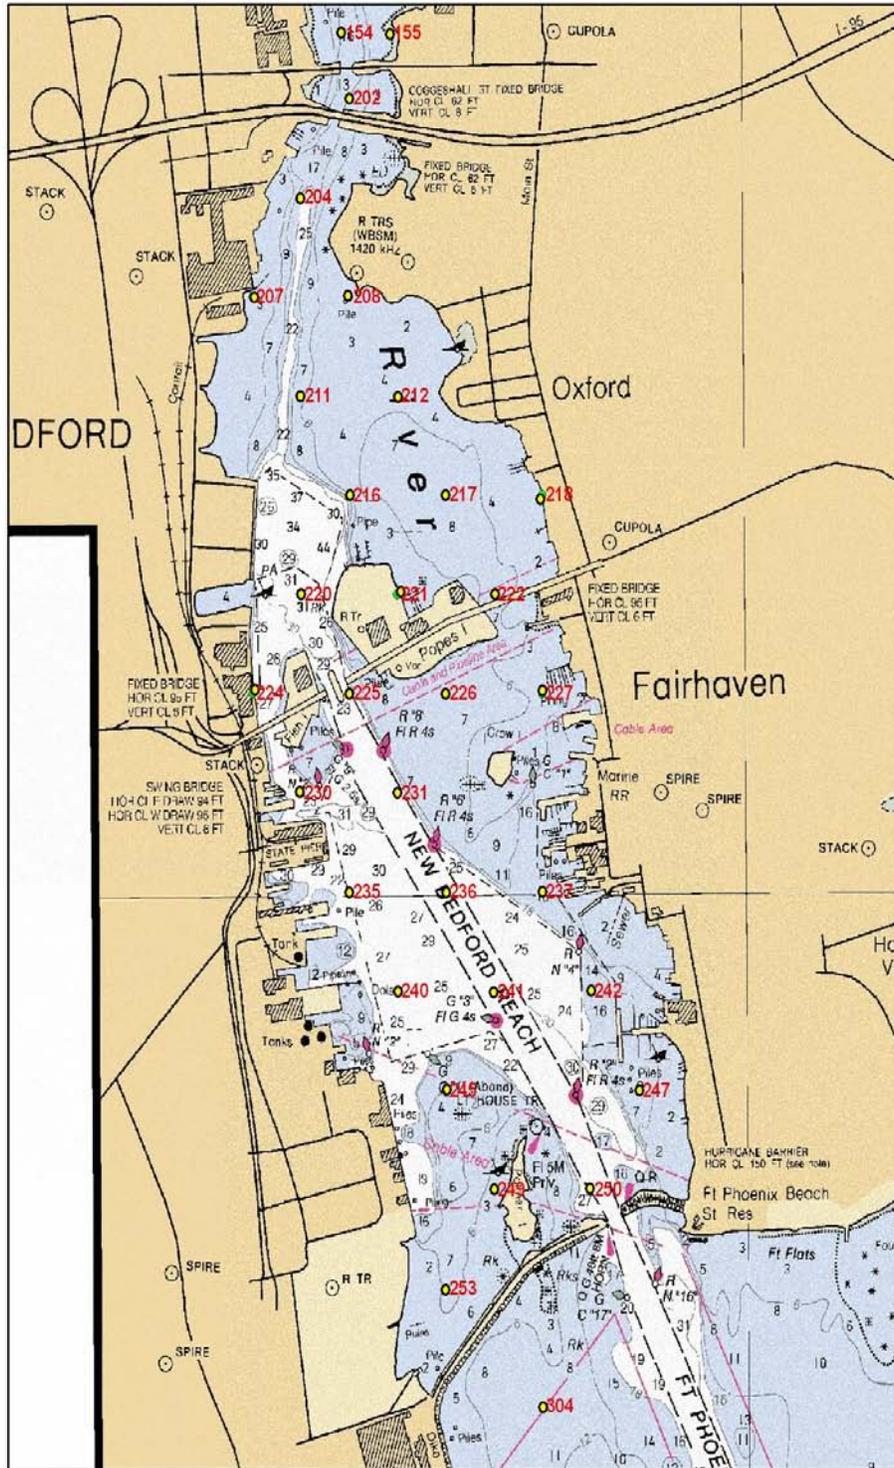

Figure 4. Area II Sampling Stations (Stations 204 – 253)

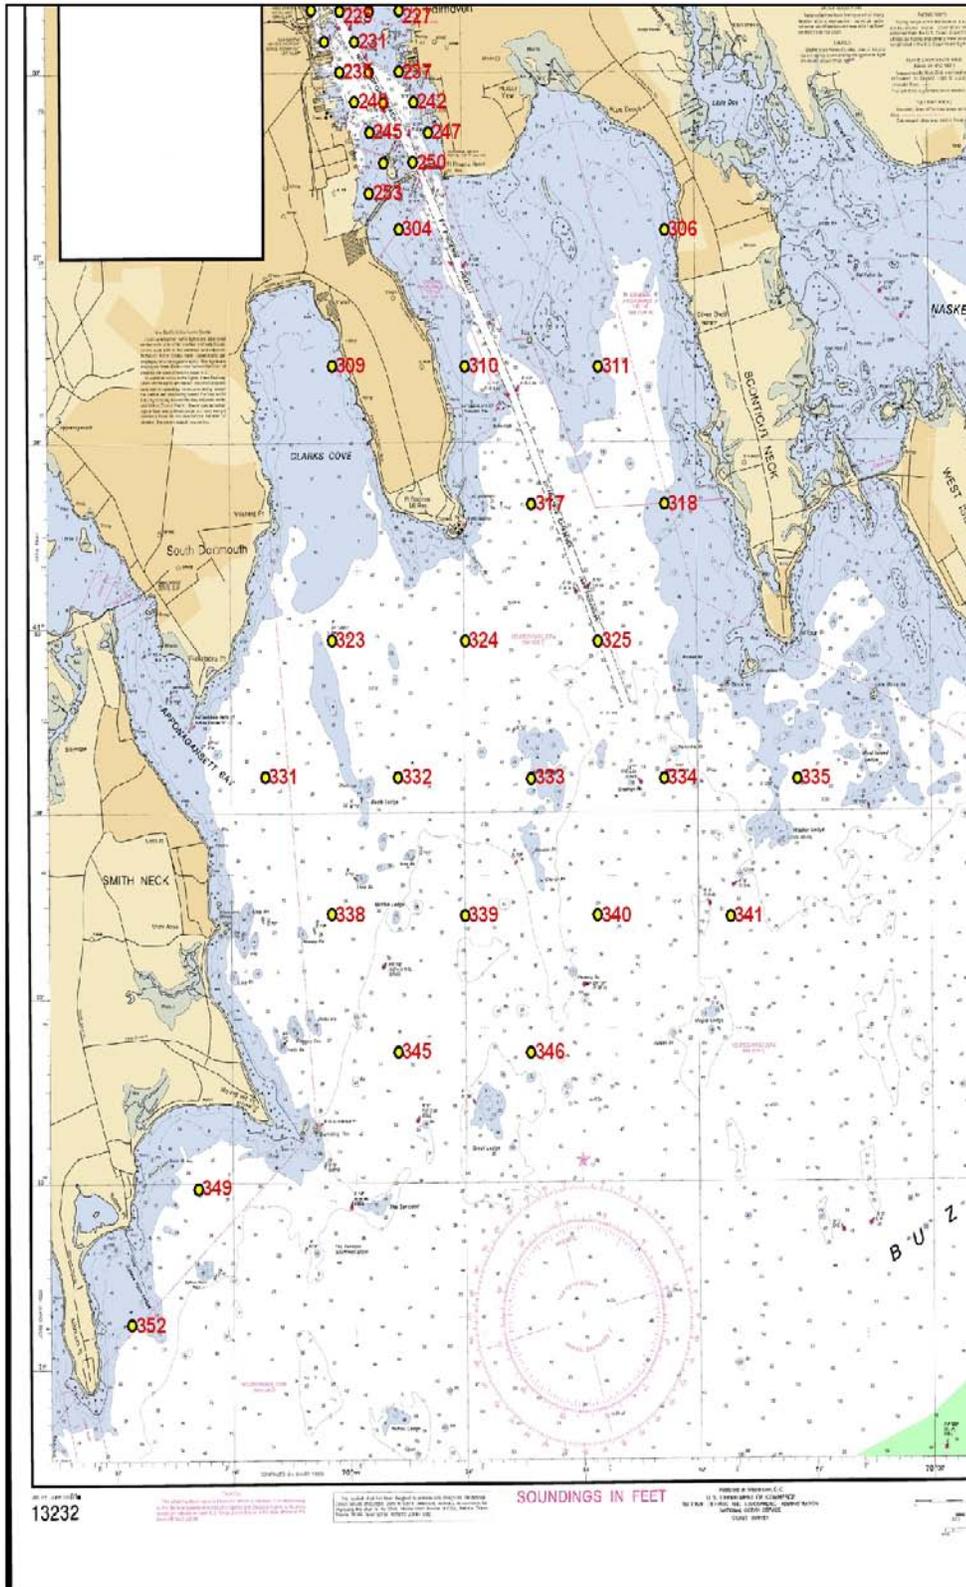

Figure 5. Area III Sampling Stations (Stations 304 – 352)

Navigation was performed using a Differential Global Positioning System (DGPS). Stations were initially located using the target coordinates established during the 1993 and 1995 surveys (Appendix A of the QAPP). In general, the targets were achieved. However, where the target coordinates were either inshore of navigable waters, or were inside the no-spud areas in the dredge area, the sample was relocated to the nearest acceptable location. All as-sampled locations were within the bounds of the associated station hexagon.

At each station, in situ water quality measurements were taken prior to the collection of sediment samples. Measured parameters included salinity, temperature, and dissolved oxygen. YSIs were used to collect water quality data from one meter above the bottom, unless limited by shallow water (in which case measurements were taken just above the bottom). Sediment samples at each station were collected for the analysis of PCBs (18 NOAA Congeners), total organic carbon (TOC), and grain size. Three benthic biology samples were collected at each station: two for community analysis and one for archiving. A summary of sampling and analysis activities is presented in Table 1.

Grab samples for chemistry analysis were collected at all of the stations using a Kynar<sup>®</sup> coated 0.1 m<sup>2</sup> Young modified Van Veen grab sampler. Each grab was inspected for acceptability. If the grab was deemed unacceptable (grab was not full; sediment was slumped or washed out) it was discarded over the opposite side of the vessel to avoid contaminating subsequent samples. The equipment was washed with site water before collecting the next sample. Once the grab was deemed acceptable, samples were collected for chemistry (PCBs and total organic carbon), grain size, and an archive from the top 2 cm. Each sample was contained in an 8-oz glass jar with a Teflon-lined lid, and labeled with pre-printed and bar-coded labels. Samples were stored in coolers on ice until being transferred to the sample custodian.

Grab samples for infauna analysis and associated grain size were collected concurrently with the samples described above. The infauna grab samples were collected using a 0.04-m<sup>2</sup> Young-modified Van Veen grab sampler. Triplicate grabs were taken at each station. Once the grab was deemed acceptable, a grain size sample was collected by inserting an open-ended syringe through the entire depth of the core and drawing the sediment out, thereby capturing a known volume of sample representing the entire depth of the grab. The remaining material was transferred to a sieving station and passed through a 0.5 mm sieve by washing with low pressure site water. All material remaining in the sieve was transferred to a clean plastic jar, preserved with buffered solution of 10% formalin and Rose Bengal stain, and identified with pre-printed labels. Grain size samples were also labeled and stored on ice. All benthic samples were transferred to sample custodians at the end of the sampling day.

For both sediment and infauna grabs, the vessel was moved slightly while on station to avoid re-sampling the same location. After each station was completed, the grab samplers were decontaminated with Alconox water solution then rinsed with site water.

**Table 1. Summary of Sampling and Analysis Program**

## 2.3 LABORATORY METHODS

### 2.3.1 Chemical and Physical Analyses

PCB, TOC, and Grain size analysis were performed by Alpha Analytical in Mansfield, Massachusetts. Table 2 summarizes the analytical methods. Standard operating procedures (SOPs) employed by Alpha Analytical are referenced below and in Table 2, and are provided in Appendix D of the QAPP (Woods Hole Group, 2009a).

#### 2.3.1.1 PCBs

All sediment samples were analyzed for percent solids prior to extraction for PCB analysis. Any sample with less than 50% solids was air-dried and re-analyzed until percent solids exceeded 50%. Alpha Analytical extracted the sediments using the shaker table extraction procedure (Alpha SOP #OP-013) followed by silica gel cleanup (Alpha SOP #OP-014) and then sulfuric acid cleanup (Alpha SOP #OP-010). Extracts were analyzed using gas chromatography/mass spectrometry (GC/MS) in the Selected Ion Monitoring (SIM) mode of operation for the 18 NOAA PCB Congeners (Alpha SOP #O-015). Sample data was quantified by the method of internal standards. PCB congener results were reported on a dry-weight basis (based on the after air-drying percent solids

result). For the LTM V PCB congener analyses, the laboratory used the Reporting Limits (RL) as the detection limits. The RL is the lowest limit of detection for a specific sample and instrument calibration. Results were qualified by the laboratory as non-detect (U) if the result of the analysis was less than ½ the RL; U-qualified data were reported as the full value of the RL. Results were qualified by the laboratory as estimated (J) if the result of the analysis was less than the RL but greater than or equal to ½ the RL; J-qualified data were reported as the value calculated from the instrument. Data from Alpha was not surrogate recovery corrected. This correction, as required by USACE and performed historically for LTM PCB results by the laboratory prior to data reporting, was performed for LTM V during the data validation process by New Environmental Horizons, Inc. Further discussion of surrogate recovery correction is provided in Section 2.4 of this report.

For the purpose of analysis, a Total PCB value was calculated from the PCB congener data. A conservative approach to calculating Total PCBs was implemented in which the 18 NOAA PCB Congeners were summed for each station. All U-qualified data were included in the sum using the full RL value. All J-qualified data also were included in the sum.

**Table 2. Analytical Methods**

| <b>Analyte Group</b> | <b>Laboratory SOP No.</b>  | <b>Equivalent EPA or other Agency Method No.</b>   |
|----------------------|--|--|
| PCBs                 | Alpha SOP OP-013 (extraction)<br><br>Alpha SOP OP-014 (silica gel cleanup)<br>Alpha SOP OP-010 (sulfuric acid cleanup)<br>Alpha SOP O-015 (GC/MS-SIM analysis) | Shaker table extraction: performance-based method (NOAA Status and Trends (NOAA 1993) Extract Cleanup: EPA Method 3630C<br><br>Extract Cleanup: EPA Method 3665A<br><br>Analysis: SW-846 8270C, modified (EPA, 1996) & EPA 680, modified (EPA, 1985) |
| TOC                  | Alpha SOP W-028  | SW-846 9060, modified (EPA, 1996)  |
| Grain Size           | Alpha SOP W-029 (Grain Size/ Particle-Size with Hydrometer)  | ASTM D422-63 (ASTM, 1998)  |
| Percent Solids       | Alpha SOP W-001  | EPA Method 2540G   |

**2.3.1.2 TOC**

Total Organic Carbon (TOC) analysis was performed by Alpha Analytical following EPA SW-846 method 9060 modified for replicate analyses (Alpha SOP #W-028). For this report, the average value of the replicate results was reported for each station.

### 2.3.1.3 Grain Size

Grain size analysis was performed by Alpha Analytical following ASTM D422-63 (Alpha SOP #W-029). Sediment grain-size was determined with phi-classes for sands using wet sieve analysis based on the methods outlined in ASTM D422-63 (particle-size analysis with hydrometer, ASTM 1998). Wet sieving yielded the following phi-classes: Gravel (>2.00 mm), Very Coarse Sand (1.00-2.00 mm), Coarse Sand (0.50-1.00 mm), Medium Sand (0.25-0.50 mm), Fine Sand (0.125-0.25 mm), Very Fine Sand (0.0625-0.125 mm), and Silt and Clay (<0.0625 mm). Pipette analysis resulted in percents of silt (0.0039-0.0625 mm) and clay (<0.0039 mm).

### 2.3.2 Benthic Biology Analysis

Benthic biology sorting, enumeration, and identification was performed by Normandeau Associates in Bedford, New Hampshire. Sample processing was performed as described in Appendix E (EMAP Near-Coastal Laboratory Procedures Macro-benthic Community Assessment) of the QAPP (Woods Hole Group, 2009a), with the exception that sample biomass determinations were not performed. At each station, three replicate samples were collected: two for species enumeration, and one for archiving.

## 2.4 DATA VALIDATION METHODS

New Environmental Horizons, Inc. (NEH) performed an independent validation of the chemical data for PCB congeners and TOC generated during the LTM V. The basis for the validation was the EPA Region I validation guidelines, modified to include project-specific and method-specific criteria as discussed in the QAPP (Woods Hole Group, 2009a), consistent with validation protocols performed historically for LTM data. The data validation reports are provided in Appendix A.

Based on the Tier 1+ validation of the 18 NOAA PCB Congeners and TOC, all results are considered usable for project decisions based on a comparison to the NBH LTMV QAPP requirements. The validation reports (Appendix A) provide an understanding of the potential uncertainty (bias) in the qualified results.

Surrogate recovery correction of PCB data was performed during data validation, which is different from previous LTM procedures. A technical memorandum was produced by NEH to document the methodology used for the surrogate recovery corrections applied during the validation stage for LTM V data, and previous corrections applied directly by the laboratory (e.g., LTM IV). The technical memorandum is presented in Appendix B and current procedures are summarized here. 4,4'-Dibromooctafluorobiphenyl (DBOB) was used as a surrogate for congeners PCB8, PCB18, PCB28, PCB44, PCB52, PCB66, and PCB101. PCB198 was used as a surrogate for congeners PCB105, PCB118, PCB128, PCB138, PCB153, PCB170, PCB180, PCB187, PCB195, PCB206, and PCB209. If these surrogates were recovered within the acceptable criteria range (50% - 130%), as outlined in the QAPP (Woods Hole Group, 2009a), then each congener result (with the exception of non-detects, which were reported at the sample-specific reporting limit) was corrected as follows using the appropriate surrogate recovery percentage:

$$\text{Corrected Result} = \text{Uncorrected Result} \times (100/(\text{Surrogate \% Recovery}))$$

If one of the surrogates was not recovered within the acceptable criteria range, then all congeners were corrected using the surrogate that did meet the criteria. If both surrogates were not recovered within the acceptable criteria range, then no surrogate recovery correction was performed.

Surrogate recovery corrections were applied to 58 samples (and two field duplicate samples). Surrogate recovery corrections were not made to the remaining 21 samples (and one field duplicate sample) as the surrogates were diluted out.

### **3.0 RESULTS**

Sediment samples and water quality parameters were collected from 79 stations in the New Bedford Harbor study area between September 22, 2009 and September 28, 2009. A field duplicate sample was also collected from each of the three harbor areas (Station 146 in Area I, Station 212 in Area II, and Station 323 in Area III). Sample collection dates, times, coordinates and total water depths are presented in Appendix C.

#### **3.1 WATER QUALITY**

In situ water quality parameters were measured at all 79 stations in the New Bedford Harbor study area (Upper Harbor, Lower Harbor, and Outer Harbor). Water quality parameters were also taken for the three field duplicates. Salinity, temperature, and dissolved oxygen were measured prior to the collection of sediment samples. Water quality measurement depths and data are presented in Appendix D. Water quality data was not recorded at five field stations (309, 311, 318, 323, 324) and for one of the field duplicates (323 FD) because the YSI exceeded available memory, thereby disabling the continuous data collection function.

Based on the data collected during field sampling, the water quality conditions can be characterized as follows:

- In the Upper Harbor, salinity ranged from 21.43 to 31.33 ppt with a median of 27.04 ppt. Temperature ranged from 18.76 to 21.64 °C with a median of 20.57 °C. Dissolved oxygen ranged from 6.40 to 10.60 mg/L with a median of 8.16 mg/L.
- In the Lower Harbor, salinity ranged from 23.40 to 27.97 ppt with a median of 26.85 ppt. Temperature ranged from 18.14 to 20.05 °C with a median of 19.77 °C. Dissolved oxygen ranged from 5.51 to 10.41 mg/L with a median of 7.07 mg/L.
- In the Outer Harbor, salinity ranged from 26.89 to 33.37 ppt with a median of 29.84 ppt. Temperature ranged from 18.12 to 19.79 °C with a median of 18.90 °C. Dissolved oxygen ranged from 6.69 to 8.06 mg/L with a median of 7.21 mg/L.

In general, salinity was higher in the Outer Harbor than in the Upper and Lower Harbors. This is a result of the seawater from Buzzards Bay in the Outer Harbor mixing with the freshwater inflow to the Upper Harbor. Temperature decreased slightly with increasing depth from the Upper Harbor to the Outer Harbor. This is likely because the sampling was conducted in September, when the shallow water remains relatively warm due to waning summer climatological influences. The temperature gradient from the Upper to Outer Harbor was mild, though, likely due to the onset of cooler fall weather. Mean dissolved oxygen was slightly higher in the Upper Harbor than in the Lower or Outer Harbors, but the low-to-high ranges overlapped substantially, and there was no strong trend. No anoxic conditions were observed, likely because of the early fall conditions during sampling, which tend to be characteristic of increasing dissolved oxygen conditions in the region.

### 3.2 CHEMICAL ANALYSES

Sediment samples were collected at all 79 stations in the New Bedford Harbor study area (Upper Harbor, Lower Harbor, and Outer Harbor). A field duplicate sample was also collected from each of the three harbor areas (Station 146 in Area I, Station 212 in Area II, and Station 323 in Area III). Sediments were analyzed by Alpha Analytical for the 18 NOAA PCB congeners and TOC. The laboratory data was validated by NEH.

#### *3.2.1 Polychlorinated Biphenyls*

At each of the 79 stations, plus the three field duplicate stations, sediment samples were collected for PCB analysis. Surrogate recovery correction of the PCB data was performed by NEH during data validation. Some of the sediment samples, mostly those collected from the Upper Harbor (Area 1), were highly contaminated, necessitating dilution in the laboratory. The surrogates that had initially been spiked into the sample were diluted out in these instances, and consequently no surrogate recovery correction could be performed. Final validated results of PCB analysis are presented in Appendix E.

Calculations of Total PCBs were performed on the validated results. This calculation summed the 18 NOAA PCB congeners, using the RL value for all non-detected (U-qualified) results. The Total PCBs calculation did not utilize a multiplier, and any samples in which surrogate recovery correction was performed for some of the congeners were given a “K” qualifier for the summed result (Appendix E).

Throughout all three study areas, Total PCBs ranged between 9 parts per billion (ppb) and 330,971 ppb. The lowest Total PCB value was at Station 306 in the Outer Harbor; the highest Total PCB value was at Station 125 in the Upper Harbor. Results display a trend of decreasing Total PCBs from the Upper Harbor to the Outer Harbor. Some details include:

- Upper Harbor Total PCB levels were between 570 ppb (Station 202) and 330,971 ppb (Station 125) with a median of 29,840 ppb (Station 138).

- In the Lower Harbor, Total PCB was between 525 ppb (Station 250) and 18,729 ppb (Station 217) with a median of 4,423 ppb (Station 236).
- Outer Harbor Total PCB levels were between 9 ppb (Station 306) and 1,131 ppb (Station 304) with a median of 118 ppb (average of Stations 333 and 335).

This trend of order-of-magnitude decreases in Total PCBs from the Upper to the Lower and into the Outer Harbor is consistent with prior LTM sampling events. High levels in the Upper Harbor are a result of the historical PCB source to the Upper Harbor from the Aerovox facility as discussed in Section 1.2.

### *3.2.2 Total Organic Carbon*

At each of the 79 stations, plus the three field duplicate stations, sediment samples were collected for TOC analysis. In the laboratory, a replicate analysis was performed. The TOC data, presented in Appendix F, are the averages of the laboratory replicates for each sample.

Throughout all three study areas, TOC ranged between 0.05% and 5.15%. The lowest TOC value was recorded at Station 306 in the Outer Harbor; the highest TOC value was recorded at Station 125 in the Upper Harbor. That the lowest and highest levels of TOC corresponded to the lowest and highest Total PCB concentrations, respectively, is consistent with prior analysis that demonstrated a relationship between TOC and PCB levels in New Bedford Harbor. Results display an overall trend of decreasing TOC from the Upper Harbor to the Outer Harbor, also indicative of the Total PCB trend.

In the Upper Harbor, TOC was between 0.10% and 5.15% with a median of 2.52%. In the Lower Harbor, TOC was between 0.33% and 4.06% with a median of 1.81%. In the Outer Harbor, TOC was between 0.05% and 3.28% with a median of 0.97%.

## **3.3 PHYSICAL ANALYSIS**

Sediment samples were collected at all 79 stations in the New Bedford Harbor study area (Upper Harbor, Lower Harbor, and Outer Harbor). A field duplicate sample was also collected from each of the three harbor areas (Station 146 in Area I, Station 212 in Area II, and Station 323 in Area III). Sediments were analyzed by Alpha Analytical for grain size.

At each of the 79 stations, plus the three field duplicate stations, four replicate sediment samples were collected for grain size analysis. One grain size replicate sample originated from the composited grab samples (top 2cm of the grab as specified in the field operations manual (Strobel, 2000)) collected for chemical analyses. The other three replicates were sub-sampled from the three sediment grab samples collected for benthic infauna analysis. An additional three field duplicates were collected in association with the chemistry analyses. The grain size data associated with the chemistry samples are presented in Appendix G. A brief summary of these grain size samples follows.

Total Percent Fines (sum of silt and clay) were highly variable throughout the study area:

- Upper Harbor: Fines ranged from 1% to 86%
- Lower Harbor: Fines ranged from 2% to 84%
- Outer Harbor: Fines ranged from 1% to 83%

Throughout all three study areas, the median grain size ( $d_{50}$ ) was between 0.0236mm and 1.0943mm, ranging between silt and very coarse sand. The finest median sediment sample was at Station 123 in the Upper Harbor; the coarsest sample was at Station 236 in the Lower Harbor.

In the Upper Harbor,  $d_{50}$  was between 0.0236mm and 0.6992mm, ranging from silt to coarse sand. The Lower Harbor  $d_{50}$  was between 0.0325mm and 1.0943mm, ranging from silt to very coarse sand. And, in the Outer Harbor,  $d_{50}$  was between 0.0270mm and 0.7155mm, ranging from silt to coarse sand.

Grain size data from the benthic community replicate sampling is presented in Appendix H. Grain size distribution curves for all (chemistry and benthic community) analyses are presented in the laboratory reports included in Appendix I. Sample locations ending in “11”, “12”, or “13” are associated with benthic replicates, while samples locations ending in “26” or “36” are associated with chemistry samples.

### 3.4 BENTHIC FAUNA

At each of the 79 stations, three replicate sediment samples were collected for benthic community analysis. Two of the replicates were sorted and enumerated, while the third replicate was archived. Benthic community abundance data in the format specified by EPA is attached to the Normandeau report, which is included in Appendix J. Results from one of the sorted and enumerated replicates are summarized as follows.

A total of 96 species and 19,688 organisms were enumerated from 27 samples in the Upper Harbor. The number of species encountered per station in the Upper Harbor ranged from 5 to 43, and the median in Upper Harbor samples was 14 species. Abundance per station in the Upper Harbor ranged from 17 to 4,137, and the median was 441 individuals. The station with the highest abundance (4,137) of any station sampled in LTM V was Station 108 in the Upper Harbor. The dominant species in the Upper Harbor was *Streblospio benedicti*, a polychaete worm. The total abundance of *Streblospio benedicti* in all Upper Harbor samples was 12,996. The next two most abundant organisms throughout the Upper Harbor were *Oligochaeta* (1,727), oligochaete worms, and *Polydora cornuta* (1,597), a polychaete worm.

A total of 136 species and 10,226 organisms were enumerated from 29 samples in the Lower Harbor. The number of species encountered per station in the Lower Harbor ranged from 4 to 59, and the median was 19 species. The station with the lowest species richness (4) of any station sampled in LTMV was Station 231 in the Lower Harbor. Abundance per station in the Lower Harbor ranged from 10 to 1,123, and the median was 318 individuals. The station with the lowest abundance (10) of any station sampled in

LTM V was Station 240 in the Lower Harbor. As with the Upper Harbor, the dominant species in the Lower Harbor was *Streblospio benedicti*, a polychaete worm. The abundance of *Streblospio benedicti* was 1,822. By comparison to the strong dominance of this species in the Upper Harbor, the *Streblospio benedicti* abundance in the Lower Harbor was much closer to the next two most abundant organisms throughout the Lower Harbor [*Tharyx acutus* (1,052), a polychaete worm, and *Leitoscoloplos sp.* (880), a polychaete worm].

A total of 233 species and 10,687 organisms were enumerated from the 23 samples in the Outer Harbor. The number of species encountered per station in the Outer Harbor ranged from 19 to 82, and the median was 43 species. The station with the highest species richness (82) of any station sampled in LTM V was Station 352 in the Outer Harbor. Abundance per station in the Outer Harbor ranged from 70 to 1,488, and the median was 439 individuals. The dominant species in the Outer Harbor was *Tharyx acutus*, a polychaete worm. The abundance of *Tharyx acutus* was 1,128. The next two most abundant organisms throughout the Outer Harbor were *Macoma tenta* (1,126), the elongate macoma clam and *Cylichna oryza* (902), a sea snail.

Although formal statistics were not computed, the data indicate an increase in benthic community diversity from the Upper to the Lower and into the Outer Harbor. Lists of all species encountered in the Upper, Lower, and Outer Harbors (for Replicate 1 benthic samples) are provided in Appendix K.

## **4.0 DISCUSSION**

The LTM V survey for New Bedford Harbor was completed in September 2009. Sediments were collected for physical, chemical and benthic biology analyses. Water quality parameters were also collected at each station. A total of 79 stations were sampled, and the appropriate field and laboratory QC was conducted.

This LTM V Summary Report presents the data. Provided in the appendices are station locations, water quality measurements, PCB (NOAA 18 Congeners) data, discussion of previous (LTM IV) and current (LTM V) approaches to PCB surrogate recovery correction, total organic carbon data, data validation reports, grain size data, and benthic infaunal community abundance data.

Although a multiplier of 2.6 has previously been developed to correlate the NOAA 18 PCB Congeners to a Total PCB value in the upper and lower harbors, this multiplier was not applied in the current or any previous LTM investigation.

The resulting data were uploaded into the New Bedford Harbor Database and are available for querying and downloading. Surrogate recovery correction was performed during data validation, and not by the laboratory. Surrogate recovery corrected results are identified in the database by a “K” qualifier. PCB Congeners, as obtained from the database, were summed (RL value used for non-detects) to obtain a measure of Total PCBs. TOC replicates, as obtained from the database, were averaged to obtain one result for each station reported herein. All other data were used as obtained from the database.

Although no formal analysis of the data is included in this report, summary observations are provided in Section 3. The results of the LTM V will be used by EPA to assess spatial trends in contaminated sediments. In conjunction with previous LTM data, the information will be used to assess temporal trends in contaminated sediments, and to assess the effectiveness of the New Bedford Harbor Superfund remediation efforts. Previous LTM reports may be found on-line at [www.epa.gov/ne/nbh](http://www.epa.gov/ne/nbh) under “Technical Documents”, “Long Term Benthic Monitoring”. LTM data also are planned for inclusion in the OU #3 Remedial Investigation.

**Did the Laboratory Narrative contain any issues which may affect data quality? Yes; however, all issues were reported in the summary data.**

**Were the %solids acceptable (>30%)? Yes all > 93% solids after air-drying. Prior to air-drying, % solids were 29-82%.**

*The data package consisted of a laboratory narrative, data sheets for samples, Method Blanks (MB), laboratory control samples (LCS), Matrix Spike/Matrix Spike Duplicates (MS/MSD), and the executed chain-of-custody. Summary information for initial and continuing calibrations were not present nor were raw data for samples and quality control (QC) reported. This Tier I+ review assumed that initial calibrations and qualitative and quantitative determination of the 209 PCB Congeners were acceptable unless an issue was raised in the laboratory narrative.*

Comments:

Samples were received intact at 2.6C to 4.1C in 5 shipments on the day after sample collection (e.g., samples collected on 9/24 were received on 9/25/09). COC seals were absent from coolers; however, these were picked up from the site by a courier and delivered directly to the lab.

Samples were analyzed for % solids, TOC, and Grain size. All samples were also air-dried and subsequently analyzed for %solids - air-dried and 18 NOAA Congeners.

*HT*: Air-dried samples were extracted on 10/5/09 and analyzed by 10/23/09 - HT met - No action required.

*Surrogates*: both surrogates (BZ19-C13 and BZ202-C13) were diluted out (0% recovery) due to dilutions made for analysis of the samples (DF ranged from 100 to 1000) for all samples except 501225, 501425, and 502825. For these three samples, surrogates were recovered within criteria - No Action required.

*LCS*: %Rec for LCS and LCSD were all within 40-140% for all 18 NOAA Congeners spiked and RPDs between LCS and LCSD all OK except BZ52 LCS recovery high (162%) LCSD and RPD OK, BZ206 LCSD low (39%) LCS and RPD OK, and BZ209 LCS&LCSD both low (20% and 21%) - RPD OK. No Action taken for BZ52 ad BZ206 since recovery OK for one of the spiked and RPD OK - Action required for low BZ209 though.

*\*ACTION: BZ209 estimated (UJ) in all 16 sediment samples with possible low bias due to low LCS/LCSD recoveries.*

| Method Blank | BZ#18 0.3 J µg/Kg   | Y               | 1.5 µg/Kg             | All samples were >>> BAL - No Action required |                  |
| Method Blank | BZ#44 0.257 J µg/Kg | Y               | 1.285 µg/Kg           | All samples were >>> BAL - No Action required |                  |
| Method Blank | BZ#52 0.443 µg/Kg   | Y               | 2.215 µg/Kg           | All samples were >>> BAL - No Action required |                  |

Comments:

*SRM*: NY/NJ Waterway Sediment. %Rec for Congeners in SRM were all within 40-140%; therefore, no Action required.

*MS/MSD*: performed on sample 500525. Sample, MS and MSD were analyzed at DF=500 ; therefore, spike level (~7 µg/Kg) was too low to be able to evaluate MS/MSD recovery (most recoveries were 0%). Replicate precision (sample, MS & MSD) reasonable (RPD <30%) for all 18 NOAA Congeners; therefore, No Action required.

*FD*: there were no field duplicates associated with the samples in this SDG - see the other LTMV for FD sample analysis.

An investigation by NEH into previous reporting of LTM data by Battelle indicated that data were surrogate recovery corrected and that non-detects were reported at Method Detection Limits (MDLs). These MDLs were surrogate recovery corrected during the MDL study but were not corrected again based upon individual sample surrogate recovery results. A technical memo was written by NEH on January 29, 2010 (approved by Lee Weishar, WHG, and Mark Koenig, USACE), explaining Battelle's process for reporting, Alpha's process for reporting, and recommendations for adjustment of the current LTMV data so that these data may be comparable to the data from previous sampling events.

For samples where the surrogates are not recovered because of the dilution made for analysis of the sample, a DV Comment was added to the validated database file "K2" to indicate that the reported value was not surrogate recovery corrected. For samples with surrogates recovered, a separate excel worksheet has been constructed (Surrogate Recovery Correction \_L09XXXX.xls) showing the lab reported result, identification of which surrogate was used for correction of each of the 18 NOAA Congeners, and the Surrogate Corrected Result. Non-detects are reported by Alpha at the Reporting Limit (RL) consistent with the QAPP. Since non-detects will not be comparable between Alpha and Battelle because the basis for the non-detects are different (MDL vs. RL), non-detects and reporting limits are not surrogate recovery corrected in the LTMV data.

For this SDG, three samples, 501225, 501425, and 502825, reported surrogate recoveries. The surrogate corrected values, as shown in Surrogate Recovery Correction\_L0912896.pdf, replaced the Lab Result values in the validated database file, the data were qualified "K" to indicate this change to the Lab Result values, and a DV Comment was added, "K1", to indicate that the Reported result was recovery corrected.

New Bedford Harbor  
18 NOAA PCB Congeners Tier I+ Data Validation Checklist

Lab Project: L0912896

Lab: Alpha Analytical

Comments:

The lab reported results for 18 NOAA Congeners + 2 surrogates. All samples were analyzed at DF>1 except for sample 502825; therefore, all RLs for individual Congeners were above the PQLs requested in QAPP Table 1-3 for these diluted sample. The RLs for sample 502825 were < RLs and PQLs requested in the QAPP; therefore, sensitivity was acceptable for these data.

---

The narrative did not raise any issues affecting quality that were not already addressed.

---

5 results were reported at levels < RL and were flagged "J" by the lab. These 5 results were accepted within Indeterminate bias due to uncertainty in quantitation at a level below the instrument calibration range

---

Qualifiers : All data were reported with "D" qualifiers to indicate results reported from a dilution analysis. As instructed by Battelle, these "D" qualifiers were not removed

---

| No               |                         |               |                            | MB > RL but samples > level in MB |                                 |                 |                 |                 |                   |       |

Calibration criteria: Unless otherwise noted in the laboratory narrative, it was assumed that all initial and continuing calibration verifications (ICV/CCV) and initial and continuing calibration blank (ICB/CCB) results were acceptable (met LTM V QAPP 2009 requirements). In addition, RPD < 25% for two replicates of each sample.

- Method Modification: Laboratory analyzed two replicates (burns) for TOC by Method 9060A rather than 4 (as in the method); this is consistent with LTMV QAPP requirements.

Samples were received intact. TOC analysis was performed on the samples "as-received" (i.e., not on "air-dried" sediments). Samples were frozen upon receipt to arrest holding time. Therefore, analyses, conducted on 10/26/09, were considered to have met HT criteria. No Action required.

MS/MD site sample used for QC: 500525. Duplicate burns of MS resulted in acceptable recovery. Sample/MD reported one burn with RPD > 25%; however, a comparison of the average sample and average MD TOC of this sample gave RPD < 25% - No action taken based on professional judgment.

Method blank reported low level TOC (average = 0.0195 %). Since all samples reported TOC > this level, no action required.

Sample/FD site sample IDs: There were no FDs associated with the samples in this SDG - see other LTMV SDGs for FDs

Replicate (duplicate) precision TOC results of each sample all had RPD < 25% - all replicates acceptable - No Action.

Data users should compute the arithmetic average of the two TOC replicate burns for each sample and use this average as the valid TOC result for that sample.

**Data Package Completeness:**

1. Were all required forms (results, summary QC, COC), as required to validate the data in accordance with EPA Region 1 present in the data package? **Yes**
2. Were all result forms for all samples listed on the chain-of-custody present in data package? **Yes**

If No, explain and request resubmittals:

## TOC Tier I+ Data Validation Checklist

Lab: Alpha Analytical

**Data Quality / Usability Issues:**

1. Did the Laboratory Narrative contain any issues which may affect data quality or usability that have not been already addressed on page 1? **No.**

If Yes, explain.

2. Explain further any actions taken based on summary QC, as necessary, below.

No further actions required.

**All TOC data were accepted as reported by the laboratory and unchanged as a consequence of this data validation review.**

**QC Actions:**

Pres./HT: HT exceedance: J detects; Non-detects: R or UJ based on professional judgment. Freezing arrests HT.

Temperature: outside control limits of  $4 \pm 2^\circ\text{C}$ : use professional judgment.

Blanks: Method Blanks and instrument blanks: TOC < RL unless all sample results are > 10 blank level. Detected results < matrix-matched blank level report as "U" (non-detected at level found). Professional judgment used for non-matrix matched blanks (e.g. aqueous blank associated with sediment samples).

Calibration Criteria: Assume acceptable unless narrated. Exceedances of any calibration criteria will affect accuracy of the data: J detects and UJ non-detects. Severe exceedances of calibration criteria, to be determined based on professional judgment, may require rejection, R, of data.

Assume acceptable unless narrated. If narrated as exceeded: %Recoveries < lower control limit: J / UJ. %Recoveries > upper control limit: J detects.

ICV/CCV: If severe exceedance <50% recovery: R non-detects.

LCS/SRM: %Recoveries < lower control limit: J / UJ. %Recoveries > upper control limit: J detects. %Recoveries < 50%, may R non-detects & J detects but use professional judgment to accept results if MS is in-control indicating acceptable accuracy in sample matrix.

MS: %Recoveries < lower control limit: J / UJ. %Recoveries > upper control limit: J detects. %Recoveries < 30%, may R non-detects & J detects but use professional judgment if sample concentration > 2x spike level.

MD: Results > 5xRL: RPD >25%: J / UJ associated results in batch - to be determined using professional judgment.

Results < 5xRL: difference >  $\pm 2xRL$ , J / UJ associated results in batch - to be determined using professional judgment.

FD: Results > 5xRL: RPD >50%: J / UJ FD results only. Results < 5xRL: difference >  $\pm 4xRL$ , J/UJ FD results only.

% Solids: 10% < % solids < 30%, J detects/R non-detects; % solids < 10%, R all results.

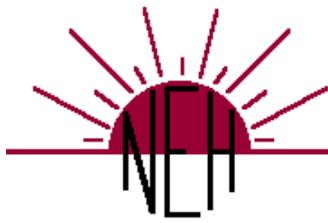

**Qualifiers:** U = analyte is non-detect at the sample-specific Reporting Limit (RL) (usable); UJ = non-detect is usable as an estimated value; J = result is usable as an estimated value; R = result is rejected due to severe QC exceedance and unusable for project objectives. Bias: L = Low; H = High; I = Indeterminate. QC Limits based on EPA Region 1 Inorganic DV guidance and LTM V QAPP 2009.

**Data Validation Report**  
**EPA Region I Tier I+**  
**18 NOAA PCB Congeners by 8270C and TOC by Method 9060**

**Client/Company:** Woods Hole Group, Inc. (WHG)

**Site/Project Name:** New Bedford Harbor Superfund Site – Long Term Monitoring (LTM) V

**Laboratory:** Alpha Analytical – Mansfield, MA

**Lab Project Number(s):** L0912896

**Date(s) of Collection:** September 22, 2009 through September 27, 2009

**Number / Type  
Samples & Analyses** 16 sediment samples for 18 NOAA PCB Congeners by EPA SW-846  
Method 8270C and Total Organic Carbon (TOC) by Method 9060

**Senior Data Reviewers:** Nancy C. Rothman, PhD, New Environmental Horizons, Inc.  
Susan D. Chapnick, New Environmental Horizons, Inc.

**Date Completed:** March 30, 2010  
**Revised:** *April 12, 2010*

*This report was revised to include the Tier I+ review of TOC data.*

This EPA Region I Tier I+ validation for 18 NOAA PCB Congeners and TOC was performed with the following intentions: 1) to determine if the data were generated and reported in accordance with the *Quality Assurance Project Plan, New Bedford Harbor Long Term Monitoring V, New Bedford, MA*, prepared by Woods Hole Group, Inc., September 2009 (LTMV QAPP); Region I, *EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses*, December 1996, including *Part III – Pesticide/PCB Data Validation Functional Guidelines*, Draft February 2004; 2) to determine if the data met project data quality objectives for acceptable accuracy, precision, sensitivity; and technical usability; and 3) to generate an electronic deliverable of validated results with project-specific data validation qualifiers added.

The Data Validation Report consists of three parts:

- This Data Validation Report letter summarizing the actions taken;
- The database file of validated sample results with validation qualifiers, bias, and comments added based on actions taken; and
- Data Validation Checklists for TOC and PCB Congeners including the Surrogate Recovery Correction worksheet completed during this validation to document the Tier I+ review. The Checklists are an integral part of the DV Report as they contain comprehensive details of all quality control (QC) reviewed, the acceptance criteria used, and the professional judgment and actions taken.

## I. Sample Descriptions and Analytical Parameters

The sample IDs, date of sampling, identification analytical parameters reviewed and the sample type (e.g., field sample, field duplicate (FD), field equipment blank (EB), as applicable), are listed below in Table 1.

Table 1. Sample Descriptions and Analytical Parameters Validated

| Sample ID | Lab Sample ID | Collection Date | Matrix   | Analytical Parameters <sup>1</sup> | Sample Type  |

Analytical method references:

18 NOAA Congeners: *Determination of PCB Homologs, Individual Congeners, and Pesticides by Gas Chromatography/Mass Spectrometry in the Select Ion Monitoring (SIM) Mode (EPA 680 & 8270C)*, Alpha SOP O-015, Rev. 2, June 19, 2006.

TOC: SW-846 Method 9060 modified, Alpha SOP W-028

<sup>1</sup> Grain Size analysis was also performed on these samples; however, data validation for this parameter was not required. TOC analysis was performed on “as-received” sediments while the 18 NOAA Congeners were performed using “air-dried” sediments.

## II. Data Validation Report Summary

This Data Validation Report represents a Tier I+ validation of the 18 NOAA PCB Congener and TOC sample results and summary QC (method and matrix), which were used to evaluate accuracy, precision, and sensitivity compared to the NBH LTMV QAPP requirements.

The following QC elements, as applicable to the analytical methods, were reviewed:

- Data package completeness and reporting protocols
- Sample receipt, holding times and preservation criteria
- Blank results including Method Blanks, Equipment Blanks, & Trip blanks
- Laboratory Control Sample (LCS) recoveries / LCS Duplicate Recoveries
- Standard Reference Material (SRM) Recoveries
- Surrogate Recoveries
- Matrix Spike (MS) / Matrix Spike Duplicate (MSD) Recoveries
- MS/MSD, LCS/LCSD, sample/Laboratory Duplicate (LD), or sample/Field Duplicate (FD) Relative Percent Differences (RPDs)
- Sample result reporting (including compound lists, reporting limits, and units)

- Calibration criteria\* (including tune criteria, initial calibration and continuing calibration verification)
- Internal Standard (IS) Recoveries\*
- Retention Time windows\*
- Other method-specific QC if applicable and reported\* (e.g., serial dilution results for metals)
- Deficiencies or protocol deviations as noted in the Laboratory Narrative

\* This QC element is reviewed associated with the Tier II-type validation only. For Tier I+ validations this QC element is assumed to be acceptable unless otherwise noted in the laboratory narrative.

Based on this Tier I+ validation of the 18 NOAA PCB Congeners and TOC, all results were considered usable for project decisions based on a comparison to the NBH LTMV QAPP requirements and with the understanding of the potential uncertainty (bias) in the qualified results summarized in Table 2. NEH generated electronic validated results based on the project database file received from WHG for these data, by updating the following database fields for field samples and field QC only: VALID\_QUAL, VALIDATION\_LEVEL, VALIDATION, VALID\_DATE, BIAS, and DV\_COMMENT.

The remainder of this report documents “exceptions” to the NBH LTMV QAPP criteria or clarifications of data reported. QC elements not discussed below met all QAPP criteria. The full documentation of all QC elements reviewed during the Tier I+ validation are presented in the attached Data Validation Checklists.

### **Sample Receipt and Holding Time**

The sediment samples were received at the laboratory intact in five shipments at 2.6°C to 4.1°C. Aliquots of the “as-received” samples were analyzed for TOC, Grain Size, and percent solids. Samples were frozen upon receipt to arrest holding time for TOC analysis. All samples had percent solids content of 29-82%; therefore, these sediment samples were air-dried, as required by the QAPP, prior to Congener analysis. After air-drying, the percent solids content for all samples was greater than 93%.

### **Accuracy**

The Method Blank reported detected results for three of the 18 NOAA Congeners and low level TOC; however, a comparison of the levels reported in the method blank with the levels reported in the samples indicated that blank action was not required.

There was no Equipment Blank required to be collected along with these sediment samples.

All 18 NOAA Congeners recovered within criteria in the LCS and LCSD except for Decachlorobiphenyl (BZ#209), which recovered low in both the LCS and LCSD. The results for Decachlorobiphenyl (BZ#209) were estimated (UJ) with a possible low bias in all sixteen sediments due to the low LCS/LCSD recoveries, as listed in Table 2.

Congener recoveries in the LCS or LCSD were also outside criteria for 2,2',5,5'-Tetrachlorobiphenyl (BZ#52) and 2,2',3,3',4,4',5,5',6-Nonachlorobiphenyl (BZ#206); however, since one spiked sample recovery was acceptable and since the RPD between the LCS and LCSD was acceptable for these two Congeners, no action to qualify sample data was taken based on professional judgment.

Congener recoveries in the MS/MSD analysis conducted on sample 500525 could not be evaluated since the level of the spike was too low compared to the concentration of PCB Congeners in the field sample (i.e., the sample, MS and MSD were all analyzed at dilution factor (DF) = 500, at this high dilution, the relatively low matrix spike level could not be detected). Therefore, no action was taken based on the MS/MSD recoveries. TOC recovery in the MS analysis of sample 500525 was acceptable, indicating acceptable accuracy for TOC in the site matrix.

The Standard Reference Material for PCB Congeners (SRM NY/NJ Waterway Sediment) and TOC SRM reported acceptable recoveries for all Congeners and TOC certified in these SRMs.

### **Precision**

LCS/LCSD precision was acceptable for all 18 NOAA Congeners indicating acceptable precision in the laboratory analysis of these samples.

MS/MSD precision in the analysis of sample 500525 was acceptable for all 18 NOAA Congeners. All TOC analyses were performed in replicate (duplicate burns), as a method modification consistent with the site QAPP requirements. Sample/MD precision was high for TOC in one set of replicates. Since the average TOC value for 500525 and the average value for the MD had acceptable precision, no action was taken based on professional judgment. Precision between all replicates of TOC reported for each sample was acceptable. These results indicate acceptable precision and representativeness of these sediments for analysis of the NOAA PCB Congeners and TOC.

There were no Field Duplicates (FD) associated with the samples in this SDG. Three sets of Sample/FD were collected and are reported for the overall LTMV program. Data users are directed to the other LTMV DV reports for FD information.

### **Sensitivity & Reporting**

All samples met sensitivity requirements for PCB Congeners and TOC as indicated in NBH LTMV QAPP Table 1-3.

Data users should compute the average of the TOC replicate results (duplicate burns) for each sample and use this arithmetic average as the valid result for TOC.

An investigation by NEH into previous reporting of LTM data by Battelle indicated that Congener data were surrogate-recovery corrected and that non-detects were reported at Method Detection Limits (MDLs). These MDLs were surrogate-recovery corrected during the MDL study but were not corrected again based upon individual sample surrogate recovery results. A technical memo was written by NEH on January 29, 2010 (approved by Lee Weishar, WHG, and Mark Koenig, USACE), explaining Battelle's process for reporting previous LTM data (LTMIV and prior monitoring data), Alpha's process for reporting LTMV results, and recommendations for adjustment of the current

LTMV data so that these data may be comparable to the data from previous sampling events reported by Battelle.

For Congener samples where the surrogates are not recovered because of analytical dilutions or when results were non-detect, the DV\_COMMENT "K2" was added to the validated database file to indicate that the reported value was not surrogate-recovery corrected.

For Congener samples where surrogate-recovery correction was performed, a separate Surrogate Recovery Correction excel worksheet was constructed (as part of the Data Validation Checklist process) showing the original lab reported result, identification of which surrogate was used for correction of each of the 18 NOAA Congeners, and the Surrogate Corrected Result. For surrogate-corrected results, the project database file was updated as follows:

1. The surrogate-corrected value, as shown in the Surrogate Recovery Correction worksheet, replaced the lab RESULT value in the validated database file;
2. The qualifier "K" was added to the VALID\_ QUAL field to identify the result as surrogate-recovery corrected; and
3. "K1" was added to the DV\_COMMENT field as the DV code to further indicate that the reported result was surrogate-recovery corrected.

Non-detects for Congeners were reported by Alpha at the Reporting Limit (RL), consistent with the LTMV QAPP requirements. Since non-detected results are not comparable between Alpha and Battelle because the basis for the non-detects are different (RL vs. MDL), non-detects and reporting limits were not surrogate-recovery corrected in the LTMV data.

For this SDG, three Congener samples, 501225, 501425, and 502825, reported surrogate recoveries. Surrogate-recovery correction was performed for these three samples, as documented in *Surrogate Recovery Correction\_L0912896*. Actions taken are listed below in Table 2.

Results reported below the sample-specific RLs are considered uncertain because they are below the calibration range. During this review, data below the sample-specific RLs were qualified as estimated (J), as shown in Table 2, and as described in the Data Validation Checklist.

The laboratory reported all results from DF > 1 analyses with a "D" qualifier. At Battelle's request, these "D" qualifiers were maintained during the DV process.

Table 2. Summary of Data Validation Actions

| Field Sample ID                                     | Analyte  | Qualifier | Bias | Validation Comments                                |
|---|--|-----------|------|--|
| 501225<br>501425 &<br>502825                        | All Congeners except:<br>2,2',3,3',4,4',5,6-Octachlorobiphenyl &<br>Decachlorobiphenyl | DK / K    |      | Reported value is surrogate recovery corrected     |
| All samples except:<br>501225<br>501425 &<br>502825 | All Congeners  | D/ DJ/ DU |      | Reported value is not surrogate recovery corrected |

Table 2. Summary of Data Validation Actions - continued

**Did the Laboratory Narrative contain any issues which may affect data quality? Yes; however, all issues were reported in the summary data.**

**Were the %solids acceptable (>30%)? Yes all > 83% solids after air-drying. Prior to air-drying, % solids were 33-81%.**

*The data package consisted of a laboratory narrative, data sheets for samples, Method Blanks (MB), laboratory control samples (LCS), Matrix Spike/Matrix Spike Duplicates (MS/MSD), and the executed chain-of-custody. Summary information for initial and continuing calibrations were not present nor were raw data for samples and quality control (QC) reported. This Tier I+ review assumed that initial calibrations and qualitative and quantitative determination of the 18 NOAA Congeners were acceptable unless an issue was raised in the laboratory narrative.*

**Comments:**

Samples were received intact at 2.1C to 4.1C in 7 shipments on the day of or day after sample collection (e.g., samples collected on 9/24 were received on 9/25/09). COC seals were absent from coolers; however, these were picked up from the site by a courier and delivered directly to the lab.

Samples were analyzed for % solids, TOC, and Grain size. All samples were also air-dried and subsequently analyzed for %solids - air-dried and 18 NOAA Congeners

*HT: Air-dried samples were extracted on 10/5/09 and analyzed by 10/23/09 - HT met - No action required.*

*Surrogates: both surrogates (BZ19-C13 and BZ202-C13) were diluted out (0% recovery) due to dilutions made for analysis of the samples (DF ranged from 20 to 1000) for all samples except 501725, 502125, 502225, 502425, 502625, 502725, 503125, & 503225. For these eight samples, surrogates were recovered within criteria except DBOB recovered low (34%) in sample 502425, DBOB recovered low (49%) in sample 502625, DBOB recovered low (43%) in sample 503125, and BZ198 recovered high (175%) in sample 503225.*

*\*ACTION: All results estimated (J and UJ) in samples 502425, 502625, 503125, and 503225 due to conflicting Surrogate recoveries.*

*LCS: %Rec for LCS and LCSD were all within 40-140% for all 18 NOAA Congeners spiked and RPDs between LCS and LCSD all OK except BZ28 LCS recovery high (185%) and RPD high (45%) - LCSD OK; and BZ52 LCS & LCSD high (168% & 147%) RPD OK.*

*\*ACTION: BZ28 estimated (J) in all 17 sediment samples due to high LCS recovery and LCS/LCSD imprecision and & BZ52 estimated (J) due to high LCS/LCSD recoveries.*

Date: ~~3/30/10~~

Comments:  
*SRM*: NY/NJ Waterway Sediment. %Rec for Congeners in SRM were all within 40-140% except BZ#128 had 152% recovery. Since the LCS/LCSD recovery was acceptable for this Congener, no action taken to qualify samples data for this SRM result.

*MS/MSD*: performed on sample 501325. Sample, MS and MSD were analyzed at DF=100 ; therefore, spike level (~7 µg/Kg) was too low to be able to evaluate MS/MSD recovery (most recoveries were 0% or >1000%). Replicate precision (sample, MS & MSD) reasonable (RPD <30%) for all 18 NOAA Congeners; therefore, No Action required.

| Decachlorobiphenyl                       | 3.49       | 3.49            | U             | RL       | 6.99  | U         | RL       | NA   | None   |

\* FD DF = 20 so RLs for FD are these RLs x (20/10)

FD precision was acceptable for all 18 NOAA Congeners. Note, sample 502125 underwent surrogate recovery correction while FD sample 508035 did not because surrogates were diluted out. No Action required.

**18 NOAA PCB Congeners Tier I+ Data Validation Checklist**

Lab Project: L0912897

Lab: Alpha Analytical

Comments:

---

An investigation by NEH into previous reporting of LTM data by Battelle indicated that data were surrogate recovery corrected and that non-detects were reported at Method Detection Limits (MDLs). These MDLs were surrogate recovery corrected during the MDL study but were not corrected again based upon individual sample surrogate recovery results. A technical memo was written by NEH on January 29, 2010 (approved by Lee Weishar, WHG, and Mark Koenig, USACE), explaining Battelle's process for reporting, Alpha's process for reporting, and recommendations for adjustment of the current LTMV data so that these data may be comparable to the data from previous sampling events.

---

For samples where the surrogates are not recovered because of the dilution made for analysis of the sample, a DV Comment was added to the validated database file "K2" to indicate that the reported value was not surrogate recovery corrected. For samples with surrogates recovered, a separate excel worksheet has been constructed (Surrogate Recovery Correction \_ L09XXXX.xls) showing the lab reported result, identification of which surrogate was used for correction of each of the 18 NOAA Congeners, and the Surrogate Corrected Result. Non-detects are reported by Alpha at the Reporting Limit (RL) consistent with the QAPP. Since non-detects will not be comparable between Alpha and Battelle because the basis for the non-detects are different (MDL vs. RL), non-detects and reporting limits are not surrogate recovery corrected in the LTMV data.

---

For this SDG, eight samples, 501725, 502125, 502225, 502425, 502625, 502725, 503125, 503225 reported surrogate recoveries. The surrogate corrected values, as shown in Surrogate Recovery Correction\_L0912897.pdf, replaced the Lab Result values in the validated database file, the data were qualified "K" to indicate this change to the Lab Result values, and a DV Comment was added, "K1", to indicate that the Reported result was recovery corrected. For samples 502425, 502625, 503125, and 503225, one of the surrogates was recovered outside criteria. For these four samples, the surrogate which was recovered within criteria was used exclusively for correction of the samples data, as indicated in the technical memo of January 29, 2010.

---

The lab reported results for 18 NOAA Congeners + 2 surrogates. All samples were analyzed at DF>1 except for samples 502625 & 503125; therefore, all RLs for individual Congeners were above the PQLs requested in QAPP Table 1-3 for these diluted sample. The RLs for samples 502625 & 503125 were < RLs and PQLs requested in the QAPP; therefore, sensitivity was acceptable for these data.

---

The narrative did not raise any issues affecting quality that were not already addressed.

---

1 result was reported at a level < RL and was flagged "J" by the lab. This 1 result was accepted with Indeterminate bias due to uncertainty in quantitation at a level below the instrument calibration range

---

*Qualifiers*: All data were reported with "D" qualifiers to indicate results reported from a dilution analysis. As instructed by Battelle, these "D" qualifiers were not removed

---

**New Bedford Harbor  
18 NOAA PCB Congeners Tier I+ Data Validation Checklist**

Lab Project: L0912897

Lab: Alpha Analytical

**ACTIONS:**

Preservation: Cooled to 4 ± 2°C. Sediments may be frozen for up to 1 year to preserve sample prior to extraction. If temperature outside criteria, use professional judgment.

HT: Extraction: waters -7d <HT< 14 d, J det/ J NDs; HT >14 d, J det/R ND

Extraction: sediment - 14d <HT< 28 d, J det/ J NDs; HT >28 d, J det/R ND (freezing arrests HT)

Analysis of extract: 40d < Extract HT < 60d, J det/ J NDs; Extract HT > 60d; J det/ R NDs

Surrogates: % Recovery > 130%, J det/Accept ND; 10% ≤ % Recovery < 50%, J det/J NDs; Recovery < 10%, J det/R NDs.

LCS/LCSD: %Rec<10%, J det/ R NDs; 10% <%Rec<40%, J det/ J NDs; %Rec >140%, J det/Accept NDs. RPD > 30%, J det/UJ NDs.

MS/MSD: %Rec<10%, J det/ R NDs; 10% <%Rec<40%, J det/ J NDs; %Rec >140%, J det/Accept NDs- Unspiked Sample only. RPD > 30%, J det/UJ NDs.

FD: RPD > 30% (waters) or 50% (sediment) for results > 2 x RL, J det/UJ NDs. Use professional judgment for values < 2 x RL.

MBs: If contamination in blank(s) exists, Blank Action Level (BAL)= 5 x Level in Blank (on a sample-equivalent basis). If a sample result is < RL and < BAL, negate (U) result at RL; if value > RL but < BAL, negate (U) result at level reported; if value > BAL, no Action.

RLs: Verify RLs are sample-specific and meet PQL given in QAPP Addendum 2009 UFP - Worksheet #15. If result > upper calibration range, J result; if

Other Data qualified J by lab stays as J; data qualified E by lab becomes J; data qualified U by lab stays U; data qualified P by lab becomes J; data qualified B becomes

Qualifiers: either U or J based on actions taken for Method Blank (MB)

% solids: 10% < % solids < 30%, J det/R ND; % solids < 10%, R detects and NDs.

**Qualifiers:** U = analyte is non-detect at the sample-specific Reporting Limit (RL) (usable); UJ = non-detect is usable as an estimated value; J = result is usable as an estimated

| Yes              | √                       | √             | √                          | √          | √                               | √               | √               | √               | √                 |                        |
| No               |                         |               |                            |            |                                 |                 |                 |                 |                   | Estimate (J)<br>503125 |

Calibration criteria: Unless otherwise noted in the laboratory narrative, it was assumed that all initial and continuing calibration verifications (ICV/CCV) and initial and continuing calibration blank (ICB/CCB) results were acceptable (met LTM V QAPP 2009 requirements). In addition, RPD < 25% for two replicates of each sample.

- Method Modification: Laboratory analyzed two replicates (burns) for TOC by Method 9060A rather than 4 (as in the method); this is consistent with LTMV QAPP requirements.

Samples were received intact. TOC analysis was performed on the samples "as-received" (i.e., not on "air-dried" sediments). Samples were frozen upon receipt to arrest holding time. Therefore, analyses, conducted on 10/26/09, were considered to have met HT criteria. No Action required.

MS/MD site sample used for QC: 501325. Duplicate burns of MS resulted in acceptable recovery and duplicate burns of sample/MD also gave RPD < 25%. Acceptable precision - no action required.

Sample/FD site sample IDs: 502125 & 508035. FD precision, based on average value for TOC for each sample, was RPD = 17.3%; therefore, FD precision was acceptable - No Action required.

Replicate (duplicate) precision TOC results of each sample all had RPD < 25% except 503125 (values reported for duplicate runs were 0.493% and 0.737% resulting in RPD = 39.7%) - all replicates acceptable except for 503125.

*\*ACTION: Replicate TOC results for sample 503125 estimated (J) with Indeterminate bias due to Replicate Imprecision.*

Data users should compute the arithmetic average of the two TOC replicate burns for each sample and use this average as the valid TOC result for that sample.

**Data Package Completeness:**

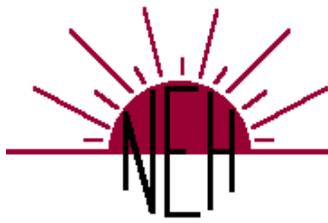

- Were all required forms (results, summary QC, COC), as required to validate the data in accordance with EPA Region 1 present in the data package? **Yes**
- Were all result forms for all samples listed on the chain-of-custody present in data package? **Yes**

If No, explain and request resubmittals:

**Date(s) of Collection:** September 22, 2009 through September 27, 2009

**Number / Type  
Samples & Analyses** 17 sediment samples for 18 NOAA PCB Congeners by EPA SW-846  
Method 8270C and Total Organic Carbon (TOC) by Method 9060

**Senior Data Reviewers:** Nancy C. Rothman, PhD, New Environmental Horizons, Inc.  
Susan D. Chapnick, New Environmental Horizons, Inc.

**Date Completed:** April 1, 2010  
**Revised:** *April 12, 2010*

*This report was revised to include the Tier I+ review of TOC data.*

This EPA Region I Tier I+ validation for 18 NOAA PCB Congeners and TOC was performed with the following intentions: 1) to determine if the data were generated and reported in accordance with the *Quality Assurance Project Plan, New Bedford Harbor Long Term Monitoring V, New Bedford, MA*, prepared by Woods Hole Group, Inc., September 2009 (LTMV QAPP); Region I, *EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses*, December 1996, including *Part III – Pesticide/PCB Data Validation Functional Guidelines*, Draft February 2004; 2) to determine if the data met project data quality objectives for acceptable accuracy, precision, sensitivity; and technical usability; and 3) to generate an electronic deliverable of validated results with project-specific data validation qualifiers added.

The Data Validation Report consists of three parts:

- This Data Validation Report letter summarizing the actions taken;
- The database file of validated sample results with validation qualifiers, bias, and comments added based on actions taken; and
- Data Validation Checklists for TOC and PCB Congeners including the Surrogate Recovery Correction worksheet completed during this validation to document the Tier I+ review. The Checklists are an integral part of the DV Report as they contain comprehensive details of all quality control (QC) reviewed, the acceptance criteria used, and the professional judgment and actions taken.

## I. Sample Descriptions and Analytical Parameters

The sample IDs, date of sampling, identification analytical parameters reviewed and the sample type (e.g., field sample, field duplicate (FD), field equipment blank (EB), as applicable), are listed below in Table 1.

Table 1. Sample Descriptions and Analytical Parameters Validated

| Sample ID | Lab Sample ID | Collection Date | Matrix   | Analytical Parameters <sup>1</sup> | Sample Type               |
|-----------|---------------|-----------------|----------|------------------------------------|---------------------------|
| 501725    | L0912897-01   | 9/23/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample              |

Analytical method references:

18 NOAA Congeners: *Determination of PCB Homologs, Individual Congeners, and Pesticides by Gas Chromatography/Mass Spectrometry in the Select Ion Monitoring (SIM) Mode (EPA 680 & 8270C)*, Alpha SOP O-015, Rev. 2, June 19, 2006.

TOC: SW-846 Method 9060 modified, Alpha SOP W-028

<sup>1</sup> Grain Size analysis was also performed on these samples; however, data validation for this parameter was not required. TOC analysis was performed on “as-received” sediments while the 18 NOAA Congeners were performed using “air-dried” sediments.

## II. Data Validation Report Summary

This Data Validation Report represents a Tier I+ validation of the 18 NOAA PCB Congener and TOC sample results and summary QC (method and matrix), which were used to evaluate accuracy, precision, and sensitivity compared to the NBH LTMV QAPP requirements.

The following QC elements, as applicable to the analytical methods, were reviewed:

- Data package completeness and reporting protocols
- Sample receipt, holding times and preservation criteria
- Blank results including Method Blanks, Equipment Blanks, & Trip blanks
- Laboratory Control Sample (LCS) recoveries / LCS Duplicate Recoveries
- Standard Reference Material (SRM) Recoveries
- Surrogate Recoveries
- Matrix Spike (MS) / Matrix Spike Duplicate (MSD) Recoveries
- MS/MSD, LCS/LCSD, sample/Laboratory Duplicate (LD), or sample/Field Duplicate (FD) Relative Percent Differences (RPDs)

- Sample result reporting (including compound lists, reporting limits, and units)
- Calibration criteria\* (including tune criteria, initial calibration and continuing calibration verification)
- Internal Standard (IS) Recoveries\*
- Retention Time windows\*
- Other method-specific QC if applicable and reported\* (e.g., serial dilution results for metals)
- Deficiencies or protocol deviations as noted in the Laboratory Narrative

\* This QC element is reviewed associated with the Tier II-type validation only. For Tier I+ validations this QC element is assumed to be acceptable unless otherwise noted in the laboratory narrative.

Based on this Tier I+ validation of the 18 NOAA PCB Congeners and TOC, all results were considered usable for project decisions based on a comparison to the NBH LTMV QAPP requirements and with the understanding of the potential uncertainty (bias) in the qualified results summarized in Table 2. NEH generated electronic validated results based on the project database file received from WHG for these data, by updating the following database fields for field samples and field QC only: VALID\_QUAL, VALIDATION\_LEVEL, VALIDATION, VALID\_DATE, BIAS, and DV\_COMMENT.

The remainder of this report documents “exceptions” to the NBH LTMV QAPP criteria or clarifications of data reported. QC elements not discussed below met all QAPP criteria. The full documentation of all QC elements reviewed during the Tier I+ validation are presented in the attached Data Validation Checklists.

### **Sample Receipt and Holding Time**

The sediment samples were received at the laboratory intact in seven shipments at 2.1°C to 4.1°C. Aliquots of the “as-received” samples were analyzed for TOC, Grain Size, and percent solids. Samples were frozen upon receipt to arrest holding time for TOC analysis. All samples had percent solids content of 33-81%; therefore, these sediment samples were air-dried, as required by the QAPP, prior to Congener analysis. After air-drying, the percent solids content for all samples was greater than 83%.

### **Accuracy**

The Method Blank reported detected results for seven of the 18 NOAA Congeners; however, a comparison of the levels reported in the method blank with the levels reported in the samples indicated that blank action to negate or qualify sample data was not required. The Method Blank was non-detect for TOC; therefore, blank action was not required.

There was no Equipment Blank required to be collected along with these sediment samples.

Surrogate recovery did not meet criteria for four samples: 502425, 502625, 503125, and 503225. One of the two surrogates was recovered low, but above 10%, in samples 502425, 502625, and 503125 and one of the two surrogates was recovered high compared to criteria in sample 503225. For these four

samples, the detected results were surrogate-recovery corrected, as required by the LTMV QAPP, using only the one surrogate in each sample that was recovered within criteria. As a consequence of performing this recovery correction calculation, the impact of the surrogates outside criteria on the sample data is uncertain; therefore, all results in these four samples were estimated (J and UJ) due to conflicting surrogate recovery results.

All 18 NOAA Congeners recovered within criteria in the LCS and LCSD except for 2,4,4'-Trichlorobiphenyl (BZ#28) and 2,2',5,5'-Tetrachlorobiphenyl (BZ#52), which recovered high in one or both of the LCS/LCSD. The results for 2,4,4'-Trichlorobiphenyl (BZ#28) and 2,2',5,5'-Tetrachlorobiphenyl (BZ#52) were estimated (J) with a possible high bias, unless other QC issues affected the results, in all seventeen sediments due to the high LCS and/or LCSD recoveries, as listed in Table 2.

Congener recoveries in the MS/MSD analysis conducted on sample 501325 could not be evaluated since the level of the spike was too low compared to the concentration of PCB Congeners in the field sample (i.e., the sample, MS and MSD were all analyzed at dilution factor (DF) = 100, at this high dilution, the relatively low matrix spike level could not be detected). Therefore, no action was taken based on the MS/MSD recoveries. TOC recovery in the MS analysis of sample 501325 was acceptable; indicating acceptable accuracy for TOC in the site matrix.

The Standard Reference Material (SRM NY/NJ Waterway Sediment) reported acceptable recovery for all Congeners certified in this SRM except 2,2',3,3',4,4'-Hexachlorobiphenyl (BZ#128), which was recovered slightly high compared to criteria. Since the LCS/LCSD recoveries for this Congener were within criteria, no action to qualify sample data was taken based on professional judgment. The TOC SRM reported acceptable recoveries for TOC certified in this SRM.

### **Precision**

LCS/LCSD precision was acceptable for all 18 NOAA Congeners except 2,4,4'-Trichlorobiphenyl (BZ#28). All 2,4,4'-Trichlorobiphenyl (BZ#28) data were estimated (J) due to LCS/LCSD imprecision, as shown in Table 2.

MS/MSD precision in the analysis of sample 501325 was acceptable for all 18 NOAA Congeners. Sample/MD precision for TOC analysis of 501325 was acceptable. These results indicate acceptable precision and representativeness of these sediments for analysis of the NOAA PCB Congeners and TOC.

All TOC analyses were performed in replicate (duplicate burns), as a method modification consistent with the site QAPP requirements. Precision between all replicates of TOC reported for each sample was acceptable for all samples except 503125. Replicate precision was not met for the duplicate burns of this one sample; therefore, the replicate values for TOC for 503125 were estimated (J) with indeterminate bias due to the observed imprecision.

Field Duplicate (FD) precision was acceptable for all 18 NOAA Congeners and TOC in the FD pair of 502125 and 508035. These results are an indication of acceptable precision and representativeness of these sediment samples to the site location for PCB Congeners and TOC.

## Sensitivity & Reporting

All samples met sensitivity requirements for PCB Congeners and TOC as indicated in NBH LTMV QAPP Table 1-3.

Data users should compute the average of the TOC replicate results (duplicate burns) for each sample and use this arithmetic average as the valid result for TOC.

An investigation by NEH into previous reporting of LTM data by Battelle indicated that Congener data were surrogate-recovery corrected and that non-detects were reported at Method Detection Limits (MDLs). These MDLs were surrogate-recovery corrected during the MDL study but were not corrected again based upon individual sample surrogate recovery results. A technical memo was written by NEH on January 29, 2010 (approved by Lee Weishar, WHG, and Mark Koenig, USACE), explaining Battelle's process for reporting previous LTM data (LTMIV and prior monitoring data), Alpha's process for reporting LTMV results, and recommendations for adjustment of the current LTMV data so that these data may be comparable to the data from previous sampling events reported by Battelle.

For Congener samples where the surrogates are not recovered because of analytical dilutions or when results were non-detect, the DV\_COMMENT "K2" was added to the validated database file to indicate that the reported value was not surrogate-recovery corrected.

For Congener samples where surrogate-recovery correction was performed, a separate Surrogate Recovery Correction excel worksheet was constructed (as part of the Data Validation Checklist process) showing the original lab reported result, identification of which surrogate was used for correction of each of the 18 NOAA Congeners, and the Surrogate Corrected Result. For surrogate-corrected results, the project database file was updated as follows:

1. The surrogate-corrected value, as shown in the Surrogate Recovery Correction worksheet, replaced the lab RESULT value in the validated database file;
2. The qualifier "K" was added to the VALID\_QUAL field to identify the result as surrogate-recovery corrected; and
3. "K1" was added to the DV\_COMMENT field as the DV code to further indicate that the reported result was surrogate-recovery corrected.

Non-detects for Congeners were reported by Alpha at the Reporting Limit (RL), consistent with the LTMV QAPP requirements. Since non-detected results are not comparable between Alpha and Battelle because the basis for the non-detects are different (RL vs. MDL), non-detects and reporting limits were not surrogate-recovery corrected in the LTMV data.

For this SDG, eight samples, 501725, 502125, 502225, 502725, 502425, 502625, 503125, and 503225 reported surrogate recoveries. For samples 502425, 502625, 503125, and 503225, one of the two surrogates were not recovered within criteria; therefore, the other surrogate, recovered within criteria, was used for correction of all detected Congener results. Surrogate-recovery correction was performed for these eight samples, as documented in *Surrogate Recovery Correction\_L0912897*. Actions taken are listed below in Table 2.

Results reported below the sample-specific RLs are considered uncertain because they are below the calibration range. During this review, data below the sample-specific RLs were qualified as estimated (J), as shown in Table 2, and as described in the Data Validation Checklist.

The laboratory reported all results from  $DF > 1$  analyses with a “D” qualifier. At Battelle’s request, these “D” qualifiers were maintained during the DV process.

Table 2. Summary of Data Validation Actions

| Field Sample ID  | Analyte   | Qualifier | Bias | Validation Comments   |
|--|---|-----------|------|---|
| 503125   | Total Organic Carbon  | J         | I    | Replicate imprecision   |

**Did the Laboratory Narrative contain any issues which may affect data quality? Yes; however, all issues were reported in the summary data.**

**Were the %solids acceptable (>30%)? Yes all > 70% solids after air-drying. Prior to air-drying, % solids were 34-80%.**

*The data package consisted of a laboratory narrative, data sheets for samples, Method Blanks (MB), laboratory control samples (LCS), Matrix Spike/Matrix Spike Duplicates (MS/MSD), and the executed chain-of-custody. Summary information for initial and continuing calibrations were not present nor were raw data for samples and quality control (QC) reported. This Tier I+ review assumed that initial calibrations and qualitative and quantitative determination of the 18 NOAA Congeners were acceptable unless an issue was raised in the laboratory narrative.*

**Comments:**

Samples were received intact at 2.0C to 3.5C in 6 shipments on the day of or day after sample collection (e.g., samples collected on 9/27 were received on 9/28/09). COC seals were absent from coolers; however, these were picked up from the site by a courier and delivered directly to the lab.

Samples were analyzed for % solids, TOC, and Grain size. All samples were also air-dried and subsequently analyzed for %solids - air-dried and 18 NOAA Congeners

*HT: Air-dried samples were extracted on 10/6/09 and analyzed by 10/27/09 - HT met - No action required.*

*Surrogates: both surrogates (DBOB and BZ198) were recovered within criteria in all samples except BZ198 recovered high (>130%) in samples 503525, 503925, 504425, 504625, and 504825. Since these samples were recovery corrected using the other surrogate (DBOB), it is unclear how these high BZ198 surrogate recoveries would have affected detected results. Since non-detects are not surrogate recovery corrected and since high recovery should not have affected the non-detects, only detected results in these five samples affected.*

*\*ACTION: All detected results estimated (J) in samples 503525, 503925, 504425, 504625, and 504825 due to conflicting Surrogate recoveries.*

*LCS: %Rec for LCS and LCSD were all within 40-140% for all 18 NOAA Congeners spiked and RPDs between LCS and LCSD all OK except BZ52 LCS recovery high (147%) - LCSD & RPD OK; and BZ105 RPD high (51%) but LCS & LCSD OK. No Action taken for high LCS BZ52 since LCSD OK and RPD OK.*

*\*ACTION: BZ105 estimated (J) in all 17 sediment samples due to LCS/LCSD imprecision.*

Date: ~~4/5/10~~

Comments:  
SRM: NY/NJ Waterway Sediment. %Rec for Congeners in SRM were all within 40-140% except BZ#66 (37%), BZ#128 (157%), BZ195 (234%), BZ206 (181%) . Since the LCS/LCSD recovery was acceptable for these Congeners, no action taken to qualify samples data based on these SRM results.

MS/MSD: performed on sample 507825. Sample, MS and MSD were analyzed at DF=1. All MS & MSD %Rec OK and RPD between MS and MSD acceptable - acceptable accuracy and precision for sample matrix by method of analysis demonstrated - No Action required.

**New Bedford Harbor**  
**18 NOAA PCB Congeners Tier I+ Data Validation Checklist**

Lab Project: L0912899

Lab: Alpha Analytical

Comments:

---

An investigation by NEH into previous reporting of LTM data by Battelle indicated that data were surrogate recovery corrected and that non-detects were reported at Method Detection Limits (MDLs). These MDLs were surrogate recovery corrected during the MDL study but were not corrected again based upon individual sample surrogate recovery results. A technical memo was written by NEH on January 29, 2010 (approved by Lee Weishar, WHG, and Mark Koenig, USACE), explaining Battelle's process for reporting, Alpha's process for reporting, and recommendations for adjustment of the current LTMV data so that these data may be comparable to the data from previous sampling events.

---

For samples where the surrogates are not recovered because of the dilution made for analysis of the sample, a DV Comment was added to the validated database file "K2" to indicate that the reported value was not surrogate recovery corrected. For samples with surrogates recovered, a separate excel worksheet has been constructed (Surrogate Recovery Correction \_ L09XXXX.xls) showing the lab reported result, identification of which surrogate was used for correction of each of the 18 NOAA Congeners, and the Surrogate Corrected Result. Non-detects are reported by Alpha at the Reporting Limit (RL) consistent with the QAPP. Since non-detects will not be comparable between Alpha and Battelle because the basis for the non-detects are different (MDL vs. RL), non-detects and reporting limits are not surrogate recovery corrected in the LTMV data.

---

All samples in this SDG reported surrogate recoveries. The surrogate corrected values, as shown in Surrogate Recovery Correction\_L0912899.pdf, replaced the Lab Result values in the validated database file, the data were qualified "K" to indicate this change to the Lab Result values, and a DV Comment was added, "K1", to indicate that the Reported result was recovery corrected. For samples 503525, 503925, 504425, 504625, and 504825, one of the surrogates was recovered outside criteria. For these five samples, the surrogate which was recovered within criteria was used exclusively for correction of the samples data, as indicated in the technical memo of January 29, 2010.

---

The lab reported results for 18 NOAA Congeners + 2 surrogates. All samples analyzed at DF=1 reported RLs for individual Congeners and PQLs below those requested in the QAPP; therefore, sensitivity was acceptable for these data. Samples with DF > 1 also met sensitivity requirements since the DF >1 was performed to ensure that all detects were reported within the instrument calibration range.

---

The narrative did not raise any issues affecting quality that were not already addressed.

---

4 results were reported at levels < RL and was flagged "J" by the lab. These 4 results were accepted with Indeterminate bias due to uncertainty in quantitation at a level below the instrument calibration range

---

*Qualifiers*: All data were reported with "D" qualifiers to indicate results reported from a dilution analysis. As instructed by Battelle, these "D" qualifiers were not removed

Lab: Alpha Analytical

**TOC Tier I+ Data Validation Checklist**

No. Samples: 16 + 1FD  
Matrix: Sediment

Date Sampled: 9/22/09 through 9/27/09

Analysis: Total Organic Carbon (TOC) by modified EPA SW-846 Method 9060

| QC Met Criteria? | Preservation<br>4 ± 2°C | HT<br>28 days | RL<br>0.01%<br>(100 mg/Kg) | MB<br>< RL | Solid LCS =<br>SRM<br>75-125% R | MS<br>75-125% R | MD<br>RPD ≤ 25% | FD<br>RPD ≤ 50% | % Solids<br>> 30% | Other |
|------------------|-------------------------|---------------|----------------------------|------------|---------------------------------|-----------------|-----------------|-----------------|-------------------|-------|
| <b>Yes</b>       | √                       | √             | √                          | √          | √                               | √               | √               | √               | √                 |       |
| <b>No</b>        |                         |               |                            |            |                                 |                 |                 |                 |                   |       |

Calibration criteria: Unless otherwise noted in the laboratory narrative, it was assumed that all initial and continuing calibration verifications (ICV/CCV) and initial and continuing calibration blank (ICB/CCB) results were acceptable (met LTM V QAPP 2009 requirements). In addition, RPD < 25% for two replicates of each sample.

- Method Modification: Laboratory analyzed two replicates (burns) for TOC by Method 9060A rather than 4 (as in the method); this is consistent with LTMV QAPP requirements.

Samples were received intact. TOC analysis was performed on the samples "as-received" (i.e., not on "air-dried" sediments). Samples were frozen upon receipt to arrest holding time. Therefore, analyses, conducted on 10/28/09, were considered to have met HT criteria. No Action required.

MS/MD site sample used for QC: 507825. Duplicate burns of MS resulted in acceptable recovery and duplicate burns of sample/MD also gave RPD < 25%. Acceptable precision - No action required.

Sample/FD site sample IDs: 503325 & 508135. FD precision, based on average value for TOC for each sample, was RPD = 10.5%; therefore, FD precision was acceptable - No Action required.

Replicate (duplicate) precision TOC results of each sample all had RPD < 25% - No Action required.

Data users should compute the arithmetic average of the two TOC replicate burns for each sample and use this average as the valid TOC result for that sample.

**Data Package Completeness:**

- Were all required forms (results, summary QC, COC), as required to validate the data in accordance with EPA Region 1 present in the data package? **Yes**
- Were all result forms for all samples listed on the chain-of-custody present in data package? **Yes**

If No, explain and request resubmittals:

## TOC Tier I+ Data Validation Checklist

Lab: Alpha Analytical**Data Quality / Usability Issues:**1. Did the Laboratory Narrative contain any issues which may affect data quality or usability that have not been already addressed on page 1? **No.**

If Yes, explain.

2. Explain further any actions taken based on summary QC, as necessary, below.

No further actions required.

**All TOC data were accepted as reported by the laboratory and unchanged as a consequence of this data validation review.****QC Actions:**

Pres./HT: HT exceedance: J detects; Non-detects: R or UJ based on professional judgment. Freezing arrests HT.

Temperature: outside control limits of  $4 \pm 2^\circ\text{C}$ : use professional judgment.

Blanks: Method Blanks and instrument blanks: TOC &lt; RL unless all sample results are &gt; 10 blank level. Detected results &lt; matrix-matched blank level report as "U" (non-detected at level found). Professional judgment used for non-matrix matched blanks (e.g. aqueous blank associated with sediment samples).

Calibration Criteria: Assume acceptable unless narrated. Exceedances of any calibration criteria will affect accuracy of the data: J detects and UJ non-detects. Severe exceedances of calibration criteria, to be determined based on professional judgment, may require rejection, R, of data.

Assume acceptable unless narrated. If narrated as exceeded: %Recoveries &lt; lower control limit: J / UJ. %Recoveries &gt; upper control limit: J detects.

ICV/CCV: If severe exceedance &lt;50% recovery: R non-detects.

LCS/SRM: %Recoveries &lt; lower control limit: J / UJ. %Recoveries &gt; upper control limit: J detects. %Recoveries &lt; 50%, may R non-detects &amp; J detects but use professional judgment to accept results if MS is in-control indicating acceptable accuracy in sample matrix.

MS: %Recoveries &lt; lower control limit: J / UJ. %Recoveries &gt; upper control limit: J detects. %Recoveries &lt; 30%, may R non-detects &amp; J detects but use professional judgment if sample concentration &gt; 2x spike level.

MD: Results &gt; 5xRL: RPD &gt;25%: J / UJ associated results in batch - to be determined using professional judgment.

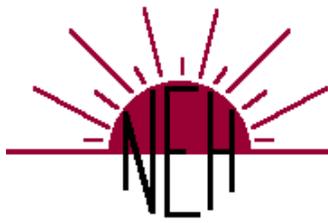

Results < 5xRL: difference >  $\pm 2xRL$ , J / UJ associated results in batch - to be determined using professional judgment.FD: Results > 5xRL: RPD >50%: J / UJ FD results only. Results < 5xRL: difference >  $\pm 4xRL$ , J/UJ FD results only.

% Solids: 10% &lt; % solids &lt; 30%, J detects/R non-detects; % solids &lt; 10%, R all results.

**Qualifiers:** U = analyte is non-detect at the sample-specific Reporting Limit (RL) (usable); UJ = non-detect is usable as an estimated value; J = result is usable as an estimated value; R = result is rejected due to severe QC exceedance and unusable for project objectives. Bias: L = Low; H = High; I = Indeterminate. QC Limits based on EPA Region 1 Inorganic DV guidance and LTM V QAPP 2009.**References:** Quality Assurance Project Plan; New Bedford Harbor Long Term Monitoring V; New Bedford, Massachusetts (September 2009); Region I, EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses, December 1996; USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review; Publication EPA 540-R-04-004, October 2004.Date: 7/17/10

**Revised:** *April 12, 2010*

*This report was revised to include the Tier I+ review of TOC data.*

This EPA Region I Tier I+ validation for 18 NOAA PCB Congeners and TOC was performed with the following intentions: 1) to determine if the data were generated and reported in accordance with the *Quality Assurance Project Plan, New Bedford Harbor Long Term Monitoring V, New Bedford, MA*, prepared by Woods Hole Group, Inc., September 2009 (LTMV QAPP); Region I, *EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses*, December 1996, including *Part III – Pesticide/PCB Data Validation Functional Guidelines*, Draft February 2004; 2) to determine if the data met project data quality objectives for acceptable accuracy, precision, sensitivity; and technical usability; and 3) to generate an electronic deliverable of validated results with project-specific data validation qualifiers added.

The Data Validation Report consists of three parts:

- This Data Validation Report letter summarizing the actions taken;
- The database file of validated sample results with validation qualifiers, bias, and comments added based on actions taken; and
- Data Validation Checklists for TOC and PCB Congeners including the Surrogate Recovery Correction worksheet completed during this validation to document the Tier I+ review. The Checklists are an integral part of the DV Report as they contain comprehensive details of all quality control (QC) reviewed, the acceptance criteria used, and the professional judgment and actions taken.

## I. Sample Descriptions and Analytical Parameters

The sample IDs, date of sampling, identification analytical parameters reviewed and the sample type (e.g., field sample, field duplicate (FD), field equipment blank (EB), as applicable), are listed below in Table 1.

Table 1. Sample Descriptions and Analytical Parameters Validated

| Sample ID | Lab Sample ID | Collection Date | Matrix   | Analytical Parameters <sup>1</sup> | Sample Type               |
|-----------|---------------|-----------------|----------|------------------------------------|---------------------------|
| 503325    | L0912899-01   | 9/26/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample              |

Analytical method references:

18 NOAA Congeners: *Determination of PCB Homologs, Individual Congeners, and Pesticides by Gas Chromatography/Mass Spectrometry in the Select Ion Monitoring (SIM) Mode (EPA 680 & 8270C)*, Alpha SOP O-015, Rev. 2, June 19, 2006.

TOC: SW-846 Method 9060 modified, Alpha SOP W-028

<sup>1</sup> Grain Size analysis was also performed on these samples; however, data validation for this parameter was not required. TOC analysis was performed on “as-received” sediments while the 18 NOAA Congeners were performed using “air-dried” sediments.

## II. Data Validation Report Summary

This Data Validation Report represents a Tier I+ validation of the 18 NOAA PCB Congener and TOC sample results and summary QC (method and matrix), which were used to evaluate accuracy, precision, and sensitivity compared to the NBH LTMV QAPP requirements.

The following QC elements, as applicable to the analytical methods, were reviewed:

- Data package completeness and reporting protocols
- Sample receipt, holding times and preservation criteria
- Blank results including Method Blanks, Equipment Blanks, & Trip blanks
- Laboratory Control Sample (LCS) recoveries / LCS Duplicate Recoveries
- Standard Reference Material (SRM) Recoveries
- Surrogate Recoveries
- Matrix Spike (MS) / Matrix Spike Duplicate (MSD) Recoveries
- MS/MSD, LCS/LCSD, sample/Laboratory Duplicate (LD), or sample/Field Duplicate (FD) Relative Percent Differences (RPDs)

- Sample result reporting (including compound lists, reporting limits, and units)
- Calibration criteria\* (including tune criteria, initial calibration and continuing calibration verification)
- Internal Standard (IS) Recoveries\*
- Retention Time windows\*
- Other method-specific QC if applicable and reported\* (e.g., serial dilution results for metals)
- Deficiencies or protocol deviations as noted in the Laboratory Narrative

\* This QC element is reviewed associated with the Tier II-type validation only. For Tier I+ validations this QC element is assumed to be acceptable unless otherwise noted in the laboratory narrative.

Based on this Tier I+ validation of the 18 NOAA PCB Congeners and TOC, all results were considered usable for project decisions based on a comparison to the NBH LTMV QAPP requirements and with the understanding of the potential uncertainty (bias) in the qualified results summarized in Table 2. NEH generated electronic validated results based on the project database file received from WHG for these data, by updating the following database fields for field samples and field QC only: VALID\_QUAL, VALIDATION\_LEVEL, VALIDATION, VALID\_DATE, BIAS, and DV\_COMMENT.

The remainder of this report documents “exceptions” to the NBH LTMV QAPP criteria or clarifications of data reported. QC elements not discussed below met all QAPP criteria. The full documentation of all QC elements reviewed during the Tier I+ validation are presented in the attached Data Validation Checklists.

### **Sample Receipt and Holding Time**

The sediment samples were received at the laboratory intact in seven shipments at 2.0°C to 3.5°C. Aliquots of the “as-received” samples were analyzed for TOC, Grain Size, and percent solids. Samples were frozen upon receipt to arrest holding time for TOC analysis. All samples had percent solids content of 34-80%; therefore, these sediment samples were air-dried, as required by the QAPP, prior to Congener analysis. After air-drying, the percent solids content for all samples was greater than 70%.

### **Accuracy**

The Method Blank was non-detect for TOC; therefore, blank action was not required.

The Method Blank reported detected results for several Congeners. Comparisons of the levels reported in the method blank with the levels reported in the samples were made and the following blank actions were taken:

- 2,2',3,5'-Tetrachlorobiphenyl (BZ#44), 2,2',5,5'-Tetrachlorobiphenyl (BZ#52), and 2,2',4,5,5'-Pentachlorobiphenyl (BZ#101) were negated (U) at the surrogate-corrected level found in sample 507825.

There was no Equipment Blank required to be collected along with these sediment samples.

Surrogate recovery did not meet criteria for five samples: 503525, 503925, 504425, 504625, and 504825. One of the two surrogates was recovered high compared to criteria in all five samples. For these samples, the detected results were surrogate-recovery corrected, as required by the LTMV QAPP, using only the one surrogate in each sample that was recovered within criteria. As a consequence of performing this recovery correction calculation, the impact of the surrogates outside criteria on the sample data is uncertain; therefore, all detected results in these five samples were estimated (J) due to conflicting surrogate recovery results.

All 18 NOAA Congeners recovered within criteria in the LCS and LCSD except for 2,2',5,5'-Tetrachlorobiphenyl (BZ#52), which was recovered high in the LCS. Since the LCSD recovery and RPD between the LCS and LCSD were acceptable for this Congener, no action to qualify sample data was taken based on professional judgment.

Congener recoveries in the MS/MSD analysis conducted on sample 507825 were all acceptable indicating acceptable accuracy for PCB Congener analysis of this matrix. TOC recovery in the MS analysis of sample 507825 was acceptable; indicating acceptable accuracy for TOC in the site matrix.

The Standard Reference Material (SRM NY/NJ Waterway Sediment) reported acceptable recovery for all Congeners certified in this SRM except 2,3',4,4'-Tetrachlorobiphenyl (BZ#66), 2,2',3,3',4,4'-Hexachlorobiphenyl (BZ#128), 2,2',3,3',4,4',5,6-Octachlorobiphenyl (BZ#195), and 2,2',3,3',4,4',5,5',6-Nonachlorobiphenyl (BZ#206), which were recovered outside criteria. Since the LCS/LCSD and MS/MSD recoveries for these Congeners were within criteria, no action to qualify sample data was taken based on professional judgment. The TOC SRM reported acceptable recoveries for TOC certified in this SRM.

### **Precision**

LCS/LCSD precision was acceptable for all 18 NOAA Congeners except 2,3,3',4,4'-Pentachlorobiphenyl (BZ#105). All 2,3,3',4,4'-Pentachlorobiphenyl (BZ#105) data were estimated (J) due to LCS/LCSD imprecision, as shown in Table 2.

MS/MSD precision in the analysis of sample 507825 was acceptable for all 18 NOAA Congeners. Sample/MD precision for TOC analysis of 507825, as well as precision between all replicates of TOC reported for each sample, was acceptable. These results indicate acceptable precision and representativeness of these sediments for analysis of the NOAA PCB Congeners and TOC.

Field Duplicate (FD) precision was acceptable for all 18 NOAA Congeners and TOC in the FD pair 503325 and 508135. These results are an indication of acceptable precision and representativeness of these sediment samples to the site location for PCB Congeners and TOC.

### **Sensitivity & Reporting**

All samples met sensitivity requirements for PCB Congeners and TOC as indicated in NBH LTMV QAPP Table 1-3.

Data users should compute the average of the TOC replicate results (duplicate burns) for each sample and use this arithmetic average as the valid result for TOC.

An investigation by NEH into previous reporting of LTM data by Battelle indicated that Congener data were surrogate-recovery corrected and that non-detects were reported at Method Detection Limits (MDLs). These MDLs were surrogate-recovery corrected during the MDL study but were not corrected again based upon individual sample surrogate recovery results. A technical memo was written by NEH on January 29, 2010 (approved by Lee Weishar, WHG, and Mark Koenig, USACE), explaining Battelle's process for reporting previous LTM data (LTMIV and prior monitoring data), Alpha's process for reporting LTMV results, and recommendations for adjustment of the current LTMV data so that these data may be comparable to the data from previous sampling events reported by Battelle.

For Congener samples where the surrogates are not recovered because of analytical dilutions or when results were non-detect, the DV\_COMMENT "K2" was added to the validated database file to indicate that the reported value was not surrogate-recovery corrected.

For Congener samples where surrogate-recovery correction was performed, a separate Surrogate Recovery Correction excel worksheet was constructed (as part of the Data Validation Checklist process) showing the original lab reported result, identification of which surrogate was used for correction of each of the 18 NOAA Congeners, and the Surrogate Corrected Result. For surrogate-corrected results, the project database file was updated as follows:

1. The surrogate-corrected value, as shown in the Surrogate Recovery Correction worksheet, replaced the lab RESULT value in the validated database file;
2. The qualifier "K" was added to the VALID\_QUAL field to identify the result as surrogate-recovery corrected; and
3. "K1" was added to the DV\_COMMENT field as the DV code to further indicate that the reported result was surrogate-recovery corrected.

Non-detects for Congeners were reported by Alpha at the Reporting Limit (RL), consistent with the LTMV QAPP requirements. Since non-detected results are not comparable between Alpha and Battelle because the basis for the non-detects are different (RL vs. MDL), non-detects and reporting limits were not surrogate-recovery corrected in the LTMV data.

For this SDG, all samples reported surrogate recoveries. For samples 503525, 503925, 504425, 504625, and 504825, one of the two surrogates were not recovered within criteria; therefore, the other surrogate, recovered within criteria, was used for correction of all detected Congener results. Surrogate-recovery correction was performed for these eight samples, as documented in *Surrogate Recovery Correction\_L0912899*. Actions taken are listed below in Table 2.

Results reported below the sample-specific RLs are considered uncertain because they are below the calibration range. During this review, data below the sample-specific RLs were qualified as estimated (J), as shown in Table 2, and as described in the Data Validation Checklist.

The laboratory reported all results from DF > 1 analyses with a "D" qualifier. At Battelle's request, these "D" qualifiers were maintained during the DV process.

**Did the Laboratory Narrative contain any issues which may affect data quality? Yes; however, all issues were reported in the summary data.**

**Were the %solids acceptable (>30%)? Yes all > 82% solids after air-drying. Prior to air-drying, % solids were 33-82%.**

*The data package consisted of a laboratory narrative, data sheets for samples, Method Blanks (MB), laboratory control samples (LCS), Matrix Spike/Matrix Spike Duplicates (MS/MSD), and the executed chain-of-custody. Summary information for initial and continuing calibrations were not present nor were raw data for samples and quality control (QC) reported. This Tier I+ review assumed that initial calibrations and qualitative and quantitative determination of the 18 NOAA Congeners were acceptable unless an issue was raised in the laboratory narrative.*

**Comments:**

Samples were received intact at 1.6C to 3.5C in 6 shipments on the day of or day after sample collection (e.g., samples collected on 9/27 were received on 9/28/09). COC seals were absent from coolers; however, these were picked up from the site by a courier and delivered directly to the lab.

Samples were analyzed for % solids, TOC, and Grain size. All samples were also air-dried and subsequently analyzed for %solids - air-dried and 18 NOAA Congeners

*HT: Air-dried samples were extracted on 10/6/09 and analyzed by 10/27/09 - HT met - No action required.*

*Surrogates: both surrogates (DBOB and BZ198) were recovered within criteria in all samples except BZ198 recovered high (>130%) in samples 505025, 505325, and 505625. Since these samples were recovery corrected using the other surrogate (DBOB), it is unclear how these high BZ198 surrogate recoveries would have affected detected results. Since non-detects are not surrogate recovery corrected and since high recovery should not have affected the non-detects, only detected results in these three samples affected.*

*\*ACTION: All detected results estimated (J) in samples 505025, 505325, and 505625 due to conflicting Surrogate recoveries.*

*LCS: %Rec for LCS and LCSD were all within 40-140% for all 18 NOAA Congeners spiked and RPDs between LCS and LCSD all OK except BZ105 LCS high (146%) but LCSD and RPD OK. No Action taken for high LCS BZ105 since LCSD OK and RPD OK.*

Date: ~~4/5/10~~

Data Reviewer: Nancy C. Rothman, Ph.D.

Comments:  
SRM: NY/NJ Waterway Sediment. %Rec for Congeners in SRM were all within 40-140% except BZ#128 (166%) and BZ195 (194%). Since the LCS/LCSD recovery was acceptable for these Congeners, no action taken to qualify samples data based on these SRM results.

MS/MSD: performed on sample 505625. Sample, MS and MSD were analyzed at DF=5. Spike level (7.46 µg/Kg) too low for all 18 NOAA Congeners except for BZ195, BZ206, & BZ209 therefore %Recovery results meaningless for all but the last 3 Congeners. % Rec high for BZ206 in MS & MSD and RPD also out for this Congener. Precision between MS & MSD also not acceptable for BZ153 & BZ180. No action for high MS/MSD for BZ206 since unspiked sample was non-detect - action only taken for MS/MSD imprecision.

\*ACTION: BZ153, BZ180 & BZ206 estimated (J and UJ) in 505625 due to MS/MSD imprecision

Date: ~~4/5/10~~

\* The sample and FD were both analyzed at DF=1

FD precision was not acceptable for 11 out of 18 NOAA Congeners (result > 2 x RL but RPD > 50%). Note both samples were surrogate recovery corrected prior to this evaluation.

*\*ACTION: 11 Congeners which exceeded FD precision criteria, as shown above, were estimated (J) in FD pair with indeterminate bias.*

Lab Project: L0912900

Lab: Alpha Analytical

Comments:

---

An investigation by NEH into previous reporting of LTM data by Battelle indicated that data were surrogate recovery corrected and that non-detects were reported at Method Detection Limits (MDLs). These MDLs were surrogate recovery corrected during the MDL study but were not corrected again based upon individual sample surrogate recovery results. A technical memo was written by NEH on January 29, 2010 (approved by Lee Weishar, WHG, and Mark Koenig, USACE), explaining Battelle's process for reporting, Alpha's process for reporting, and recommendations for adjustment of the current LTMV data so that these data may be comparable to the data from previous sampling events.

---

For samples where the surrogates are not recovered because of the dilution made for analysis of the sample, a DV Comment was added to the validated database file "K2" to indicate that the reported value was not surrogate recovery corrected. For samples with surrogates recovered, a separate excel worksheet has been constructed (Surrogate Recovery Correction \_ L09XXXX.xls) showing the lab reported result, identification of which surrogate was used for correction of each of the 18 NOAA Congeners, and the Surrogate Corrected Result. Non-detects are reported by Alpha at the Reporting Limit (RL) consistent with the QAPP. Since non-detects will not be comparable between Alpha and Battelle because the basis for the non-detects are different (MDL vs. RL), non-detects and reporting limits are not surrogate recovery corrected in the LTMV data.

---

All samples in this SDG reported surrogate recoveries. The surrogate corrected values, as shown in Surrogate Recovery Correction\_L0912900.pdf, replaced the Lab Result values in the validated database file, the data were qualified "K" to indicate this change to the Lab Result values, and a DV Comment was added, "K1", to indicate that the Reported result was recovery corrected. For samples 505025, 505325, and 505625, one of the surrogates was recovered outside criteria. For these five samples, the surrogate which was recovered within criteria was used exclusively for correction of the samples data, as indicated in the technical memo of January 29, 2010.

---

The lab reported results for 18 NOAA Congeners + 2 surrogates. All samples analyzed at DF=1 reported RLs for individual Congeners and PQLs below those requested in the QAPP; therefore, sensitivity was acceptable for these data. Samples with DF > 1 also met sensitivity requirements since the DF >1 was performed to ensure that all detects were reported within the instrument calibration range.

---

The narrative did not raise any issues affecting quality that were not already addressed.

---

4 results were reported at levels < RL and was flagged "J" by the lab. These 4 results were accepted with Indeterminate bias due to uncertainty in quantitation at a level below the instrument calibration range

---

*Qualifiers* : All data were reported with "D" qualifiers to indicate results reported from a dilution analysis. As instructed by Battelle, these "D" qualifiers were not removed

18 NOAA PCB Congeners Tier I+ Data Validation Checklist**

Lab Project: L0912900

Lab: Alpha Analytical

**ACTIONS:**

Preservation: Cooled to 4 ± 2°C. Sediments may be frozen for up to 1 year to preserve sample prior to extraction. If temperature outside criteria, use professional judgment.

HT: Extraction: waters -7d <HT< 14 d, J det/ J NDs; HT >14 d, J det/R ND

Extraction: sediment - 14d <HT< 28 d, J det/ J NDs; HT >28 d, J det/R ND (freezing arrests HT)

Analysis of extract: 40d < Extract HT < 60d, J det/ J NDs; Extract HT > 60d; J det/ R NDs

Surrogates: % Recovery > 130%, J det/Accept ND; 10% ≤ % Recovery < 50%, J det/J NDs; Recovery < 10%, J det/R NDs.

LCS/LCSD: %Rec<10%, J det/ R NDs; 10% <%Rec<40%, J det/ J NDs; %Rec >140%, J det/Accept NDs. RPD > 30%, J det/UJ NDs.

MS/MSD: %Rec<10%, J det/ R NDs; 10% <%Rec<40%, J det/ J NDs; %Rec >140%, J det/Accept NDs- Unspiked Sample only. RPD > 30%, J det/UJ NDs.

FD: RPD > 30% (waters) or 50% (sediment) for results > 2 x RL, J det/UJ NDs. Use professional judgment for values < 2 x RL.

MBs: If contamination in blank(s) exists, Blank Action Level (BAL)= 5 x Level in Blank (on a sample-equivalent basis). If a sample result is < RL and < BAL, negate (U) result at RL; if value > RL but < BAL, negate (U) result at level reported; if value > BAL, no Action.

RLs: Verify RLs are sample-specific and meet PQL given in QAPP Addendum 2009 UFP - Worksheet #15. If result > upper calibration range, J result; if

Other Data qualified J by lab stays as J; data qualified E by lab becomes J; data qualified U by lab stays U; data qualified P by lab becomes J; data qualified B becomes

Qualifiers: either U or J based on actions taken for Method Blank (MB)

% solids: 10% < % solids < 30%, J det/R ND; % solids < 10%, R detects and NDs.

**Qualifiers:** U = analyte is non-detect at the sample-specific Reporting Limit (RL) (usable); UJ = non-detect is usable as an estimated value; J = result is usable as an estimated

| No               |                         |               |                            |            |                                 |                 |                 |                 |                   | Estimate (J)<br>505125,<br>505825, &<br>506325 |

Calibration criteria: Unless otherwise noted in the laboratory narrative, it was assumed that all initial and continuing calibration verifications (ICV/CCV) and initial and continuing calibration blank (ICB/CCB) results were acceptable (met LTM V QAPP 2009 requirements). In addition, RPD < 25% for two replicates of each sample.

- Method Modification: Laboratory analyzed two replicates (burns) for TOC by Method 9060A rather than 4 (as in the method); this is consistent with LTMV QAPP requirements.

Samples were received intact. TOC analysis was performed on the samples "as-received" (i.e., not on "air-dried" sediments). Samples were frozen upon receipt to arrest holding time. Therefore, analyses, conducted on 10/29/09, were considered to have met HT criteria. No Action required.

MS/MD site sample used for QC: 505625. Duplicate burns of MS resulted in acceptable recovery and duplicate burns of sample/MD also gave RPD < 25%. Acceptable precision - No action required.

Sample/FD site sample IDs: 506425 & 508235. FD precision, based on average value for TOC for each sample, was RPD = 24.2%; therefore, FD precision was acceptable - No Action required.

Replicate (duplicate) precision TOC results of each sample all had RPD < 25% except 505125 (values reported for duplicate runs RPD = 26.9%); 505825 (values reported for duplicate runs RPD = 28.0%); and 506325 (values reported for duplicate runs RPD = 26.9%) - all replicates acceptable except for 505125, 505825, & 506325.

*\*ACTION: Replicate TOC results for samples 505125, 505825, and 506325 estimated (J) with Indeterminate bias due to Replicate Imprecision.*

Data users should compute the arithmetic average of the two TOC replicate burns for each sample and use this average as the valid TOC result for that sample.

**Data Package Completeness:**

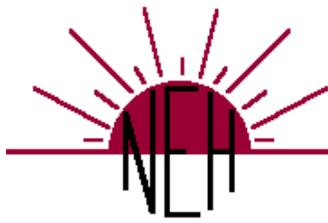

- Were all required forms (results, summary QC, COC), as required to validate the data in accordance with EPA Region 1 present in the data package? **Yes**
- Were all result forms for all samples listed on the chain-of-custody present in data package? **Yes**

If No, explain and request resubmittals:

**Data Validation Report**  
**EPA Region I Tier I+**  
**18 NOAA PCB Congeners by 8270C and TOC by Method 9060**

**Client/Company:** Woods Hole Group, Inc. (WHG)

**Site/Project Name:** New Bedford Harbor Superfund Site – Long Term Monitoring (LTM) V

**Laboratory:** Alpha Analytical – Mansfield, MA

**Lab Project Number(s):** L0912900

**Date(s) of Collection:** September 25, 2009 through September 28, 2009

**Number / Type  
Samples & Analyses** 17 sediment samples for 18 NOAA PCB Congeners by EPA SW-846  
Method 8270C and Total Organic Carbon (TOC) by Method 9060

**Senior Data Reviewers:** Nancy C. Rothman, PhD, New Environmental Horizons, Inc.  
Susan D. Chapnick, New Environmental Horizons, Inc.

**Date Completed:** April 6, 2010  
**Revised:** *April 12, 2010*

*This report was revised to include the Tier I+ review of TOC data.*

This EPA Region I Tier I+ validation for 18 NOAA PCB Congeners and TOC was performed with the following intentions: 1) to determine if the data were generated and reported in accordance with the *Quality Assurance Project Plan, New Bedford Harbor Long Term Monitoring V, New Bedford, MA*, prepared by Woods Hole Group, Inc., September 2009 (LTMV QAPP); Region I, *EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses*, December 1996, including *Part III – Pesticide/PCB Data Validation Functional Guidelines*, Draft February 2004; 2) to determine if the data met project data quality objectives for acceptable accuracy, precision, sensitivity; and technical usability; and 3) to generate an electronic deliverable of validated results with project-specific data validation qualifiers added.

The Data Validation Report consists of three parts:

- This Data Validation Report letter summarizing the actions taken;
- The database file of validated sample results with validation qualifiers, bias, and comments added based on actions taken; and
- Data Validation Checklists for TOC and PCB Congeners including the Surrogate Recovery Correction worksheet completed during this validation to document the Tier I+ review. The Checklists are an integral part of the DV Report as they contain comprehensive details of all quality control (QC) reviewed, the acceptance criteria used, and the professional judgment and actions taken.

## I. Sample Descriptions and Analytical Parameters

The sample IDs, date of sampling, identification analytical parameters reviewed and the sample type (e.g., field sample, field duplicate (FD), field equipment blank (EB), as applicable), are listed below in Table 1.

Table 1. Sample Descriptions and Analytical Parameters Validated

| Sample ID | Lab Sample ID | Collection Date | Matrix   | Analytical Parameters <sup>1</sup> | Sample Type  |
|-----------|---------------|-----------------|----------|------------------------------------|--------------|
| 504925    | L0912900-01   | 9/25/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample |

Analytical method references:

18 NOAA Congeners: *Determination of PCB Homologs, Individual Congeners, and Pesticides by Gas Chromatography/Mass Spectrometry in the Select Ion Monitoring (SIM) Mode (EPA 680 & 8270C)*, Alpha SOP O-015, Rev. 2, June 19, 2006.

TOC: SW-846 Method 9060 modified, Alpha SOP W-028

<sup>1</sup> Grain Size analysis was also performed on these samples; however, data validation for this parameter was not required. TOC analysis was performed on “as-received” sediments while the 18 NOAA Congeners were performed using “air-dried” sediments.

## II. Data Validation Report Summary

This Data Validation Report represents a Tier I+ validation of the 18 NOAA PCB Congener and TOC sample results and summary QC (method and matrix), which were used to evaluate accuracy, precision, and sensitivity compared to the NBH LTMV QAPP requirements.

The following QC elements, as applicable to the analytical methods, were reviewed:

- Data package completeness and reporting protocols
- Sample receipt, holding times and preservation criteria
- Blank results including Method Blanks, Equipment Blanks, & Trip blanks
- Laboratory Control Sample (LCS) recoveries / LCS Duplicate Recoveries
- Standard Reference Material (SRM) Recoveries
- Surrogate Recoveries
- Matrix Spike (MS) / Matrix Spike Duplicate (MSD) Recoveries
- MS/MSD, LCS/LCSD, sample/Laboratory Duplicate (LD), or sample/Field Duplicate (FD) Relative Percent Differences (RPDs)

- Sample result reporting (including compound lists, reporting limits, and units)
- Calibration criteria\* (including tune criteria, initial calibration and continuing calibration verification)
- Internal Standard (IS) Recoveries\*
- Retention Time windows\*
- Other method-specific QC if applicable and reported\* (e.g., serial dilution results for metals)
- Deficiencies or protocol deviations as noted in the Laboratory Narrative

\* This QC element is reviewed associated with the Tier II-type validation only. For Tier I+ validations this QC element is assumed to be acceptable unless otherwise noted in the laboratory narrative.

Based on this Tier I+ validation of the 18 NOAA PCB Congeners and TOC, all results were considered usable for project decisions based on a comparison to the NBH LTMV QAPP requirements and with the understanding of the potential uncertainty (bias) in the qualified results summarized in Table 2. NEH generated electronic validated results based on the project database file received from WHG for these data, by updating the following database fields for field samples and field QC only: VALID\_QUAL, VALIDATION\_LEVEL, VALIDATION, VALID\_DATE, BIAS, and DV\_COMMENT.

The remainder of this report documents “exceptions” to the NBH LTMV QAPP criteria or clarifications of data reported. QC elements not discussed below met all QAPP criteria. The full documentation of all QC elements reviewed during the Tier I+ validation are presented in the attached Data Validation Checklists.

### **Sample Receipt and Holding Time**

The sediment samples were received at the laboratory intact in six shipments at 1.6°C to 3.5°C. Aliquots of the “as-received” samples were analyzed for TOC, Grain Size, and percent solids. Samples were frozen upon receipt to arrest holding time for TOC analysis. All samples had percent solids content of 33-82%; therefore, these sediment samples were air-dried, as required by the QAPP, prior to Congener analysis. After air-drying, the percent solids content for all samples was greater than 82%.

### **Accuracy**

The Method Blank was non-detect for TOC; therefore, blank action was not required.

The Method Blank reported detected results for several Congeners. Comparisons of the levels reported in the method blank with the levels reported in the samples were made and the blank actions to negate sample data were applied after surrogate-recovery correction. Blank actions taken are described in the Data Validation Checklist and listed in Table 2.

There was no Equipment Blank required to be collected along with these sediment samples.

Surrogate recovery did not meet criteria for three samples: 505025, 505325, and 505625. One of the two surrogates was recovered high compared to criteria in all three samples. For these samples, the detected results were surrogate-recovery corrected, as required by the LTMV QAPP, using only the one surrogate in each sample that was recovered within criteria. As a consequence of performing this recovery correction calculation, the impact of the surrogates outside criteria on the sample data is uncertain; therefore, all detected results in these three samples were estimated (J) due to conflicting surrogate recovery results.

All 18 NOAA Congeners recovered within criteria in the LCS and LCSD except for 2,3,3',4,4'-Pentachlorobiphenyl (BZ#105), which was recovered high in the LCS. Since the LCSD recovery and RPD between the LCS and LCSD were acceptable for this Congener, no action to qualify sample data was taken based on professional judgment.

Congener recoveries in the MS/MSD analysis conducted on sample 505625 were acceptable for three Congeners that had spike levels appropriate to the sample concentrations. For the remainder of the Congeners, the spike level was too low compared to the concentration of PCB Congeners in the field sample to evaluate recovery. No action was taken based on the MS/MSD recoveries. TOC recovery in the MS analysis of sample 505625 was acceptable; indicating acceptable accuracy for TOC in the site matrix.

The Standard Reference Material (SRM NY/NJ Waterway Sediment) reported acceptable recovery for all Congeners certified in this SRM except 2,2',3,3',4,4'-Hexachlorobiphenyl (BZ#128) and 2,2',3,3',4,4',5,6-Octachlorobiphenyl (BZ#195), which were recovered outside criteria. Since the LCS/LCSD recoveries for these Congeners were within criteria, no action to qualify sample data was taken based on professional judgment. The TOC SRM reported acceptable recoveries for TOC certified in this SRM.

### **Precision**

LCS/LCSD precision was acceptable for all 18 NOAA Congeners; therefore, no action was required.

MS/MSD precision in the analysis of sample 505625 was acceptable for all 18 NOAA Congeners except for 2,2',4,4',5,5'-Hexachlorobiphenyl (BZ#153), 2,2',3,4,4',5,5'-Heptachlorobiphenyl (BZ#180), and 2,2',3,3',4,4',5,5',6-Nonachlorobiphenyl (BZ#206). The results for these three Congeners were estimated (J and UJ) in the unspiked sample with indeterminate bias due to the observed imprecision. Sample/MD precision for TOC analysis of 505625 was acceptable.

All TOC analyses were performed in replicate (duplicate burns), as a method modification consistent with the site QAPP requirements. Precision between all replicates of TOC reported for each sample was acceptable for all samples except 505125, 505825, and 506325. Replicate precision was not met for the duplicate burns of these three samples; therefore, the replicate values for TOC for 505125, 505825, and 506325 were estimated (J) with indeterminate bias due to the observed imprecision.

Field Duplicate (FD) precision was unacceptable for 11 of the 18 NOAA Congeners in the FD pair of 506425 and 508235. The results for 11 Congeners in these samples were estimated (J) with indeterminate bias, as shown in Table 2, due to the observed imprecision. Precision for TOC was acceptable in this FD pair. These results are an indication of generally unacceptable precision and

representativeness of these sediment samples to the site location for PCB Congeners but acceptable precision and representativeness of these sediment samples to the site location for TOC.

### **Sensitivity & Reporting**

All samples met sensitivity requirements for PCB Congeners and TOC as indicated in NBH LTMV QAPP Table 1-3.

Data users should compute the average of the TOC replicate results (duplicate burns) for each sample and use this arithmetic average as the valid result for TOC.

An investigation by NEH into previous reporting of LTM data by Battelle indicated that Congener data were surrogate-recovery corrected and that non-detects were reported at Method Detection Limits (MDLs). These MDLs were surrogate-recovery corrected during the MDL study but were not corrected again based upon individual sample surrogate recovery results. A technical memo was written by NEH on January 29, 2010 (approved by Lee Weishar, WHG, and Mark Koenig, USACE), explaining Battelle's process for reporting previous LTM data (LTMIV and prior monitoring data), Alpha's process for reporting LTMV results, and recommendations for adjustment of the current LTMV data so that these data may be comparable to the data from previous sampling events reported by Battelle.

For Congener samples where the surrogates are not recovered because of analytical dilutions or when results were non-detect, the DV\_COMMENT "K2" was added to the validated database file to indicate that the reported value was not surrogate-recovery corrected.

For Congener samples where surrogate-recovery correction was performed, a separate Surrogate Recovery Correction excel worksheet was constructed (as part of the Data Validation Checklist process) showing the original lab reported result, identification of which surrogate was used for correction of each of the 18 NOAA Congeners, and the Surrogate Corrected Result. For surrogate-corrected results, the project database file was updated as follows:

1. The surrogate-corrected value, as shown in the Surrogate Recovery Correction worksheet, replaced the lab RESULT value in the validated database file;
2. The qualifier "K" was added to the VALID\_QUAL field to identify the result as surrogate-recovery corrected; and
3. "K1" was added to the DV\_COMMENT field as the DV code to further indicate that the reported result was surrogate-recovery corrected.

Non-detects for Congeners were reported by Alpha at the Reporting Limit (RL), consistent with the LTMV QAPP requirements. Since non-detected results are not comparable between Alpha and Battelle because the basis for the non-detects are different (RL vs. MDL), non-detects and reporting limits were not surrogate-recovery corrected in the LTMV data.

For this SDG, all Congener samples reported surrogate recoveries. For samples 505025, 505325, and 505625, one of the two surrogates was not recovered within criteria; therefore, the other surrogate, recovered within criteria, was used for correction of all detected Congener results. Surrogate-recovery correction was performed for all samples as documented in *Surrogate Recovery Correction\_L0912900*. Actions taken are listed below in Table 2.

Results reported below the sample-specific RLs are considered uncertain because they are below the calibration range. During this review, data below the sample-specific RLs were qualified as estimated (J), as shown in Table 2, and as described in the Data Validation Checklist.

The laboratory reported all results from DF > 1 analyses with a “D” qualifier. At Battelle’s request, these “D” qualifiers were maintained during the DV process.

Table 2. Summary of Data Validation Actions

| Field Sample ID  | Analyte   | Qualifier | Bias | Validation Comments  |
|--|---|-----------|------|--|
| 505125, 505825, & 506325   | Total Organic Carbon  | J         | I    | Replicate imprecision  |
| 504925, 505225, 505425, 505525, 505725, 505925, 506025, & 506225 | All Congeners except:<br>2,2',3,3',4,4',5,6-Octachlorobiphenyl,<br>2,2',3,3',4,4',5,5',6-Nonachlorobiphenyl, &<br>Decachlorobiphenyl - Homologue  | DK / K    |      | Reported value is surrogate recovery corrected   |
| 504925, 505225, 505425, 505525, 505725, 505925, 506025, & 506225 | 2,2',3,3',4,4',5,6-Octachlorobiphenyl,<br>2,2',3,3',4,4',5,5',6-Nonachlorobiphenyl, &<br>Decachlorobiphenyl - Homologue   | DU/ U     |      | Reported value is not surrogate recovery corrected   |

**Did the Laboratory Narrative contain any issues which may affect data quality? Yes; however, all issues were reported in the summary data.**

**Were the %solids acceptable (>30%)? Yes all > 81% solids after air-drying. Prior to air-drying, % solids were 36-96%.**

*The data package consisted of a laboratory narrative, data sheets for samples, Method Blanks (MB), laboratory control samples (LCS), Matrix Spike/Matrix Spike Duplicates (MS/MSD), and the executed chain-of-custody. Summary information for initial and continuing calibrations were not present nor were raw data for samples and quality control (QC) reported. This Tier I+ review assumed that initial calibrations and qualitative and quantitative determination of the 18 NOAA Congeners were acceptable unless an issue was raised in the laboratory narrative.*

Comments:

Samples were received intact at 1.6C to 3.1C in 4 shipments on the day of or day after sample collection . COC seals were absent from coolers; however, these were picked up from the site by a courier and delivered directly to the lab.

Samples were analyzed for % solids, TOC, and Grain size. All samples were also air-dried and subsequently analyzed for %solids - air-dried and 18 NOAA Congeners

HT: Air-dried samples were extracted on 10/6/09 and analyzed by 11/12/09 - HT met - No action required.

Surrogates : both surrogates (DBOB and BZ198) were recovered within criteria in all samples. LCS reported DBOB below criteria - no action since no direct impact on samples

LCS: %Rec for LCS and LCSD were all within 40-140% for all 18 NOAA Congeners spiked. RPDs were all above criteria (RPD > 30%) though except for BZ105 since LCS recovery, as also shown by surrogate spikes were all low compare dot LCSD. Since the MS/MSD RPDs were all OK, decision made, based on professional judgment, to not qualify sample data for LCS RPDs since LCS recoveries all OK and MS/MSD RPDs OK.

| Method Blank | None                | -               | -                       | No Blank Action required   |                  |
|              |                     |                 |                         |                            |                  |
|              |                     |                 |                         |                            |                  |
|              |                     |                 |                         |                            |                  |

Comments:  
*SRM*: NY/NJ Waterway Sediment. %Rec for Congeners in SRM were all within 40-140%, no action required.

*MS/MSD*: performed on sample 507125. Sample, MS and MSD were analyzed at DF=1. Spike level (7.9 µg/Kg) is appropriate to the matrix. %Rec OK for all 18 NOAA Congeners except BZ66 MS low (38%) - MSD and RPD OK and BZ52 MSD high (141%) - MS and RPD OK. Since the MS or MSD were acceptable and RPDs OK for these two Congeners, no Action taken.

*FD*: there were no FDs associated with the samples in this SDG. See FD precision in three other LTMV SDGs.

An investigation by NEH into previous reporting of LTM data by Battelle indicated that data were surrogate recovery corrected and that non-detects were reported at Method Detection Limits (MDLs). These MDLs were surrogate recovery corrected during the MDL study but were not corrected again based upon individual sample surrogate recovery results. A technical memo was written by NEH on January 29, 2010 (approved by Lee Weishar, WHG, and Mark Koenig, USACE), explaining Battelle's process for reporting, Alpha's process for reporting, and recommendations for adjustment of the current LTMV data so that these data may be comparable to the data from previous sampling events.

For samples where the surrogates are not recovered because of the dilution made for analysis of the sample, a DV Comment was added to the validated database file "K2" to indicate that the reported value was not surrogate recovery corrected. For samples with surrogates recovered, a separate excel worksheet has been constructed (Surrogate Recovery Correction \_ L09XXXX.xls) showing the lab reported result, identification of which surrogate was used for correction of each of the 18 NOAA Congeners, and the Surrogate Corrected Result. Non-detects are reported by Alpha at the Reporting Limit (RL) consistent with the QAPP. Since non-detects will not be comparable between Alpha and Battelle because the basis for the non-detects are different (MDL vs. RL), non-detects and reporting limits are not surrogate recovery corrected in the LTMV data.

Date: ~~4/8/10~~  
Data Reviewer: ~~Nancy C. Rothman, Ph.D.~~

New Bedford Harbor  
18 NOAA PCB Congeners Tier I+ Data Validation Checklist

Lab Project: L0912904

Lab: Alpha Analytical

Comments:

---

All samples in this SDG reported surrogate recoveries. The surrogate corrected values, as shown in Surrogate Recovery Correction\_L0912904.pdf, replaced the Lab Result values in the validated database file, the data were qualified "K" to indicate this change to the Lab Result values, and a DV Comment was added, "K1", to indicate that the Reported result was recovery corrected.

---

---

The lab reported results for 18 NOAA Congeners + 2 surrogates. All samples analyzed at DF=1 reported RLs for individual Congeners and PQLs below those requested in the QAPP; therefore, sensitivity was acceptable for these data. Samples with DF > 1 also met sensitivity requirements since the DF >1 was performed to ensure that all detects were reported within the instrument calibration range.

---

---

The narrative did not raise any issues affecting quality that were not already addressed.

---

---

11 results were reported at levels < RL and was flagged "J" by the lab. These 11 results were accepted with Indeterminate bias due to uncertainty in quantitation at a level below the instrument calibration range

---

---

*Qualifiers* : All data were reported with "D" qualifiers to indicate results reported from a dilution analysis. As instructed by Battelle, these "D" qualifiers were not removed

**New Bedford Harbor  
18 NOAA PCB Congeners Tier I+ Data Validation Checklist**

Lab Project: L0912904

Lab: Alpha Analytical

**ACTIONS:**

Preservation: Cooled to 4 ± 2°C. Sediments may be frozen for up to 1 year to preserve sample prior to extraction. If temperature outside criteria, use professional judgment.

HT: Extraction: waters -7d <HT< 14 d, J det/ J NDs; HT >14 d, J det/R ND

Extraction: sediment - 14d <HT< 28 d, J det/ J NDs; HT >28 d, J det/R ND (freezing arrests HT)

Analysis of extract: 40d < Extract HT < 60d, J det/ J NDs; Extract HT > 60d; J det/ R NDs

Surrogates: % Recovery > 130%, J det/Accept ND; 10% ≤ % Recovery < 50%, J det/J NDs; Recovery < 10%, J det/R NDs.

LCS/LCSD: %Rec<10%, J det/ R NDs; 10% <%Rec<40%, J det/ J NDs; %Rec >140%, J det/Accept NDs. RPD > 30%, J det/UJ NDs.

MS/MSD: %Rec<10%, J det/ R NDs; 10% <%Rec<40%, J det/ J NDs; %Rec >140%, J det/Accept NDs- Unspiked Sample only. RPD > 30%, J det/UJ NDs.

FD: RPD > 30% (waters) or 50% (sediment) for results > 2 x RL, J det/UJ NDs. Use professional judgment for values < 2 x RL.

MBs: If contamination in blank(s) exists, Blank Action Level (BAL)= 5 x Level in Blank (on a sample-equivalent basis). If a sample result is < RL and < BAL, negate (U) result at RL; if value > RL but < BAL, negate (U) result at level reported; if value > BAL, no Action.

RLs: Verify RLs are sample-specific and meet PQL given in QAPP Addendum 2009 UFP - Worksheet #15. If result > upper calibration range, J result; if

Other Data qualified J by lab stays as J; data qualified E by lab becomes J; data qualified U by lab stays U; data qualified P by lab becomes J; data qualified B becomes

Qualifiers: either U or J based on actions taken for Method Blank (MB)

% solids: 10% < % solids < 30%, J det/R ND; % solids < 10%, R detects and NDs.

**Qualifiers:** U = analyte is non-detect at the sample-specific Reporting Limit (RL) (usable); UJ = non-detect is usable as an estimated value; J = result is usable as an estimated

|------------------|-------------------------|---------------|----------------------------|------------|---------------------------------|-----------------|-----------------|-----------------|-------------------|-------|
| <b>Yes</b>       | √                       | √             | √                          | √          | √                               | √               | √               | NA              | √                 |       |
| <b>No</b>        |                         |               |                            |            |                                 |                 |                 |                 |                   |       |

Calibration criteria: Unless otherwise noted in the laboratory narrative, it was assumed that all initial and continuing calibration verifications (ICV/CCV) and initial and continuing calibration blank (ICB/CCB) results were acceptable (met LTM V QAPP 2009 requirements).

▪ Method Modification: Laboratory analyzed two replicates (burns) for TOC by Method 9060A rather than 4 (as in the method); this is consistent with LTMV QAPP requirements.

Samples were received intact. TOC analysis was performed on the samples "as-received" (i.e., not on "air-dried" sediments). Samples were frozen upon receipt to arrest holding time. Therefore, analyses, conducted on 10/29/09, were considered to have met HT criteria. No Action required.

MS/MD site sample used for QC: 507125. One replicate of the MS was high outside criteria at 127% recovery but the other replicate MS was acceptable at 105%. No action taken based on professional judgment because the average MS recovery for this sample met criteria at 116% recovery and the SRM % Rec was acceptable, indicating acceptable accuracy for the TOC method in the sediment matrix.

Sample/FD site sample IDs: There were no FDs associated with the samples in this SDG - see other LTMV SDGs for FDs

Replicate (duplicate) precision between sample/MD and the replicate TOC results of each sample all had RPD < 25% - all replicates acceptable - No Action.

Data users should compute the arithmetic average of the two TOC replicate burns for each sample and use this average as the valid TOC result for that sample.

**Data Package Completeness:**

1. Were all required forms (results, summary QC, COC), as required to validate the data in accordance with EPA Region 1 present in the data package? **Yes**
2. Were all result forms for all samples listed on the chain-of-custody present in data package? **Yes**

If No, explain and request resubmittals:

TOC Tier I+ Data Validation Checklist

**Data Quality / Usability Issues:**

1. Did the Laboratory Narrative contain any issues which may affect data quality or usability that have not been already addressed on page 1? **No.**  
If Yes, explain.

2. Explain further any actions taken based on summary QC, as necessary, below.

No further actions required.

**All TOC data were accepted as reported by the laboratory and unchanged as a consequence of this data validation review.**

**QC Actions:**

Pres./HT: HT exceedance: J detects; Non-detects: R or UJ based on professional judgment. Freezing arrests HT.  
Temperature: outside control limits of  $4 \pm 2^\circ\text{C}$ : use professional judgment.

Blanks: Method Blanks and instrument blanks: TOC < RL unless all sample results are > 10 blank level. Detected results < matrix-matched blank level report as "U" (non-detected at level found). Professional judgment used for non-matrix matched blanks (e.g. aqueous blank associated with sediment samples).

Calibration Criteria: Assume acceptable unless narrated. Exceedances of any calibration criteria will affect accuracy of the data: J detects and UJ non-detects. Severe exceedances of calibration criteria, to be determined based on professional judgment, may require rejection, R, of data.

ICV/CCV: Assume acceptable unless narrated. If narrated as exceeded: %Recoveries < lower control limit: J / UJ. %Recoveries > upper control limit: J detects.  
If severe exceedance <50% recovery: R non-detects.

LCS/SRM: %Recoveries < lower control limit: J / UJ. %Recoveries > upper control limit: J detects. %Recoveries < 50%, may R non-detects & J detects but use professional judgment to accept results if MS is in-control indicating acceptable accuracy in sample matrix.

MS: %Recoveries < lower control limit: J / UJ. %Recoveries > upper control limit: J detects. %Recoveries < 30%, may R non-detects & J detects but use professional judgment if sample concentration > 2x spike level.

MD: Results > 5xRL: RPD >25%: J / UJ associated results in batch - to be determined using professional judgment.  
Results < 5xRL: difference >  $\pm 2xRL$ , J / UJ associated results in batch - to be determined using professional judgment.

FD: Results > 5xRL: RPD >50%: J / UJ FD results only. Results < 5xRL: difference >  $\pm 4xRL$ , J/UJ FD results only.

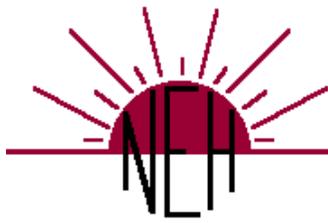

% Solids: 10% < % solids < 30%, J detects/R non-detects; % solids < 10%, R all results.

**Qualifiers:** U = analyte is non-detect at the sample-specific Reporting Limit (RL) (usable); UJ = non-detect is usable as an estimated value; J = result is usable as an estimated value; R = result is rejected due to severe QC exceedance and unusable for project objectives. Bias: L = Low; H = High; I = Indeterminate. QC Limits based on EPA Region 1 Inorganic DV guidance and LTM V QAPP 2009.

**Data Validation Report**  
**EPA Region I Tier I+**  
**18 NOAA PCB Congeners by 8270C and TOC by Method 9060**

**Client/Company:** Woods Hole Group, Inc. (WHG)

**Site/Project Name:** New Bedford Harbor Superfund Site – Long Term Monitoring (LTM) V

**Laboratory:** Alpha Analytical – Mansfield, MA

**Lab Project Number(s):** L0912904

**Date(s) of Collection:** September 22, 2009 through September 26, 2009

**Number / Type  
Samples & Analyses** 15 sediment samples for 18 NOAA PCB Congeners by EPA SW-846  
Method 8270C and Total Organic Carbon (TOC) by Method 9060

**Senior Data Reviewers:** Nancy C. Rothman, PhD, New Environmental Horizons, Inc.  
Susan D. Chapnick, New Environmental Horizons, Inc.

**Date Completed:** April 9, 2010

This EPA Region I Tier I+ validation for 18 NOAA PCB Congeners and TOC was performed with the following intentions: 1) to determine if the data were generated and reported in accordance with the *Quality Assurance Project Plan, New Bedford Harbor Long Term Monitoring V, New Bedford, MA*, prepared by Woods Hole Group, Inc., September 2009 (LTMV QAPP); Region I, *EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses*, December 1996, including *Part III – Pesticide/PCB Data Validation Functional Guidelines*, Draft February 2004; 2) to determine if the data met project data quality objectives for acceptable accuracy, precision, sensitivity; and technical usability; and 3) to generate an electronic deliverable of validated results with project-specific data validation qualifiers added.

The Data Validation Report consists of three parts:

- This Data Validation Report letter summarizing the actions taken;
- The database file of validated sample results with validation qualifiers, bias, and comments added based on actions taken; and
- Data Validation Checklists for TOC and PCB Congeners including the Surrogate Recovery Correction worksheet completed during this validation to document the Tier I+ review. The Checklists are an integral part of the DV Report as they contain comprehensive details of all quality control (QC) reviewed, the acceptance criteria used, and the professional judgment and actions taken.

## I. Sample Descriptions and Analytical Parameters

The sample IDs, date of sampling, identification analytical parameters reviewed and the sample type (e.g., field sample, field duplicate (FD), field equipment blank (EB), as applicable), are listed below in Table 1.

Table 1. Sample Descriptions and Analytical Parameters Validated

| Sample ID | Lab Sample ID | Collection Date | Matrix   | Analytical Parameters <sup>1</sup> | Sample Type  |
|-----------|---------------|-----------------|----------|------------------------------------|--------------|
| 506525    | L0912904-01   | 9/26/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample |
| 506625    | L0912904-02   | 9/26/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample |
| 506725    | L0912904-03   | 9/24/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample |
| 506825    | L0912904-04   | 9/24/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample |
| 506925    | L0912904-05   | 9/24/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample |
| 507025    | L0912904-06   | 9/24/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample |
| 507125    | L0912904-07   | 9/24/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample |
| 507225    | L0912904-08   | 9/23/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample |
| 507325    | L0912904-09   | 9/23/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample |
| 507425    | L0912904-10   | 9/23/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample |
| 507525    | L0912904-11   | 9/23/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample |

Table 1. Sample Descriptions and Analytical Parameters Validated - continued

| Sample ID | Lab Sample ID | Collection Date | Matrix   | Analytical Parameters <sup>1</sup> | Sample Type  |
|-----------|---------------|-----------------|----------|------------------------------------|--------------|
| 507625    | L0912904-12   | 9/23/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample |
| 507725    | L0912904-13   | 9/22/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample |
| 504525    | L0912904-14   | 9/25/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample |
| 507925    | L0912904-15   | 9/22/09         | Sediment | TOC & 18 NOAA Congeners            | Field Sample |

Analytical method references:

18 NOAA Congeners: *Determination of PCB Homologs, Individual Congeners, and Pesticides by Gas Chromatography/Mass Spectrometry in the Select Ion Monitoring (SIM) Mode (EPA 680 & 8270C)*, Alpha SOP O-015, Rev. 2, June 19, 2006.

TOC: SW-846 Method 9060 modified, Alpha SOP W-028

<sup>1</sup> Grain Size analysis was also performed on these samples; however, data validation for this parameter was not required. TOC analysis was performed on “as-received” sediments while the 18 NOAA Congeners were performed using “air-dried” sediments.

## II. Data Validation Report Summary

This Data Validation Report represents a Tier I+ validation of the 18 NOAA PCB Congener and TOC sample results and summary QC (method and matrix), which were used to evaluate accuracy, precision, and sensitivity compared to the NBH LTMV QAPP requirements.

The following QC elements, as applicable to the analytical methods, were reviewed:

- Data package completeness and reporting protocols
- Sample receipt, holding times and preservation criteria
- Blank results including Method Blanks, Equipment Blanks, & Trip blanks
- Laboratory Control Sample (LCS) recoveries / LCS Duplicate Recoveries
- Standard Reference Material (SRM) Recoveries
- Surrogate Recoveries
- Matrix Spike (MS) / Matrix Spike Duplicate (MSD) Recoveries
- MS/MSD, LCS/LCSD, sample/Laboratory Duplicate (LD), or sample/Field Duplicate (FD) Relative Percent Differences (RPDs)
- Sample result reporting (including compound lists, reporting limits, and units)
- Calibration criteria\* (including tune criteria, initial calibration and continuing calibration verification)
- Internal Standard (IS) Recoveries\*

- Retention Time windows\*
- Other method-specific QC if applicable and reported\* (e.g., serial dilution results for metals)
- Deficiencies or protocol deviations as noted in the Laboratory Narrative

\* This QC element is reviewed associated with the Tier II-type validation only. For Tier I+ validations this QC element is assumed to be acceptable unless otherwise noted in the laboratory narrative.

Based on this Tier I+ validation of the 18 NOAA PCB Congeners and TOC, all results were considered usable for project decisions based on a comparison to the NBH LTMV QAPP requirements and with the understanding of the potential uncertainty (bias) in the qualified results summarized in Table 2. NEH generated electronic validated results based on the project database file received from WHG for these data, by updating the following database fields for field samples and field QC only: VALID\_QUAL, VALIDATION\_LEVEL, VALIDATION, VALID\_DATE, BIAS, and DV\_COMMENT.

The remainder of this report documents “exceptions” to the NBH LTMV QAPP criteria or clarifications of data reported. QC elements not discussed below met all QAPP criteria. The full documentation of all QC elements reviewed during the Tier I+ validation are presented in the attached Data Validation Checklists.

### **Sample Receipt and Holding Time**

The sediment samples were received at the laboratory intact in four shipments at 1.6°C to 3.1°C. Aliquots of the “as-received” samples were analyzed for TOC, Grain Size, and percent solids. Samples were frozen upon receipt to arrest holding time for TOC analysis. All samples had percent solids content of 36-96%; therefore, these sediment samples were air-dried, as required by the QAPP, prior to Congener analysis. After air-drying, the percent solids content for all samples was greater than 81%.

### **Accuracy**

The Method Blank was non-detect for all PCB Congeners and TOC; therefore, blank action was not required. There was no Equipment Blank required to be collected along with these sediment samples.

Congener recoveries in the MS/MSD analysis conducted on sample 507125 were acceptable except for 2,3',4,4'-Tetrachlorobiphenyl (BZ#66), which recovered low compared to criteria in the MS and 2,2',5,5'-Tetrachlorobiphenyl (BZ#52), which recovered high compared to criteria in the MSD. Since the other spike (MSD or MS) was acceptable for these Congeners, no action was taken to qualify the unspiked sample based on professional judgment.

All TOC analyses were performed in replicate (duplicate burns), as a method modification consistent with the site QAPP requirements. The MS recoveries for TOC performed on sample 507125 were high in one replicate and within criteria in the other replicate. No action was taken based on professional judgment because the average MS recovery (of the two replicates) met criteria and the SRM recoveries were in control, indicating acceptable accuracy of the TOC method in the sediment matrix.

The Standard Reference Material for PCB Congeners (SRM NY/NJ Waterway Sediment) and TOC SRM reported acceptable recoveries for all Congeners and TOC certified in these SRMs.

### **Precision**

LCS/LCSD precision was unacceptable for all 18 NOAA Congeners except for 2,3,3',4,4'-Pentachlorobiphenyl (BZ#105), since the LCS recoveries were all low within criteria and the LCSD were all high within criteria. Since the MS/MSD showed acceptable precision and since the imprecision based on high relative percent differences (RPDs) in the LCS/LCSD were obviously related to the LCS having lower extraction efficiency than the LCSD, no action to qualify sample data was taken based on professional judgment.

MS/MSD precision in the analysis of sample 507125 was acceptable for all 18 NOAA Congeners. Sample/MD precision for TOC analysis of 507125, as well as precision between all replicates of TOC reported for each sample, was acceptable. These results are an indication of acceptable precision in the laboratory analysis of this matrix for PCB Congeners and TOC.

There were no Field Duplicates associated with the samples in this SDG. Three sets of Sample/FD were collected and are reported for the overall LTMV program. Data users are directed to the other LTMV DV reports for FD information.

### **Sensitivity & Reporting**

All samples met sensitivity requirements for PCB Congeners and TOC as indicated in NBH LTMV QAPP Table 1-3.

Data users should compute the average of the TOC replicate results (duplicate burns) for each sample and use this arithmetic average as the valid result for TOC.

An investigation by NEH into previous reporting of LTM data by Battelle indicated that Congener data were surrogate-recovery corrected and that non-detects were reported at Method Detection Limits (MDLs). These MDLs were surrogate-recovery corrected during the MDL study but were not corrected again based upon individual sample surrogate recovery results. A technical memo was written by NEH on January 29, 2010 (approved by Lee Weishar, WHG, and Mark Koenig, USACE), explaining Battelle's process for reporting previous LTM data (LTMIV and prior monitoring data), Alpha's process for reporting LTMV results, and recommendations for adjustment of the current LTMV data so that these data may be comparable to the data from previous sampling events reported by Battelle.

For Congener samples where the surrogates are not recovered because of analytical dilutions or when results were non-detect, the DV\_COMMENT "K2" was added to the validated database file to indicate that the reported value was not surrogate-recovery corrected.

For Congener samples where surrogate-recovery correction was performed, a separate Surrogate Recovery Correction excel worksheet was constructed (as part of the Data Validation Checklist process) showing the original lab reported result, identification of which surrogate was used for correction of each of the 18 NOAA Congeners, and the Surrogate Corrected Result. For surrogate-corrected results, the project database file was updated as follows:

1. The surrogate-corrected value, as shown in the Surrogate Recovery Correction worksheet, replaced the lab RESULT value in the validated database file;
2. The qualifier "K" was added to the VALID\_ QUAL field to identify the result as surrogate-recovery corrected; and
3. "K1" was added to the DV\_COMMENT field as the DV code to further indicate that the reported result was surrogate-recovery corrected.

Non-detects for Congeners were reported by Alpha at the Reporting Limit (RL), consistent with the LTMV QAPP requirements. Since non-detected results are not comparable between Alpha and Battelle because the basis for the non-detects are different (RL vs. MDL), non-detects and reporting limits were not surrogate-recovery corrected in the LTMV data.

For this SDG, all Congener samples reported surrogate recoveries. Surrogate-recovery correction was performed for all samples as documented in *Surrogate Recovery Correction\_L0912904*. Actions taken are listed below in Table 2.

Results reported below the sample-specific RLs are considered uncertain because they are below the calibration range. During this review, data below the sample-specific RLs were qualified as estimated (J), as shown in Table 2, and as described in the Data Validation Checklist.

The laboratory reported all results from DF > 1 analyses with a "D" qualifier. At Battelle's request, these "D" qualifiers were maintained during the DV process.

Table 2. Summary of Data Validation Actions

| Field Sample ID | Analyte  | Qualifier | Bias | Validation Comments   |
|-----------------|--|-----------|------|---|
| 504525          | All Congeners except:<br>Decachlorobiphenyl - Homologue  | DK        |      | Reported value is surrogate recovery corrected  |
| 504525          | Decachlorobiphenyl - Homologue   | DJK       | I    | Reported value is surrogate recovery corrected + Result uncertain below the calibration range |
| 506525          | All Congeners except:<br>2,2',3,3',4,4',5,6-Octachlorobiphenyl                                     | K         |      | Reported value is surrogate recovery corrected  |
| 506525 & 506625 | 2,2',3,3',4,4',5,6-Octachlorobiphenyl  | U         |      | Reported value is not surrogate recovery corrected  |
| 506625          | All Congeners except:<br>2,2',3,3',4,4',5,6-Octachlorobiphenyl &<br>Decachlorobiphenyl - Homologue | K         |      | Reported value is surrogate recovery corrected  |
| 506625          | Decachlorobiphenyl - Homologue   | JK        | I    | Reported value is surrogate recovery corrected + Result uncertain below the calibration range |

Date: January 29, 2010  
Re: PCB Surrogate Recovery Correction for LTMV

---

During the development of the New Bedford Harbor Long Term Monitoring Program V (LTMV) Quality Assurance Project Plan, it was determined that historical LTM PCB Congener data were surrogate recovery corrected by Battelle, at the laboratory level, prior to inclusion of the data into the project database. In December 2009, I had the opportunity of speaking with a chemist at Battelle, who worked on the LTM IV project, and found out the following about their procedures for reporting of PCB Congener data:

- Battelle was aware that samples may require dilution for accurate quantitation; therefore, higher than normal spike levels of surrogates were added to the samples prior to extraction. Quantitation of the 18 NOAA Congeners was performed by Gas Chromatography-Electron Capture Detection (GC-ECD).
- All efforts were made to have surrogate recoveries reported for each sample so that multiple dilutions of some sample extracts were performed to not only quantitate the PCB Congeners but to also quantitate the surrogates.
- Two surrogates, PCB34 and PCB112, were used for recovery correcting sample data. PCB34 was used to recovery correct the following congeners: PCB8, PCB18, PCB28, PCB44, PCB52, PCB66, and PCB101. PCB112 was used to recovery correct the remaining 11 congeners (PCB105, PCB118, PCB128, PCB138, PCB153, PCB170, PCB180, PCB187, PCB195, PCB206, and PCB209).
- Battelle used surrogate recovery information from the lowest valid dilution analysis of an extract to associate with all other dilution data for that extract. For example, if a dilution factor (DF) = 10 were performed resulting in acceptable recovery for surrogates PCB34 and PCB112, yet the extract required a DF=100 to accurately quantitate the 18 NOAA Congeners, the DF=10 surrogate recoveries were used to correct the DF=100 sample data.
- Recovery correction was performed on results retaining all possible calculation values (e.g., if output of the GC-ECD data system reported a result with 10 numbers, the entire data output was used in performing correction).

- If for some reason one of the surrogates was not recovered, or recovered poorly (i.e., below acceptance criteria), all 18 NOAA Congeners were corrected using the one surrogate with acceptable recovery.
- Recovery Correction for detected results occurred as follows:

$$\text{Corrected Result} = \text{Uncorrected Result} \times (100/(\text{Surrogate \% Recovery}))$$

For example if an uncorrected congener result was 128.5398  $\mu\text{g}/\text{Kg}$  (retaining all values reported by the GC-ECD data system) and the surrogate was recovered at 85.46% (also retaining all values reported by GC system), then the corrected result is:

$$128.5398 (100/85.46) = 150.4093 \mu\text{g}/\text{Kg}$$

If instead the surrogate was recovered at 112.64%, then the corrected result is:

$$128.5398 (100/112.64) = 114.1156 \mu\text{g}/\text{Kg}$$

- Battelle reported non-detects at sample-specific Method Detection Limits (MDLs). These MDLs were surrogate recovery corrected when they were generated originally but Battelle did not recovery correct the MDLs on a sample-specific basis for LTMIV.
- Battelle currently has added a comment code to the historical LTM data to indicate that these results have been surrogate recovery corrected.

There are some notable differences in how LTMV data are being generated by Alpha as compared to the Battelle procedures listed above: 1) Alpha did not use higher than normal levels for spiking of surrogates prior to extraction; 2) Alpha has generated PCB Congener results using Gas Chromatography/Mass Spectrometry operated in the Selected Ion Monitoring mode (GC/MS-SIM); 3) the surrogates used by Alpha are 4,4'-Dibromooctafluorobiphenyl (DBOB) and PCB198; 4) all data generated by Alpha for the 18 NOAA Congeners are *not* surrogate recovery corrected, as required by laboratory policy; 5) data are reported to 3 significant figures and surrogates to 2-to-3 significant figures at most as required by the methods; and 6) non-detects are reported at the sample-specific reporting limit (RL)

To ensure data comparability between the various phases of the LTM project, it has been decided that the LTMV data need recovery correction. After discussing this issue with the Battelle database administrator, Paul Dragos, it is proposed that NEH will perform this recovery correction during the data validation process. The recommended procedure for this is as follows:

- Alpha/WHG team will electronically deliver data to Battelle and Battelle will generate an electronic deliverable for NEH's use in the project-required database format.
- NEH will perform the data validation choosing results for reporting, if multiple analyses are performed, so that only one result for each of the 18 NOAA congeners for each sample is reported in the validated database file.
- Valid data will be surrogate recovery corrected by NEH using the same logic used by Battelle. DBOB will be used to recovery correct the congeners PCB8, PCB18, PCB28, PCB44, PCB52, PCB66, and PCB101 and surrogate PCB198 will be used to recovery correct congeners PCB105, PCB118, PCB128, PCB138, PCB153, PCB170, PCB180, PCB187, PCB195, PCB206, and PCB209. Alpha's MDL study, performed in August 2009, indicates that this assignment for surrogate to congener is appropriate (i.e., that the surrogate used for correction is the one closest in retention time to the congener being corrected).
- NEH will replace the lab uncorrected value with the corrected value and add a comment code to the database file indicating the lab value was replaced (same code as Battelle has used for historical data).
- If both surrogates are not recovered at all or if recovery is very poor in the judgment of NEH recovery correction will not occur. In these instances, NEH will add a comment code to the database result indicating that recovery correction was not possible.
- Non-detects will be reported at the sample-specific RL and will not be recovery corrected.

Data users are cautioned that even after NEH has performed surrogate recovery correction for LTMV PCB congener data, that there may be data comparability issues across the complete LTM data set. Trending of non-detects for LTM must recognize the difference in reporting of non-detects using MDLs versus reporting non-detects at RLs. Additionally, using final uncorrected data (as reported by Alpha) versus data output from the instrument (as reported by Battelle) as the starting point for recovery correction, may lead to differences in results, especially as levels of PCB Congeners increase.

**Lab Number:** L0912906  
**Report Date:** 02/02/10

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

For additional information, please contact Client Services at 800-624-9220.

---

### Report Submission

This report replaces the original report issued on October 14, 2009. The report was ammended to include revised Grain Size data.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

## GLOSSARY

### Acronyms

- EPA** - Environmental Protection Agency.
- LCS** - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD** - Laboratory Control Sample Duplicate: Refer to LCS.
- MS** - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD** - Matrix Spike Sample Duplicate: Refer to MS.
- NA** - Not Applicable.
- NC** - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- ND** - Not detected at the reported detection limit for the sample.
- NI** - Not Ignitable.
- RDL** - Reported Detection Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD** - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

### Terms

**Analytical Method:** Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RDL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Woods Hole Labs shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Woods Hole Labs.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## Hydrometer Test Data

Hydrometer test uses material passing #200  
 Percent passing #200 based upon complete sample = 89.1  
 Weight of hydrometer sample = 33.65  
 Automatic temperature correction  
 Composite correction (fluid density and meniscus height) at 20 deg. C = -.04  
 Meniscus correction only = -3.0  
 Specific gravity of solids = 2.65  
 Hydrometer type = 151H  
 Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

## Hydrometer Test Data

Hydrometer test uses material passing #200  
 Percent passing #200 based upon complete sample = 94.5  
 Weight of hydrometer sample = 38.78  
 Automatic temperature correction  
 Composite correction (fluid density and meniscus height) at 20 deg. C = -.04  
 Meniscus correction only = -3.0  
 Specific gravity of solids = 2.65  
 Hydrometer type = 151H

Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

## Hydrometer Test Data

Hydrometer test uses material passing #200  
 Percent passing #200 based upon complete sample = 80.6  
 Weight of hydrometer sample = 50.29  
 Automatic temperature correction  
 Composite correction (fluid density and meniscus height) at 20 deg. C = -.04  
 Meniscus correction only = -3.0  
 Specific gravity of solids = 2.65  
 Hydrometer type = 151H  
 Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

Alpha Analytical

## Certificate/Approval Program Summary

Last revised December 15, 2009 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

### **Connecticut Department of Public Health Certificate/Lab ID: PH-0141.**

*Wastewater/Non-Potable Water* (Inorganic Parameters: pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable), Total Cyanide. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

*Solid Waste/Soil* (Inorganic Parameters: pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc, Total Organic Carbon, Total Cyanide, Corrosivity, TCLP 1311. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

### **Florida Department of Health Certificate/Lab ID: E87814. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: SM2320B, EPA 120.1, SM2510B, EPA 245.1, EPA 150.1, EPA 160.2, SM2540D, EPA 335.2, SM2540G, EPA 180.1. Organic Parameters: EPA 625, 608.)

*Solid & Chemical Materials* (Inorganic Parameters: 6020, 7470, 7471, 9045, 9014. Organic Parameters: EPA 8260, 8270, 8082, 8081.)

*Air & Emissions* (EPA TO-15.)

### **Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: EPA 120.1, 150.1, 160.2, 180.1, 200.8, 245.1, 310.1, 335.2, 608, 625, 1631, 3010, 3015, 3020, 6020, 9010, 9014, 9040, SM2320B, 2510B, 2540D, 2540G, 4500CN-E, 4500H-B, Organic Parameters: EPA 3510, 3580, 3630, 3640, 3660, 3665, 5030, 8015 (mod), 3570, 8081, 8082, 8260, 8270, )

*Solid & Chemical Materials* (Inorganic Parameters: 6020, 7196, 7470, 7471, 7474, 9010, 9014, 9040, 9045, 9060. Organic Parameters: EPA 8015 (mod), EPA 3570, 1311, 3050, 3051, 3060, 3580, 3630, 3640, 3660, 3665, 5035, 8081, 8082, 8260, 8270.)

*Biological Tissue* (Inorganic Parameters: EPA 6020. Organic Parameters: EPA 3570, 3510, 3610, 3630, 3640, 8270.)

### **Maine Department of Human Services Certificate/Lab ID: MA0030.**

*Wastewater* (Inorganic Parameters: EPA 120.1, 300.0, SM 2320, 2510B, 2540C, 2540D, EPA 245.1. Organic Parameters: 608, 624.)

### **Massachusetts Department of Environmental Protection Certificate/Lab ID: M-MA030.**

*Non-Potable Water* (Inorganic Parameters: SM4500H+B. Organic Parameters: EPA 624.)

### **New Hampshire Department of Environmental Services Certificate/Lab ID: 2206. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: EPA 200.8, 245.1, 1631E, 120.1, 150.1, 180.1, 310.1, 335.2, 160.2, SM2540D, 2540G, 4500CN-E, 4500H+B, 2320B, 2510B. Organic Parameters: EPA 625, 608.)

**New Jersey Department of Environmental Protection Certificate/Lab ID: MA015. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: SW-846 1312, 3010, 3020A, 3015, 6020, SM2320B, EPA 200.8, SM2540C, 2540D, 2540G, EPA 120.1, SM2510B, EPA 180.1, 245.1, 1631E, SW-846 9040B, 6020, 9010B, 9014 Organic Parameters: EPA 608, 625, SW-846 3510C, 3580A, 5030B, 3035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8081A, 8082 8260B, 8270C)

*Solid & Chemical Materials* (Inorganic Parameters: SW-846 6020, 9010B, 9014, 1311, 1312, 3050B, 3051, 3060A, 7196A, 7470A, 7471A, 9045C, 9060. Organic Parameters: SW-846 3580A, 5030B, 3035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8081A, 8082, 8260B, 8270C, 3570, 8015B.)

*Atmospheric Organic Parameters* (EPA TO-15)

*Biological Tissue* (Inorganic Parameters: SW-846 6020 Organic Parameters: SW-846 8270C, 3510C, 3570, 3610B, 3630C, 3640A)

**New York Department of Health Certificate/Lab ID: 11627. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: EPA 310.1, SM2320B, EPA 365.2, 160.1, EPA 160.2, SM2540D, EPA 200.8, 6020, 1631E, 245.1, 335.2, 9014, 150.1, 9040B, 120.1, SM2510B, EPA 376.2, 180.1, 9010B. Organic Parameters: EPA 624, 8260B, 8270C, 608, 8081A, 625, 8082, 3510C, 3511, 5030B.)

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 9040B, 9045C, SW-846 Ch7 Sec 7.3, EPA 6020, 7196A, 7471A, 7474, 9014, 9040B, 9045C, 9010B. Organic Parameters: EPA 8260B, 8270C, 8081A, DRO 8015B, 8082, 1311, 3050B, 3580, 3050B, 3035, 3570, 3051, 5035, 5030B.)

*Air & Emissions* (EPA TO-15.)

**Pennsylvania Department of Environmental Protection Certificate/Lab ID: 68-02089. *NELAP Accredited.***

*Non-Potable Water* (Organic Parameters: EPA 5030B, EPA 8260)

**Rhode Island Department of Health Certificate/Lab ID: LAO00299. *NELAP Accredited via LA-DEQ.***

Refer to MA-DEP Certificate for Non-Potable Water.

Refer to LA-DEQ Certificate for Non-Potable Water.

**Texas Commission of Environmental Quality Certificate/Lab ID: T104704419-08-TX. *NELAP Accredited.***

*Solid & Chemical Materials* (Inorganic Parameters: EPA 6020, 7470, 7471, 1311, 7196, 9014, 9040, 9045, 9060. Organic Parameters: EPA 8015, 8270, 8260, 8081, 8082.)

**U.S. Army Corps of Engineers**

**Department of Defense Certificate/Lab ID: L2217.01.**

*Non-Potable Water* (Inorganic Parameters: EPA 3005A,3020, 6020, 245.1, 245.7, 1631E, 7470A, 7474, 9014, 120.1, 9050A, 180.1, SM4500H-B, 2320B, 2510B, 2540D,9040. Organic Parameters: EPA 3510C, 5030B, 9010B, 624, 8260B, 8270C, 8270 Alk-PAH, 8082, 8081A, 8015 (SHC), 8015 (DRO).)

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 1311, 1312,3051, 6020, 747A, 7474, 9045C,9060, SM 2540G, ASTM D422-63. Organic Parameters: EPA 3580, 3570, 3540C, 5035, 8260B, 8270C, 8270 Alk-PAH, 8082, 8081A, 8015 (SHC), 8015 (DRO).

*Air & Emissions* (EPA TO-15.)

**Analytes Not Accredited by NELAP**

Certification is not available by NELAP for the following analytes: **8270C**: Biphenyl.

**Report Date:** 02/02/10

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

For additional information, please contact Client Services at 800-624-9220.

---

### Report Submission

This report replaces the original report issued on October 22, 2009. The report was ammended to include revised Grain Size data.

### Grain Size

The WG382094-1 Laboratory Duplicate RPD is outside the acceptance criteria for gravel (60%), coarse sand (25%). The elevated RPD has been attributed to the non-homogenous nature of the sample utilized for the

## GLOSSARY

### Acronyms

- EPA** - Environmental Protection Agency.
- LCS** - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD** - Laboratory Control Sample Duplicate: Refer to LCS.
- MS** - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD** - Matrix Spike Sample Duplicate: Refer to MS.
- NA** - Not Applicable.
- NC** - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- ND** - Not detected at the reported detection limit for the sample.
- NI** - Not Ignitable.
- RDL** - Reported Detection Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD** - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

### Terms

**Analytical Method:** Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RDL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Woods Hole Labs shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Woods Hole Labs.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## Hydrometer Test Data

Hydrometer test uses material passing #200  
 Percent passing #200 based upon complete sample = 67.4  
 Weight of hydrometer sample = 57.331  
 Automatic temperature correction  
 Composite correction (fluid density and meniscus height) at 20 deg. C = -0.04  
 Meniscus correction only = -3.0  
 Specific gravity of solids = 2.65  
 Hydrometer type = 151H  
 Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

## Hydrometer Test Data

Hydrometer test uses material passing #200  
 Percent passing #200 based upon complete sample = 75.7  
 Weight of hydrometer sample = 51.23  
 Automatic temperature correction  
 Composite correction (fluid density and meniscus height) at 20 deg. C = -0.04  
 Meniscus correction only = -3.0  
 Specific gravity of solids = 2.65  
 Hydrometer type = 151H  
 Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

## Hydrometer Test Data

Hydrometer test uses material passing #200  
 Percent passing #200 based upon complete sample = 76.8  
 Weight of hydrometer sample = 41.43  
 Automatic temperature correction  
 Composite correction (fluid density and meniscus height) at 20 deg. C = -0.04  
 Meniscus correction only = -3.0  
 Specific gravity of solids = 2.65  
 Hydrometer type = 151H  
 Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

## Hydrometer Test Data

Hydrometer test uses material passing #200  
 Percent passing #200 based upon complete sample = 95.1  
 Weight of hydrometer sample = 35.54  
 Automatic temperature correction  
 Composite correction (fluid density and meniscus height) at 20 deg. C = -0.04  
 Meniscus correction only = -3.0  
 Specific gravity of solids = 2.65  
 Hydrometer type = 151H  
 Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

## Hydrometer Test Data

Hydrometer test uses material passing #200

Percent passing #200 based upon complete sample = 96.3

Weight of hydrometer sample = 38.22

Automatic temperature correction

Composite correction (fluid density and meniscus height) at 20 deg. C = -0.04

Meniscus correction only = -3.0

Specific gravity of solids = 2.65

Hydrometer type = 151H

Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$ 

| Elapsed Time (min.) | Temp. (deg. C.) | Actual Reading | Corrected Reading | K      | Rm   | Eff. Depth | Diameter (mm.) | Percent Finer | Percent Retained |

Alpha Analytical

## Certificate/Approval Program Summary

Last revised December 15, 2009 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

### **Connecticut Department of Public Health Certificate/Lab ID: PH-0141.**

*Wastewater/Non-Potable Water* (Inorganic Parameters: pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable), Total Cyanide. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

*Solid Waste/Soil* (Inorganic Parameters: pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc, Total Organic Carbon, Total Cyanide, Corrosivity, TCLP 1311. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

### **Florida Department of Health Certificate/Lab ID: E87814. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: SM2320B, EPA 120.1, SM2510B, EPA 245.1, EPA 150.1, EPA 160.2, SM2540D, EPA 335.2, SM2540G, EPA 180.1. Organic Parameters: EPA 625, 608.)

*Solid & Chemical Materials* (Inorganic Parameters: 6020, 7470, 7471, 9045, 9014. Organic Parameters: EPA 8260, 8270, 8082, 8081.)

*Air & Emissions* (EPA TO-15.)

### **Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: EPA 120.1, 150.1, 160.2, 180.1, 200.8, 245.1, 310.1, 335.2, 608, 625, 1631, 3010, 3015, 3020, 6020, 9010, 9014, 9040, SM2320B, 2510B, 2540D, 2540G, 4500CN-E, 4500H-B, Organic Parameters: EPA 3510, 3580, 3630, 3640, 3660, 3665, 5030, 8015 (mod), 3570, 8081, 8082, 8260, 8270, )

*Solid & Chemical Materials* (Inorganic Parameters: 6020, 7196, 7470, 7471, 7474, 9010, 9014, 9040, 9045, 9060. Organic Parameters: EPA 8015 (mod), EPA 3570, 1311, 3050, 3051, 3060, 3580, 3630, 3640, 3660, 3665, 5035, 8081, 8082, 8260, 8270.)

*Biological Tissue* (Inorganic Parameters: EPA 6020. Organic Parameters: EPA 3570, 3510, 3610, 3630, 3640, 8270.)

### **Maine Department of Human Services Certificate/Lab ID: MA0030.**

*Wastewater* (Inorganic Parameters: EPA 120.1, 300.0, SM 2320, 2510B, 2540C, 2540D, EPA 245.1. Organic Parameters: 608, 624.)

### **Massachusetts Department of Environmental Protection Certificate/Lab ID: M-MA030.**

*Non-Potable Water* (Inorganic Parameters: SM4500H+B. Organic Parameters: EPA 624.)

### **New Hampshire Department of Environmental Services Certificate/Lab ID: 2206. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: EPA 200.8, 245.1, 1631E, 120.1, 150.1, 180.1, 310.1, 335.2, 160.2, SM2540D, 2540G, 4500CN-E, 4500H+B, 2320B, 2510B. Organic Parameters: EPA 625, 608.)

**New Jersey Department of Environmental Protection Certificate/Lab ID: MA015. NELAP Accredited.**

*Non-Potable Water* (Inorganic Parameters: SW-846 1312, 3010, 3020A, 3015, 6020, SM2320B, EPA 200.8, SM2540C, 2540D, 2540G, EPA 120.1, SM2510B, EPA 180.1, 245.1, 1631E, SW-846 9040B, 6020, 9010B, 9014 Organic Parameters: EPA 608, 625, SW-846 3510C, 3580A, 5030B, 3035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8081A, 8082 8260B, 8270C)

*Solid & Chemical Materials* (Inorganic Parameters: SW-846 6020, 9010B, 9014, 1311, 1312, 3050B, 3051, 3060A, 7196A, 7470A, 7471A, 9045C, 9060. Organic Parameters: SW-846 3580A, 5030B, 3035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8081A, 8082, 8260B, 8270C, 3570, 8015B.)

*Atmospheric Organic Parameters* (EPA TO-15)

*Biological Tissue* (Inorganic Parameters: SW-846 6020 Organic Parameters: SW-846 8270C, 3510C, 3570, 3610B, 3630C, 3640A)

**New York Department of Health Certificate/Lab ID: 11627. NELAP Accredited.**

*Non-Potable Water* (Inorganic Parameters: EPA 310.1, SM2320B, EPA 365.2, 160.1, EPA 160.2, SM2540D, EPA 200.8, 6020, 1631E, 245.1, 335.2, 9014, 150.1, 9040B, 120.1, SM2510B, EPA 376.2, 180.1, 9010B. Organic Parameters: EPA 624, 8260B, 8270C, 608, 8081A, 625, 8082, 3510C, 3511, 5030B.)

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 9040B, 9045C, SW-846 Ch7 Sec 7.3, EPA 6020, 7196A, 7471A, 7474, 9014, 9040B, 9045C, 9010B. Organic Parameters: EPA 8260B, 8270C, 8081A, DRO 8015B, 8082, 1311, 3050B, 3580, 3050B, 3035, 3570, 3051, 5035, 5030B.)

*Air & Emissions* (EPA TO-15.)

**Pennsylvania Department of Environmental Protection Certificate/Lab ID: 68-02089. NELAP Accredited.**

*Non-Potable Water* (Organic Parameters: EPA 5030B, EPA 8260)

**Rhode Island Department of Health Certificate/Lab ID: LAO00299. NELAP Accredited via LA-DEQ.**

Refer to MA-DEP Certificate for Non-Potable Water.

Refer to LA-DEQ Certificate for Non-Potable Water.

**Texas Commission of Environmental Quality Certificate/Lab ID: T104704419-08-TX. NELAP Accredited.**

*Solid & Chemical Materials* (Inorganic Parameters: EPA 6020, 7470, 7471, 1311, 7196, 9014, 9040, 9045, 9060. Organic Parameters: EPA 8015, 8270, 8260, 8081, 8082.)

**U.S. Army Corps of Engineers**

**Department of Defense Certificate/Lab ID: L2217.01.**

*Non-Potable Water* (Inorganic Parameters: EPA 3005A,3020, 6020, 245.1, 245.7, 1631E, 7470A, 7474, 9014, 120.1, 9050A, 180.1, SM4500H-B, 2320B, 2510B, 2540D,9040. Organic Parameters: EPA 3510C, 5030B, 9010B, 624, 8260B, 8270C, 8270 Alk-PAH, 8082, 8081A, 8015 (SHC), 8015 (DRO).)

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 1311, 1312,3051, 6020, 747A, 7474, 9045C,9060, SM 2540G, ASTM D422-63. Organic Parameters: EPA 3580, 3570, 3540C, 5035, 8260B, 8270C, 8270 Alk-PAH, 8082, 8081A, 8015 (SHC), 8015 (DRO).

*Air & Emissions* (EPA TO-15.)

**Analytes Not Accredited by NELAP**

Certification is not available by NELAP for the following analytes: **8270C**: Biphenyl.

**Report Date:** 02/02/10

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

For additional information, please contact Client Services at 800-624-9220.

---

### Report Submission

This report replaces the original report issued on October 22, 2009. The report was ammended to include revised Grain Size data.

### Grain Size

The WG382945-1 Laboratory Duplicate RPD is outside the acceptance criteria for gravel (32%), % coarse sand (24%). The elevated RPD has been attributed to the non-homogenous nature of the sample utilized for

## GLOSSARY

### Acronyms

- EPA** - Environmental Protection Agency.
- LCS** - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD** - Laboratory Control Sample Duplicate: Refer to LCS.
- MS** - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD** - Matrix Spike Sample Duplicate: Refer to MS.
- NA** - Not Applicable.
- NC** - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- ND** - Not detected at the reported detection limit for the sample.
- NI** - Not Ignitable.
- RDL** - Reported Detection Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD** - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

### Terms

**Analytical Method:** Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RDL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Woods Hole Labs shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Woods Hole Labs.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

**Hydrometer Test Data**

Hydrometer test uses material passing #200  
 Percent passing #200 based upon complete sample = 69.8  
 Weight of hydrometer sample = 68.94  
 Automatic temperature correction  
 Composite correction (fluid density and meniscus height) at 20 deg. C = -0.04  
 Meniscus correction only = -3.0  
 Specific gravity of solids = 2.65  
 Hydrometer type = 151H  
 Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

## Hydrometer Test Data

Hydrometer test uses material passing #200

Percent passing #200 based upon complete sample = 9.5

Weight of hydrometer sample = 96.06

Automatic temperature correction

Composite correction (fluid density and meniscus height) at 20 deg. C = -0.04

Meniscus correction only = -3.0

Specific gravity of solids = 2.65

Hydrometer type = 151H

Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

## Hydrometer Test Data

Hydrometer test uses material passing #200

Percent passing #200 based upon complete sample = 71.2

Weight of hydrometer sample = 53.72

Automatic temperature correction

Composite correction (fluid density and meniscus height) at 20 deg. C = -0.04

Meniscus correction only = -3.0

Specific gravity of solids = 2.65

Hydrometer type = 151H

Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

## Hydrometer Test Data

Hydrometer test uses material passing #200

Percent passing #200 based upon complete sample = 21.0

Weight of hydrometer sample = 89.97

Automatic temperature correction

Composite correction (fluid density and meniscus height) at 20 deg. C = -0.04

Meniscus correction only = -3.0

Specific gravity of solids = 2.65

Hydrometer type = 151H

Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

|                             |              | #20                | 414.24                  | 411.02               | 82.6          | 17.4             |
|                             |              | #40                | 381.04                  | 377.89               | 77.1          | 22.9             |
|                             |              | #60                | 374.35                  | 369.81               | 69.1          | 30.9             |
|                             |              | #140               | 354.76                  | 347.15               | 55.8          | 44.2             |
|                             |              | #200               | 348.46                  | 346.66               | 52.6          | 47.4             |

## Hydrometer Test Data

Hydrometer test uses material passing #200  
 Percent passing #200 based upon complete sample = 52.6  
 Weight of hydrometer sample = 57.02  
 Automatic temperature correction  
 Composite correction (fluid density and meniscus height) at 20 deg. C = -0.04  
 Meniscus correction only = -3.0  
 Specific gravity of solids = 2.65  
 Hydrometer type = 151H  
 Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

| Elapsed Time (min.) | Temp. (deg. C.) | Actual Reading | Corrected Reading | K      | Rm  | Eff. Depth | Diameter (mm.) | Percent Finer | Percent Retained |

## Certificate/Approval Program Summary

Last revised December 15, 2009 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

### **Connecticut Department of Public Health Certificate/Lab ID: PH-0141.**

*Wastewater/Non-Potable Water* (Inorganic Parameters: pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable), Total Cyanide. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

*Solid Waste/Soil* (Inorganic Parameters: pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc, Total Organic Carbon, Total Cyanide, Corrosivity, TCLP 1311. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

### **Florida Department of Health Certificate/Lab ID: E87814. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: SM2320B, EPA 120.1, SM2510B, EPA 245.1, EPA 150.1, EPA 160.2, SM2540D, EPA 335.2, SM2540G, EPA 180.1. Organic Parameters: EPA 625, 608.)

*Solid & Chemical Materials* (Inorganic Parameters: 6020, 7470, 7471, 9045, 9014. Organic Parameters: EPA 8260, 8270, 8082, 8081.)

*Air & Emissions* (EPA TO-15.)

### **Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: EPA 120.1, 150.1, 160.2, 180.1, 200.8, 245.1, 310.1, 335.2, 608, 625, 1631, 3010, 3015, 3020, 6020, 9010, 9014, 9040, SM2320B, 2510B, 2540D, 2540G, 4500CN-E, 4500H-B, Organic Parameters: EPA 3510, 3580, 3630, 3640, 3660, 3665, 5030, 8015 (mod), 3570, 8081, 8082, 8260, 8270, )

*Solid & Chemical Materials* (Inorganic Parameters: 6020, 7196, 7470, 7471, 7474, 9010, 9014, 9040, 9045, 9060. Organic Parameters: EPA 8015 (mod), EPA 3570, 1311, 3050, 3051, 3060, 3580, 3630, 3640, 3660, 3665, 5035, 8081, 8082, 8260, 8270.)

*Biological Tissue* (Inorganic Parameters: EPA 6020. Organic Parameters: EPA 3570, 3510, 3610, 3630, 3640, 8270.)

### **Maine Department of Human Services Certificate/Lab ID: MA0030.**

*Wastewater* (Inorganic Parameters: EPA 120.1, 300.0, SM 2320, 2510B, 2540C, 2540D, EPA 245.1. Organic Parameters: 608, 624.)

### **Massachusetts Department of Environmental Protection Certificate/Lab ID: M-MA030.**

*Non-Potable Water* (Inorganic Parameters: SM4500H+B. Organic Parameters: EPA 624.)

### **New Hampshire Department of Environmental Services Certificate/Lab ID: 2206. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: EPA 200.8, 245.1, 1631E, 120.1, 150.1, 180.1, 310.1, 335.2, 160.2, SM2540D, 2540G, 4500CN-E, 4500H+B, 2320B, 2510B. Organic Parameters: EPA 625, 608.)

**New Jersey Department of Environmental Protection Certificate/Lab ID: MA015. NELAP Accredited.**

*Non-Potable Water* (Inorganic Parameters: SW-846 1312, 3010, 3020A, 3015, 6020, SM2320B, EPA 200.8, SM2540C, 2540D, 2540G, EPA 120.1, SM2510B, EPA 180.1, 245.1, 1631E, SW-846 9040B, 6020, 9010B, 9014 Organic Parameters: EPA 608, 625, SW-846 3510C, 3580A, 5030B, 3035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8081A, 8082 8260B, 8270C)

*Solid & Chemical Materials* (Inorganic Parameters: SW-846 6020, 9010B, 9014, 1311, 1312, 3050B, 3051, 3060A, 7196A, 7470A, 7471A, 9045C, 9060. Organic Parameters: SW-846 3580A, 5030B, 3035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8081A, 8082, 8260B, 8270C, 3570, 8015B.)

*Atmospheric Organic Parameters* (EPA TO-15)

*Biological Tissue* (Inorganic Parameters: SW-846 6020 Organic Parameters: SW-846 8270C, 3510C, 3570, 3610B, 3630C, 3640A)

**New York Department of Health Certificate/Lab ID: 11627. NELAP Accredited.**

*Non-Potable Water* (Inorganic Parameters: EPA 310.1, SM2320B, EPA 365.2, 160.1, EPA 160.2, SM2540D, EPA 200.8, 6020, 1631E, 245.1, 335.2, 9014, 150.1, 9040B, 120.1, SM2510B, EPA 376.2, 180.1, 9010B. Organic Parameters: EPA 624, 8260B, 8270C, 608, 8081A, 625, 8082, 3510C, 3511, 5030B.)

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 9040B, 9045C, SW-846 Ch7 Sec 7.3, EPA 6020, 7196A, 7471A, 7474, 9014, 9040B, 9045C, 9010B. Organic Parameters: EPA 8260B, 8270C, 8081A, DRO 8015B, 8082, 1311, 3050B, 3580, 3050B, 3035, 3570, 3051, 5035, 5030B.)

*Air & Emissions* (EPA TO-15.)

**Pennsylvania Department of Environmental Protection Certificate/Lab ID: 68-02089. NELAP Accredited.**

*Non-Potable Water* (Organic Parameters: EPA 5030B, EPA 8260)

**Rhode Island Department of Health Certificate/Lab ID: LAO00299. NELAP Accredited via LA-DEQ.**

Refer to MA-DEP Certificate for Non-Potable Water.

Refer to LA-DEQ Certificate for Non-Potable Water.

**Texas Commission of Environmental Quality Certificate/Lab ID: T104704419-08-TX. NELAP Accredited.**

*Solid & Chemical Materials* (Inorganic Parameters: EPA 6020, 7470, 7471, 1311, 7196, 9014, 9040, 9045, 9060. Organic Parameters: EPA 8015, 8270, 8260, 8081, 8082.)

**U.S. Army Corps of Engineers**

**Department of Defense Certificate/Lab ID: L2217.01.**

*Non-Potable Water* (Inorganic Parameters: EPA 3005A,3020, 6020, 245.1, 245.7, 1631E, 7470A, 7474, 9014, 120.1, 9050A, 180.1, SM4500H-B, 2320B, 2510B, 2540D,9040. Organic Parameters: EPA 3510C, 5030B, 9010B, 624, 8260B, 8270C, 8270 Alk-PAH, 8082, 8081A, 8015 (SHC), 8015 (DRO).)

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 1311, 1312,3051, 6020, 747A, 7474, 9045C,9060, SM 2540G, ASTM D422-63. Organic Parameters: EPA 3580, 3570, 3540C, 5035, 8260B, 8270C, 8270 Alk-PAH, 8082, 8081A, 8015 (SHC), 8015 (DRO).

*Air & Emissions* (EPA TO-15.)

**Analytes Not Accredited by NELAP**

Certification is not available by NELAP for the following analytes: **8270C**: Biphenyl.

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

For additional information, please contact Client Services at 800-624-9220.

---

### Report Submission

This report replaces the original report issued on February 2, 2010. The report was ammended to include revised Grain Size data.

The WG381751-1 Laboratory Duplicate RPD is outside the acceptance criteria for gravel (200%),% very coarse sand (68%), clay (26%). The elevated RPD has been attributed to the non-homogenous nature of the sample utilized for the laboratory duplicate.

## GLOSSARY

### Acronyms

- EPA** - Environmental Protection Agency.
- LCS** - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD** - Laboratory Control Sample Duplicate: Refer to LCS.
- MDL** - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- MS** - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD** - Matrix Spike Sample Duplicate: Refer to MS.
- NA** - Not Applicable.
- NC** - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- NI** - Not Ignitable.
- RL** - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD** - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

### Terms

**Analytical Method:** Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.

Report Format: Data Usability Report

**Project Name:** NBH LONG TERM MONITORING  
**Project Number:** TO-0018

**Lab Number:** L0912909  
**Report Date:** 08/03/10

*Data Qualifiers*

**RE** - Analytical results are from sample re-extraction.

**J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

**ND** - Not detected at the reporting limit (RL) for the sample.

**Project Name:** NBH LONG TERM MONITORING  
**Project Number:** TO-0018

**Lab Number:** L0912909  
**Report Date:** 08/03/10

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## Hydrometer Test Data

Hydrometer test uses material passing #200

Percent passing #200 based upon complete sample = 51.2

Weight of hydrometer sample = 39.13

Automatic temperature correction

Composite correction (fluid density and meniscus height) at 20 deg. C = -.04

Meniscus correction only = -3.0

Specific gravity of solids = 2.65

Hydrometer type = 151H

Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

Alpha Analytical

## Certificate/Approval Program Summary

Last revised July 19, 2010 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

### **Connecticut Department of Public Health Certificate/Lab ID: PH-0141.**

*Wastewater/Non-Potable Water* (Inorganic Parameters: pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable), Total Cyanide. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

*Solid Waste/Soil* (Inorganic Parameters: pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc, Total Organic Carbon, Total Cyanide, Corrosivity, TCLP 1311. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

### **Florida Department of Health Certificate/Lab ID: E87814. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: SM2320B, EPA 120.1, SM2510B, EPA 245.1, EPA 150.1, EPA 160.2, SM2540D, EPA 335.2, SM2540G, EPA 180.1. Organic Parameters: EPA 625, 608.)

*Solid & Chemical Materials* (Inorganic Parameters: 6020, 7470, 7471, 9045, 9014. Organic Parameters: EPA 8260, 8270, 8082, 8081.)

*Air & Emissions* (EPA TO-15.)

### **Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: EPA 120.1, 150.1, 160.2, 180.1, 200.8, 245.1, 310.1, 335.2, 608, 625, 1631, 3010, 3015, 3020, 6020, 9010, 9014, 9040, SM2320B, 2510B, 2540D, 2540G, 4500CN-E, 4500H-B, Organic Parameters: EPA 3510, 3580, 3630, 3640, 3660, 3665, 5030, 8015 (mod), 3570, 8081, 8082, 8260, 8270, )

*Solid & Chemical Materials* (Inorganic Parameters: 6020, 7196, 7470, 7471, 7474, 9010, 9014, 9040, 9045, 9060. Organic Parameters: EPA 8015 (mod), EPA 3570, 1311, 3050, 3051, 3060, 3580, 3630, 3640, 3660, 3665, 5035, 8081, 8082, 8260, 8270.)

*Biological Tissue* (Inorganic Parameters: EPA 6020. Organic Parameters: EPA 3570, 3510, 3610, 3630, 3640, 8270.)

### **Massachusetts Department of Environmental Protection Certificate/Lab ID: M-MA030.**

*Non-Potable Water* (Inorganic Parameters: SM4500H+B. Organic Parameters: EPA 624.)

### **New Hampshire Department of Environmental Services Certificate/Lab ID: 2206. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: EPA 200.8, 245.1, 1631E, 120.1, 150.1, 180.1, 310.1, 335.2, 160.2, SM2540D, 2540G, 4500CN-E, 4500H+B, 2320B, 2510B. Organic Parameters: EPA 625, 608.)

### **New Jersey Department of Environmental Protection Certificate/Lab ID: MA015. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: SW-846 1312, 3010, 3020A, 3015, 6020, SM2320B, EPA 200.8, SM2540C, 2540D, 2540G, EPA 120.1, SM2510B, EPA 180.1, 245.1, 1631E, SW-846 9040B, 6020, 9010B, 9014 Organic Parameters: EPA 608, 625, SW-846 3510C, 3580A, 5030B, 3035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8081A, 8082 8260B, 8270C)

*Solid & Chemical Materials* (Inorganic Parameters: SW-846 6020, 9010B, 9014, 1311, 1312, 3050B, 3051, 3060A, 7196A, 7470A, 7471A, 9045C, 9060. Organic Parameters: SW-846 3580A, 5030B, 3035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8081A, 8082, 8260B, 8270C, 3570, 8015B.)

*Atmospheric Organic Parameters* (EPA TO-15)

*Biological Tissue* (Inorganic Parameters: SW-846 6020 Organic Parameters: SW-846 8270C, 3510C, 3570, 3610B, 3630C, 3640A)

**New York Department of Health** Certificate/Lab ID: 11627. **NELAP Accredited.**

*Non-Potable Water* (Inorganic Parameters: EPA 310.1, SM2320B, EPA 365.2, 160.1, EPA 160.2, SM2540D, EPA 200.8, 6020, 1631E, 245.1, 335.2, 9014, 150.1, 9040B, 120.1, SM2510B, EPA 376.2, 180.1, 9010B. Organic Parameters: EPA 624, 8260B, 8270C, 608, 8081A, 625, 8082, 3510C, 3511, 5030B.)

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 9040B, 9045C, SW-846 Ch7 Sec 7.3, EPA 6020, 7196A, 7471A, 7474, 9014, 9040B, 9045C, 9010B. Organic Parameters: EPA 8260B, 8270C, 8081A, DRO 8015B, 8082, 1311, 3050B, 3580, 3050B, 3035, 3570, 3051, 5035, 5030B.)

*Air & Emissions* (EPA TO-15.)

**Rhode Island Department of Health** Certificate/Lab ID: LAO00299. **NELAP Accredited via LA-DEQ.**

Refer to MA-DEP Certificate for Non-Potable Water.

Refer to LA-DEQ Certificate for Non-Potable Water.

**Texas Commission of Environmental Quality** Certificate/Lab ID: T104704419-08-TX. **NELAP Accredited.**

*Solid & Chemical Materials* (Inorganic Parameters: EPA 6020, 7470, 7471, 1311, 7196, 9014, 9040, 9045, 9060. Organic Parameters: EPA 8015, 8270, 8260, 8081, 8082.)

*Air* (Organic Parameters: EPA TO-15)

**U.S. Army Corps of Engineers**

**Department of Defense** Certificate/Lab ID: L2217.01.

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 1311, 1312, 3051, 6020, 747A, 7474, 9045C, 9060, SM 2540G, ASTM D422-63. Organic Parameters: EPA 3580, 3570, 3540C, 5035, 8260B, 8270C, 8270 Alk-PAH, 8082, 8081A, 8015 (SHC), 8015 (DRO).

*Air & Emissions* (EPA TO-15.)

#### **Analytes Not Accredited by NELAP**

Certification is not available by NELAP for the following analytes: **8270C**: Biphenyl.

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

For additional information, please contact Client Services at 800-624-9220.

---

### Report Submission

This report replaces the original report issued on February 2, 2010. The report was ammended to include revised Grain Size data.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Authorized Signature:  Peter Henriksen

## GLOSSARY

### Acronyms

- EPA** - Environmental Protection Agency.
- LCS** - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD** - Laboratory Control Sample Duplicate: Refer to LCS.
- MDL** - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- MS** - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD** - Matrix Spike Sample Duplicate: Refer to MS.
- NA** - Not Applicable.
- NC** - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- NI** - Not Ignitable.
- RL** - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD** - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

### Terms

**Analytical Method:** Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.

**Report Format:** Data Usability Report

**Project Name:** NBH LONG TERM MONITORING  
**Project Number:** TO-0018

**Lab Number:** L0912910  
**Report Date:** 08/03/10

*Data Qualifiers*

- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the reporting limit (RL) for the sample.

**Project Name:** NBH LONG TERM MONITORING  
**Project Number:** TO-0018

**Lab Number:** L0912910  
**Report Date:** 08/03/10

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

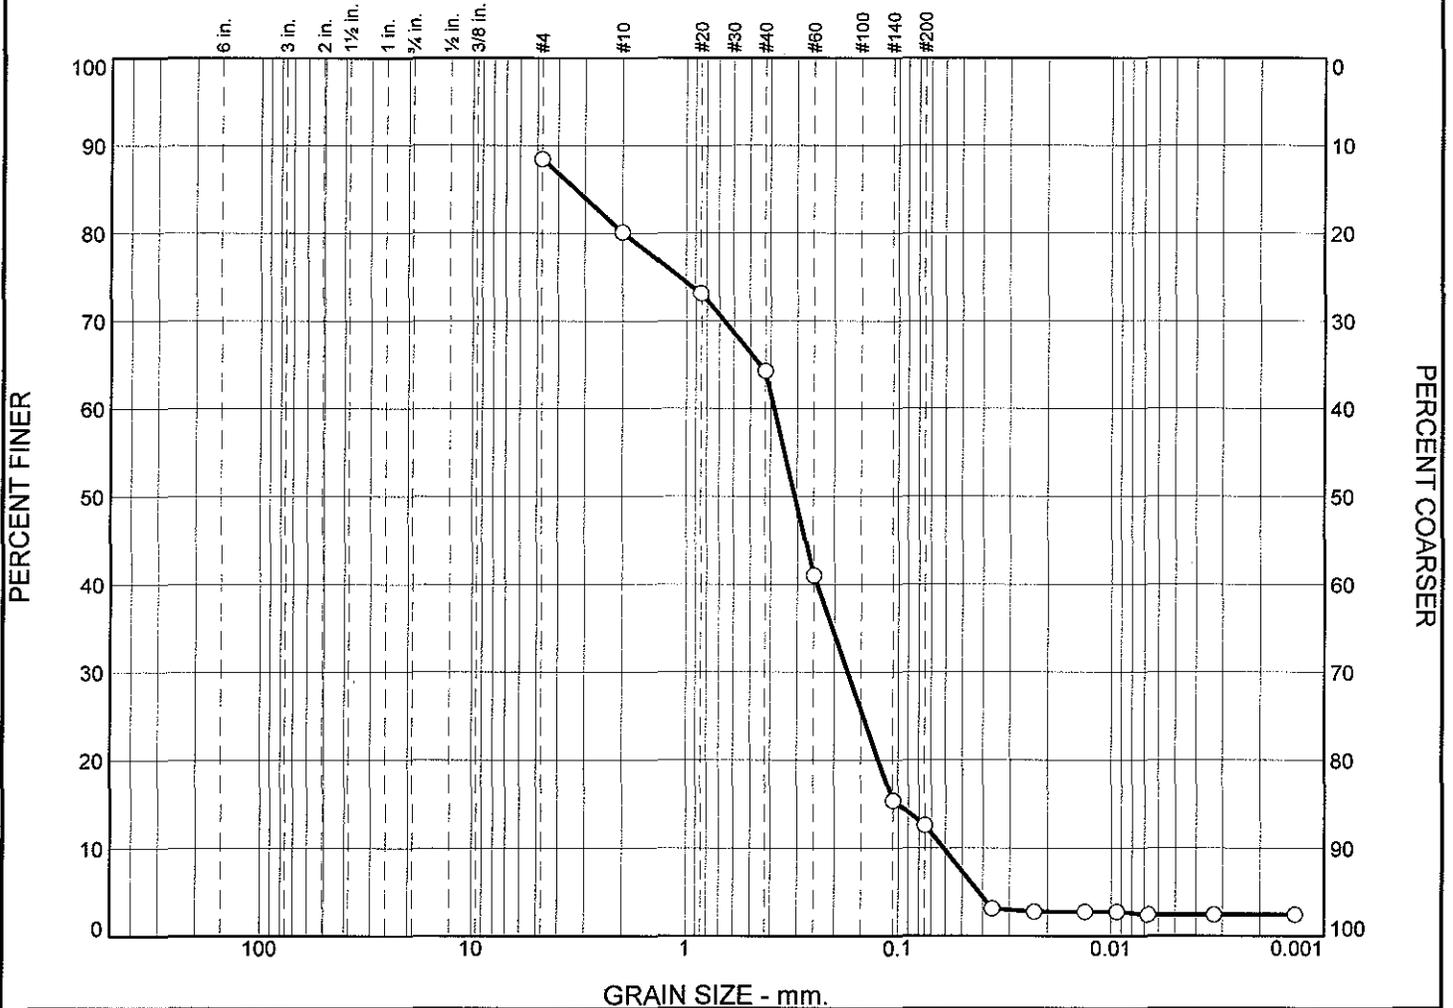

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## Hydrometer Test Data

Hydrometer test uses material passing #200

Percent passing #200 based upon complete sample = 41.7

Weight of hydrometer sample = 43.96

Automatic temperature correction

Composite correction (fluid density and meniscus height) at 20 deg. C = -.04

Meniscus correction only = -3.0

Specific gravity of solids = 2.65

Hydrometer type = 151H

Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times Rm$

## GRAIN SIZE DISTRIBUTION TEST DATA

1/28/2010

Client: Woods Hole Group

Project: New Bedford Long Term Monitoring

Project Number: L0912910

Location: 502426

Sample Number: L0912910-17

Sieve opening list: BS Bulk Sieve

## Sieve Test Data

Post #200 Wash Test Weights (grams): Dry Sample and Tare = 51.36  
 Tare Wt. = 4.04  
 Minus #200 from wash = 8.6%

| Dry Sample and Tare (grams) | Tare (grams) | Sieve Opening Size | Weight Retained (grams) | Sieve Weight (grams) | Percent Finer | Percent Retained |
|-----------------------------|--------------|--------------------|-------------------------|----------------------|---------------|------------------|
| 51.75                       | 0.00         | #4                 | 522.82                  | 519.16               | 92.9          | 7.1              |
|                             |              | #10                | 463.49                  | 459.91               | 86.0          | 14.0             |
|                             |              | #20                | 380.18                  | 375.18               | 76.3          | 23.7             |
|                             |              | #40                | 369.48                  | 366.48               | 70.6          | 29.4             |
|                             |              | #60                | 369.95                  | 366.98               | 64.8          | 35.2             |
|                             |              | #140               | 345.36                  | 344.18               | 62.5          | 37.5             |
|                             |              | #200               | 349.49                  | 346.53               | 56.8          | 43.2             |

## Hydrometer Test Data

Hydrometer test uses material passing #200

Percent passing #200 based upon complete sample = 56.8

Weight of hydrometer sample = 51.75

Automatic temperature correction

Composite correction (fluid density and meniscus height) at 20 deg. C = -.04

Meniscus correction only = -3.0

Specific gravity of solids = 2.65

Hydrometer type = 151H

Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$ 

| Elapsed Time (min.) | Temp. (deg. C.) | Actual Reading | Corrected Reading | K      | Rm  | Eff. Depth | Diameter (mm.) | Percent Finer | Percent Retained |

Alpha Analytical

## Certificate/Approval Program Summary

Last revised July 19, 2010 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

### **Connecticut Department of Public Health Certificate/Lab ID: PH-0141.**

*Wastewater/Non-Potable Water* (Inorganic Parameters: pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable), Total Cyanide. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

*Solid Waste/Soil* (Inorganic Parameters: pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc, Total Organic Carbon, Total Cyanide, Corrosivity, TCLP 1311. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

### **Florida Department of Health Certificate/Lab ID: E87814. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: SM2320B, EPA 120.1, SM2510B, EPA 245.1, EPA 150.1, EPA 160.2, SM2540D, EPA 335.2, SM2540G, EPA 180.1. Organic Parameters: EPA 625, 608.)

*Solid & Chemical Materials* (Inorganic Parameters: 6020, 7470, 7471, 9045, 9014. Organic Parameters: EPA 8260, 8270, 8082, 8081.)

*Air & Emissions* (EPA TO-15.)

### **Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: EPA 120.1, 150.1, 160.2, 180.1, 200.8, 245.1, 310.1, 335.2, 608, 625, 1631, 3010, 3015, 3020, 6020, 9010, 9014, 9040, SM2320B, 2510B, 2540D, 2540G, 4500CN-E, 4500H-B, Organic Parameters: EPA 3510, 3580, 3630, 3640, 3660, 3665, 5030, 8015 (mod), 3570, 8081, 8082, 8260, 8270, )

*Solid & Chemical Materials* (Inorganic Parameters: 6020, 7196, 7470, 7471, 7474, 9010, 9014, 9040, 9045, 9060. Organic Parameters: EPA 8015 (mod), EPA 3570, 1311, 3050, 3051, 3060, 3580, 3630, 3640, 3660, 3665, 5035, 8081, 8082, 8260, 8270.)

*Biological Tissue* (Inorganic Parameters: EPA 6020. Organic Parameters: EPA 3570, 3510, 3610, 3630, 3640, 8270.)

### **Massachusetts Department of Environmental Protection Certificate/Lab ID: M-MA030.**

*Non-Potable Water* (Inorganic Parameters: SM4500H+B. Organic Parameters: EPA 624.)

### **New Hampshire Department of Environmental Services Certificate/Lab ID: 2206. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: EPA 200.8, 245.1, 1631E, 120.1, 150.1, 180.1, 310.1, 335.2, 160.2, SM2540D, 2540G, 4500CN-E, 4500H+B, 2320B, 2510B. Organic Parameters: EPA 625, 608.)

### **New Jersey Department of Environmental Protection Certificate/Lab ID: MA015. *NELAP Accredited.***

*Non-Potable Water* (Inorganic Parameters: SW-846 1312, 3010, 3020A, 3015, 6020, SM2320B, EPA 200.8, SM2540C, 2540D, 2540G, EPA 120.1, SM2510B, EPA 180.1, 245.1, 1631E, SW-846 9040B, 6020, 9010B, 9014 Organic Parameters: EPA 608, 625, SW-846 3510C, 3580A, 5030B, 3035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8081A, 8082 8260B, 8270C)

*Solid & Chemical Materials* (Inorganic Parameters: SW-846 6020, 9010B, 9014, 1311, 1312, 3050B, 3051, 3060A, 7196A, 7470A, 7471A, 9045C, 9060. Organic Parameters: SW-846 3580A, 5030B, 3035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8081A, 8082, 8260B, 8270C, 3570, 8015B.)

*Atmospheric Organic Parameters* (EPA TO-15)

*Biological Tissue* (Inorganic Parameters: SW-846 6020 Organic Parameters: SW-846 8270C, 3510C, 3570, 3610B, 3630C, 3640A)

**New York Department of Health** Certificate/Lab ID: 11627. **NELAP Accredited.**

*Non-Potable Water* (Inorganic Parameters: EPA 310.1, SM2320B, EPA 365.2, 160.1, EPA 160.2, SM2540D, EPA 200.8, 6020, 1631E, 245.1, 335.2, 9014, 150.1, 9040B, 120.1, SM2510B, EPA 376.2, 180.1, 9010B. Organic Parameters: EPA 624, 8260B, 8270C, 608, 8081A, 625, 8082, 3510C, 3511, 5030B.)

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 9040B, 9045C, SW-846 Ch7 Sec 7.3, EPA 6020, 7196A, 7471A, 7474, 9014, 9040B, 9045C, 9010B. Organic Parameters: EPA 8260B, 8270C, 8081A, DRO 8015B, 8082, 1311, 3050B, 3580, 3050B, 3035, 3570, 3051, 5035, 5030B.)

*Air & Emissions* (EPA TO-15.)

**Rhode Island Department of Health** Certificate/Lab ID: LAO00299. **NELAP Accredited via LA-DEQ.**

Refer to MA-DEP Certificate for Non-Potable Water.

Refer to LA-DEQ Certificate for Non-Potable Water.

**Texas Commission of Environmental Quality** Certificate/Lab ID: T104704419-08-TX. **NELAP Accredited.**

*Solid & Chemical Materials* (Inorganic Parameters: EPA 6020, 7470, 7471, 1311, 7196, 9014, 9040, 9045, 9060. Organic Parameters: EPA 8015, 8270, 8260, 8081, 8082.)

*Air* (Organic Parameters: EPA TO-15)

**U.S. Army Corps of Engineers**

**Department of Defense** Certificate/Lab ID: L2217.01.

*Solid & Hazardous Waste* (Inorganic Parameters: EPA 1311, 1312, 3051, 6020, 747A, 7474, 9045C, 9060, SM 2540G, ASTM D422-63. Organic Parameters: EPA 3580, 3570, 3540C, 5035, 8260B, 8270C, 8270 Alk-PAH, 8082, 8081A, 8015 (SHC), 8015 (DRO).

*Air & Emissions* (EPA TO-15.)

**Analytes Not Accredited by NELAP**

Certification is not available by NELAP for the following analytes: **8270C**: Biphenyl.

Serial No: 08031016:16

**Project Name:** NBH LONG TERM MONITORING  
**Project Number:** TO-0018

**Lab Number:** L0912911  
**Report Date:** 08/03/10

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

For additional information, please contact Client Services at 800-624-9220.

---

### Report Submission

This report replaces the original report issued on February 2, 2010. The report was ammended to include revised Grain Size data.

### Grain Size

The WG382946-1 Laboratory Duplicate RPD is outside the acceptance criteria for gravel (133%), % very coarse sand (152%), % coarse sand (123%), % fine sand (169%),% very fine sand (168%),silt (182%),clay (178%). The elevated RPD has been attributed to the non-homogenous nature of the sample utilized for the laboratory duplicate.

## GLOSSARY

### Acronyms

- EPA** - Environmental Protection Agency.
- LCS** - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
- LCSD** - Laboratory Control Sample Duplicate: Refer to LCS.
- MDL** - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- MS** - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
- MSD** - Matrix Spike Sample Duplicate: Refer to MS.
- NA** - Not Applicable.
- NC** - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
- NI** - Not Ignitable.
- RL** - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
- RPD** - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.

### Terms

**Analytical Method:** Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.

**Report Format:** Data Usability Report

**Project Name:** NBH LONG TERM MONITORING  
**Project Number:** TO-0018

**Lab Number:** L0912911  
**Report Date:** 08/03/10

*Data Qualifiers*

- RE** - Analytical results are from sample re-extraction.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the reporting limit (RL) for the sample.

**Project Name:** NBH LONG TERM MONITORING  
**Project Number:** TO-0018

**Lab Number:** L0912911  
**Report Date:** 08/03/10

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

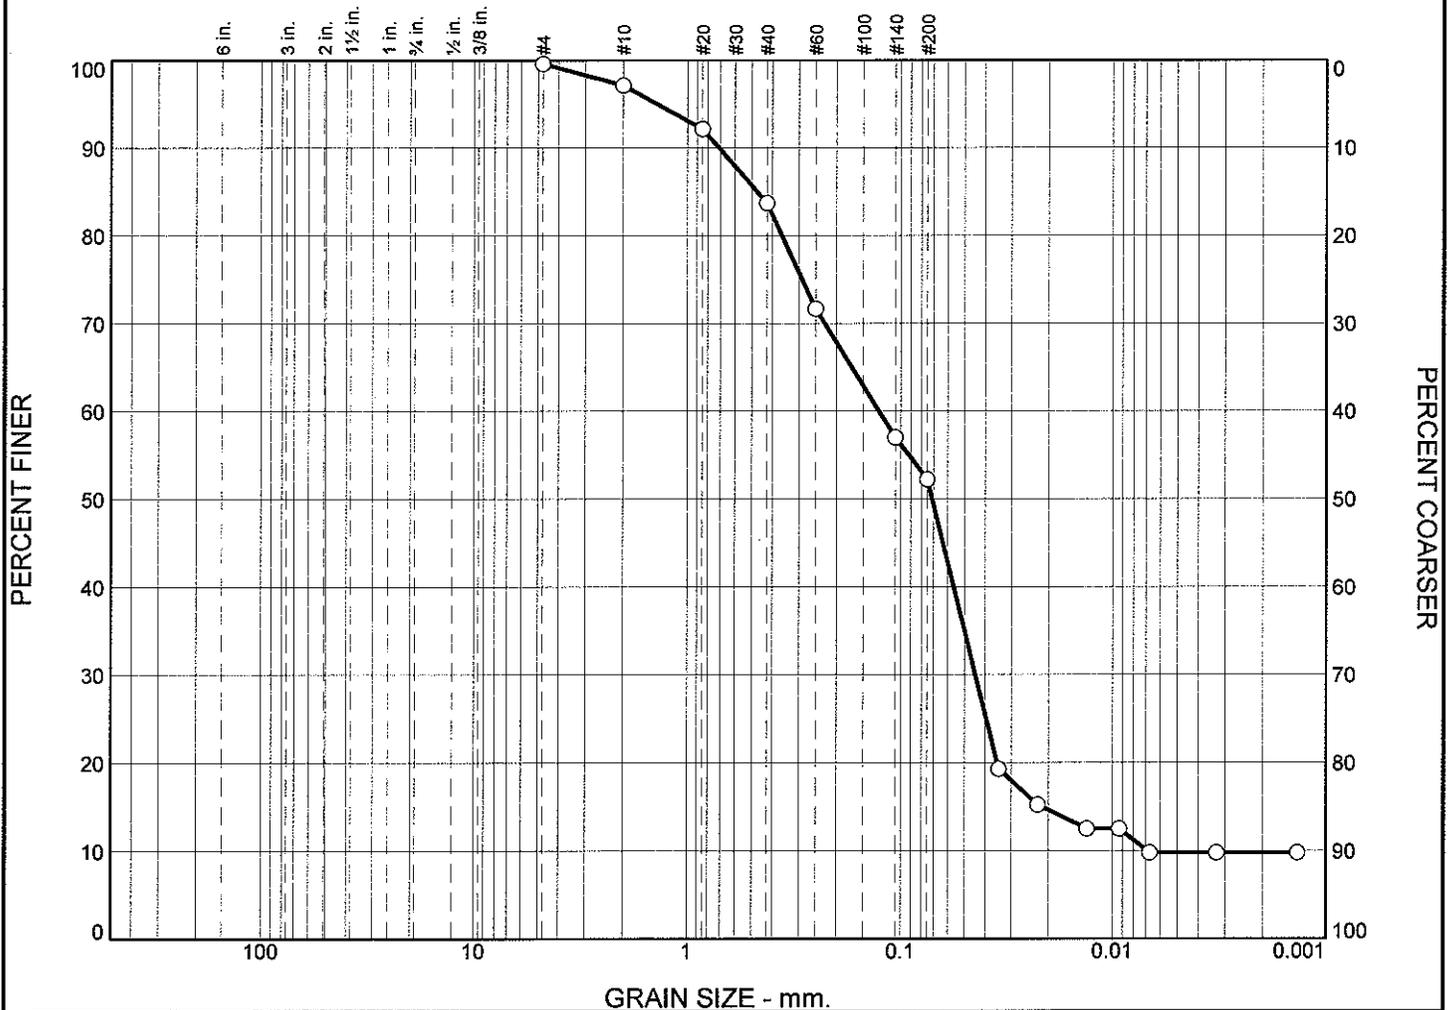

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## Hydrometer Test Data

Hydrometer test uses material passing #200

Percent passing #200 based upon complete sample = 52.2

Weight of hydrometer sample = 61.81

Automatic temperature correction

Composite correction (fluid density and meniscus height) at 20 deg. C = -0.04

Meniscus correction only = -3.0

Specific gravity of solids = 2.65

Hydrometer type = 151H

Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

## Hydrometer Test Data

Hydrometer test uses material passing #200

Percent passing #200 based upon complete sample = 93.8

Weight of hydrometer sample = 62.58

Automatic temperature correction

Composite correction (fluid density and meniscus height) at 20 deg. C = -0.04

Meniscus correction only = -3.0

Specific gravity of solids = 2.65

Hydrometer type = 151H

Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

## Hydrometer Test Data

Hydrometer test uses material passing #200

Percent passing #200 based upon complete sample = 2.2

Weight of hydrometer sample = 80.22

Automatic temperature correction

Composite correction (fluid density and meniscus height) at 20 deg. C = -0.04

Meniscus correction only = -3.0

Specific gravity of solids = 2.65

Hydrometer type = 151H

Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

## Hydrometer Test Data

Hydrometer test uses material passing #200

Percent passing #200 based upon complete sample = 26.5

Weight of hydrometer sample = 58.36

Automatic temperature correction

Composite correction (fluid density and meniscus height) at 20 deg. C = -0.04

Meniscus correction only = -3.0

Specific gravity of solids = 2.65

Hydrometer type = 151H

Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$

**Hydrometer Test Data**

Hydrometer test uses material passing #200  
 Percent passing #200 based upon complete sample = 47.6  
 Weight of hydrometer sample = 58.36  
 Automatic temperature correction  
 Composite correction (fluid density and meniscus height) at 20 deg. C = -0.04  
 Meniscus correction only = -3.0  
 Specific gravity of solids = 2.65  
 Hydrometer type = 151H  
 Hydrometer effective depth equation:  $L = 16.294964 - 0.2645 \times R_m$
