- Appendix A    Laboratory Data
- Appendix B    Data Validation Summary, MassDEP, NBH Seafood Contaminant Survey Monitoring 2011 Sampling
- Appendix C    Seafood Monitoring - Field Sampling Activities for the NBH Superfund Site 2011 Annual Report
- Appendix D    Seafood Monitoring – Striped Bass Field Sampling Activities for the NBH Superfund Site 2011 Annual Report

## **1. Introduction**

This report documents the levels of PCBs (polychlorinated biphenyls) measured in edible seafood species caught in New Bedford Harbor and surrounding Buzzards Bay in southeastern Massachusetts in 2011. This seafood monitoring program is part of the ongoing PCB cleanup program for the New Bedford Harbor (NBH) Superfund Site, and was a collaborative effort involving the MA Department of Marine Fisheries (DMF), the MA Department of Environmental Protection, (MassDEP), and the U.S. Environmental Protection Agency-New England Region (EPA).

Due to the identification of high PCB levels in area seafood, the MA Department of Public Health in 1979 promulgated regulations restricting seafood consumption in three closure areas in and around NBH as shown on Figure 1 (MADPH, 1979). NBH was subsequently listed as a Superfund site in 1983. Per the 1998 Record of Decision (ROD) (EPA, 1998) for the site, approximately 900,000 cubic yards (cy) of PCB-contaminated sediments and soils are to be removed. Based on annual funding rates received to date, the cleanup may take twenty years or more from now to complete. Consistent with the 1998 ROD, this seafood monitoring program will aid in the evaluation of the overall effectiveness of the harbor cleanup, as well as assist in the implementation of institutional controls and seafood restrictions.

## **2. Seafood Monitoring Program Design**

Based on previous investigations and risk assessments performed for the NBH Site, a variety of species were selected for this monitoring program that are considered locally caught seafood; are generally available for field collection; and which bracket potential worse case tissue levels (MassDEP, 2011). In previous sampling rounds, these species include lobster (*Homarus americanus*), blue crabs (*Carcinus maenas*), quahog (i.e., hard shelled clam, *Mercenaria mercenaria*), alewife (*Alosa pseudoharengus*), American eel (*Anguilla rostrata*), black sea bass (*Centropristes striatus*), winter flounder (*Pseudopleuronectes americanus*), and scup (*Stenotomus chrysops*). The goal of this seafood monitoring program is to acquire annual collections of these species in sufficient numbers from all three closure areas to enable statistical comparisons between them, but with the understanding that some species may not necessarily be caught in sufficient numbers every year.

To meet this goal, the monitoring design calls for five composite samples for each species from each of the three closure areas. Based on previous site sampling experience, modifications have been made to the original sampling approach. Because there has been no significant change since 2002 in the PCB concentration levels to below the regulated restrictions (MADPH, 1979), the species collected for the most part were ones that do not currently have restrictions that may pose a risk, if consumed. Thus, lobster, blue crab, and eel were not sampled in 2011 because their PCB concentrations were significantly above the seafood restrictions. However, additional sampling did include striped bass, two post-spawn quahog events, and sediment and water samples at the quahog locations. The rest of the species collected were the same as the previous year and included alewife, black sea bass,

bluefish, conch (channeled and knobbed whelk), pre-spawn quahog, and scup. Each composite sample consists of five legally harvestable organisms for black sea bass, scup, and conch. For bluefish, the composite sample consists of three legally harvestable organisms. For alewife and striped bass, the composite sample consists of one harvestable organism. For quahog, the composite sample consists of one dozen legally harvestable organisms. The number of composites was determined according to Sokal and Rohlf (1995) using the coefficient of variation (c.v.) from the DMF's 1995 lobster sampling program in Area III (mean = 1.3 ppm, standard deviation = 0.28, c.v. = 22%). The significance level used was 5% and the probability that the significance will be found if it exists was set at 90%. Based on the known levels of PCBs in NBH seafood, there is a high likelihood of detecting PCB concentrations that are 50% different between each closure area.

In addition to comparing the results of this monitoring to past and future seafood monitoring results, the results of this seafood monitoring program will be compared to the current U.S. Food and Drug Administration's (FDA's) criteria for PCBs in commercial seafood of 2 parts per million (ppm). It was exceedances of the FDA criteria in NBH seafood which prompted promulgation of the state's seafood closure areas in 1979 (the FDA criteria at that time was 5 ppm). In addition to comparisons to the current FDA level, and as explained in the 1998 ROD, EPA will compare the results of the seafood monitoring program to a site-specific threshold of 0.02 ppm PCBs. This 0.02 ppm PCB level was developed to ensure the protection of local residents and sport fishermen whose seafood consumption might include seafood caught mostly if not entirely from NBH.

### **3. 2011 Field Collection**

The DMF field sampling program included the collection of alewife, bluefish, black sea bass, conch (channeled and knobbed whelk), quahog, scup, sediment and water. The Sampling Report for all samples collected in 2011 is in Appendix C.

Alewife was collected using a net in April (Figure 2). Black sea bass was harvested by fish pots during May, June, and October (Figure 3). Bluefish was collected using rod and reel in June (Figure 4). Conch was collected using fish and conch in June, July, and October (Figure 5).

The collection of quahog was done pre-spawn in May and the two post-spawn sampling events in August and October (Figures 6 to 8). Quahogs were collected using a rake and diver. The pre-spawn quahogs were collected from the three seafood closure Areas. The post-spawn quahogs were collected from Areas 2 and 3.

Scup was collected using fish pots in May and June (Figure 9). Striped bass was collected using hook and line in July (Figure 10).

Despite considerable effort to collect species according to the monitoring program design, all species were not obtained in all three closure areas as originally planned. No flounder were collected because the stock is considered "overfished" as determined by the Atlantic States Marine Fisheries Commission. Black sea bass was substituted for flounder.

Complete collection information including the dates fished, identification information, species, station identification, latitude and longitude, and collection method are included on the Field Collection Forms in Appendices C and D. All samples were delivered frozen to Alpha Woods Hole Labs (Alpha) in Mansfield, MA for analysis.

#### **4. Analytical Chemistry**

The seafood samples were analyzed for four PCB Aroclors and 136 PCB congeners by GC/MS-SIM (gas chromatography/mass spectrometry-selective ion monitoring) based on EPA Methods 680 and 8270C. Both the Aroclor and the congener approach were used to allow comparisons with previous site data of both types. The four Aroclors measured were Aroclors 1242, 1248, 1254 and 1260. In the previous years of sampling, a fifth Aroclor 1232 was included. Aroclor 1232 was dropped in 2009, because in all the previous sampling rounds, it was never detected. The 136 congeners measured included the eighteen NOAA (National Oceanic and Atmospheric Administration) list congeners and the twelve WHO '98 (1998 World Health Organization) list of dioxin-like congeners. Two congeners, BZ #105 and #118, appear on both lists. The NOAA congener list was used by the MA DMF in its analysis of Area III lobsters from 1988 - 1998, while Aroclors had been used previous to this. The NOAA list typically represents approximately 45% of the total PCB in marine tissue (NOAA, 1993).

The congeners quantitated in this effort are listed in the New Bedford Harbor Superfund Site Quality Assurance Project Plan (MassDEP, 2011a). The WHO '98 congeners were included to enable the evaluation of risks to human health due to the presence of any dioxin-like PCB congeners, if deemed necessary.

Tissue from the collected specimens was filleted, sub-sampled and/or composited as necessary for sample homogenization, extraction and analysis. The first step in the analytical process for the quahog samples was the compositing of twelve individual samples from each location; these were combined to form one composite sample per location. For each group, approximately five grams of wet sample tissue was homogenized using a tissumizer. Samples were then extracted using EPA method 3570 Microscale Solvent Extraction (MSE) techniques (spin extraction with acetone/methylene chloride in a sealed vessel).

The extract was then cleaned up to remove the lipid portion and separate the PCB Analytes from the lipid. Following sample cleanup, extracts were dried and concentrated using either the Kuderna-Danish (K-D) or TurboVap method, brought up to final volume and analyzed. Extract cleanup was performed using Gel Permeation Chromatography (GPC) and Sulfuric Acid Cleanup. Silica Gel Cleanup was also employed as appropriate, based on the sample extracts.

Sample analysis using GC/MS-SIM allowed identification and quantitation of both congeners and Aroclors using selected PCB congeners from BZ1 to BZ209. The identification of the specific congeners was accomplished by comparing their mass spectra with the electron impact spectra of the calibration standards. Congener concentrations were determined using mean relative response factors from a multi-level calibration curve.

Response factors for congeners were determined relative to internal standard technique. Aroclor identification was performed using pattern recognition from the GC/MS-SIM chromatogram and comparing responses of three to five discrete peaks unique to each Aroclor. Aroclor concentrations were determined by calculating the concentration of each corresponding peak in the sample chromatogram and the three to five resulting concentrations are averaged to provide a final result for the sample. A multi-point curve was used for the individual congeners to demonstrate the linear range of the instrument. Continuing calibrations assured linearity remained for the duration of the analysis. A single point calibration was used for the Aroclors utilizing the congener calibration. Laboratory SOPs are available in the Quality Assurance Project Plan Revision 7 (MassDEP, 2011a) should further details on chromatographic conditions, quality control criteria, and other elements of the analysis be needed. While lipid content was reported, the wet weight PCB concentrations reported herein are not lipid normalized.

The data validation summary for the laboratory analysis is presented in Appendix B.

## 5. Results and Discussion

As with previous studies of sediments, water column, seafood, and air at the NBH Site, the current data set demonstrates a generally decreasing trend (north to south) of PCB levels in locally caught seafood. In other words, tissue PCB levels decrease proportionally with the distance from the primary source of PCBs to the upper harbor (the Aerovox facility). Figures 11 through 19 graphically summarize the current data, and Tables 1 through 12 tabulate the totals and averages of the congener and Aroclor sample results.

PCBs are a group of similar organic molecules featuring a “figure-eight” structure of two bonded benzene rings with chlorine atoms attached at up to ten different attachment sites. Theoretically, up to 209 different PCB congeners (or molecular variations) are possible, yet only about 120 of these are found in the natural environment. Furthermore, NOAA has demonstrated that 18 specific congeners are the most pervasive and generally make up almost half of the PCB mass in marine tissues. In addition, WHO considers 12 specific dioxin-like congeners presents the greatest risk to human health. As noted above in section 4, two congeners, BZ #105 and BZ #118, are included in both the NOAA and the WHO congener sets.

Throughout their industrial use in the U.S., PCBs were sold under the Aroclor trade name. Aroclors are a mixture of congeners, and different Aroclor types consisting of different congeners and chlorine levels were manufactured (e.g., Aroclor 1242 had 42% chlorine, and Aroclor 1260 had 60% chlorine). For this monitoring effort, both Aroclors and congeners (136 including the 28 congeners of the combined NOAA and WHO subsets) were measured to assist in the comparison with previous site data, as well as to further understand the similarities and differences of these two analytical approaches.

In the current sampling round, the Aroclors concentrations are higher than the congeners concentration for all the Area averages. However, generally there was not a large difference between the congener and Aroclor results.

For the quahog, there was an increase in PCB congener concentration after spawning using only the detected values as shown in Table 9. There was an increase in the lipid concentration for the quahog after spawning. It is expected that the PCB and lipid concentrations would drop after spawning.

Water and sediment were collected at the same locations as the per-spawn quahog locations as shown on Tables 10 and 11. For the water and generally for the sediment samples, the concentration of PCB decreased as the distance from the main PCB source (Aerovox plant) was increased. A comparison between the water, sediment, and quahog is presented in Table 12. There seem to be a good correlation between the water, sediment, and quahog.

Overall, the current data set indicate continued levels of PCBs in NBH area seafood above the 1998 ROD's site-specific goal of 0.02 ppm. Only one striped bass (fillet) was collected (Area II) had an Aroclor basis of 3.2, and congener basis of 2.0 ppm) and one Scup sample in Area II (Aroclor basis of 2.6 ppm and congener basis of 1.2 ppm) were found to be elevated above the FDA level of 2 ppm. The highest PCB level reported fillet for this data set was the 3.2 ppm Aroclor and 2.0 ppm congener for striped bass fillet (see Table 3). Also, the liver and stomach contents of the striped bass were analyzed. The liver concentration was 23 ppm (congener) and 38 ppm (Aroclor). The stomach contents concentration was 0.95 ppm (congener) and 1.4 ppm (Aroclor).

It should be noted that these PCB levels do not apply to seafood caught by the harbor's commercial fishing fleet, as this seafood is caught significantly further offshore than the three PCB closure areas at the New Bedford Harbor Superfund Site. However, these results do indicate the need to continue the outreach program to inform and educate the local communities and recreational sport fishermen about the fishing bans.

The seafood sampling program has been on-going since 2002, the previous year's reports can be found at the EPA's web site at [www.epa.gov/ne/nbh](http://www.epa.gov/ne/nbh) under "Technical Documents".

Notes and Footnotes for Tables:

<sup>1</sup> = summation of 136 PCB congener results (1/2 Sample Quantitation Limit [SQL] used for non-detected results)

<sup>2</sup> = summation of detected 136 PCB congeners

<sup>3</sup> = summation of 18 NOAA PCB congener results (1/2 SQL used for non-detected results)

<sup>4</sup> = summation of 12 WHO PCB congener results (1/2 SQL used for non-detected results)

<sup>5</sup> = summation of 18 NOAA & 12 WHO PCB congener results (1/2 SQL used for non-detected results); duplicative congeners (BZ# 105, #118, #167/128) subtracted from total for one data set

<sup>6</sup> = summation of 4 Aroclor results (1/2 SQL used for non-detected results); if all Aroclor results are not detected, then total value represents SQL for each individual Aroclor

U = not detected; value represents SQL

J1 = concentration of detected congeners contributes < 50% of total congener result

J2 = concentration of detected congeners contributes 50% to 90% of total congener result

J3 = concentration of detected congeners contributes 90% to 99% of total congener result

J4 = concentration of detected congeners contributes > 99% of total congener result

Results reported in milligrams per kilogram (mg/kg) wet weight, unless otherwise noted.  
PCB Congeners and Aroclors analyzed by GC/MS-SIM.

<b>Average for 2 Areas</b>		0.21	0.36	0.31	171	148											

Notes: For the PCBs concentrations, the post-spawn was divided by the pre-spawn and multiplied by 100 to obtain a percentage of the pre-spawn. Less than 100% means that the pre-spawn was higher than the post-spawn results. More than 100% means that the post-spawn was higher than the pre-spawn results.

For the Lipid concentrations, the 10 post-spawn samples were averaged; the 10 pre-spawn samples were averaged; and then the Post was divided by the Pre and then multiplied by 100 to obtain a percentage of the pre-spawn.

## **Appendices**

Appendix A Laboratory Data

Appendix B Data Validation Summary, MassDEP, NBH Seafood Contaminant Survey Monitoring 2011 Sampling

Appendix C Seafood Monitoring - Field Sampling Activities for the NBH Superfund Site 2011 Annual Report

Appendix D Seafood Monitoring – Striped Bass Field Sampling Activities for the NBH Superfund Site 2011 Annual Report

## Appendix A

### Laboratory Data

Table 1 Sample Data for Alewife Area I

Table 2A Sample Data for Black Sea Bass Area II

Table 2B Sample Data for Black Sea Bass Area III

Table 3 Sample Data for Striped Bass Area III

Table 4 Sample Data for Bluefish Area II and Area III

Table 5A Sample Data for Conch (Channel Whelk) Area II

Table 5B Sample Data for Conch (Channel Whelk) Area III

Table 6A Sample Data for Pre-Spawn Quahog Area I

Table 6B Sample Data for Pre-Spawn Quahog Area II

Table 6C Sample Data for Pre-Spawn Quahog Area III

Table 7A Sample Data for Post-Spawn 1 Quahog Area II

Table 7B Sample Data for Post-Spawn 1 Quahog Area III

Table 8A Sample Data for Post-Spawn 2 Quahog Area II

Table 8B Sample Data for Post-Spawn 2 Quahog Area III

Table 9A Sample Data for Scup Area II

Table 9B Sample Data for Scup Area III

Table 10A Sample Data for Sediment Area I

Table 10B Sample Data for Sediment Area II

Table 10C Sample Data for Sediment Area III

Table 11A Sample Data for Surface Water Area I

Table 11B Sample Data for Surface Water Area II

Table 11C Sample Data for Surface Water Area III

The following notes and footnotes apply to the tables in Appendix A

<sup>1</sup> = summation of 136 PCB congener results (1/2 Sample Quantitation Limit [SQL] used for non-detected results)

<sup>2</sup> = summation of detected 136 PCB congeners

<sup>3</sup> = summation of 18 NOAA PCB congener results (1/2 SQL used for non-detected results)

<sup>4</sup> = summation of 12 WHO PCB congener results (1/2 SQL used for non-detected results)

<sup>5</sup> = summation of 18 NOAA & 12 WHO PCB congener results (1/2 SQL used for non-detected results); duplicative congeners (BZ# 105, #118, #167/128) subtracted from total for one data set

<sup>6</sup> = summation of 4 Aroclor results (1/2 SQL used for non-detected results); if all Aroclor results are not detected, then total value represents SQL for each individual Aroclor

U = not detected; value represents SQL

J1 = concentration of detected congeners contributes < 50% of total congener result

J2 = concentration of detected congeners contributes 50% to 90% of total congener result

J3 = concentration of detected congeners contributes 90% to 99% of total congener result

J4 = concentration of detected congeners contributes > 99% of total congener result

Results reported in milligrams per kilogram (mg/kg) wet weight, unless otherwise noted.

PCB Congeners and Aroclors analyzed by GC/MS-SIM.

New Bedford Harbor Seafood Contaminant Survey Monitoring  
2011 Sampling**

## INTRODUCTION

Seventy-two fish tissue samples, sixteen sediment samples, and sixteen water samples were collected from New Bedford Harbor, MA, during 2011. Fish tissue samples were preserved by freezing (-20°C) and were received in May through November, 2011, by Alpha Analytical Laboratory located in Mansfield, Massachusetts. Sediment and water samples were received in May, 2011, by Alpha Analytical Laboratory. Tissue samples were analyzed for percent lipids and polychlorinated biphenyls (PCBs) by GC/MS Selected Ion Monitoring (SIM). Water samples were analyzed for PCBs by GC/MS SIM, and sediment samples were analyzed for PCBs by GC/MS SIM, grain size, and total organic carbon (TOC).

Tissue samples were analyzed in seven separate data sets: L1106298 (quahogs – pre-spawn), L1106701 (alewife), L1110781 (bluefish), L1110782 (scup), L1110324 (striped bass), L1110783 (black sea bass), and L1119412 (conch, quahogs – post-spawn). Sediment and water samples were analyzed in two separate data sets: L1106299 and L1107065 (quahogs – pre-spawn). Tier I+ data validation was performed for ninety-five percent of the samples. Tier II data validation was performed for five percent of the samples. Tier II validation was performed for the samples of SDG L1110324. The data packages were validated using Region I EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (USEPA, 1996), Region I Laboratory Data Validation Functional Guidelines for Evaluating Organics Analyses (USEPA, 2004), Alpha Analytical Laboratory Standard Operating Procedure (SOP) O-015 (Alpha, 2011), and the Quality Assurance Project Plan, Seafood Contaminant Survey, New Bedford Harbor Superfund Site, Revision 7.0 (MADEP, 2011).

For Tier I+ data validation, data were evaluated for the following parameters:

- \* Collection and Preservation
- \* Holding Times
- \* Data Completeness
  - Initial Calibration (only if problems noted in case narrative)
  - Continuing Calibration (only if problems noted in case narrative)
- \* Blanks
- \* Surrogate Standards
  - Standard Reference Material (SRM)
  - Laboratory Control Sample/laboratory Control Sample Duplicate (LCS/LCSD)
  - Matrix Spike/Matrix Spike Duplicates (MS/MSD)
  - Laboratory Duplicates
- \* Internal Standards (only if problems noted in case narrative)
  - Target Compound Quantitation (only if problems noted in case narrative)
  - Miscellaneous

\* - all criteria were met for this parameter

For Tier II data validation, all of the parameters listed above for Tier I+ data validation were evaluated, even if no problems were noted in the case narrative.

## DATA VALIDATION SUMMARY

In general, laboratory performance is considered acceptable and all results are usable. The following qualifying statements have been applied to the 2011 data.

### Initial Calibration

**PCB (L1110324)** – Percent relative standard deviations (RSDs) were above the control limit of 20 for BZ 126 (21) and BZ 169 (26). BZ 126 and BZ 169 were not detected in the samples, and quantitation limits were qualified as estimated (UJ) in samples A2-A NBH11-FF-A-2, A2-A NBH11-SC-A-2, and A2-A NBH11-LV-A-2.

### Continuing Calibration

**PCB (L1106299)** – The narrative states that aqueous sample NBH11-SF-J-3 was analyzed outside the twelve hour GC/MS tune window. Based on professional judgment, there was no impact on sample results and results were reported unqualified.

**PCB (L1106298)** – The narrative states that fish tissue sample NBH11-SF-F-2 was analyzed outside the twelve hour GC/MS tune window. Based on professional judgment, there was no impact on sample results and results were reported unqualified.

**PCB (L1106298)** – The narrative states that the continuing calibration percent difference for BZ 169 (35) was outside the control limit of 25. BZ 169 was not detected in the associated samples, and quantitation limits for BZ 169 were qualified as estimated (UJ) in tissue samples NBH11-SF-H-2, NBH11-SF-O-2, and NBH11-SF-I-3.

**PCB (L1107065)** – The narrative states that the continuing calibration percent difference for BZ 169 (35) was outside the control limit of 25. BZ 169 was not detected in the associated samples, and quantitation limits for BZ 169 were qualified as estimated (UJ) in sediment samples NBH11-SF-A-1, NBH11-SF-B-1, and NBH11-SF-D-1.

**PCB (L1110782)** – The narrative states that the continuing calibration percent differences for BZ 189 (30), BZ 126 (31), and BZ 169 (55) were outside the control limit of 25. These congeners were not detected in the associated sample, and quantitation limits for BZ 189, BZ 126, and BZ 169 were qualified as estimated (UJ) in tissue sample NBH11-FF-A-2.

### Standard Reference Material

**PCB (L1110782)** – Percent recovery for congener BZ 28/31 (32) in the SRM was less than the lower control limit of 40. A potential low bias is indicated for this congener, and positive results for BZ 28/31 were qualified as estimated (J) in all samples in SDG L1110782.

**PCB (L1119412)** – Percent recoveries for ten congeners in the SRM associated with a subset of samples were greater than the upper control limit of 140:

Congener	SRM %Rec
BZ 99	147
BZ 149	202
BZ 153	150
BZ 138/163	162
BZ 158	159
BZ 182/187	144
BZ 183	146
BZ 167/128	166
BZ 156	150
BZ 180	196

Positive detections of these congeners in the following associated quahog post-spawn samples collected in October 2011 were qualified as estimated (J) and may represent potential high biases:

NBH11-SF-C-2	NBH11-SF-G-2	NBH11-SF-D-3
NBH11-SF-D-2	NBH11-SF-H-2	NBH11-SF-I-3
NBH11-SF-F-2	NBH11-SF-B-3	NBH11-SF-J-3

## LCS/LCSD

**PCB (L1110781, L1110324, L1110783)** – A low level LFB was not analyzed or reported for this tissue sample data set. The LFB is not a method requirement; therefore, the project requirement for a low level LFB was removed from the QAPP effective with the June 2011 revision. Percent recoveries for the SRM and laboratory control sample were within control limits for all target analytes. Based on professional judgment no data qualifiers were applied.

**PCB (L1110782)** – A low level LFB was not analyzed or reported for this tissue sample data set. The LFB is not a method requirement; therefore, the project requirement for a low level LFB was removed from the QAPP effective with the June 2011 revision. Percent recoveries for the SRM and LCS/LCSD were within control limits for all target analytes except BZ 28/31 (32) and BZ 126 (36, 31). Percent recoveries of BZ 126 (36, 31) in the LCS/LCSD were less than the lower control limit of 40, and percent recovery of BZ 28/31 (32) in the SRM less than the lower control limit of 40, indicating potential low biases for these congeners. Based on professional judgment no data qualifiers were applied as a result of the missing LFB. BZ 126 was not detected in any of the samples, and quantitation limits were qualified as estimated (UJ) based on the low LCS/LCSD. Positive results for BZ 28/31 were reported in all samples and were qualified as estimated (J) based on the low SRM.

**PCB (L1119412)** – A low level LFB was not analyzed or reported for this tissue sample data set. The LFB is not a method requirement; therefore, the project requirement for a low level LFB was removed from the QAPP effective with the June 2011 revision. Percent recoveries for the SRM and LCS/LCSD were within control limits for all target analytes except BZ 99, BZ 149, BZ 153, BZ 138/163, BZ 158, BZ 182/187, BZ 183, BZ 167/128, BZ 156, and BZ 180. Percent recoveries of BZ 99, BZ 149, BZ 153, BZ 138/163, BZ 158, BZ 182/187, BZ 183, BZ 167/128, BZ 156, and BZ 180 in the SRM were greater than the upper control limit of 140, indicating potential high biases for these congeners. Based on professional judgment no data qualifiers were applied as a result of the missing LFB. Positive detections of congeners BZ 99, BZ 149, BZ 153, BZ 138/163, BZ 158, BZ 182/187, BZ 183, BZ 167/128, BZ 156, and BZ 180 were qualified as estimated (J) based on high SRM recoveries and may represent potential high biases in the following associated quahog post-spawn sample s collected in October 2011:

NBH11-SF-C-2	NBH11-SF-G-2	NBH11-SF-D-3
NBH11-SF-D-2	NBH11-SF-H-2	NBH11-SF-I-3
NBH11-SF-F-2	NBH11-SF-B-3	NBH11-SF-J-3

## MS/MSD

**PCB (L1110324)** – Percent recoveries of the following congeners were less than the lower QAPP control limit of 40 in the MS/MSD of sample A2-A NBH11-FF-A-2:

Congener	MS %Rec	MSD %Rec
BZ 52	OK	12
BZ 43/49	OK	29
BZ 101/84	OK	35
BZ 99	OK	35
BZ 153	35	17
BZ 138/163	OK	35

Positive results for these congeners were reported in sample A2-A NBH11-FF-A-2 and were qualified as estimated (J). The results may represent potential low biases.

## Laboratory Duplicates

**PCB (L1119412)** – Relative percent differences (RPDs) or absolute differences between laboratory duplicate results for the following congeners and Aroclors in conch sample NBH11-SF-A-2 were above the control limit:

Congener	RPD	Congener	RPD
BZ 52	35	BZ 149	33
BZ 43/49	35	BZ 118	37

BZ 70	38	BZ 146	37
BZ 66	42	BZ 153	39
BZ 95	35	BZ 138/163	39
BZ 92	35	BZ 105	40
BZ 101/84	38	BZ 180	32
BZ 99	37	Aroclor 1254	39
BZ 110	33		

Results for these congeners and Aroclor 1254 were qualified as estimated (J) in conch sample NBH11-SF-A-2.

#### Target Compound Quantitation

**PCB (L1106299)** - The narrative states that a subset of samples in SDG L1106299 contain peaks with retention time patterns that match Aroclor 1248 and/or Aroclor 1254; however the peak area ratios do not completely match those typical of Aroclor 1248 or Aroclor 1254. Therefore, results for Aroclor 1248 and Aroclor 1254 in a subset of samples in SDG L1106299 are reported by the laboratory as “weathered.”

**PCB (L1106298, L1110324)** - The narrative states that a subset of samples in SDG L1106298 and all samples in SDG L1110324 contain peaks with retention time patterns that match Aroclor 1248, Aroclor 1254, and/or Aroclor 1260; however, the peak area ratios do not completely match those typical of Aroclor 1248, Aroclor 1254, or Aroclor 1260. Therefore, results for Aroclor 1248, Aroclor 1254, and Aroclor 1260 in a subset of samples in SDG L1106298 and all samples in SDG L1110324 are reported by the laboratory as “weathered.”

**PCB (L1106701)** - The narrative states that sample NBH11-FF-A-1 contains peaks with retention time patterns that match Aroclor 1248 and Aroclor 1254; however, the peak area ratios do not completely match those typical of Aroclor 1248 or Aroclor 1254. Therefore, results for Aroclor 1248 and Aroclor 1254 in tissue sample NBH11-FF-A-1 are reported by the laboratory as “weathered.”

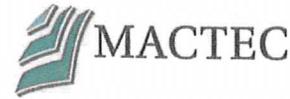

**PCB (L1107065)** - The narrative states that a subset of samples in SDG L1107065 contain peaks with retention time patterns that match Aroclor 1248, Aroclor 1254, and/or Aroclor 1260; however, the peak area ratios do not completely match those typical of Aroclor 1248, Aroclor 1254, or Aroclor 1260. Therefore, results for Aroclor 1248, Aroclor 1254, and Aroclor 1260 in a subset of samples in SDG L1107065 are reported by the laboratory as “weathered.”

**PCB (L1110781)** - The narrative states that a subset of samples in SDG L1110781 contain peaks with retention time patterns that match Aroclor 1248, Aroclor 1254, and/or Aroclor 1260; however, the peak area ratios do not completely match those typical of Aroclor 1248, Aroclor 1254, or Aroclor 1260. Therefore, results for Aroclor 1248, Aroclor 1254, and Aroclor 1260 in a subset of samples in SDG L1110781 are reported by the laboratory as “weathered.”

**PCB (L1110782)** - The narrative states that a subset of samples in SDG L1110782 contain peaks with retention time patterns that match Aroclor 1248, Aroclor 1254, and/or Aroclor 1260; however, the peak area ratios do not completely match those typical of Aroclor 1248, Aroclor 1254, or Aroclor 1260. Therefore, results for Aroclor 1248, Aroclor 1254, and/or Aroclor 1260 in a subset of samples in SDG L1110782 are reported by the laboratory as “weathered.”

**PCB (L1110783)** - The narrative states that all samples in SDG L1110783 contain peaks with retention time patterns that match Aroclor 1248, Aroclor 1254, and/or Aroclor 1260; however, the peak area ratios do not completely match those typical of Aroclor 1248, Aroclor 1254, or Aroclor 1260. Therefore, results for Aroclor 1248, Aroclor 1254, and/or Aroclor 1260 in all samples in SDG L1110783 are reported by the laboratory as “weathered.”

**PCB (L1119412)** - The narrative states that a subset of samples in SDG L1119412 contain peaks with retention time patterns that match Aroclor 1248, Aroclor 1254, and/or Aroclor 1260; however, the peak area ratios do not completely match those typical of Aroclor 1248, Aroclor 1254, or Aroclor 1260. Therefore, results for Aroclor 1248, Aroclor 1254, and/or Aroclor 1260 in a subset of samples in SDG L1119412 are reported by the laboratory as “weathered.”

Miscellaneous

**All Parameters (L1106299)** – Sediment sample NBH11-SF-D-2 was incorrectly logged into the laboratory with a sample collection date of 05/04/11. The correct sample collection date as indicated on the chain of custody documentation was 05/02/11. The collection date was manually corrected during data validation.

### **Seafood Monitoring - Field Sampling Activities for the New Bedford Harbor Superfund Site 2011 Annual Report**

Seafood Monitoring - Field Sampling Activities for the New Bedford Harbor Superfund Site  
2011 Annual Report

Vin Malkoski, Senior Marine Fisheries Biologist  
Massachusetts Division of Marine Fisheries  
April 2012

The Massachusetts Division of Marine Fisheries (*MarineFisheries*) under an agreement with the Massachusetts Department of Environmental Protection (MassDEP) collects legal-size fish and shellfish from the three New Bedford Harbor fish closure areas. At the end of the collection period, these frozen samples were delivered to the Alpha Woods Hole Laboratories in Mansfield, Massachusetts for analysis. MassDEP provides the results of the analyses to EPA to monitor and support the site remediation project. This report describes *MarineFisheries*' field activities in 2011 in accordance with the Seafood Monitoring and Field Sampling Work Plan and makes recommendations for the upcoming 2012 field season based on results obtained during the previous field season.

### **Sample Sites**

The three Fish Closure Areas are identified in Attachment 1 from the EPA Record of Decision for the Upper and Lower Operable Unit, New Bedford Harbor Superfund Site, New Bedford, Massachusetts, dated September 25, 1998. These three Fish Closure Areas were designated by the Mass. Dept. of Public Health in 1979. Area 1 includes the waters of the Acushnet River and the New Bedford/Fairhaven Inner Harbor north of the Hurricane Barrier. Area 2 comprises the waters of the Outer Harbor and Clarks Cove south of the Hurricane Barrier and north of a line drawn from Wilbur Point in Fairhaven to Ricketsons Point in Dartmouth. Area 3 is that portion of Buzzards Bay south of the line drawn from Wilbur Point in Fairhaven to Ricketsons Point in Dartmouth and north of a line drawn from Rocky Point on West Island in Fairhaven to the Negro Ledge C3 buoy then to Misham Point in Dartmouth.

There are five original sample stations in each of the three fish closure areas in the waters of the City of New Bedford and the Towns of Dartmouth and Fairhaven. Station locations within each area vary for different species as what may be suitable habitat for one species may not be suitable for another (Attachment 1 – Figure 1 to 9). Area 1 was sampled during the 2011 collection season for alewife and quahog. In order to provide samples from as many stations as possible, both channel and knobbed whelk were included in the 2011 collections.

### **2011 Field Collections**

Complete information including the harvest dates, collection identification information, species, and station identification information, location by latitude and longitude, and collection method is appended to this report as Attachment 2 – Collection Sheets 1 to 7. Data Form 1 contains length and weight information for the fish species collected.

**Alewife (*Alosa pseudoharengus*)**

Five alewives were collected at the New Bedford Reservoir at Station A-1 in April using a net.

**Black Sea Bass (*Centropristes striata*)**

Black Sea Bass were collected from ten stations in Areas 2 and 3 during May, June, and October using fish pots.

**Bluefish (*Pomatomus saltatrix*)**

Bluefish were collected from four stations in Areas 2 and 3 during June using rod and reel.

**Channeled whelk (*Busycon canaliculatum*) and knobbed whelk (*Busycon carica*)**

Ten stations were established in 2009 for the collection of channeled whelk in Areas 2 and 3. In 2011, we were able to collect them from nine stations. No conch were collected from Station B-3. Sampling was attempted from April through October, with actual collection during June, July, and October using fish and conch pots.

**Quahog (*Mercenaria mercenaria*)**

*Marine Fisheries* collected pre-spawn quahogs from 15 stations in all three of the Fish Closure Areas by rake and diver in May 2011. No samples were obtained from Station A-1 and an extra sample was taken at Station O-2. Sediment and bottom water samples were also collected at each station. Two sets of post-spawn quahogs were collected from ten stations in Areas 2 and 3 in August and October. At least 12 quahogs were harvested per station in each collection in order to provide sufficient sample sizes for the Work Plan.

**Scup (*Stenotomus chrysops*)**

Scup were collected in May and June from each of the ten stations in Areas 2 and 3 using fish pots.

### **Planning for 2012 Field Collections**

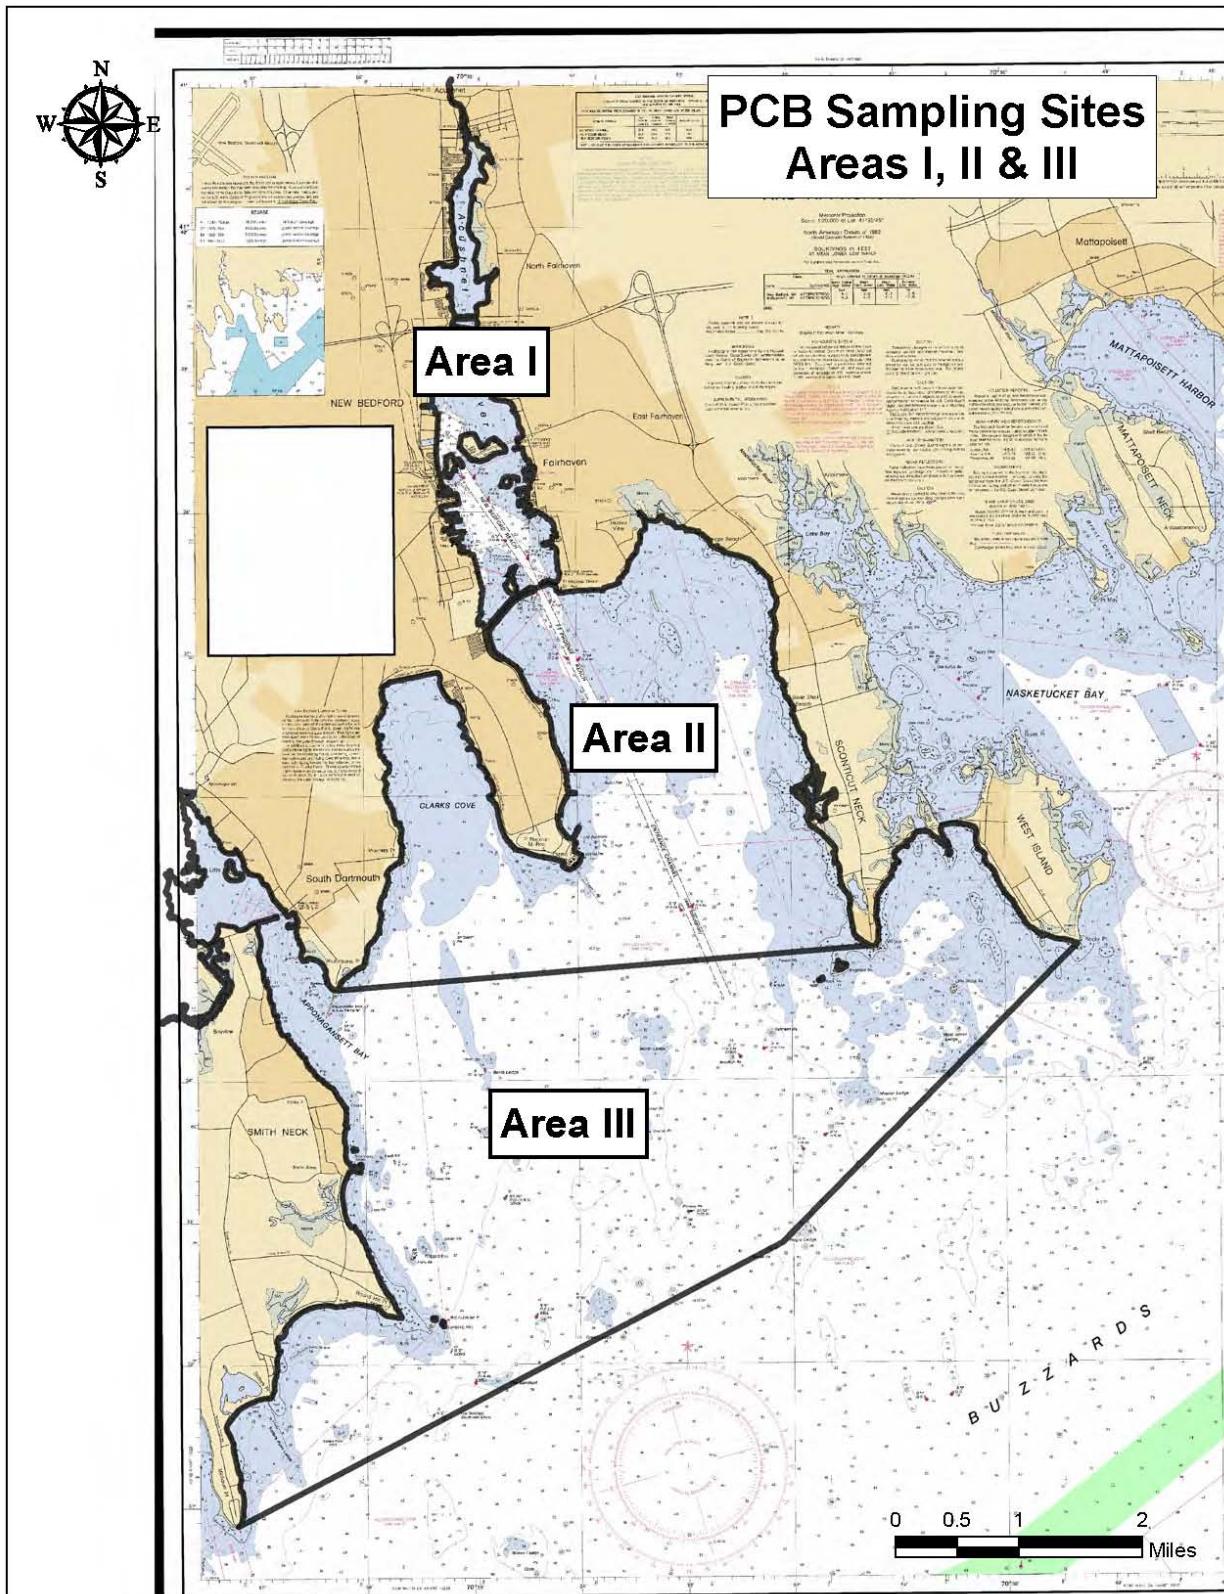

Alewife, black sea bass, bluefish, channeled whelk, quahog, and scup sampling will continue as described above. For 2012, American lobster and blue crabs will be collected from designated stations and only one post-spawn quahog collection will be obtained in August.

Due to the continued status of the southern New England winter flounder stock as “overfished” as determined by the Atlantic States Marine Fisheries Commission, black sea bass will be harvested instead.

**RE:** Striped Bass Seafood Monitoring – Field Sampling Activities for the New Bedford Harbor Superfund Site, 2011 Annual Report

MACTEC Engineering & Consulting, Inc. (MACTEC) performed striped bass sampling from New Bedford Harbor fish closure areas for the Massachusetts Department of Environmental Protection (MassDEP). At the end of the collection period, samples were delivered to the Alpha Woods Hole Laboratories in Mansfield, Massachusetts for analysis. This letter report describes the striped bass sample collection field activities in 2011 undertaken in accordance with the Field Sampling Work Plan For Striped Bass Sample Collection prepared by MACTEC for MassDEP (June 10, 2010).

### **Sample Sites**

The three Fish Closure Areas are identified in Figure 1. These three Fish Closure Areas were designated by the Massachusetts Department of Public Health in 1979. Area I includes the waters of the Acushnet River and the New Bedford/Fairhaven Inner Harbor north of the Hurricane Barrier. Area II comprises the waters of the Outer Harbor and Clarks Cove south of the Hurricane Barrier and north of a line drawn from Wilbur Point in Fairhaven to Ricketsons Point in Dartmouth. Area III is that portion of Buzzards Bay south of the line drawn from Wilbur Point in Fairhaven to Ricketsons Point in Dartmouth and north of a line drawn from Rocky Point on West Island in Fairhaven to the Negro Ledge C3 buoy then to Misham Point in Dartmouth.

### **2011 Striped Bass Field Collection**

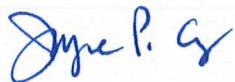

A single day of striped bass fishing was done on July 6, 2011. The sport fishing service, Bounty Hunter, located in Fairhaven, MA was contracted. Fishing was done using rod and reel techniques. Attempts were made to collect legal size striped bass (28 inches or greater) in each area. No fish were caught in Fish Closure Area I or Area III. One legal size striped bass was caught in Area II. The location where the sample was collected is marked on Figure 1. Information regarding the harvest date, sample identification information, species, specimen length and weight, location by latitude and longitude, and collection method is in this letter report as Attachment 1 – Field Collection Forms, Photos, and Chain of Custody.

Fishing success was low with only one striped bass collected in eight hours of fishing. The low catch rate is believed to be due to warm water conditions that occur during midsummer. Optimum times for catching fish in the New Bedford Harbor closure areas would be from the

middle of May through the middle of June. MACTEC recommends completing future sample collection effort during this time period.

Thank you for the opportunity to provide the MassDEP with sampling support for the Seafood Monitoring program being conducted at the New Bedford Harbor Superfund Site.
