Appendix D Seafood Monitoring – Striped Bass Field Sampling Activities for the NBH Superfund Site 2010 Annual Report

## **1. Introduction**

This report documents the levels of PCBs (polychlorinated biphenyls) measured in edible seafood species caught in New Bedford Harbor and surrounding Buzzards Bay in southeastern Massachusetts in 2010. This seafood monitoring program is part of the ongoing PCB cleanup program for the New Bedford Harbor (NBH) Superfund Site, and was a collaborative effort involving the MA Department of Marine Fisheries (DMF), the MA Department of Environmental Protection, (MassDEP) and the U.S. Environmental Protection Agency-New England Region (EPA).

Due to the identification of high PCB levels in area seafood, the MA Department of Public Health in 1979 promulgated regulations restricting seafood consumption in three closure areas in and around NBH as shown on Figure 1 (MADPH, 1979). NBH was subsequently listed as a Superfund site in 1983. Per a 1998 Record of Decision (ROD) (EPA, 1998) for the site, approximately 900,000 cubic yards (cy) of PCB-contaminated sediments and soils are to be removed. Based on annual funding rates received to date, the cleanup may take twenty years or more from now to complete. Consistent with the 1998 ROD, this seafood monitoring program will aid in the evaluation of the overall effectiveness of the harbor cleanup, as well as assist in the implementation of institutional controls and seafood restrictions.

## **2. Seafood Monitoring Program Design**

Based on previous investigations and risk assessments performed for the NBH Site, a variety of species were selected for this monitoring program that are considered locally caught seafood; are generally available for field collection; and which bracket potential worse case tissue levels (MassDEP, 2010). In previous sampling rounds, these species include lobster (*Homarus americanus*), blue crabs (*Carcinus maenas*), quahog (i.e., hard shelled clam, *Mercenaria mercenaria*), alewife (*Alosa pseudoharengus*), American eel (*Anguilla rostrata*), black sea bass (*Centropristes striatus*), winter flounder (*Pseudopleuronectes americanus*), and scup (*Stenotomus chrysops*). The goal of this seafood monitoring program is to acquire annual collections of these species in sufficient numbers from all three closure areas to enable statistical comparisons between them, but with the understanding that some species may not necessarily be caught in sufficient numbers every year.

To meet this goal, the monitoring design calls for five composite samples for each species from each of the three closure areas. Based on previous site sampling experience, modifications have been made to the original sampling approach. Because there has been no significant change since 2002 in the PCB concentration levels to below the regulated restrictions (MADPH, 1979), the species collected for the most part in 2010 were ones that do not currently have restrictions that may pose a risk, if consumed. Thus, lobster, blue crab, eel, and quahog in Area I were not sampled in 2010 because their PCB concentrations were significantly above the seafood restrictions. However, additional sampling did include a two post-spawn quahog events and striped bass. The rest of the species collected were the same as the previous year and included alewife, black sea bass, bluefish, conch (channeled

and knobbed whelk), pre-spawn quahog, and scup. Each composite sample consists of five legally harvestable organisms for black sea bass, scup, and conch. For blue fish, the composite sample consists of three legally harvestable organisms. For alewife, the composite sample consists of one harvestable organism. For quahog, the composite sample consists of one dozen legally harvestable organisms. For striped bass, the sample consists of one harvestable organism. The number of composites was determined according to Sokal and Rohlf (1995) using the coefficient of variation (c.v.) from the DMF's 1995 lobster sampling program in Area III (mean = 1.3 ppm, standard deviation = 0.28, c.v. = 22%). The significance level used was 5% and the probability that the significance will be found if it exists was set at 90%. Based on the known levels of PCBs in NBH seafood, there is a high likelihood of detecting PCB concentrations that are 50% different between each closure area.

In addition to comparing the results of this monitoring to past and future seafood monitoring results, the results of this seafood monitoring program will be compared to the current U.S. Food and Drug Administration's (FDA's) criteria for PCBs in commercial seafood of 2 parts per million (ppm). It was exceedances of the FDA criteria in NBH seafood which prompted promulgation of the state's seafood closure areas in 1979 (the FDA criteria at that time was 5 ppm). In addition to comparisons to the current FDA level, and as explained in the 1998 ROD, EPA will compare the results of the seafood monitoring program to a site-specific threshold of 0.02 ppm PCBs. This 0.02 ppm PCB level was developed to ensure the protection of local residents and sport fishermen whose seafood consumption might include seafood caught mostly if not entirely from NBH.

### **3. 2010 Field Collection**

The DMF field sampling program included the collection of alewife, bluefish, black sea bass, conch (channeled and knobbed whelk), quahog, and scup. The Sampling Report for all species collected in 2010 is in Appendix C.

Alewife was collected using a net in March (Figure 2). Black sea bass was harvested by fish pots during May, June, and July (Figure 3). Bluefish was collected using rod and reel in June and July (Figure 4). Conch was collected using fish pots, conch pots, and divers in April through November (Figure 5).

The collection of quahog was done pre-spawn in May and the two post-spawn sampling events in August and October (Figures 6 to 8). Quahogs were collected using a rake and diver from two seafood closure Areas. Six stations were located in Area 2 and four stations were located in Area 3.

Scup was collected using fish pots in June (Figure 9). Striped bass was collected using hook and line in July (Figure 10).

Despite considerable effort to collect species according to the monitoring program design, all species were not obtained in all three closure areas as originally planned. No flounder were collected because the stock is considered "overfished" as determined by the Atlantic States Marine Fisheries Commission. Black sea bass was substituted for flounder.

Complete collection information including the dates fished, identification information, species, station identification, latitude and longitude, and collection method are included on the Field Collection Forms in Appendix C. All samples were delivered frozen to Alpha Woods Hole Labs (Alpha) in Raynham, MA for analysis.

#### **4. Analytical Chemistry**

The seafood samples were analyzed for four PCB Aroclors and 136 PCB congeners by GC/MS-SIM (gas chromatography/mass spectrometry-selective ion monitoring) based on EPA Methods 680 and 8270C. Both the Aroclor and the congener approach were used to allow comparisons with previous site data of both types. The four Aroclors measured were Aroclors 1242, 1248, 1254 and 1260. In the previous years of sampling, a fifth Aroclor 1232 was included. Aroclor 1232 was dropped in 2009, because in all the previous sampling rounds, it was never detected. The 136 congeners measured included the eighteen NOAA (National Oceanic and Atmospheric Administration) list congeners and the twelve WHO '98 (1998 World Health Organization) list of dioxin-like congeners. Two congeners, BZ #105 and #118, appear on both lists. The NOAA congener list was used by the MA DMF in its analysis of Area III lobsters from 1988 - 1998, while Aroclors had been used previous to this. The NOAA list typically represents approximately 45% of the total PCB in marine tissue (NOAA, 1993).

The congeners quantitated in this effort are listed in the New Bedford Harbor Superfund Site Quality Assurance Project Plan (MassDEP, 2010a). The WHO '98 congeners were included to enable the evaluation of risks to human health due to the presence of any dioxin-like PCB congeners, if deemed necessary.

Tissue from the collected specimens was filleted, sub-sampled and/or composited as necessary for sample homogenization, extraction and analysis. The first step in the analytical process for the quahog samples was the compositing of twelve individual samples from each location; these were combined to form one composite sample per location. For each group, approximately five grams of wet sample tissue was homogenized using a tissumizer. Samples were then extracted using EPA method 3570 Microscale Solvent Extraction (MSE) techniques (spin extraction with acetone/methylene chloride in a sealed vessel).

The extract was then cleaned up to remove the lipid portion and separate the PCB Analytes from the lipid. Following sample cleanup, extracts were dried and concentrated using either the Kuderna-Danish (K-D) or TurboVap method, brought up to final volume and analyzed. Extract cleanup was performed using Gel Permeation Chromatography (GPC) and Sulfuric Acid Cleanup. Silica Gel Cleanup was also employed as appropriate, based on the sample extracts.

Sample analysis using GC/MS-SIM allowed identification and quantitation of both congeners and Aroclors using selected PCB congeners from BZ1 to BZ209. The identification of the specific congeners was accomplished by comparing their mass spectra with the electron impact spectra of the calibration standards. Congener concentrations were determined using mean relative response factors from a multi-level calibration curve.

Response factors for congeners were determined relative to internal standard technique. Aroclor identification was performed using pattern recognition from the GC/MS-SIM chromatogram and comparing responses of three to five discrete peaks unique to each Aroclor. Aroclor concentrations were determined by calculating the concentration of each corresponding peak in the sample chromatogram and the three to five resulting concentrations are averaged to provide a final result for the sample. A multi-point curve was used for the individual congeners to demonstrate the linear range of the instrument. Continuing calibrations assured linearity remained for the duration of the analysis. A single point calibration was used for the Aroclors utilizing the congener calibration. Laboratory SOPs are available in the Quality Assurance Project Plan Revision 5 (MassDEP, 2010a) should further details on chromatographic conditions, quality control criteria, and other elements of the analysis be needed. While lipid content was reported, the wet weight PCB concentrations reported herein are not lipid normalized.

The data validation summary for the laboratory analysis is presented in Appendix B.

## 5. Results and Discussion

As with previous studies of sediments, water column, seafood, and air at the NBH Site, the current data set demonstrates a generally decreasing trend (north to south) of PCB levels in locally caught seafood. In other words, tissue PCB levels decrease proportionally with the distance from the primary source of PCBs to the upper harbor (the Aerovox facility). Figures 11 through 18 graphically summarize the current data, and Tables 1 through 8 tabulate the totals and averages of the congener and Aroclor sample results.

PCBs are a group of similar organic molecules featuring a “figure-eight” structure of two bonded benzene rings with chlorine atoms attached at up to ten different attachment sites. Theoretically, up to 209 different PCB congeners (or molecular variations) are possible, yet only about 120 of these are found in the natural environment. Furthermore, NOAA has demonstrated that 18 specific congeners are the most pervasive and generally make up almost half of the PCB mass in marine tissues. In addition, WHO considers 12 specific dioxin-like congeners to present the greatest risk to human health. As noted above in section 4, two congeners, BZ #105 and BZ #118, are included in both the NOAA and the WHO congener sets.

Throughout their industrial use in the U.S., PCBs were sold under the Aroclor trade name. Aroclors are a mixture of congeners, and different Aroclor types consisting of different congeners and chlorine levels were manufactured (e.g., Aroclor 1242 had 42% chlorine, and Aroclor 1260 had 60% chlorine). For this monitoring effort, both Aroclors and congeners (136 including the 28 congeners of the combined NOAA and WHO subsets) were measured to assist in the comparison with previous site data, as well as to further understand the similarities and differences of these two analytical approaches.

In the current sampling round, the Aroclors concentrations are higher than the congeners concentration for all the Area averages. However, generally there was not a large difference between the congener and Aroclor results.

For the quahog, there was an average decrease of about 9% (100% - 91%) post-spawn 1 and about 21% (100% - 79%) post-spawn 2 in PCB congener concentration after spawning using only the detected values as shown in Table 9. There was an average 30% decrease (100% - 70%) post-spawn 1 in the lipid concentration for the quahog after spawning. The post spawn 2 lipid concentration increase from the post spawn 1 to an average 82% compared to the pre-spawn concentration.

Overall, the current data set indicate continued levels of PCBs in NBH area seafood above the 1998 ROD's site-specific goal of 0.02 ppm. Two striped bass (fillet) in Area III (Aroclor basis of 36 and 3.2 ppm, and congener basis of 30 and 2.5 ppm) and one Scup sample in Area II (Aroclor basis of 2.1 ppm and congener basis of 1.3 ppm) were found to be elevated equal the FDA level of 2 ppm. The highest PCB level reported fillet for this data set was the 36 ppm Aroclor and 30 ppm congener for striped bass fillet (see Table 3). This sample had the highest PCB concentration outside of Area I reported to data. Because of the limited number of samples collected, it is difficult to draw definitive conclusion regarding the risk of consuming striped bass caught in the New Bedford Harbor Site. Future sampling efforts will attempt to collect more samples. Also, the liver and skin/scales of the striped bass were sampled. The highest liver concentration was 120 ppm (Aroclor) and 110 ppm (congener). The highest skin/scales concentration was 1.5 ppm (Aroclor) and 1.6 ppm (congener). The highest liver and skin/scales concentrations were from the sample with the highest fillet concentration.

It should be noted that these PCB levels do not apply to seafood caught by the harbor's commercial fishing fleet, as this seafood is caught significantly further offshore than the three PCB closure areas at the New Bedford Harbor Superfund Site. However, these results do indicate the need to continue the outreach program to inform and educate the local communities and recreational sport fishermen about the fishing bans.

The seafood sampling program has been on-going since 2002, the previous year's reports can be found at the EPA's web site at [www.epa.gov/ne/nbh](http://www.epa.gov/ne/nbh) under "Technical Documents".

Notes and Footnotes for Tables:

<sup>1</sup> = summation of 136 PCB congener results (1/2 Sample Quantitation Limit [SQL] used for non-detected results)

<sup>2</sup> = summation of detected 136 PCB congeners

<sup>3</sup> = summation of 18 NOAA PCB congener results (1/2 SQL used for non-detected results)

<sup>4</sup> = summation of 12 WHO PCB congener results (1/2 SQL used for non-detected results)

<sup>5</sup> = summation of 18 NOAA & 12 WHO PCB congener results (1/2 SQL used for non-detected results); duplicative congeners (BZ# 105, #118, #167/128) subtracted from total for one data set

<sup>6</sup> = summation of 4 Aroclor results (1/2 SQL used for non-detected results); if all Aroclor results are not detected, then total value represents SQL for each individual Aroclor

U = not detected; value represents SQL

J1 = concentration of detected congeners contributes < 50% of total congener result

J2 = concentration of detected congeners contributes 50% to 90% of total congener result

J3 = concentration of detected congeners contributes 90% to 99% of total congener result

J4 = concentration of detected congeners contributes > 99% of total congener result

Results reported in milligrams per kilogram (mg/kg) wet weight, unless otherwise noted.  
PCB Congeners and Aroclors analyzed by GC/MS-SIM.

<b>Average for 2 Areas</b>		0.38	0.27	0.31	70	82				91	79				98	95

Notes: For the PCBs concentrations, the post-spawn was divided by the pre-spawn and multiplied by 100 to obtain a percentage of the pre-spawn. Less than 100% means that the pre-spawn was higher than the post-spawn results. More than 100% means that the post-spawn was higher than the pre-spawn results.

For the Lipid concentrations, the 10 post-spawn samples were averaged; the 10 pre-spawn samples were averaged; and then the Post was divided by the Pre and then multiplied by 100 to obtain a percentage of the pre-spawn.

Notes and Footnotes for Tables:

<sup>1</sup> = summation of 136 PCB congener results (1/2 Sample Quantitation Limit [SQL] used for non-detected results)

<sup>2</sup> = summation of detected 136 PCB congeners

<sup>3</sup> = summation of 18 NOAA PCB congener results (1/2 SQL used for non-detected results)

<sup>4</sup> = summation of 12 WHO PCB congener results (1/2 SQL used for non-detected results)

<sup>5</sup> = summation of 18 NOAA & 12 WHO PCB congener results (1/2 SQL used for non-detected results); duplicative congeners (BZ# 105, #118, #167/128) subtracted from total for one data set

<sup>6</sup> = summation of 4 Aroclor results (1/2 SQL used for non-detected results); if all Aroclor results are not detected, then total value represents SQL for each individual Aroclor

U = not detected; value represents SQL

J1 = concentration of detected congeners contributes < 50% of total congener result

J2 = concentration of detected congeners contributes 50% to 90% of total congener result

J3 = concentration of detected congeners contributes 90% to 99% of total congener result

J4 = concentration of detected congeners contributes > 99% of total congener result

Results reported in milligrams per kilogram (mg/kg) wet weight, unless otherwise noted.  
PCB Congeners and Aroclors analyzed by GC/MS-SIM.

## **Appendix B**

**Data Validation Summary  
Massachusetts Department of Environmental Protection  
New Bedford Harbor Seafood Contaminant Survey Monitoring  
2010 Sampling**

**Data Validation Summary**  
**Massachusetts Department of Environmental Protection**  
**New Bedford Harbor Seafood Contaminant Survey Monitoring**  
**2010 Sampling**

**Introduction:**

Sixty-eight fish tissue samples were collected from New Bedford Harbor, MA, during 2010. Samples were preserved by freezing (-20°C) and were received in March through November, 2010, by Alpha Analytical Laboratory located in Mansfield, Massachusetts. Tissue samples were analyzed for the following parameters: polychlorinated biphenyls (PCBs) by GC/MS Single Ion Monitoring (SIM) and percent lipids.

Tissue samples were analyzed in seven separate data sets: L1011835 (scup), L1011837 (black sea bass), L1011838 (quahogs – pre-spawn and post-spawn), L1011839 (alewife), L1011840 (striped bass and bluefish), L1100647 (conch), and L1100649 (quahogs – post-spawn). Tier I+ data validation was performed for all data sets. The data packages were validated using Region I EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (USEPA, 1996), Region I Laboratory Data Validation Functional Guidelines for Evaluating Organics Analyses (USEPA, 2004), Alpha Analytical Laboratory Standard Operating Procedure (SOP) O-010 (Alpha, 2002), and the Quality Assurance Project Plan, Seafood Contaminant Survey, New Bedford Harbor Superfund Site, Revision 5.0 (MADEP, 5/1/08).

For Tier I+ data validation, data were evaluated for the following parameters:

- Collection and Preservation
- \* Holding Times
- \* Data Completeness
- \* Initial Calibration (only if problems noted in case narrative)
- \* Continuing Calibration (only if problems noted in case narrative)
- \* Blanks
- Surrogate Standards
- Standard Reference Material
- Laboratory Control Samples
- Matrix Spike/Matrix Spike Duplicates
- \* Laboratory Duplicates
- \* Internal Standards (only if problems noted in case narrative)
- Target Compound Quantitation (only if problems noted in case narrative)
- Miscellaneous

\* - all criteria were met for this parameter

In general, laboratory performance is considered acceptable and all results are usable. The following qualifying statements have been applied to the 2010 data.

Collection and Preservation

**All Parameters (L1011840)** – No sample collection dates were reported on the chain of custody or sample tags for the bluefish samples reported in SDG L1011840. Sample collection personnel were contacted and provided the sample collection dates of 6/18/2010 and 7/7/2010. The collection date for the bluefish sample was revised by MACTEC in the database and on the laboratory hardcopy report.

Surrogates

**PCB (L1011840)** – Percent recovery of the surrogate BZ 202-C13 (48) was below the 50-130 control limits in sample NBH10-FF-A-2, indicating a potential low bias for reported results. Positive and non-detected results for all target analytes in sample NBH10-FF-A-2 were qualified as estimated (J/UJ) and may represent potential low biases.

**PCB (L1100649)** – Percent recoveries of the surrogate BZ 202-C13 were below the 50-130 control limits in samples NBH10-SF-D-2 (49), NBH10-SF-F-2 (49), NBH10-SF-D-3 (47), NBH10-SF-I-3 (49), and NBH10-SF-J-3 (48), indicating a potential low bias for reported results. Positive and non-detected results for all target analytes in the following samples were qualified as estimated (J/UJ) and may represent potential low biases:

NBH10-SF-D-2
NBH10-SF-F-2
NBH10-SF-D-3
NBH10-SF-I-3
NBH10-SF-J-3

#### Standard Reference Material

**PCB (L1011835, L1011837)** – Percent recoveries for congeners BZ 52 (193) and BZ 43/39 (184) in the Standard Reference Material were above the 60-140 control limits. Potential high biases are indicated for these congeners; therefore, positive results for BZ 52 and BZ 43/49 were qualified as estimated (J) in all samples in SDGs L1011835 and L1011837.

**PCB (L1011840)** – Percent recoveries for the majority of Standard Reference Material target analytes were below the 60-140 control limits. In addition, percent recoveries for 26 of 62 spiked congeners were below the 60-140 control limits in the laboratory control sample, and percent recoveries for 11 of 62 spiked congeners were below control limits in the laboratory control sample duplicate. Actual percent recoveries ranged from 41 to 59. Potential low biases are indicated for the majority of spiked congeners; therefore, based on professional judgment, positive and non-detected results for all congeners were qualified as estimated (J/UJ) in all samples in SDG L1011840.

**PCB (L1100647)** – Percent recoveries for ten congeners in the Standard Reference Material were below the 60-140 control limits:

Congener	SRM %Rec	Qualifier
BZ 28/31	53	J
BZ 66	55	J
BZ 110	52	J
BZ 151	59	J
BZ 149	58	J
BZ 118	58	J
BZ 153	56	J
BZ 105	55	J
BZ 182/187	55	J
BZ 156	53	J

Positive detections of these congeners were reported in all samples in SDG L1100647. Results were qualified as estimated (J) in all samples and may represent potential low biases.

#### Laboratory Control Samples

**PCB (L1011835, L1011837)** – Percent recoveries for 33 of 62 spiked congeners were below the 60-140 control limits in the laboratory control sample. In addition, 61 of 62 relative percent differences (RPDs) between laboratory control sample and laboratory control sample duplicate recoveries were outside the control limit of 30. Potential low biases are indicated for the majority of spiked congeners; therefore, based on professional judgment, positive and non-detected results for all congeners were qualified as estimated (J/UJ) in all samples in SDGs L1011835 and L1011837.

**PCB (L1011839)** – Percent recoveries for congeners BZ 18 (58, 58) and BZ 15 (57, 56) in the LCS/LSCD associated with sample NBH10-FF-C-1 were below the 60-140 control limits. Potential low biases are indicated for these congeners; therefore, the positive results for BZ 18 and BZ 15 were qualified as estimated (J) in associated sample NBH10-FF-C-1.

**PCB (L1011840)** – Percent recoveries for 26 of 62 spiked congeners were below the 60-140 control limits in the laboratory control sample, and percent recoveries for 11 of 62 spiked congeners were below control limits in the laboratory control sample duplicate. In addition, percent recoveries for the majority of Standard Reference Material target analytes were below the 60-140 control limits, and percent recoveries for the majority of spiked target analytes in the matrix spike were below control limits. Actual percent recoveries ranged from 41 to 59. Potential low biases are indicated for the majority of spiked congeners; therefore, based on professional judgment, positive and non-detected results for all congeners were qualified as estimated (J/UJ) in all samples in SDG L1011840.

**PCB (L1100647)** – Percent recovery of BZ 126 (39) in the Laboratory Fortified Blank was below the 40-140 control limits indicating a potential low bias. In addition, percent recoveries for BZ 105 (59), BZ 126 (46, 48), BZ 156 (59), BZ 170/190 (55, 58), and BZ 169 (53, 56) in the LCS and/or LCSD were below the 60-140 control limits indicating potential low biases. BZ 126 and BZ 169 were not detected in the associated samples, and quantitation limits for BZ 126 and BZ 169 in all samples of SDG L1100647 were qualified as estimated (UJ). Positive and non-detected results for BZ 105, BZ 156, and BZ 170/190 were qualified as estimated (J/UJ) in all samples of SDG L1100647 and may represent potential low biases.

**PCB (L1100649)** – Percent recoveries of BZ 126 (52, 51) and BZ 170/190 (58) in the LCS and/or LCSD were below the 60-140 control limits indicating potential low biases. BZ 126 was not detected in the associated samples, and quantitation limits were qualified as estimated (UJ) in all samples of SDG L1100649. Positive and non-detected results for BZ 170/190 were qualified as estimated (J/UJ) in all samples of SDG L1100649 and may represent potential low biases.

#### Matrix Spikes/Matrix Spike Duplicates

**PCB (L1011838)** – Percent recoveries for congeners BZ 1 (56), BZ 5/8 (59), BZ 18 (56), BZ 15 (54, 58), and BZ 37 (59) were below control limits of 60-140 in the matrix spike/matrix spike duplicate (MS/MSD) associated with sample NBH10-SF-B-2 QUAHOGS (pre-spawn). These congeners were not detected in the sample, and quantitation limits were qualified as estimated (UJ) in sample NBH10-SF-B-2 QUAHOGS (pre-spawn).

**PCB (L1011839)** – Percent recoveries for congener BZ 15 (57, 55) were below control limits of 60-140 in the MS/MSD associated with sample NBH10-FF-C-1. The positive detection of congener BZ-15 in sample NBH10-FF-C-1 was qualified as estimated (J).

**PCB (L1011840)** – Sample NBH10-FF-A-3 STRIPED BASS was used for MS/MSD analyses. Percent recoveries for 37 of 62 spiked target analytes in the matrix spike and 10 of 62 spiked target analytes in the matrix spike duplicate were below control limits. In addition, percent recoveries for 26 of 62 spiked congeners were below the 60-140 control limits in the laboratory control sample; percent recoveries for 11 of 62 spiked congeners were below control limits in the laboratory control sample duplicate, and percent recoveries for the majority of Standard Reference Material target analytes were below the 60-140 control limits. Actual percent recoveries ranged from 41 to 59. Potential low biases are indicated for the majority of spiked congeners; therefore, based on professional judgment, positive and non-detected results for all congeners were qualified as estimated (J/UJ) in all samples in SDG L1011840.

**PCB (L1100647)** – Sample NBH10-SF-B-2 CONCH was used for MS/MSD analyses. Percent recoveries for the following analytes were below the 60-140 control limits:

Congener	MS %Rec	MSD %Rec	Qualifier
BZ 28/31	57	OK	J
BZ 52	24	OK	J
BZ 43/49	35	OK	J
BZ 37	57	OK	J
BZ 74	57	OK	J
BZ 70	58	OK	J
BZ 66	53	OK	J
BZ 95	57	OK	J
BZ 101/84	23	OK	J
BZ 99	16	OK	J

BZ 110	36	OK	J
BZ 77	58	OK	J
<b>Congener, cont'd</b>	<b>MS %Rec</b>	<b>MSD %Rec</b>	<b>Qualifier</b>
BZ 149	50	OK	J
BZ 118	15	OK	J
BZ 138/163	3	OK	J
BZ 105	57	OK	J
BZ 126	51	57	UJ
BZ 180	59	OK	J
BZ 170/190	55	OK	J
BZ 169	56	OK	UJ

Positive and non-detected results for the above analytes were qualified as estimated (J/UJ) in sample NBH10-SF-B-2 CONCH as indicated in the table.

**PCB (L1100649)** – Percent recoveries for congeners BZ 77 (59), BZ 126 (49, 49), and BZ 170/190 (54, 55) were below control limits of 60-140 in the MS/MSD associated with sample NBH10-SF-B-2 QUAHOGS (post-spawn). These congeners were not detected in the sample, and quantitation limits were qualified as estimated (UJ) in sample NBH10-SF-B-2 QUAHOGS (post-spawn).

#### Target Compound Quantitation

**PCB (L1011835)** - The narrative states that a subset of samples in SDG L1011835 contain peaks with retention time patterns that match Aroclor 1254; however, the peak area ratios do not completely match those typical of Aroclor 1254. Therefore, results for Aroclor 1254 in SDG L1011835 are reported by the laboratory as “weathered.”

**PCB (L1011837)** - The narrative states that a subset of samples in SDG L1011837 contain peaks with retention time patterns that match Aroclor 1248 and/or Aroclor 1254; however, the peak area ratios do not completely match those typical of Aroclor 1248 and Aroclor 1254. Therefore, results for Aroclor 1248 and Aroclor 1254 in SDG L1011837 are reported by the laboratory as “weathered.”

**PCB (L1011839)** - The narrative states that sample NBH10-FF-C-1 contains peaks with retention time patterns that match Aroclor 1248 and/or Aroclor 1254; however, the peak area ratios do not completely match those typical of Aroclor 1248 and Aroclor 1254. Therefore, results for Aroclor 1248 and Aroclor 1254 in sample NBH10-FF-C-1 are reported by the laboratory as “weathered.”

**PCB (L1011840)** - The narrative states that a subset of samples in SDG L1011840 contain peaks with retention time patterns that match Aroclor 1248, Aroclor 1254, and/or Aroclor 1260; however, the peak area ratios do not completely match those typical of Aroclor 1248, Aroclor 1254, or Aroclor 1260. Therefore, results for Aroclor 1248, Aroclor 1254, and Aroclor 1260 in SDG L1011840 are reported by the laboratory as “weathered.”

**PCB (L1011840)** – Concentrations for several congeners used to quantitate Aroclor 1248 and Aroclor 1254 in sample NBH10-FF-C-3 STRIPED BASS were above the linear range of calibration in the initial undiluted analysis of the sample. However, results for Aroclor 1248 and Aroclor 1254 in the initial undiluted analysis were within the calibration range. Since several of the congeners used to quantitate Aroclor 1248 and Aroclor 1254 were above the calibration range in the undiluted analysis, based on professional judgment the affected congeners as well as results for Aroclor 1248 and Aroclor 1254 were reported from a subsequent diluted analysis of sample NBH10-FF-C-3 STRIPED BASS.

**PCB (L1100647)** - The narrative states that a subset of samples in SDG L1100647 contain peaks with retention time patterns that match Aroclor 1248, Aroclor 1254, and/or Aroclor 1260; however, the peak area ratios do not completely match those typical of Aroclor 1248, Aroclor 1254, or Aroclor 1260. Therefore, results for Aroclor 1248, Aroclor 1254, and Aroclor 1260 in SDG L1100647 are reported by the laboratory as “weathered.”

**PCB (L1100649)** - The narrative states that samples NBH10-SF-C-2 and NBH10-SF-H-2 contain peaks with retention time patterns that match Aroclor 1248; however, the peak area ratios do not completely match those typical of Aroclor 1248. Therefore, results for Aroclor 1248 in samples NBH10-SF-C-2 and NBH10-SF-H-2 are reported by the laboratory as "weathered."

Miscellaneous

**All Parameters (L1011838)** – The laboratory reported incorrect sample collection dates for a subset of samples. The laboratory was contacted for follow up, and sample collection dates were corrected to match the chain of custody documentation.

**All Parameters (L1011840)** – The laboratory reported incorrect sample collection dates for bluefish samples reported in SDG L1011840. Sample collection personnel were contacted and provided the sample collection dates; the collection date for the bluefish sample was revised by MACTEC in the database and on the laboratory hardcopy report.

**PCB (L1011838)** – Discrepancies between results reported on the hardcopy Form 1s and results contained in the laboratory EDD were noted. In all cases, positive detections between the MDL and RL were reported as non-detected (U) on the Form 1 and as J-qualified detections on the EDD. The laboratory was contacted for follow up, and after input from the laboratory the final results on the Form 1s were revised to match those reported on the EDD.

## **Appendix C**

### **Seafood Monitoring - Field Sampling Activities for the New Bedford Harbor Superfund Site 2010 Annual Report**

Seafood Monitoring - Field Sampling Activities for the New Bedford Harbor Superfund Site  
2010 Annual Report

Vin Malkoski, Senior Marine Fisheries Biologist  
Massachusetts Division of Marine Fisheries  
March 2011

The Massachusetts Division of Marine Fisheries (*MarineFisheries*) under an agreement with the Massachusetts Department of Environmental Protection (MassDEP) collects legal-size fish and shellfish from the three New Bedford Harbor fish closure areas. At the end of the collection period, these frozen samples were delivered to the Alpha Woods Hole Laboratories in Mansfield, Massachusetts for analysis. MassDEP provides the results of the analyses to EPA to monitor and support the site remediation project. This report describes *MarineFisheries*' field activities in 2010 in accordance with the Seafood Monitoring and Field Sampling Work Plan and makes recommendations for the upcoming 2011 field season based on results obtained during the previous field season.

### **Sample Sites**

The three Fish Closure Areas are identified in Attachment 1 from the EPA Record of Decision for the Upper and Lower Operable Unit, New Bedford Harbor Superfund Site, New Bedford, Massachusetts, dated September 25, 1998. These three Fish Closure Areas were designated by the Mass. Dept. of Public Health in 1979. Area 1 includes the waters of the Acushnet River and the New Bedford/Fairhaven Inner Harbor north of the Hurricane Barrier. Area 2 comprises the waters of the Outer Harbor and Clarks Cove south of the Hurricane Barrier and north of a line drawn from Wilbur Point in Fairhaven to Ricketsons Point in Dartmouth. Area 3 is that portion of Buzzards Bay south of the line drawn from Wilbur Point in Fairhaven to Ricketsons Point in Dartmouth and north of a line drawn from Rocky Point on West Island in Fairhaven to the Negro Ledge C3 buoy then to Misham Point in Dartmouth.

There are five original sample stations in each of the three fish closure areas in the waters of the City of New Bedford and the Towns of Dartmouth and Fairhaven. Station locations within each area vary for different species as what may be suitable habitat for one species may not be suitable for another (Attachment 1 – Figure 1 to 9). Area 1 was not sampled during the 2010 collection season, except for alewife. Samples of whelk were obtained from only 4 of the 10 stations despite repeated sampling events (fish pots, conch pots, and diving) well into November. In an attempt to provide samples, both channel and knobbed whelk were included in the 2010 collections.

### **2010 Field Collections**

Complete information including the harvest dates, collection identification information, species, and station identification information, location by latitude and longitude, and collection method is appended to this report as Attachment 2 – Collection Sheets 1 to 7. Data Form 1 contains length and weight information for the fish species collected.

**Alewife (*Alosa pseudoharengus*)**

Five alewives were collected at the New Bedford Reservoir at Station C-1 in March using a net.

**Black Sea Bass (*Centropristes striata*)**

Black Sea Bass were collected from ten stations in Areas 2 and 3 during May, June, and July using fish pots.

**Bluefish (*Pomatomus saltatrix*)**

Bluefish were collected from each station during June and July using rod and reel.

**Channeled whelk (*Busycon canaliculatum*) and knobbed whelk (*Busycon carica*)**

Ten stations were established in 2009 for the collection of channeled whelk. In 2010, we had great difficulty finding whelk at all stations and were only able to collect them from four stations. Sampling was conducted from April through November using fish pots, conch pots, and divers.

**Quahog (*Mercenaria mercenaria*)**

Marine Fisheries collected pre-spawn and post-spawn quahogs from ten stations in two of the three Fish Closure Areas using rake and diver. Stations B, C, D, F, G, and H in Area 2 and Stations B, D, I, and J in Area 3 were sampled. Station J was added in 2009 to Area 3 and sampled. Pre-spawn quahogs were collected in May. Post-spawn quahogs were collected in August and October. At least 12 quahogs were harvested per station in each collection in order to provide sufficient sample sizes for the Work Plan.

**Scup (*Stenotomus chrysops*)**

Five legal size scup were collected in June from each of the ten stations in Areas 2 and 3.

**Planning for 2011 Field Collections**

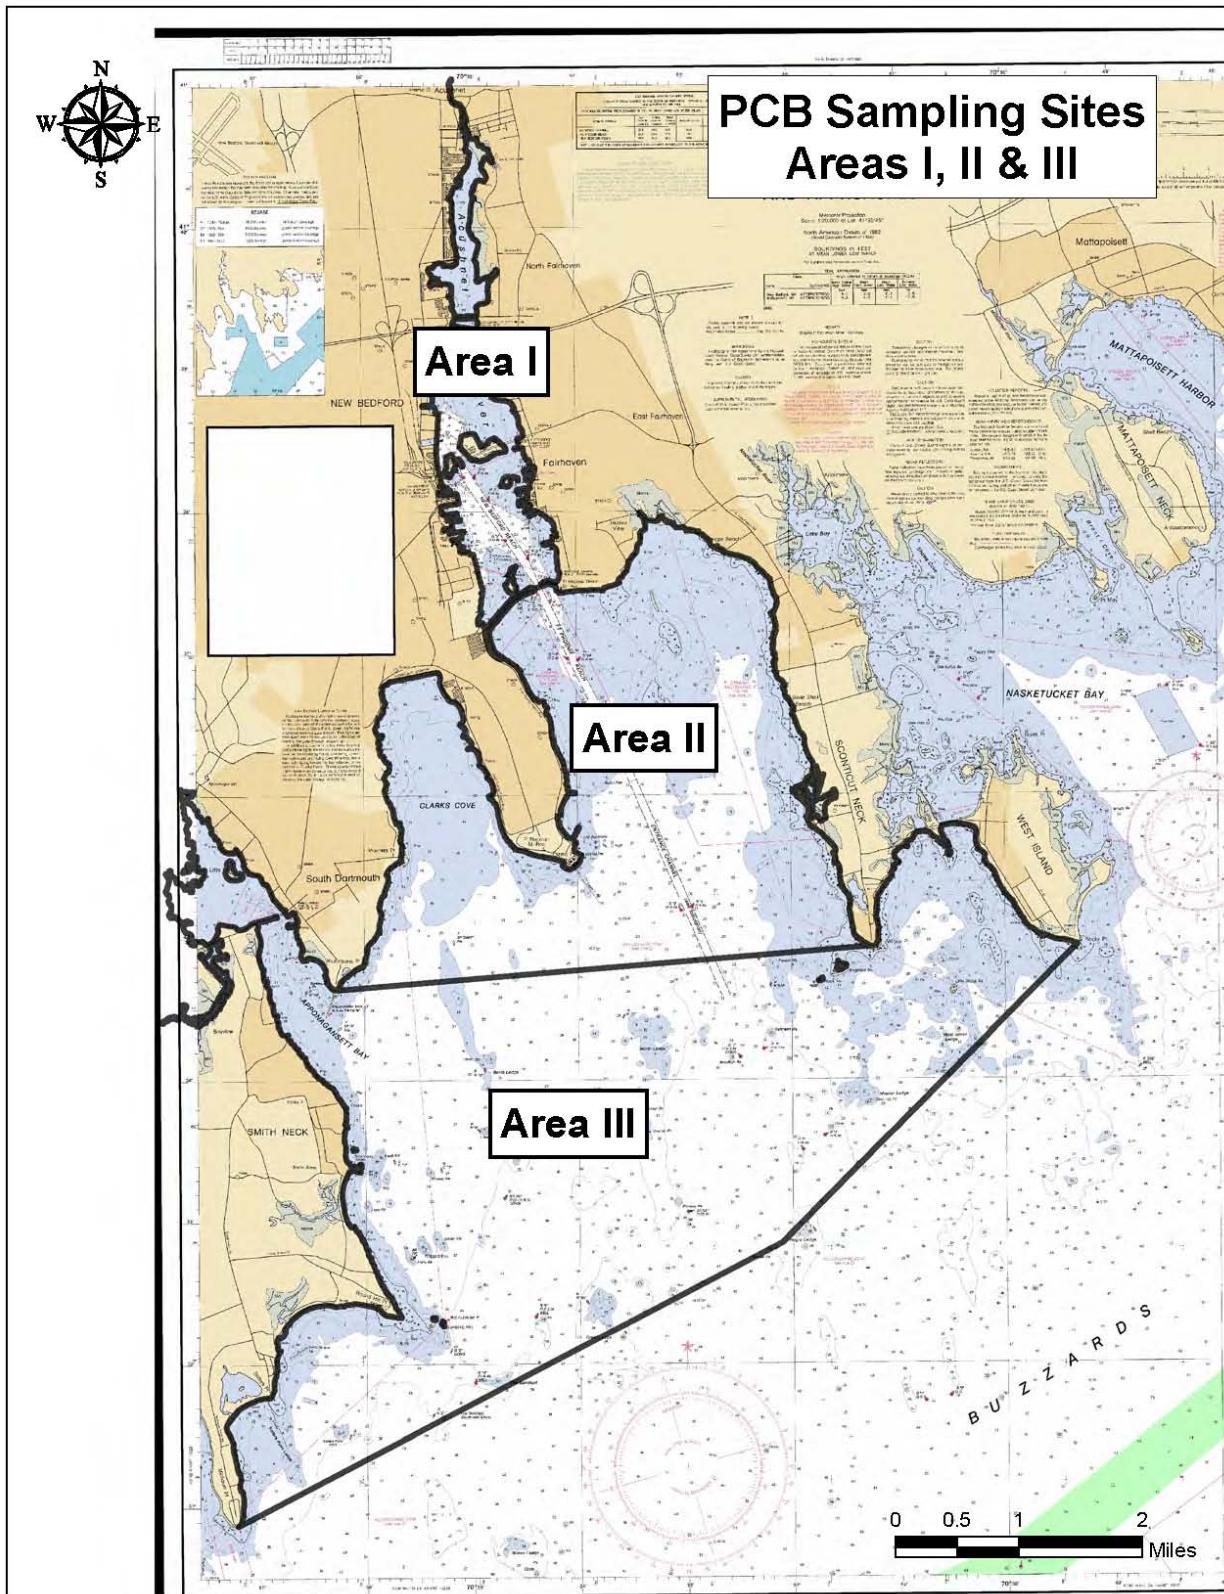

Alewife, black sea bass, bluefish, channeled whelk, quahog, and scup sampling will continue as described above. Two additional quahogs samples will be obtained (Stations E1 and E2), as well as sediment and water samples at selected stations.

Due to the continued status of the southern New England winter flounder stock as “overfished” as determined by the Atlantic States Marine Fisheries Commission, black sea bass will again be harvested in their place.

Boston, MA 02108

**RE:** Striped Bass Seafood Monitoring – Field Sampling Activities for the New Bedford Harbor Superfund Site, 2010 Annual Report

MACTEC Engineering & Consulting, Inc. (MACTEC) collected legal size striped bass from New Bedford Harbor fish closure areas for the Massachusetts Department of Environmental Protection (MassDEP). At the end of the collection period, these frozen samples were delivered to the Alpha Woods Hole Laboratories in Mansfield, Massachusetts for analysis. This letter report describes the striped bass sample collection field activities in 2010 undertaken in accordance with the Field Sampling Work Plan For Striped Bass Sample Collection prepared by MACTEC for MassDEP (June 10, 2010).

### Sample Sites

The three Fish Closure Areas are identified in Figure 1. These three Fish Closure Areas were designated by the Massachusetts Department of Public Health in 1979. Area I includes the waters of the Acushnet River and the New Bedford/Fairhaven Inner Harbor north of the Hurricane Barrier. Area II comprises the waters of the Outer Harbor and Clarks Cove south of the Hurricane Barrier and north of a line drawn from Wilbur Point in Fairhaven to Ricketsons Point in Dartmouth. Area III is that portion of Buzzards Bay south of the line drawn from Wilbur Point in Fairhaven to Ricketsons Point in Dartmouth and north of a line drawn from Rocky Point on West Island in Fairhaven to the Negro Ledge C3 buoy then to Misham Point in Dartmouth.

### 2010 Striped Bass Field Collection

Striped bass fishing was done on June 15, 2010 and July 3<sup>rd</sup> and 4<sup>th</sup>, 2010 using rod and reel techniques. Attempts were made to collect legal size striped bass (28 inches or greater) in each area. No fish were caught on June 15. On July 3<sup>rd</sup> and 4<sup>th</sup>, four striped bass were caught in Area II and four were caught in Area III. No striped bass were caught in Area I. Legal sized fish were only obtained from one station just north of the southern boundary of Area III on July 4, 2010. Three of the four fish caught in Area III met the size limit goal for the project. The sampling location is marked on Figure 1. Legal size fish were collected for lab analysis. Sub-legal size fish were released. Information regarding the harvest dates, sample identification information,

Mr. Paul Craffey

June 21, 2011

species, specimen length and weight, location by latitude and longitude, and collection method is in this letter report as Attachment 1 – Field Collection Forms, Photos, and Chain of Custody.

Thank you for the opportunity to provide the MassDEP with sampling support for the Seafood Monitoring program being conducted at the New Bedford Harbor Superfund Site.
