Appendices

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-199600-1 performed on behalf of the General Electric Company (GE) for groundwater sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semivolatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/ PCBs/ HERB	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-1S	480-199600-1	Water	7/5/2022		X	X	X	X	X	X	X
MW-2022-7	480-199600-2	Water	7/5/2022		X	X	X	X	X	X	X
TRIP BLANK 070522	480-199600-3	Water	7/5/2022		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
PCDD / PCDFs = Polychlorinated Dibenzodioxins / Polychlorinated Dibenzofurans
PFAS = Per and polyfluoroalkyl substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Notes:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, USEPA Modified method 537, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013 and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017 and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020 and approved by EPA on July 23, 2020).
- USEPA Method 537 Modified, Eurofins Laboratories SOP BR-LC-009, Rev. 8.0 Per- and Poly-fluorinated Substances (PFAS) in Water, Soils, Sediments and Tissue (April 2022)

- Department of Defense (DoD) Quality Systems Manual (QSM) 5.3, USEPA Data Review and Validation Guideline for Perfluoroalkyl Substances (PFASs) Analyzed Using EPA Method 537, (November 2018)
- DoD Final Data Validation Guidelines Module 3: PFAS, (May 2020)

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration (C) Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	2	0	1	0	0	0	3
SVOCs	2	0	0	0	0	0	2
PCBs	2	0	0	0	0	0	2
PEST	2	0	0	0	0	0	2
HERB	2	0	0	0	0	0	2
PCDD/PCDF	2	0	0	0	0	0	2
PFAS	2	0	0	0	0	0	2
Metals	2	0	0	0	0	0	2
MISC	2	0	0	0	0	0	2

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. = standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

Table 5. Data Validation Checklist for Volatile Organic Compounds

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X	X		
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

3 Semivolatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 6. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

Note:
s.u. = standard units

All samples were analyzed within the specified holding time criterion.

3.2 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

Sample location associated with the MS/MSD exhibiting recoveries outside of the control limits are presented in the following table.

Table 7. Sample with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample Location	Compounds	MS Recovery	MSD Recovery
MW-2022-7	a,a-Dimethylphenethylamine	<10%	<10%
	p-Phenylene diamine	<10%	<10%

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 8. Sample with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Control Limit	Sample Result	Qualification
< 10%	Non-detect	R
	Detect	J

3.3 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Sample locations associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 9. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample Locations	Compounds	LCS Recovery
MW-2022-1S MW-2022-7	a,a-Dimethylphenethylamine	<10%
	Benzidine	<10%
	p-Phenylene diamine	<10%

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 10. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
< 10%	Non-detect	R
	Detect	J

3.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.5 Data Validation Checklist

Table 11. Data Validation Checklist for SemiVolatile Organic Compounds

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Laboratory Control Sample (LCS)		X	X		
Matrix Spike (MS)		X	X		
Matrix Spike Duplicate(MSD)		X	X		
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 12. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

Table 13. Data Validation Checklist for Polychlorinated Biphenyls

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required

Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 14. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Water/Soil	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criteria.

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 15. Summary of Blank Contamination Qualification

Sample Location	Compound	Sample Result	Qualification
MW-2022-7	4,4'-DDT	Detected sample results <RL and <BAL	"U" at the RL

Note:

RL Reporting limit

5.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.4 Data Validation Checklist

Table 16. Data Validation Checklist for Herbicides / Pesticides

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 17. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water/Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 18. Summary of Blank Contamination Qualifications

Sample Locations	Compounds	Sample Result	Qualification
MW-2022-1S	1,2,3,4,6,7,8-HpCDD 1,2,3,4,6,7,8-HpCDF 1,2,3,4,7,8-HxCDD 1,2,3,4,7,8-HxCDF 1,2,3,6,7,8-HxCDD 1,2,3,6,7,8-HxCDF 2,3,4,6,7,8-HxCDF 2,3,7,8-TCDD OCDD OCDF Total HpCDD Total HpCDF Total HxCDD Total HxCDF Total PeCDF Total TCDD	Detected sample results <RL and <BAL	““U” at the RL
MW-2022-7	1,2,3,4,6,7,8-HpCDD 1,2,3,4,6,7,8-HpCDF 1,2,3,4,7,8,9-HpCDF 1,2,3,4,7,8-HxCDD 1,2,3,4,7,8-HxCDF 1,2,3,6,7,8-HxCDD 1,2,3,6,7,8-HxCDF	Detected sample results <RL and <BAL	““U” at the RL

	Total PeCDD		
	Total PeCDF		

RL = reporting limit
MB = method blank

6.3 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.5 Data Validation Checklist

Table 19. Data Validation Checklist for Dioxines and Furans

7 Perfluoroalkyl Substances Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 20. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C

The holding time has been changed from the original holding time documented in EPA 537 of 14 days for extraction to 28 days. This was documented in EPA Technical Brief EPA/600/F-17/022h Updated January 2020. Utilizing the new guidance of 28 days all samples were analyzed within the specified holding time criteria.

All samples were analyzed within the specified holding time criterion.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

System performance and Overall Assessment		X		X	

9 General Chemistry Analyses

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 24. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9

All samples were analyzed within the specified holding times.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B) from the data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 25. Summary of Blank Contamination Qualification

Sample Location	Analytes	Sample Result	Qualification
MW-2022-1S	Cyanide, Total	Detected sample results <RL and <BAL	"U" at the RL

9.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.4 Data Validation Checklist for General Chemistry

Table 26. Data Validation Checklist for Cyanide and Sulfide

General Chemistry: SW9012/SM 4500 S2 F	Reported		Performance Acceptable		Not Required

B. Equipment/Field Blanks	X				X
System performance and Overall Assessment		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 27. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.2%	3
SVOCs	97.6%	6
PCBs	100%	0
PEST	100%	0
HERB	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the

FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Appendix B **Annotated Sample Analysis Data Sheets**

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-199627-1 performed on behalf of the General Electric Company (GE) for groundwater sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semivolatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/ PCBs/ HERB	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-3	480-199627-1	Water	7/6/2022		X	X	X	X	X	X	X
MW-2022-RB-1	480-199627-2	Water	7/6/2022		X	X	X	X	X	X	X
TRIP BLANK 070622	480-199627-3	Water	7/6/2022		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
PCDD / PCDFs = Polychlorinated Dibenzodioxins / Polychlorinated Dibenzofurans
PFAS = Per and polyfluoroalkyl substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Notes:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, USEPA Modified method 537, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013 and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017 and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020 and approved by EPA on July 23, 2020).
- USEPA Method 537 Modified, Eurofins Laboratories SOP BR-LC-009, Rev. 8.0 Per- and Poly-fluorinated Substances (PFAS) in Water, Soils, Sediments and Tissue (April 2022)

- Department of Defense (DoD) Quality Systems Manual (QSM) 5.3, USEPA Data Review and Validation Guideline for Perfluoroalkyl Substances (PFASs) Analyzed Using EPA Method 537, (November 2018)
- DoD Final Data Validation Guidelines Module 3: PFAS, (May 2020)

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration (C) Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	1	0	2	0	0	0	3
SVOCs	1	0	1	0	0	0	2
PCBs	1	0	1	0	0	0	2
PEST	1	0	1	0	0	0	2
HERB	1	0	1	0	0	0	2
PCDD/PCDF	1	0	1	0	0	0	2
PFAS	1	0	1	0	0	0	2
Metals	1	0	1	0	0	0	2
MISC	1	0	1	0	0	0	2

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. = standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

Table 5. Data Validation Checklist for Volatile Organic Compounds

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X	X		
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

3 Semivolatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 6. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

Note:
s.u. = standard units

All samples were analyzed within the specified holding time criterion.

3.2 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Sample locations associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 7. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample Locations	Compound	LCS Recovery
MW-2022-3 MW-2022-RB-1	p-Phenylene diamine	<10%

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 8. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
< 10%	Non-detect	R
	Detect	J

3.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.4 Data Validation Checklist

Table 9. Data Validation Checklist for SemiVolatile Organic Compounds

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Laboratory Control Sample (LCS)		X	X		
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 10. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

Table 11. Data Validation Checklist for Polychlorinated Biphenyls

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 12. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Water/Soil	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criteria.

5.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.3 Data Validation Checklist

Table 13. Data Validation Checklist for Herbicides / Pesticides

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 14. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water/Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 15. Summary of Blank Contamination Qualifications

Sample Locations	Compounds	Sample Result	Qualification
MW-2022-3	1,2,3,4,6,7,8-HpCDF 1,2,3,4,7,8,9-HpCDF 1,2,3,4,7,8-HxCDF 1,2,3,7,8,9-HxCDD 2,3,4,6,7,8-HxCDF 2,3,4,7,8-PeCDF OCDD OCDF Total HpCDF Total HxCDD Total HxCDF Total PeCDF	Detected sample results <RL and <BAL	““U” at the RL

RL = reporting limit
MB = method blank

6.3 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX (or JNXB if method blank contamination is present in the rinse blank sample).

6.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.5 Data Validation Checklist

Table 16. Data Validation Checklist for Dioxines and Furans

PCDD/PCDF: SW-846 8290	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X	X		
B. Equipment blanks	X				X
System performance and Overall Assessment		X		X	

PCDD/PCDF: SW-846 8290	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 17. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C

The holding time has been changed from the original holding time documented in EPA 537 of 14 days for extraction to 28 days. This was documented in EPA Technical Brief EPA/600/F-17/022h Updated January 2020. Utilizing the new guidance of 28 days all samples were analyzed within the specified holding time criteria.

All samples were analyzed within the specified holding time criterion.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

Table 18. Data Validation Checklist for Perfluoroalkyl Substances

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

8 Metals Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 19. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.

All samples were analyzed within the specified holding times.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is

compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Zinc was detected in method blank batch 632959; however, the associated sample results were non-detect. Hence, qualification was not required.

8.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.4 Data Validation Checklist

Table 20. Data Validation Checklist for Metals

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required

Holding Times		X		X	
Blanks					
A. Method blanks		X		X	
B. Equipment blanks	X				X
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

9 General Chemistry Analyses

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 21. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9

All samples were analyzed within the specified holding times.

9.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.3 Data Validation Checklist for General Chemistry

Table 22. Data Validation Checklist for Cyanide and Sulfide

General Chemistry: SW9012/SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 23. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.2%	3
SVOCs	99.2%	2
PCBs	100%	0
PEST	100%	0
HERB	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Data Validation Report

PDI Summary Report for Upland Disposal Facility Area

GE-Pittsfield/Housatonic River Site
Pittsfield, Massachusetts

Volatile Organic Compounds, Semivolatile Organic Compounds, Polychlorinated Biphenyls, Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDFs), Perfluoroalkyl Substances (PFAs), Metals, and Miscellaneous Analyses

SDGs # 480-199492-1

Analyses Performed By:
Eurofins
Amherst, New York, USA

Report #47719R
Review Level: Tier I/II
Project: 30131071.0003

Contents

1 Summary 5
1.1 Analytical Data Package Documentation 5
1.2 Data Validation Procedures 6
2 Volatile Organic Compound Analyses 9
2.1 Holding Times 9
2.2 Field Duplicate Analysis 9
2.3 System Performance and Overall Assessment 10
2.4 Data Validation Checklist 10
3 Semivolatile Organic Compound Analyses 10
3.1 Holding Times 10
3.2 Laboratory Control Sample Analysis 11
3.3 Field Duplicate Analysis 11
The calculated RPDs between the parent sample and field duplicate were acceptable. 12
3.4 System Performance and Overall Assessment 12
3.5 Data Validation Checklist 12
4 Polychlorinated Biphenyl Analyses 13
4.1 Holding Times 13
4.2 Field Duplicate Analysis 13
The calculated RPDs between the parent sample and field duplicate were acceptable. 13
4.3 System Performance and Overall Assessment 13
4.4 Data Validation Checklist 14
5 Pesticide/Herbicide Analyses 14
5.1 Holding Times 14
5.2 Blank Contamination 15
5.3 Field Duplicate Analysis 16

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-199492-1 performed on behalf of the General Electric Company (GE) for groundwater sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semivolatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/ PCBs/ HERB	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-4S	480-199492-1	Water	6/29/2022		X	X	X	X	X	X	X
MW-2022-4D	480-199492-2	Water	6/30/2022		X	X	X	X	X	X	X
MW-2022-DUP-1	480-199492-3	Water	6/30/2022	MW-2022-4D	X	X	X	X	X	X	X
TRIPBLANK 062922	480-199492-4	Water	6/29/2022		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
PCDD / PCDFs = Polychlorinated Dibenzodioxins / Polychlorinated Dibenzofurans
PFAS = Per and polyfluoroalkyl substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Notes:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, USEPA Modified method 537, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013 and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017 and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020 and approved by EPA on July 23, 2020).
- USEPA Method 537 Modified, Eurofins Laboratories SOP BR-LC-009, Rev. 8.0 Per- and Poly-fluorinated Substances (PFAS) in Water, Soils, Sediments and Tissue (April 2022)

- Department of Defense (DoD) Quality Systems Manual (QSM) 5.3, USEPA Data Review and Validation Guideline for Perfluoroalkyl Substances (PFASs) Analyzed Using EPA Method 537, (November 2018)
- DoD Final Data Validation Guidelines Module 3: PFAS, (May 2020)

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration (C) Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	3	0	1	0	0	0	4
SVOCs	3	0	0	0	0	0	3
PCBs	3	0	0	0	0	0	3
PEST	3	0	0	0	0	0	3
HERB	3	0	0	0	0	0	3
PCDD/PCDF	3	0	0	0	0	0	3
PFAS	3	0	0	0	0	0	3
Metals	3	0	0	0	0	0	3
MISC	3	0	0	0	0	0	3

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. = standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water. Results for duplicate samples are summarized in the following table.

Table 5. Field Duplicate Sample Results

Sample ID/ Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-4D/ MW-2022-DUP-1_20220630	All compounds	U	U	AC

Notes:
AC Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

2.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.4 Data Validation Checklist

Table 6. Data Validation Checklist for Volatile Organic Compounds

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X	X		
Field Duplicate RPD		X		X	
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

3 Semivolatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 7. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

Note:
s.u. = standard units

All samples were analyzed within the specified holding time criterion.

3.2 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Sample locations associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 8. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample Locations	Compounds	LCS Recovery
MW-2022-4S MW-2022-4D MW-2022-DUP-1	p-Phenylene diamine	<10%

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 9. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
< 10%	Non-detect	R
	Detect	J

3.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water. Results for duplicate samples are summarized in the following table.

Table 10. Field Duplicate Sample Results

Sample ID/ Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-4D/ MW-2022-DUP-1_20220630	Benzo(g,h,i)perylene	5 U	0.37 J	AC

Notes:
AC Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

3.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.5 Data Validation Checklist

Table 11. Data Validation Checklist for SemiVolatile Organic Compounds

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Laboratory Control Sample (LCS)		X	X		
Field Duplicate RPD		X		X	
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 12. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water. Results for duplicate samples are summarized in the following table.

Table 13. Field Duplicate Sample Results

Sample ID/ Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-4D/ MW-2022-DUP-1_20220630	All compounds	U	U	AC

Notes:
AC Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

4.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.4 Data Validation Checklist

Table 14. Data Validation Checklist for Polychlorinated Biphenyls

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Field Duplicate RPD		X		X	
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 15. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Water/Soil	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criteria.

The analyses that exceeded the holding times are presented in the following table.

Sample Locations	Holding Time	Criteria
MW-2022-4S MW-2022-4D	Samples were extracted 10th day from collection	7 days from collection to extraction

Sample Locations	Holding Time	Criteria
MW-2022-DUP-1		

Sample results associated with samples analyzed by analytical method SW-846 8141B were qualified, as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 16. Summary of Blank Contamination Qualification

Sample Location	Compound	Sample Result	Qualification
MW-2022-4S MW-2022-4D MW-2022-DUP-1	Endrin aldehyde	Detected sample results <RL and <BAL	“U” at the RL

Note:

RL Reporting limit

5.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water. Results for duplicate samples are summarized in the following table.

Table 17. Field Duplicate Sample Results

Sample ID/ Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-4D/ MW-2022-DUP-1_20220630	All compounds	U	U	AC

Notes:
AC Acceptable
The calculated RPDs between the parent sample and field duplicate were acceptable.

5.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.5 Data Validation Checklist

Table 18. Data Validation Checklist for Herbicides / Pesticides

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X	X		
Field Duplicate RPD		X		X	
Reporting limits (units)		X		X	
Blanks					

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
A. Method blanks		X	X		
B. Equipment blanks	X				X
System performance and Overall Assessment		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 19. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water/Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the

estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the "B" qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 20. Summary of Blank Contamination Qualifications

Sample Locations	Compounds	Sample Result	Qualification
MW-2022-4S	1,2,3,4,6,7,8-HpCDD 1,2,3,4,6,7,8-HpCDF 1,2,3,4,7,8,9-HpCDF 1,2,3,4,7,8-HxCDD 1,2,3,6,7,8-HxCDD 1,2,3,7,8,9-HxCDD 1,2,3,7,8-PeCDD 1,2,3,7,8-PeCDF OCDD OCDF Total HpCDD Total HpCDF Total HxCDD Total PeCDD Total PeCDF	Detected sample results <RL and <BAL	""U" at the RL
MW-2022-4D	1,2,3,4,6,7,8-HpCDD 1,2,3,4,6,7,8-HpCDF 1,2,3,4,7,8,9-HpCDF 1,2,3,6,7,8-HxCDD 1,2,3,6,7,8-HxCDF 1,2,3,7,8,9-HxCDD 1,2,3,7,8,9-HxCDF	Detected sample results <RL and <BAL	""U" at the RL

Sample Locations	Compounds	Sample Result	Qualification
	1,2,3,7,8-PeCDD 1,2,3,7,8-PeCDF 2,3,4,6,7,8-HxCDF OCDD OCDF Total HpCDD Total HpCDF Total HxCDD Total HxCDF Total PeCDD Total PeCDF		
MW-2022-DUP-1	1,2,3,4,6,7,8-HpCDD 1,2,3,4,6,7,8-HpCDF 1,2,3,4,7,8-HxCDD 1,2,3,4,7,8-HxCDF 1,2,3,6,7,8-HxCDF 1,2,3,7,8,9-HxCDD 1,2,3,7,8,9-HxCDF 1,2,3,7,8-PeCDD 1,2,3,7,8-PeCDF OCDD OCDF Total HpCDD Total HpCDF Total HxCDD Total HxCDF Total PeCDD Total PeCDF	Detected sample results <RL and <BAL	““U” at the RL

RL = reporting limit
MB = method blank

6.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water. Results for duplicate samples are summarized in the following table.

Table 21. Field Duplicate Sample Results

Sample ID/ Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-4D/ MW-2022-DUP-1_20220630	2,3,4,7,8-PeCDF	0.56 J	0.24 J	AC

Notes:
AC Acceptable
The calculated RPDs between the parent sample and field duplicate were acceptable.

6.4 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.5 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.6 Data Validation Checklist

Table 22. Data Validation Checklist for Dioxines and Furans

PCDD/PCDF: SW-846 8290	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X	X		
B. Equipment blanks	X				X
Field Duplicate RPD		X		X	
System performance and Overall Assessment		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 23. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C

The holding time has been changed from the original holding time documented in EPA 537 of 14 days for extraction to 28 days. This was documented in EPA Technical Brief EPA/600/F-17/022h Updated January 2020. Utilizing the new guidance of 28 days all samples were analyzed within the specified holding time criteria.

All samples were analyzed within the specified holding time criterion.

7.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water. Results for duplicate samples are summarized in the following table.

Table 24. Field Duplicate Sample Results

Sample ID/ Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-4D/ MW-2022-DUP-1_20220630	Perfluorohexane sulfonic acid (PFHxS)	0.49 J	0.47 J	AC
	Perfluorooctane sulfonic acid (PFOS)	1.4 J	1.2 J	AC

Notes:
AC Acceptable
The calculated RPDs between the parent sample and field duplicate were acceptable.

7.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.4 Data Validation Checklist

Table 25. Data Validation Checklist for Perfluoroalkyl Substances

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Tier I Validation					
Holding times		X		X	
Field Duplicate RPD		X		X	

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

8 Metals Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 26. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.

All samples were analyzed within the specified holding times.

8.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water. Results for duplicate samples are summarized in the following table.

Table 27. Field Duplicate Sample Results

Sample ID/ Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-4D/ MW-2022-DUP-1_20220630	Barium	0.0072	0.0072	AC

Sample ID/ Duplicate ID	Compound	Sample Result	Duplicate Result	RPD

Notes:
AC Acceptable
The calculated RPDs between the parent sample and field duplicate were acceptable.

8.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.4 Data Validation Checklist

Table 28. Data Validation Checklist for Metals

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I/II Validation					
Holding Times		X		X	
Field Duplicate RPD		X		X	
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

9 General Chemistry Analyses

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 29. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9

All samples were analyzed within the specified holding times.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B) from the data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 30. Summary of Blank Contamination Qualification

Sample Location	Analytes	Sample Result	Qualification
MW-2022-4D MW-2022-DUP-1	Cyanide, Total	Detected sample results <RL and <BAL	“U” at the RL

9.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water. Results for duplicate samples are summarized in the following table.

Table 31. Field Duplicate Sample Results

Sample ID/ Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-4D/ MW-2022-DUP-1_20220630	All compounds	U	U	AC

Notes:
AC Acceptable
The calculated RPDs between the parent sample and field duplicate were acceptable.

9.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.5 Data Validation Checklist for General Chemistry

Table 32. Data Validation Checklist for Cyanide and Sulfide

General Chemistry: SW9012/SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Field Duplicate RPD		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
B. Equipment/Field Blanks	X				X
System performance and Overall Assessment		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 33. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.2%	4
SVOCs	99.0%	3
PCBs	100%	0
PEST	100%	0
HERB	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-199543-1 performed on behalf of the General Electric Company (GE) for groundwater sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semivolatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/ PCBs/ HERB	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-6	480-199543-1	Water	7/1/2022		X	X	X	X	X	X	X
MW-2022-9	480-199543-2	Water	7/1/2022		X	X	X	X	X	X	X
TRIP BLANK 070122	480-199543-3	Water	7/1/2022		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
PCDD / PCDFs = Polychlorinated Dibenzodioxins / Polychlorinated Dibenzofurans
PFAS = Per and polyfluoroalkyl substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X

Notes:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, USEPA Modified method 537, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013 and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017 and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020 and approved by EPA on July 23, 2020).
- USEPA Method 537 Modified, Eurofins Laboratories SOP BR-LC-009, Rev. 8.0 Per- and Poly-fluorinated Substances (PFAS) in Water, Soils, Sediments and Tissue (April 2022)

- Department of Defense (DoD) Quality Systems Manual (QSM) 5.3, USEPA Data Review and Validation Guideline for Perfluoroalkyl Substances (PFASs) Analyzed Using EPA Method 537, (November 2018)
- DoD Final Data Validation Guidelines Module 3: PFAS, (May 2020)

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration (C) Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	2	0	1	0	0	0	3
SVOCs	2	0	0	0	0	0	2
PCBs	2	0	0	0	0	0	2
PEST	2	0	0	0	0	0	2
HERB	2	0	0	0	0	0	2
PCDD/PCDF	2	0	0	0	0	0	2
PFAS	2	0	0	0	0	0	2
Metals	2	0	0	0	0	0	2
MISC	2	0	0	0	0	0	2

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. = standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

Table 5. Data Validation Checklist for Volatile Organic Compounds

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X	X		
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

3 Semivolatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 6. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

Note:
s.u. = standard units

All samples were analyzed within the specified holding time criterion.

3.2 Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 7. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample Locations	Compounds	LCS Recovery	LCSD Recovery
MW-2022-6 MW-2022-9	Famphur	<10%	< LL but > 10%
	a,a-Dimethylphenethylamine	AC	<10%
	p-Phenylene diamine	<10%	<10%

Notes:

AC Acceptable

LL Lower control limit

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 8. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	No Action
	Detect	J
< LL but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.4 Data Validation Checklist

Table 9. Data Validation Checklist for SemiVolatile Organic Compounds

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Laboratory Control Sample (LCS)		X	X		
Laboratory Control Sample Duplicate (LCSD)		X	X		
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 10. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

Table 11. Data Validation Checklist for Polychlorinated Biphenyls

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 12. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Water/Soil	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

The analyses that exceeded the holding times are presented in the following table.

Sample Locations	Holding Time	Criteria
MW-2022-6 MW-2022-9	Samples were extracted 11th day from collection	7 days from collection to extraction

Sample results associated with samples analyzed by analytical method SW-846 8141B were qualified, as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were

greater than the BAL resulted in the removal of the laboratory qualifier (B) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 13. Summary of Blank Contamination Qualification

Sample Location	Compound	Sample Result	Qualification
MW-2022-6	4,4'-DDT	Detected sample results <RL and <BAL	"U" at the RL

Note:

RL Reporting limit

5.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.4 Data Validation Checklist

Table 14. Data Validation Checklist for Herbicides / Pesticides

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X	X		
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X	X		
B. Equipment blanks	X				X
System performance and Overall Assessment		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 15. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water/Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 16. Summary of Blank Contamination Qualifications

Sample Locations	Compounds	Sample Result	Qualification
MW-2022-6	1,2,3,4,6,7,8-HpCDF 1,2,3,6,7,8-HxCDF	Detected sample results <RL and <BAL	““U” at the RL

Sample Locations	Compounds	Sample Result	Qualification
	2,3,4,6,7,8-HxCDF OCDD OCDF Total HpCDF Total HxCDD Total HxCDF		
MW-2022-9	1,2,3,4,6,7,8-HpCDD 1,2,3,4,6,7,8-HpCDF 1,2,3,4,7,8-HxCDD 1,2,3,4,7,8-HxCDF 1,2,3,6,7,8-HxCDD 1,2,3,7,8-PeCDF 2,3,4,6,7,8-HxCDF 2,3,7,8-TCDD OCDD OCDF Total HpCDD Total HpCDF Total HxCDD Total HxCDF Total PeCDF Total TCDD	Detected sample results <RL and <BAL	““U” at the RL

RL = reporting limit
MB = method blank

6.3 Compound Identification

PCDD/PCDF compounds are identified by using the compound’s ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the

compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.5 Data Validation Checklist

Table 17. Data Validation Checklist for Dioxines and Furans

PCDD/PCDF: SW-846 8290	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes

Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X	X		
B. Equipment blanks	X				X
System performance and Overall Assessment		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 18. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C

The holding time has been changed from the original holding time documented in EPA 537 of 14 days for extraction to 28 days. This was documented in EPA Technical Brief EPA/600/F-17/022h Updated January 2020. Utilizing the new guidance of 28 days all samples were analyzed within the specified holding time criteria.

All samples were analyzed within the specified holding time criterion.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

Table 19. Data Validation Checklist for Perfluoroalkyl Substances

Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

8 Metals Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 20. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.

All samples were analyzed within the specified holding times.

8.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.3 Data Validation Checklist

Table 21. Data Validation Checklist for Metals

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I/II Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

9 General Chemistry Analyses

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 22. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9

All samples were analyzed within the specified holding times.

9.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.3 Data Validation Checklist for General Chemistry

Table 23. Data Validation Checklist for Cyanide and Sulfide

General Chemistry: SW9012/SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 24. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.2%	3
SVOCs	97.6%	6
PCBs	100%	0
PEST	100%	0
HERB	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Preservation Codes:

A - HCL	M - Hexane
B - NaOH	N - None
C - Zn Acetate	O - AsNaO2
D - Nitric Acid	P - Na2O4S
E - NaHSO4	Q - Na2SO3
F - MeOH	R - Na2S2O3
G - Amchlor	S - H2SO4
H - Ascorbic Acid	T - TSP Dodecahydrate
I - Ice	U - Acetone
J - DI Water	V - MCAA
K - EDTA	W - pH 4-5
L - EDA	Y - Trizma
	Z - other (specify)

Other:

Possible Hazard Identification
☐ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☐ Unknown ☐ Radiological

Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)
☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months

Deliverable Requested: I, II, III, IV, Other (specify)

Special Instructions/QC Requirements:

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-199645-1 performed on behalf of the General Electric Company (GE) for groundwater sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semivolatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/ PCBs/ HERB	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-2	480-199645-1	Water	7/7/2022		X	X	X	X	X	X	X
TRIP BLANK 070722	480-199645-2	Water	7/7/2022		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
PCDD / PCDFs = Polychlorinated Dibenzodioxins / Polychlorinated Dibenzofurans
PFAS = Per and polyfluoroalkyl substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Notes:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, USEPA Modified method 537, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013 and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017 and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020 and approved by EPA on July 23, 2020).
- USEPA Method 537 Modified, Eurofins Laboratories SOP BR-LC-009, Rev. 8.0 Per- and Poly-fluorinated Substances (PFAS) in Water, Soils, Sediments and Tissue (April 2022)

- Department of Defense (DoD) Quality Systems Manual (QSM) 5.3, USEPA Data Review and Validation Guideline for Perfluoroalkyl Substances (PFASs) Analyzed Using EPA Method 537, (November 2018)
- DoD Final Data Validation Guidelines Module 3: PFAS, (May 2020)

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration (C) Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	1	0	1	0	0	0	2
SVOCs	1	0	0	0	0	0	1
PCBs	1	0	0	0	0	0	1
PEST	1	0	0	0	0	0	1
HERB	1	0	0	0	0	0	1
PCDD/PCDF	1	0	0	0	0	0	1
PFAS	1	0	0	0	0	0	1
Metals	1	0	0	0	0	0	1
MISC	1	0	0	0	0	0	1

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. = standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

Table 5. Data Validation Checklist for Volatile Organic Compounds

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X	X		
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

3 Semivolatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 6. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

Note:
s.u. = standard units

All samples were analyzed within the specified holding time criterion.

3.2 Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 7. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample Location	Compound	LCS Recovery	LCSD Recovery
MW-2022-2	p-Phenylene diamine	<10%	<10%

Notes:

AC Acceptable

LL Lower control limit

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 8. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	No Action

Control Limit	Sample Result	Qualification
	Detect	J
< LL but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.4 Data Validation Checklist

Table 8. Data Validation Checklist for SemiVolatile Organic Compounds

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Laboratory Control Sample (LCS)		X	X		
Laboratory Control Sample Duplicate (LCSD)		X	X		
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 9. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

Table 10. Data Validation Checklist for Polychlorinated Biphenyls

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 11. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Water/Soil	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed withing the holding time criterion.

5.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.3 Data Validation Checklist

Table 12. Data Validation Checklist for Herbicides / Pesticides

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X	X		
Reporting limits (units)		X		X	
System performance and Overall Assessment		X		X	

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 13. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water/Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 14. Summary of Blank Contamination Qualifications

Sample Location	Compounds	Sample Result	Qualification
MW-2022-2	1,2,3,4,6,7,8-HpCDD 1,2,3,4,7,8-HxCDF OCDD OCDF Total HpCDD Total HxCDF	Detected sample results <RL and <BAL	““U” at the RL

Notes:
RL = reporting limit
MB = method blank

6.3 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.5 Data Validation Checklist

Table 15. Data Validation Checklist for Dioxines and Furans

PCDD/PCDF: SW-846 8290	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)

Holding times/Preservation		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X	X		
B. Equipment blanks	X				X
System performance and Overall Assessment		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

PCDD/PCDF: SW-846 8290	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					

7 Perfluoroalkyl Substances Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 16. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C

The holding time has been changed from the original holding time documented in EPA 537 of 14 days for extraction to 28 days. This was documented in EPA Technical Brief EPA/600/F-17/022h Updated January 2020. Utilizing the new guidance of 28 days all samples were analyzed within the specified holding time criteria.

All samples were analyzed within the specified holding time criterion.

7.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds 1H,1H,2H,2H-perfluorodecanesulfonicacid (8:2) and 1H,1H,2H,2H-perfluorooctanesulfonic acid (6:2) were detected in method blank batch 181706. However, the associated sample results were non-detect. Hence, qualification was not required.

7.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.4 Data Validation Checklist

Table 17. Data Validation Checklist for Perfluoroalkyl Substances

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes

Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X		X	
B. Equipment / Field blanks	X				X
System performance and Overall Assessment		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

8 Metals Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 18. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.

All samples were analyzed within the specified holding times.

8.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.3 Data Validation Checklist

Table 19. Data Validation Checklist for Metals

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes

System performance and Overall Assessment		X		X	

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 22. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.2%	2
SVOCs	99.2%	1
PCBs	100%	0
PEST	100%	0
HERB	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Data Validation Report

PDI Summary Report for Upland Disposal Facility Area

GE-Pittsfield/Housatonic River Site
Pittsfield, Massachusetts

Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses

SDG # 480-203803-1

Analyses Performed By:
Eurofins Buffalo
Amherst, New York, USA

Eurofins Burlington, South Burlington, Vermont, USA

Eurofins Pittsburgh, Pennsylvania, USA

Eurofins Lancaster Laboratories Environmental Testing, LLC
Pennsylvania, USA

Report #50541R
Review Level: Tier I/II
Project: 30181915 Task 0003

Appendix A **Chain of Custody**

Appendix B **Annotated Sample Analysis Data Sheets**

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-203803-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2002-4S	480-203803-1	Water	11/09/2022		X	X	X	X	X	X	X
DUP-1	480-203803-2	Water	11/09/2022	MW-2002-4S	X	X	X	X	X	X	X
TripBlank-110922	480-203803-3	Water	11/09/2022		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

The case narrative page documented that the sample DUP-1 (480-203803-2) the collection time did not listed on the chain-of-custody (COC). The laboratory logged the collection time as per container label.

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in

the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations

and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	0	0	0	1	1	1	3
SVOCs	0	0	0	1	1	0	2
PCBs	0	0	0	1	1	0	2
PEST	0	0	0	1	1	0	2
HERB	0	0	0	1	1	0	2
OPC	0	0	0	1	1	0	2
PCDD/PCDF	0	0	0	1	1	0	2
PFAS	0	0	0	1	1	0	2
Metals	0	0	0	1	1	0	2
MISC	0	0	0	1	1	0	2

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

2.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

2.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

2.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

2.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 5. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compounds	Criteria
MW-2002-4S DUP-1 TripBlank-110922	CCV %D	Acrolein	-29.0%
		Acetone	+53.2%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 6. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Continuing Calibration Verification (CCV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

2.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

2.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

2.7 Matrix Spike/Matrix Spike Duplicate Analysis

Matrix Spike / Matrix Spike Duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

2.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

2.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

Table 7. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2002-4S / DUP-1	All target compounds	U	U	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

2.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

The laboratory calibrated for the compounds 2-Chloro-1,3-butadiene, 2-Chloroethyl vinyl ether, Acetonitrile, Methacrylonitrile, Methyl methacrylate, and Propionitrile; however, they were not spiked or evaluated in the LCS. Therefore, these results will be qualified as estimated, J/UJ.

2.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.12 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 8. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

3.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

3.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 9. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compounds	Criteria
MW-2002-4S DUP-1	CCV %D	Pyridine	-37.9%
		Bis(2-chloroethyl)ether	-25.9%
		bis (2-chloroisopropyl) ether	-48.4%
		Hexachlorobutadiene	+26.0%
		4-Nitroquinoline-1-oxide	-42.0%
	Continuing Calibration RRF	4-Nitroquinoline-1-oxide	0.0058

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 10. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Continuing Calibration Verification (CCV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J

Continuing Calibration	Criteria	Sample Result	Qualification
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

3.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

3.7 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

3.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 11. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery
MW-2002-4S DUP-1	Prep Batch: 649783	3,3'-Dimethylbenzidine	<LL but >10%
		a,a-Dimethylphenethylamine	<10%
		Kepone	<LL but >10%
		Methapyrilene	<LL but >10%
		p-Phenylene diamine	<10%

Note:
LL Lower control limit

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 12. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

Table 13. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2002-4S / DUP-1	All target compounds	U	U	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

3.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

3.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.12 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 14. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

4.3 System Performance

System performance and column resolution were acceptable.

4.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

4.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. Multiple-point calibrations were performed for Aroclor 1016 and 1260 only. Single-point calibrations were performed for the remaining Aroclors. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

4.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The continuing calibration %D were within the specified control limits.

4.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires that both the surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries reported from the primary column were within control limits.

4.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

4.7 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

4.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less

than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix. Results for duplicate samples are summarized in the following table.

Table 15. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2002-4S / DUP-1	All target compounds	U	U	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

4.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

The dual column analysis exhibited an acceptable %RPD between columns.

4.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 16. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

The analyses that exceeded the holding are presented in the following table.

Table 17. Summary of Holding Time Exceedances

Sample ID	Holding Time	Criteria
MW-2002-4S DUP-1	The sample extracted on 9th day from collection	7 days from collection to extraction

Sample results associated with sample locations analyzed by analytical method SW-846 8141B were qualified, as specified in the table below. All other holding times were met.

Table 18. Summary of Holding Time Qualifications

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 19. Summary of Blank Contamination Qualifications

Sample ID	Method	Compound	Sample Result	Qualification
MW-2002-4S DUP-1	SW-846 8081B	4,4'-DDT (MB)	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RL Reporting limit

5.3 System Performance

System performance and column resolution were acceptable.

5.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

5.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

5.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 20. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compound	Criteria
MW-2002-4S DUP-1	CCV %D	Dimethoate	-22.8%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 5. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	%RSD > 20% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
Continuing Calibration Verification (CCV)	%D >15% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J

5.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. Pesticide - herbicide analysis requires that one of the two pesticide - herbicide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

5.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

5.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries and RPDs within the control limits.

5.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent

sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 22. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compounds	Sample Result	Duplicate Result	RPD
MW-2002-4S / DUP-1	Aldrin	0.050 U	0.0090 J	AC
	gamma-BHC (Lindane)	0.050 U	0.0090 J	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

5.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

Dual column analysis performed on the field samples exhibited RPDs within the control limit.

5.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.11 Data Validation Checklist

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 23. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 24. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2002-4S	1,2,3,4,6,7,8-HpCDD (MB) 1,2,3,4,6,7,8-HpCDF (MB) 1,2,3,4,7,8,9-HpCDF (MB) 1,2,3,4,7,8-HxCDD (MB) 1,2,3,4,7,8-HxCDF (MB)	Detected sample results <RL and <BAL	“U” at the RL

6.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

System performance and column resolution were acceptable.

6.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

6.4.1 Initial Calibration

A maximum relative standard deviation (RSD) of 15% is allowed for all non-labeled compounds (target) and 30% is allowed for all labeled compounds (internal standards and recovery standards).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

6.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibited percent difference (%D) less than the control limit (20%).

The continuing calibration %D were within the specified control limits.

6.5 Labeled Standard Performance

Labeled standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the labeled standards exhibit recoveries within the control limits of 40% to 135%.

All labeled standard responses were within control limits.

6.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

6.7 Ongoing Precision Result / Laboratory Control Sample Analysis

The Ongoing Precision Result/Laboratory Control Sample (OPR/LCS) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the OPR analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

6.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 25. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compounds	Sample Result	Duplicate Result	RPD
MW-2002-4S / DUP-1	2,3,7,8-TCDD	0.44 J	0.15 J	AC
	2,3,7,8-TCDF	1.4 J	0.13 J	AC
	Total TCDD	0.44 J	0.15 J	AC
	Total TCDF	1.4 J	0.13 J	AC

Note:
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

6.9 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.11 Data Validation Checklist

7 Perfluoroalkyl Substances Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 26. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of ten times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

7.3 Mass Calibration

Mass calibration and system performance were acceptable.

7.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

7.4.1 Initial Calibration

The percent relative standard deviation (%RSD) of the response factors (RF) must be less than 20%, or for linear calibration, $R^2 \geq 0.99$. Analytes must be within 70-130% of their true value for each calibration standard.

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

7.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (30%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 27. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compound	Criteria
MW-2002-4S DUP-1	CCV %D	8:2 FTS	+35.4%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 28. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration Verification (CCV)	%D >30% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

7.5 Isotopically Labelled Standards

7.5.1 Extracted Internal Standard

Labeled standards must be added to all field samples and QC samples prior to extraction. Extracted Internal Standard (EIS) recoveries must be within the limits of 50% to150% (25% to 150% for poor responding analytes FBA, PFPeA, fluorotelomer sulfonates).

All EIS recoveries were within the specified control limits.

7.5.2 Injection Internal Standards

Injection internal standards are added to the aliquot of sample dilutions, QC samples, and standards just prior to analysis. Peak areas must be within 50-150% of the area measured in the ICAL midpoint standard. On days when ICAL is not performed, the peak areas must be within 50-150% of the peak area measured in daily initial CCV.

Samples associated with internal standards exhibited responses within the control limits.

7.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD less than 30%. The MS/MSD recovery control limits do not apply when the concentration detected in the parent sample exceeds the MS/MSD spike level by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

7.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 29. Samples with Laboratory Control Sample/Laboratory Control Sample Duplicate Recoveries Outside Control Limits

Sample ID	Compound	LCS Recovery	LCSD Recovery
MW-2002-4S DUP-1	8:2 FTS	AC	>UL

Note:
UL Upper control limit

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 30. Laboratory Control Sample/Laboratory Control Sample Duplicate Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

7.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water. Results for duplicate samples are summarized in the following table.

Table 31. Field Duplicate Sample Result

Sample ID / Duplicate ID	Compounds	Sample Result	Duplicate Result	RPD
MW-2002-4S / DUP-1	Perfluorobutanesulfonic acid (PFBS)	0.69 J	0.68 J	AC
	Perfluorobutanoic acid (PFBA)	5.4	5.6	AC
	Perfluoroheptanoic acid (PFHpA)	0.84 J	0.77 J	AC
	Perfluorohexanoic acid (PFHxA)	1.0 J	0.99 J	AC
	Perfluorooctanoic acid (PFOA)	1.8	1.9	AC
	Perfluoropentanoic acid (PFPeA)	1.2 J	1.2 J	AC

Note:
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

7.9 Compound Identification

PFC analytes are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

All identified compounds met the specified criteria.

7.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8 Metals Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 32. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analyte zinc was detected in the associated method blank batch- 649922; however, the associated sample results were non-detect. No qualification of the sample results was required.

8.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

8.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All initial and continuing calibration verification standard recoveries were within the control limit.

8.3.2 Lower Limit of Quantitation Check Standard

The lower limit of quantitation check (LLQC) check standard serves to verify the linearity of calibration of the analysis at the reporting limit. The LLQC recoveries must be within 70 to 130%, and 50 to 150% for antimony (Sb), lead (Pb), and thallium (Tl). The LLQC standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the LLQC standard analysis are presented below in the LLQC standards evaluation table (if applicable).

All LLQC standard recoveries were within control limits.

8.3.3 ICP Interference Control Sample

The Interference Control Sample (ICS) verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

8.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils and RPD 20% for water matrices and 35% for soil matrices. The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample associated with this SDG.

8.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis was not performed on sample associated with this SDG.

8.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 33. Field Duplicate Sample Results

Sample ID / Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
MW-2002-4S / DUP-1	Barium	0.013	0.012	8.0%

The calculated RPD between the parent sample and field duplicate were acceptable.

8.6 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All LCS recoveries were within control limits, with the exception of the analytes associated with samples, as presented in the following table.

Table 34. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Analyte	LCS Recovery
MW-2002-4S DUP-1	Prep Batch: 622883	Antimony	123%

The criteria used to evaluate LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified.

Table 35. Laboratory Control Sample Recovery Criteria and Qualifications

Control limit	Sample Result	Qualification
LCS (water) percent recovery 50% to 79%	Non-detect	UJ
	Detect	J
LCS (water) percent recovery <50%	Non-detect	R
	Detect	J
LCS (water) percent recovery >120%	Non-detect	No Action
	Detect	J

8.7 Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 15% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample.

The serial dilution was not performed on sample associated with this SDG.

8.8 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9 General Chemistry Analyses

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 36. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Cyanide was detected in the associated method blank batch- 650143 and associated calibration blanks; however, the associated sample results were non-detect. No qualification of the sample results was required.

9.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

9.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration must be greater than 0.995 analytes and all initial and continuing calibration verification standard recoveries must be within the control limits of 85%-115%.

All initial and continuing calibration verification standard recoveries were within the control limit.

9.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

9.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample for the analyte cyanide associated with this SDG.

The MS analysis performed on sample MW-2002-4S for the analyte sulfide exhibiting recoveries outside of the control limits are presented in the following table.

Table 37. Samples with Matrix Spike Recoveries Outside Control Limits

Sample ID	Analyte	MS Recovery
MW-2002-4S	Sulfide	128%

The criteria used to evaluate MS recoveries are presented in the following table. In the case of an MS deviation, the sample results are qualified. The qualifications are applied to the parent sample result for the analyte sulfide associated with this SDG.

Table 38. Matrix Spike Recovery Evaluation Criteria and Qualifications

Control limit	Sample Result	Qualification
MS percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS percent recovery <30%	Non-detect	R
	Detect	J
MS percent recovery >125%	Non-detect	No Action
	Detect	J

9.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis was not performed on a sample within this SDG.

9.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 39. Field Duplicate Sample Results

Sample ID / Duplicate ID	Analytes	Sample Result	Duplicate Result	RPD
MW-2002-4S / DUP-1	Cyanide	U	U	AC
	Sulfide	U	U	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

9.6 Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120% for water and within laboratory established acceptance limits for soils.

The LCS analysis exhibited recoveries within the control limits.

9.7 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.8 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B / SM 4500 S2 F	Reported		Performance Acceptable		Not Required

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip

blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 40. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.1%	3
SVOCs	97.6%	6
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Note. Since laboratory accreditations are subject to change, Eurofins Environment Testing Northeast, LLC places the ownership of method, analyte & accreditation compliance upon out subcontract laboratories. This sample shipment is forwarded under chain-of-custody If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Northeast, LLC laboratory or other instructions will be provided Any changes to accreditation status should be brought to Eurofins Environment Testing Northeast, LLC attention immediately If all requested accreditations are current to date, return the signed Chain of Custody attesting to said complicance to Eurofins Environment Testing Northeast, LLC

Possible Hazard Identification	Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)
Unconfirmed	☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months
Deliverable Requested I, II, III, IV, Other (specify) Primary Deliverable Rank. 2	Special Instructions/QC Requirements

Appendix B

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
H	Sample was prepped or analyzed beyond the specified holding time
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

LCMS

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Client Sample ID: MW-2002-4S
Lab Sample ID: 480-203803-1

Data Validation Report

PDI Summary Report for Upland Disposal Facility Area

GE-Pittsfield/Housatonic River Site
Pittsfield, Massachusetts

Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses

SDG # 480-203847-1

Analyses Performed By:
Eurofins Buffalo
Amherst, New York, USA

Eurofins Burlington, South Burlington, Vermont, USA

Eurofins Pittsburgh, Pennsylvania, USA

Eurofins Lancaster Laboratories Environmental Testing, LLC
Pennsylvania, USA

Report #50610R
Review Level: Tier I
Project: 30181915 Task 0003

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-203847-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2002-5	480-203847-1	Water	11/10/2022		X	X	X	X	X	X	X
TripBlank 111022	480-203847-3	Water	11/10/2022		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	1	0	1	0	0	0	2
SVOCs	1	0	0	0	0	0	1
PCBs	1	0	0	0	0	0	1
PEST	1	0	0	0	0	0	1
HERB	1	0	0	0	0	0	1
OPC	1	0	0	0	0	0	1
PCDD/PCDF	1	0	0	0	0	0	1
PFAS	1	0	0	0	0	0	1
Metals	1	0	0	0	0	0	1
MISC	1	0	0	0	0	0	1

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

Note: The case narrative documented that the sample MW-2002-5 (480-203847-1) was re-prepared and/or re-analyzed beyond the holding time due to laboratory control sample (LCS) exhibited recoveries outside the control limits for some of the compounds and the compound di-n-butyl phthalate detected in the method blank associated

with the preparation batch- 649957. The initial results used for the documentation purposes and the affected results were qualified due to blank contamination and LCS recoveries exceedances. Refer to Sections 3.2 and 3.5 and for details respectively.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 6. Summary of Blank Contamination Qualifications

Sample ID	Compound	Sample Result	Qualification
MW-2002-5	Di-n-butyl phthalate (MB)	Detected sample results >RL and <BAL	"U" at detected sample concentration

Notes:
RL Reporting limit
MB Method blank

3.3 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.3.1 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 7. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compounds	Criteria
MW-2002-5	Continuing Calibration RRF	4-Nitroquinoline-1-oxide	0.0050

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 8. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.4 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 9. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery
MW-2002-5	Prep Batch: 649957	a,a-Dimethylphenethylamine	<10%
		p-Phenylene diamine	<10%

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 10. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.5 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.6 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X	X		
Laboratory Control Sample (LCS) %R		X	X		
Dilution Factor		X		X	
Continuing calibration RRFs		X	X		

Note:
%R Percent recovery

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 11. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

5 Pesticide/Herbicide Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 12. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

The analyses that exceeded the holding are presented in the following table.

Table 13. Summary of Holding Time Exceedances

Sample ID	Holding Time	Criteria
MW-2002-5	The sample extracted on 8th day from collection	7 days from collection to extraction

Sample results associated with sample locations analyzed by analytical method SW-846 8141B were qualified, as specified in the table below. All other holding times were met.

Table 14. Summary of Holding Time Qualifications

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 15. Summary of Blank Contamination Qualifications

Sample ID	Method	Compound	Sample Result	Qualification
MW-2002-5	SW-846 8081B	delta-BHC (MB)	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RL Reporting limit

5.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.4 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X	X		
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X	X		
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 16. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 17. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2002-5	1,2,3,4,6,7,8-HpCDD (MB) 1,2,3,4,7,8,9-HpCDF (MB) 1,2,3,4,7,8-HxCDD (MB)	Detected sample results <RL and <BAL	“U” at the RL

Sample ID	Compounds	Sample Result	Qualification
	1,2,3,6,7,8-HxCDD (MB) 1,2,3,7,8-PeCDF (MB) 2,3,4,6,7,8-HxCDF (MB) 2,3,4,7,8-PeCDF (MB) OCDD (MB) OCDF (MB) Total HpCDD (MB) Total HpCDF (MB) Total HxCDD (MB) Total HxCDF (MB) Total PeCDF (MB)		

Notes:
MB Method blank
RL Reporting limit

6.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.4 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X	X		
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 18. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

8 Metals Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 19. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.3 Data Validation Checklist

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

9 General Chemistry Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 20. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Cyanide was detected in the associated method blank batch- 650143 and associated calibration blanks; however, the associated sample results were non-detect. No qualification of the sample results was required.

9.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.4 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B / SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under the Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 21. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.1%	2
SVOCs	97.6%	3
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data review were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Appendix B

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
*+	LCS and/or LCSD is outside acceptance limits, high biased.
B	Compound was found in the blank and sample.
E	Result exceeded calibration range.
H	Sample was prepped or analyzed beyond the specified holding time
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1+	Surrogate recovery exceeds control limits, high biased.

GC Semi VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
B	Compound was found in the blank and sample.
H	Sample was prepped or analyzed beyond the specified holding time
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

LCMS

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-203904-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-1D	480-203904-1	Water	11/11/2022		X	X	X	X	X	X	X
TripBlank 111122	480-203904-2	Water	11/11/2022		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	

Items Reviewed	Reported		Performance Acceptable		Not Required

9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	1	0	1	0	0	0	2
SVOCs	1	0	0	0	0	0	1

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

The analyses that exceeded the holding are presented in the following table.

Table 65. Summary of Holding Time Exceedances

Sample ID	Holding Time	Criteria
MW-2022-1D RE	11 days from collection to extraction	7 days from collection to extraction

Sample results associated with sample locations analyzed by analytical method SW-846 8270D were qualified, as specified in the table below. All other holding times were met.

Table 6. Summary of Holding Time Qualifications

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

Note: The case narrative documented that the sample MW-2022-1D (480-203904-1) was re-prepared and/or re-analyzed beyond the holding time due to laboratory control sample (LCS), matrix spike/matrix spike duplicate (MS/MSD) exhibited recoveries outside the control limits for some of the compounds and the compound di-n-butyl phthalate detected in the method blank associated with the preparation batch- 650418. The re-prepared and re-analyzed batch- 650942 results used for the documentation purposes and the affected results were qualified due to LCS recoveries exceedances. Some of the useable results were documented from the preparation batch- 650942. Refer to Section 3.3 for details.

3.2 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.2.1 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 8. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compound	Criteria
MW-2022-1D	Continuing Calibration RRF	4-Nitroquinoline-1-oxide	0.0042

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 9. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.3 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 10. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery
MW-2022-1D RE	Prep Batch: 650942	a,a-Dimethylphenethylamine	<10%
		p-Phenylene diamine	<10%

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 11. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J

Control Limit	Sample Result	Qualification
< 10%	Non-detect	R
	Detect	J

3.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.5 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X	X		
Reporting limits (units)		X		X	
Laboratory Control Sample (LCS) %R		X	X		
Dilution Factor		X		X	
Continuing calibration RRFs		X	X		

Note:
%R Percent recovery

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 12. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

5 Pesticide/Herbicide Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 13. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Method	Matrix	Holding Time	Preservation
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

The analyses that exceeded the holding are presented in the following table.

Table 14. Summary of Holding Time Exceedances

Sample ID	Holding Time	Criteria
MW-2022-1D	The sample extracted on 10th day from collection	7 days from collection to extraction

Sample results associated with sample locations analyzed by analytical method SW-846 8141B were qualified, as specified in the table below. All other holding times were met.

Table 15. Summary of Holding Time Qualifications

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 16. Summary of Blank Contamination Qualifications

Sample ID	Method	Compound	Sample Result	Qualification
MW-2022-1D	SW-846 8081B	Endosulfan II (MB)	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RL Reporting limit

5.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.4 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X	X		
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 17. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 18. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-1D	1,2,3,4,6,7,8-HpCDF (MB) 1,2,3,7,8-PeCDF (MB) OCDD (MB) Total HpCDF (MB) Total PeCDF (MB)	Detected sample results <RL and <BAL	“U” at the RL

Notes:
MB Method blank
RL Reporting limit

6.3 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.5 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 19. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

8 Metals Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 20. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.3 Data Validation Checklist

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

9 General Chemistry Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 21. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Cyanide was detected in the associated method blank batch- 650557 and associated calibration blanks; however, the associated sample results were non-detect. No qualification of the sample results was required.

9.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.4 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B / SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under the Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 22. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.1%	2
SVOCs	97.6%	3
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data review were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Appendix B

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
*+	LCS and/or LCSD is outside acceptance limits, high biased.
B	Compound was found in the blank and sample.
E	Result exceeded calibration range.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
H	Sample was prepped or analyzed beyond the specified holding time
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1+	Surrogate recovery exceeds control limits, high biased.

GC Semi VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
B	Compound was found in the blank and sample.
F1	MS and/or MSD recovery exceeds control limits.
H	Sample was prepped or analyzed beyond the specified holding time
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

LCMS

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Appendices

Appendix A **Chain of Custody**

Appendix B **Annotated Sample Analysis Data Sheets**

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-204058-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-4D	480-204058-1	Water	11/15/2022		X	X	X	X	X	X	X
TRIP BLANK 111522	480-204058-2	Water	11/15/2022		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	0	0	0	1	0	1	2
SVOCs	0	0	0	1	0	0	1
PCBs	0	0	0	1	0	0	1
PEST	0	0	0	1	0	0	1
HERB	0	0	0	1	0	0	1
OPC	0	0	0	1	0	0	1
PCDD/PCDF	0	0	0	1	0	0	1
PFAS	0	0	0	1	0	0	1
Metals	0	0	0	1	0	0	1
MISC	0	0	0	1	0	0	1

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

2.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

2.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

2.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

2.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 5. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compounds	Criteria
MW-2022-4D TRIP BLANK 111522	CCV %D	2-Butanone (MEK)	+25.6%
		4-Methyl-2-pentanone (MIBK)	+41.6%
		2-Hexanone	+41.9%
		1,2-Dibromo-3-Chloropropane	+28.1%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 6. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Continuing Calibration Verification (CCV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

2.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

2.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

2.7 Matrix Spike/Matrix Spike Duplicate Analysis

Matrix Spike / Matrix Spike Duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

2.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 7. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery
MW-2022-4D	651003	2-Hexanone	>UL
		4-Methyl-2-pentanone (MIBK)	>UL

Note:
UL Upper control limit

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 8. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action

Control Limit	Sample Result	Qualification
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

2.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate sample was not collected within this SDG.

2.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

The laboratory calibrated for the compounds 2-Chloro-1,3-butadiene, 2-Chloroethyl vinyl ether, Acetonitrile, Methacrylonitrile, Methyl methacrylate, and Propionitrile; however, they were not spiked or evaluated in the LCS. Therefore, these results will be qualified as estimated, J/UJ.

2.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 9. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing

concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

3.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

All compounds associated with the initial calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 10. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Initial Calibration	Compound	Criteria
MW-2022-4D	ICV %D	a,a-Dimethylphenethylamine	+40.5%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 11. Initial Calibration Evaluation Criteria and Qualifications

Initial Calibration	Criteria	Sample Result	Qualification
Initial Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R

Initial Calibration	Criteria	Sample Result	Qualification
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 30% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
Initial Calibration Verification (ICV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 12. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compounds	Criteria
MW-2022-4D	CCV %D	4-Nitroquinoline-1-oxide	-53.8%
	Continuing Calibration RRF	4-Nitroquinoline-1-oxide	0.0039

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 13. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Continuing Calibration Verification (CCV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

3.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

3.7 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

3.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 14. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery
MW-2022-4D	Prep Batch: 650942	a,a-Dimethylphenethylamine	<10%
		Famphur	<LL but >10%
		Kepone	<LL but >10%
		p-Phenylene diamine	<10%

Note:
LL Lower control limit

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 15. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil.

A field duplicate sample was not collected within this SDG.

3.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

3.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 16. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

4.3 System Performance

System performance and column resolution were acceptable.

4.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

4.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. Multiple-point calibrations were performed for Aroclor 1016 and 1260 only. Single-point calibrations were performed for the remaining Aroclors. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

4.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The continuing calibration %D were within the specified control limits.

4.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires that both the surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries reported from the primary column were within control limits.

4.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

4.7 Laboratory Control Sample Analysis / Laboratory Control Sample Duplicate

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries and RPDs within the control limits.

4.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix.

A field duplicate sample was not collected within this SDG.

4.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

The dual column analysis exhibited an acceptable %RPD between columns.

4.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 17. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

The analyses that exceeded the holding are presented in the following table.

Table 18. Summary of Holding Time Exceedances

Sample ID	Holding Time	Criteria
MW-2022-4D	The sample extracted on 13th day from collection	7 days from collection to extraction (SW-846 8141B)

Sample results associated with sample locations analyzed by analytical method SW-846 8141B were qualified, as specified in the table below. All other holding times were met.

Table 19. Summary of Holding Time Qualifications

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds 4,4'-DDD, 4,4'-DDT, and endrin aldehyde were detected in the associated method blank batch-650176; however, the associated sample results were non-detect. No qualification of the sample results was required.

5.3 System Performance

System performance and column resolution were acceptable.

5.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

5.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

5.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 20. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compound	Criteria
MW-2022-4D	CCV %D	Dimethoate	-53.3%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 5. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	%RSD > 20% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
Continuing Calibration Verification (CCV)	%D >15% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J

5.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. Pesticide - herbicide analysis requires that one of the two pesticide - herbicide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

5.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

5.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries and RPDs within the control limits.

5.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate sample was not collected within this SDG.

5.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

Dual column analysis performed on the field samples exhibited RPDs within the control limit.

5.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 22. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the

estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the "B" qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 23. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-4D	1,2,3,4,6,7,8-HpCDF (MB) 1,2,3,4,7,8-HxCDD (MB) 1,2,3,6,7,8-HxCDD (MB) 1,2,3,7,8-PeCDF (MB) 2,3,4,6,7,8-HxCDF (MB) 2,3,4,7,8-PeCDF (MB) OCDD (MB) Total HpCDF (MB) Total HxCDD (MB) Total HxCDF (MB) Total PeCDF (MB)	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RL Reporting limit

6.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

System performance and column resolution were acceptable.

6.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

6.4.1 Initial Calibration

A maximum relative standard deviation (RSD) of 15% is allowed for all non-labeled compounds (target) and 30% is allowed for all labeled compounds (internal standards and recovery standards).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

6.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibited percent difference (%D) less than the control limit (20%).

The continuing calibration %D were within the specified control limits.

6.5 Labeled Standard Performance

Labeled standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the labeled standards exhibit recoveries within the control limits of 40% to 135%.

All labeled standard responses were within control limits.

6.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

6.7 Ongoing Precision Result / Laboratory Control Sample Analysis

The Ongoing Precision Result/Laboratory Control Sample (OPR/LCS) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the OPR analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

6.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate sample was not collected within this SDG.

6.9 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7 Perfluoroalkyl Substances Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 24. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of ten times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 6. Summary of Blank Contamination Qualifications

Sample ID	Compound	Sample Result	Qualification
MW-2022-4D	6:2 FTS (MB)	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RL Reporting limit

7.3 Mass Calibration

Mass calibration and system performance were acceptable.

7.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

7.4.1 Initial Calibration

The percent relative standard deviation (%RSD) of the response factors (RF) must be less than 20%, or for linear calibration, $R^2 \geq 0.99$. Analytes must be within 70-130% of their true value for each calibration standard.

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

7.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (30%) and RRF value greater than control limit (0.05).

All compounds associated with the continuing calibrations were within the specified control limits.

7.5 Isotopically Labelled Standards

7.5.1 Extracted Internal Standard

Labeled standards must be added to all field samples and QC samples prior to extraction. Extracted Internal Standard (EIS) recoveries must be within the limits of 50% to150% (25% to 150% for poor responding analytes FBA, PFPeA, fluorotelomer sulfonates).

All EIS recoveries were within the specified control limits.

7.5.2 Injection Internal Standards

Injection internal standards are added to the aliquot of sample dilutions, QC samples, and standards just prior to analysis. Peak areas must be within 50-150% of the area measured in the ICAL midpoint standard. On days when ICAL is not performed, the peak areas must be within 50-150% of the peak area measured in daily initial CCV.

Samples associated with internal standards exhibited responses within the control limits.

7.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD less than 30%. The MS/MSD recovery control limits do not apply when the concentration detected in the parent sample exceeds the MS/MSD spike level by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

7.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries and RPDs within the control limits.

7.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water.

A field duplicate sample was not collected within this SDG.

7.9 Compound Identification

PFC analytes are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

All identified compounds met the specified criteria.

7.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review,

the overall data quality is within the guidelines specified in the method.

8 Metals Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 26. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

8.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

8.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All initial and continuing calibration verification standard recoveries were within the control limit.

8.3.2 Lower Limit of Quantitation Check Standard

The lower limit of quantitation check (LLQC) check standard serves to verify the linearity of calibration of the analysis at the reporting limit. The LLQC recoveries must be within 70 to 130%, and 50 to 150% for antimony (Sb), lead (Pb), and thallium (Tl). The LLQC standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the LLQC standard analysis are presented below in the LLQC standards evaluation table (if applicable).

All LLQC standard recoveries were within control limits.

8.3.3 ICP Interference Control Sample

The Interference Control Sample (ICS) verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

8.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils and RPD 20% for water matrices and 35% for soil matrices. The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample associated with this SDG.

8.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis was not performed on sample associated with this SDG.

8.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate sample was not collected within this SDG.

8.6 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

8.7 Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 15% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample.

The serial dilution was not performed on sample associated with this SDG.

8.8 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9 General Chemistry Analyses

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 27. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Cyanide was detected in the associated method blank batch- 651455 and associated calibration blanks; however, the associated sample results were non-detect. No qualification of the sample results was required.

9.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

9.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration must be greater than 0.995 analytes and all initial and continuing calibration verification standard recoveries must be within the control limits of 85%-115%.

All initial and continuing calibration verification standard recoveries were within the control limit.

9.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

9.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample for the analyte cyanide associated with this SDG.

The MS analysis performed on sample MW-2022-4D for the analyte sulfide exhibiting recoveries outside of the control limits are presented in the following table.

Table 28. Samples with Matrix Spike Recoveries Outside Control Limits

Sample ID	Analyte	MS Recovery
MW-2022-4D	Sulfide	160%

The criteria used to evaluate MS recoveries are presented in the following table. In the case of an MS deviation, the sample results are qualified. The qualifications are applied to the parent sample result for the analyte sulfide associated with this SDG.

Table 29. Matrix Spike Recovery Evaluation Criteria and Qualifications

Control limit	Sample Result	Qualification
MS percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS percent recovery <30%	Non-detect	R
	Detect	J
MS percent recovery >125%	Non-detect	No Action
	Detect	J

9.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis performed on sample MW-2022-4D exhibited acceptable RPD value.

9.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate sample was not collected within this SDG.

9.6 Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120% for water and within laboratory established acceptance limits for soils.

The LCS analysis exhibited recoveries within the control limits.

9.7 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.8 Data Validation Checklist for General Chemistry

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 30. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.1%	2
SVOCs	97.6%	3
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Appendix B

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1-	Surrogate recovery exceeds control limits, low biased.

LCMS

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
*5-	Isotope dilution analyte is outside acceptance limits, low biased.
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Appendices

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-204125-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-RB-1	480-204125-1	Water	11/17/2022		X	X	X	X	X	X	X
MW-2022-2	480-204125-2	Water	11/17/2022		X	X	X	X	X	X	X
TRIPBLANK 111722	480-204125-3	Water	11/17/2022		X						
MW-2022-3	480-204125-4	Water	11/17/2022		X	X	X	X	X	X	X

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	0	0	0	2	0	2	4
SVOCs	0	0	0	2	0	1	3
PCBs	0	0	0	2	0	1	3
PEST	0	0	0	2	0	1	3
HERB	0	0	0	2	0	1	3
OPC	0	0	0	2	0	1	3
PCDD/PCDF	0	0	0	2	0	1	3
PFAS	0	0	0	2	0	1	3
Metals	0	0	0	2	0	1	3
MISC	0	0	0	2	0	1	3

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

2.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

2.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

2.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 5. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Initial Calibration	Compound	Criteria
MW-2022-RB-1 MW-2022-2	ICV %D	Acrolein	-27.6%

Sample ID	Initial Calibration	Compound	Criteria
TRIPBLANK 111722 MW-2022-3			

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 6. Initial Calibration Evaluation Criteria and Qualifications

Initial Calibration	Criteria	Sample Result	Qualification
Initial Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 30% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
Initial Calibration Verification (ICV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

2.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 7. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compound	Criteria
MW-2022-RB-1 MW-2022-2 TRIPBLANK 111722 MW-2022-3	CCV %D	trans-1,4-Dichloro-2-butene	+29.1%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 8. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Continuing Calibration Verification (CCV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

2.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

2.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

2.7 Matrix Spike/Matrix Spike Duplicate Analysis

Matrix Spike / Matrix Spike Duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

2.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

2.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate sample was not collected within this SDG.

2.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

The laboratory calibrated for the compounds 2-Chloro-1,3-butadiene, 2-Chloroethyl vinyl ether, Acetonitrile, Methacrylonitrile, Methyl methacrylate, and Propionitrile; however, they were not spiked or evaluated in the LCS. Therefore, these results will be qualified as estimated, J/UJ.

2.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.12 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 9. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 10. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-2	Di-n-butyl phthalate (MB, RB)	Detected sample results <RL and <BAL	"U" at the RL
	Pyridine (MB, RB)	Detected sample results <RL and <BAL	"U" at the RL
MW-2022-3	Di-n-butyl phthalate (MB, RB)	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RB Rinse blank
RL Reporting limit

3.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

3.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at

the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

All compounds associated with the initial calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 11. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Initial Calibration	Compound	Criteria
MW-2022-RB-1 MW-2022-2 MW-2022-3	ICV %D	a,a-Dimethylphenethylamine	+26.5%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 12. Initial Calibration Evaluation Criteria and Qualifications

Initial Calibration	Criteria	Sample Result	Qualification
Initial Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 30% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ

Initial Calibration	Criteria	Sample Result	Qualification
Initial Calibration Verification (ICV)		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 13. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compounds	Criteria
MW-2022-RB-1 MW-2022-2 MW-2022-3	CCV %D	a,a-Dimethylphenethylamine	-37.2%
		4-Nitroquinoline-1-oxide	-48.0%
	Continuing Calibration RRF	4-Nitroquinoline-1-oxide	0.0048

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 14. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration Verification (CCV)		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

3.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

3.7 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

3.8 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample/laboratory control sample (LCS/LCSD) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 15. Samples with Laboratory Control Sample/Laboratory Control Sample Duplicate Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-RB-1 MW-2022-2 MW-2022-3	Prep Batch: 651208	2,3,4,6-Tetrachlorophenol	>UL	AC
		3,3'-Dimethylbenzidine	<LL but >10%	<LL but >10%
		a,a-Dimethylphenethylamine	<10%	<10%
		Benzidine	<10%	<10%
		Kepone	<LL but >10%	AC
		Methapyrilene	<LL but >10%	<LL but >10%
		N-Nitrosomorpholine	AC	<10%
		Pentachloronitrobenzene	>UL	>UL
		p-Phenylene diamine	<10%	<10%

Notes:

LL Lower control limit
UL Upper control limit
AC Acceptable

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 16. Laboratory Control Sample/Laboratory Control Sample Duplicate Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R

Control Limit	Sample Result	Qualification
	Detect	J

Samples associated with LCS/LCSD recoveries exhibiting an RPD greater than of the control limit presented in the following table.

Table 17. Samples with Relative Percent Difference Greater than Control Limits

Sample ID	Batch	Compounds
MW-2022-RB-1	Prep Batch: 651208	Benzidine
MW-2022-2		Kepone
MW-2022-3		N-Nitrosomorpholine

The criteria used to evaluate the RPD between the LCS/LCSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 18. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

3.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate sample was not collected within this SDG.

3.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

The laboratory calibrated for the compounds 2-Picoline, 4-Nitroquinoline-1-oxide, Aramite, Total, and Sulfotepp; however, they were not spiked or evaluated in the LCS/LCSD. Therefore, these results will be qualified as estimated, J/UJ.

3.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 19. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

4.3 System Performance

System performance and column resolution were acceptable.

4.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

4.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. Multiple-point calibrations were performed for Aroclor 1016 and 1260 only. Single-point calibrations were performed for the remaining Aroclors. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

4.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The continuing calibration %D were within the specified control limits.

4.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires that both the surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries reported from the primary column were within control limits.

4.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

4.7 Laboratory Control Sample Analysis / Laboratory Control Sample Duplicate

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries and RPDs within the control limits.

4.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix. Results for duplicate samples are summarized in the following table.

A field duplicate sample was not collected within this SDG.

4.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

The dual column analysis exhibited an acceptable %RPD between columns.

4.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 20. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

Note: The case narrative section documented that the samples MW-2022-RB-1 (480-204125-1), MW-2022-2 (480-204125-2), and MW-2022-3 (480-204125-3) were re-prepared and re-analyzed beyond the holding time for the analysis of method SW-846 8081B due to LCS recoveries exceedance during the initial analysis. The initial analysis results used for documentation purpose and sample results were qualified due to LCS recovery exceedance. Refer to Section 5.7 for details.

Note: The case narrative section documented that the samples MW-2022-RB-1 (480-204125-1), MW-2022-2 (480-204125-2), and MW-2022-3 (480-204125-3) were re-prepared and re-analyzed beyond the holding time for the analysis of method SW-846 8151A due to surrogate and LCS recoveries exceedance during the initial analysis. The initial analysis results used for documentation purpose and sample results were qualified due to surrogate recovery and LCS recovery exceedances. Refer to Sections 5.5, 5.7 for details respectively.

The analyses that exceeded the holding are presented in the following table.

Table 21. Summary of Holding Time Exceedances

Sample ID	Holding Time	Criteria
MW-2022-RB-1 MW-2022-2 MW-2022-3	The samples were extracted on 13th day from collection	7 days from collection to extraction (SW-846 8141B)

Sample results associated with sample locations analyzed by analytical method SW-846 8141B were qualified, as specified in the table below. All other holding times were met.

Table 22. Summary of Holding Time Qualifications

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 5. Summary of Blank Contamination Qualifications

Sample ID	Compound	Sample Result	Qualification
MW-2022-2	4,4'-DDD (MB)	Detected sample results <RL and <BAL	“U” at the RL

Notes:
MB Method blank
RL Reporting limit

5.3 System Performance

System performance and column resolution were acceptable.

5.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

5.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

5.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 24. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compound	Criteria
MW-2022-RB-1 MW-2022-2 MW-2022-3	CCV %D	Dimethoate	-54.4%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 6. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	%RSD > 20% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration Verification (CCV)	%D >15% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J

5.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. Pesticide - herbicide analysis requires that one of the two pesticide - herbicide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

Samples associated with surrogates exhibiting recoveries outside of the control limits presented in the following table.

Table 26. Samples Associated with Surrogates Exhibiting Recoveries Outside of the Control Limits

Sample ID	Surrogate	Recovery
MW-2022-RB-1 MW-2022-2	2,4-Dichlorophenylacetic acid (Method SW-846 8151A)	<LL but >10%

Note:
LL Lower control limit

The criteria used to evaluate the surrogate recoveries are presented in the following table. In the case of a surrogate deviation, the sample results are qualified as documented in the table below.

Table 27. Evaluation Criteria for Surrogate Recoveries

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Surrogates diluted below the calibration curve due to the high concentration of a target compound.	Non-detect	UJ/J[1]
	Detect	

Note:
1. A more concentrated analysis was not performed with surrogate compounds within the calibration range; therefore, no determination of extraction efficiency could be made.

5.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

5.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 28. Samples with Laboratory Control Sample/Laboratory Control Sample Duplicate Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-RB-1 MW-2022-2 MW-2022-3	Prep Batch: 651231 (Method: SW-846 8081B)	4,4'-DDE	<LL but >10%	<LL but >10%
	Prep Batch: 651209 (Method: SW-846 8151A)	2,4-D	AC	<LL but >10%
		Silvex (2,4,5-TP)	AC	<LL but >10%

Notes:
AC Acceptable
LL Lower control limit

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 29. Laboratory Control Sample/Laboratory Control Sample Duplicate Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ

Control Limit	Sample Result	Qualification
	Detect	J
< 10%	Non-detect	R
	Detect	J

Samples associated with LCS/LCSD recoveries exhibiting an RPD greater than of the control limit presented in the following table.

Table 30. Samples with Relative Percent Difference Greater than Control Limits

Sample ID	Batch	Compound
MW-2022-RB-1 MW-2022-2 MW-2022-3	Prep Batch: 651209 (Method: SW-846 8151A)	2,4-D
		Silvex (2,4,5-TP)

The criteria used to evaluate the RPD between the LCS/LCSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 30. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

5.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

A field duplicate sample was not collected within this SDG.

5.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

Dual column analysis performed on the field samples exhibited RPDs within the control limit.

5.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 31. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the "B" qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 32. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-2	1,2,3,4,6,7,8-HpCDF (MB, RB) 1,2,3,4,7,8,9-HpCDF (MB, RB) 1,2,3,4,7,8-HxCDD (MB) 1,2,3,7,8,9-HxCDD (MB) 1,2,3,7,8,9-HxCDF (MB) 2,3,4,6,7,8-HxCDF (MB) OCDD (MB, RB) OCDF (MB) Total HpCDF (MB, RB) Total HxCDD (MB) Total HxCDF (MB) Total PeCDF (MB)	Detected sample results <RL and <BAL	"U" at the RL

Notes:

MB Method blank
RB Rinse blank
RL Reporting limit

6.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

System performance and column resolution were acceptable.

6.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

6.4.1 Initial Calibration

A maximum relative standard deviation (RSD) of 15% is allowed for all non-labeled compounds (target) and 30% is allowed for all labeled compounds (internal standards and recovery standards).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

6.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibited percent difference (%D) less than the control limit (20%).

The continuing calibration %D were within the specified control limits.

6.5 Labeled Standard Performance

Labeled standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the labeled standards exhibit recoveries within the control limits of 40% to 135%.

Samples associated with labelled standards exhibiting recoveries outside of the control limits presented in the following table.

Table 33. Samples Associated with Labelled Standards Exhibiting Recoveries Outside of the Control Limits

Sample ID	Labelled Standards	Associated Compounds	Recovery
MW-2022-2	13C-2,3,4,6,7,8-HxCDF	2,3,4,6,7,8-HxCDF	<LL but >10%
	13C-2,3,4,7,8-PeCDF	2,3,4,7,8-PeCDF	<LL but >10%
	13C-2,3,7,8-TCDF	2,3,7,8-TCDF	<LL but >10%

Note:
LL Lower control limit

The criteria used to evaluate the surrogate recoveries are presented in the following table. In the case of a surrogate deviation, the sample results are qualified as documented in the table below.

Table 34. Evaluation Criteria for Labelled Standard Recoveries

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

6.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

6.7 Ongoing Precision Result / Laboratory Control Sample Analysis

The Ongoing Precision Result/Laboratory Control Sample (OPR/LCS) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the OPR analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

6.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less

than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

A field duplicate sample was not collected within this SDG.

6.9 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7 Perfluoroalkyl Substances Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 35. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of ten times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

7.3 Mass Calibration

Mass calibration and system performance were acceptable.

7.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

7.4.1 Initial Calibration

The percent relative standard deviation (%RSD) of the response factors (RF) must be less than 20%, or for linear calibration, $R^2 \geq 0.99$. Analytes must be within 70-130% of their true value for each calibration standard.

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

7.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (30%) and RRF value greater than control limit (0.05).

All compounds associated with the continuing calibrations were within the specified control limits.

7.5 Isotopically Labelled Standards

7.5.1 Extracted Internal Standard

Labeled standards must be added to all field samples and QC samples prior to extraction. Extracted Internal Standard (EIS) recoveries must be within the limits of 50% to150% (25% to 150% for poor responding analytes FBA, PFPeA, fluorotelomer sulfonates).

All EIS recoveries were within the specified control limits.

7.5.2 Injection Internal Standards

Injection internal standards are added to the aliquot of sample dilutions, QC samples, and standards just prior to analysis. Peak areas must be within 50-150% of the area measured in the ICAL midpoint standard. On days when ICAL is not performed, the peak areas must be within 50-150% of the peak area measured in daily initial CCV.

Samples associated with internal standards exhibited responses within the control limits.

7.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD less than 30%. The MS/MSD recovery control limits do not apply when the concentration detected in the parent sample exceeds the MS/MSD spike level by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

7.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries and RPDs within the control limits.

7.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water.

A field duplicate sample was not collected within this SDG.

7.9 Compound Identification

PFC analytes are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

All identified compounds met the specified criteria.

7.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8 Metals Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 36. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Nickel was detected in the associated method blank batch- 651518; however, the associated sample results were non-detect. No qualification of the sample results was required.

8.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

8.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All initial and continuing calibration verification standard recoveries were within the control limit.

8.3.2 Lower Limit of Quantitation Check Standard

The lower limit of quantitation check (LLQC) check standard serves to verify the linearity of calibration of the analysis at the reporting limit. The LLQC recoveries must be within 70 to 130%, and 50 to 150% for antimony (Sb), lead (Pb), and thallium (Tl). The LLQC standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the LLQC standard analysis are presented below in the LLQC standards evaluation table (if applicable).

All LLQC standard recoveries were within control limits.

8.3.3 ICP Interference Control Sample

The Interference Control Sample (ICS) verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

8.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils and RPD 20% for water matrices and 35% for soil matrices. The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample associated with this SDG.

8.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis was not performed on sample associated with this SDG.

8.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

A field duplicate sample was not collected within this SDG.

8.6 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

8.7 Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 15% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample.

The serial dilution was not performed on sample associated with this SDG.

8.8 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9 General Chemistry Analyses

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 37. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

The analyses that exceeded the holding are presented in the following table.

Table 38. Summary of Holding Time Exceedances

Sample ID	Holding Time	Criteria
MW-2022-RB-1 MW-2022-2 MW-2022-3	The samples were extracted on 22nd day from collection	14 days from collection to analysis (Cyanide)

Sample results associated with sample locations analyzed by analytical method SW-846 9012B were qualified, as specified in the table below. All other holding times were met.

Table 39. Summary of Holding Time Qualifications

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Cyanide was detected in the associated method blank batch- 652955 and associated calibration blanks; however, the associated sample results were non-detect. No qualification of the sample results was required.

9.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

9.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration must be greater than 0.995 analytes and all initial and continuing calibration verification standard recoveries must be within the control limits of 85%-115%.

All initial and continuing calibration verification standard recoveries were within the control limit.

9.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

9.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample for the analyte cyanide associated with this SDG.

The MS analysis performed on sample MW-2022-RB-1 for the analyte sulfide exhibiting recoveries outside of the control limits are presented in the following table.

Table 40. Samples with Matrix Spike Recoveries Outside Control Limits

Sample ID	Analyte	MS Recovery
MW-2022-RB-1	Sulfide	148%

The criteria used to evaluate MS recoveries are presented in the following table. In the case of an MS deviation, the sample results are qualified. The qualifications are applied to the parent sample result for the analyte sulfide associated with this SDG.

Table 41. Matrix Spike Recovery Evaluation Criteria and Qualifications

Control limit	Sample Result	Qualification
MS percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS percent recovery <30%	Non-detect	R
	Detect	J
MS percent recovery >125%	Non-detect	No Action
	Detect	J

9.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis performed on sample MW-2022-RB-1 exhibited acceptable RPD value.

9.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

A field duplicate sample was not collected within this SDG.

9.6 Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120% for water and within laboratory established acceptance limits for soils.

The LCS analysis exhibited recoveries within the control limits.

9.7 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.8 Data Validation Checklist for General Chemistry

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 42. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.1%	4
SVOCs	96.0%	15
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Appendix B

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
*+	LCS and/or LCSD is outside acceptance limits, high biased.
*1	LCS/LCSD RPD exceeds control limits.
B	Compound was found in the blank and sample.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
*1	LCS/LCSD RPD exceeds control limits.
B	Compound was found in the blank and sample.
H	Sample was prepped or analyzed beyond the specified holding time
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1-	Surrogate recovery exceeds control limits, low biased.

Dioxin

Qualifier	Qualifier Description
*5-	Isotope dilution analyte is outside acceptance limits, low biased.
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
^+	Continuing Calibration Verification (CCV) is outside acceptance limits, high biased.
H	Sample was prepped or analyzed beyond the specified holding time
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Appendices

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-204931-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-9	480-204931-1	Water	12/15/2022		X	X	X	X	X	X	X
MW-2022-6	480-204931-2	Water	12/15/2022		X	X	X	X	X	X	X
TRIP BLANK 121522	480-204931-3	Water	12/15/2022		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	2	0	1	0	0	0	3
SVOCs	2	0	0	0	0	0	2
PCBs	2	0	0	0	0	0	2
PEST	2	0	0	0	0	0	2
HERB	2	0	0	0	0	0	2
OPC	2	0	0	0	0	0	2
PCDD/PCDF	2	0	0	0	0	0	2
PFAS	2	0	0	0	0	0	2
Metals	2	0	0	0	0	0	2
MISC	2	0	0	0	0	0	2

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

Note: The case narrative documented that the batch- 654156 associated samples were re-prepared and/or re-analyzed beyond the holding time due to laboratory control sample/laboratory control sample duplicate (LCS/LCSD) exhibited recoveries outside the control limits for some of the compounds. The initial results used for the documentation purposes and the affected results were qualified due to LCS/LCSD recoveries exceedances. Refer to Section 3.3 for details.

3.2 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.2.1 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 6. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compound	Criteria
MW-2022-9 MW-2022-6	Continuing Calibration RRF	4-Nitroquinoline-1-oxide	0.0051

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 7. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	

Note:

Continuing Calibration	Criteria	Sample Result	Qualification

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.3 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 8. Samples with Laboratory Control Sample and Laboratory Control Sample Duplicate Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-9 MW-2022-6	Prep Batch: 654156	a,a-Dimethylphenethylamine	<10%	<10%
		Benzidine		
		Kepone		
		p-Phenylene diamine		

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 9. Laboratory Control Sample and Laboratory Control Sample Duplicate Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.5 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Laboratory Control Sample (LCS) %R		X	X		
Laboratory Control Sample Duplicate (LCSD) %R		X	X		
Dilution Factor		X		X	
Continuing calibration RRFs		X	X		

Note:
%R Percent recovery

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 10. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

5 Pesticide/Herbicide Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 11. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Method	Matrix	Holding Time	Preservation
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criterion.

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 12. Summary of Blank Contamination Qualifications

Sample ID	Method	Compound	Sample Result	Qualification
MW-2022-9	SW-846 8081B	4,4'-DDT (MB)	Detected sample results <RL and <BAL	“U” at the RL

Notes:
MB Method blank
RL Reporting limit

5.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.4 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X

A. Method Blanks		X	X		
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 13. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the "B" qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 14. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-9 MW-2022-6	1,2,3,4,6,7,8-HpCDD (MB) 1,2,3,4,6,7,8-HpCDF (MB) 1,2,3,4,7,8,9-HpCDF (MB) 1,2,3,4,7,8-HxCDF (MB) 1,2,3,6,7,8-HxCDD (MB) 1,2,3,6,7,8-HxCDF (MB) 1,2,3,7,8,9-HxCDD (MB) 1,2,3,7,8-PeCDF (MB) 2,3,4,6,7,8-HxCDF (MB) 2,3,4,7,8-PeCDF (MB) OCDD (MB) OCDF (MB) Total HpCDD (MB) Total HpCDF (MB) Total HxCDD (MB) Total HxCDF (MB) Total PeCDF (MB)	Detected sample results <RL and <BAL	"U" at the RL
MW-2022-6	1,2,3,4,7,8-HxCDD (MB) 1,2,3,7,8,9-HxCDF (MB) 1,2,3,7,8-PeCDD (MB) Total PeCDD (MB)	Detected sample results <RL and <BAL	"U" at the RL

Notes:

RL Reporting limit

6.3 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.5 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 15. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

8 Metals Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 16. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B) from the data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 17. Summary of Blank Contamination Qualifications

Sample ID	Analyte	Sample Result	Qualification
MW-2022-9 MW-2022-6	Zinc (MB)	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RL Reporting limit

8.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.4 Data Validation Checklist

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)

Blanks					
A. Method Blanks		X	X		

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

9 General Chemistry Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 18. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Cyanide was detected in the associated method blank batch- 654363 and associated calibration blanks; however, the associated sample results were non-detect. No qualification of the sample results was required.

9.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.4 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B / SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under the Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 19. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	97.2%	3
SVOCs	96.0%	10
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data review were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

MW-2022-9 (480-204931-1)	12/15/22	12:40 Eastern		Water			X	2	
MW-2022-6 (480-204931-2)	12/15/22	14:45 Eastern		Water			X	2	

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Northeast, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Northeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Northeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Northeast, LLC.

Possible Hazard Identification	*Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)*
Unconfirmed	☐ *Return To Client* ☐ *Disposal By Lab* ☐ *Archive For* _____ *Months*
Deliverable Requested: I, II, III, IV, Other (specify) Primary Deliverable Rank: 2	Special Instructions/QC Requirements:

Appendix B

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
*1	LCS/LCSD RPD exceeds control limits.
E	Result exceeded calibration range.
H	Sample was prepped or analyzed beyond the specified holding time
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1+	Surrogate recovery exceeds control limits, high biased.

GC Semi VOA

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

LCMS

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-204949-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-8	480-204949-1	Water	12/19/2022		X	X	X	X	X	X	X
MW-2022-7	480-204949-2	Water	12/19/2022		X	X	X	X	X	X	X
TRIPBLANK 121922	480-204949-3	Water	12/19/2022		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X

11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	0	0	0	2	0	1	3
SVOCs	0	0	0	2	0	0	2
PCBs	0	0	0	2	0	0	2
PEST	0	0	0	2	0	0	2
HERB	0	0	0	2	0	0	2
OPC	0	0	0	2	0	0	2
PCDD/PCDF	0	0	0	2	0	0	2
PFAS	0	0	0	2	0	0	2
Metals	0	0	0	2	0	0	2
MISC	0	0	0	2	0	0	2

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

2.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

2.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

2.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

2.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 5. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compounds	Criteria
MW-2022-8 MW-2022-7 TRIPBLANK 121922	CCV %D	4-Methyl-2-pentanone (MIBK)	-26.5%
		Ethyl methacrylate	-30.2%
		2-Hexanone	-28.9%
		Acetonitrile	+41.3%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 6. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial/Continuing Calibration Verification (ICV/CCV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

2.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

2.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

2.7 Matrix Spike/Matrix Spike Duplicate Analysis

Matrix Spike / Matrix Spike Duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

2.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 7. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery
MW-2022-8 MW-2022-7 TRIPBLANK 121922	Batch: 654142	Bromoform	>UL

Note:
AC Acceptable

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 12. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

2.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

2.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

The laboratory calibrated for the compounds 2-Chloro-1,3-butadiene, 2-Chloroethyl vinyl ether, Acetonitrile, Methacrylonitrile, Methyl methacrylate, and Propionitrile; however, they were not spiked or evaluated in the LCS. Therefore, these results will be qualified as estimated, J/UJ.

2.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.12 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I/II Validation					
Holding times/Preparation		X	X		
Reporting limits (units)		X		X

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 8. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

3.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

3.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 9. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compounds	Criteria
MW-2022-8 MW-2022-7	CCV %D	Pyridine	-27.1%
		bis (2-chloroisopropyl) ether	-34.7%
		Benzidine	-41.9%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 10. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Continuing Calibration Verification (CCV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

3.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

3.7 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

3.8 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The 3.8 Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 11. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-8 MW-2022-7	Prep Batch: 668661	p-Phenylene diamine	<10%	<10%
		3,3'-Dimethylbenzidine	<LL but >10%	<LL but >10%
		a,a-Dimethylphenethylamine	<10%	<10%
		Kepone	<10%	<10%
		Famphur	<LL but >10%	<LL but >10%

Note:
AC Acceptable

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 12. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J

Control Limit	Sample Result	Qualification
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

Sample locations associated with LCS/LCSD recoveries exhibiting an RPD greater than of the control limit presented in the following table.

Sample Locations	Compound
MW-2022-8	Dibenz(a,h)anthracene
MW-2022-7	Famphur

The criteria used to evaluate the RPD between the LCS/LCSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

3.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

3.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

3.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.12 Data Validation Checklist

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 14. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

4.3 System Performance

System performance and column resolution were acceptable.

4.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

4.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. Multiple-point calibrations were performed for Aroclor 1016 and 1260 only. Single-point calibrations were performed for the remaining Aroclors. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

4.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The continuing calibration %D were within the specified control limits.

4.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires that both the surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries reported from the primary column were within control limits.

4.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

4.7 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

4.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix.

A field duplicate analysis was not performed on sample associated with this SDG.

4.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

The dual column analysis exhibited an acceptable %RPD between columns.

4.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 16. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criterion.

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

5.3 System Performance

System performance and column resolution were acceptable.

5.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

5.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

5.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

The continuing calibration %D were within the specified control limits.

5.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. Pesticide - herbicide analysis requires that one of the two pesticide - herbicide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

5.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

5.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries and RPDs within the control limits.

5.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on sample associated with this SDG.

5.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

Sample locations associated with %D analysis exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Compound	%D
MW-2022-8	Aldrin	35.1%

The criteria used to evaluate the %D are presented in the following table. In the case of a %D deviation, the sample results are qualified as documented in the table below.

Control Limit (%D)	Qualification
>25% to 70%	J

Control Limit (%D)	Qualification
>70% to 100%	JN
>100% [1]	R
>100% to 200% (Interference detected)[2]	J or JN
>50% (pesticide) sample results less than the RL)	U

When the pesticide sample results are less than the RL and the %D greater than 50% the sample result are raised to the RL and reported as non-detect.

Notes:

1: If the pattern is confirmed sample results will be qualified as estimated (J). If pattern exhibits interference or if the pesticide cannot be positively determined due to weathering the sample results will be qualified as tentative identification estimate (JN).

2: If interference is detected in either column the sample results will be qualified as tentative identification estimate (JN).

5.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 23. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 24. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-8	1,2,3,4,6,7,8-HpCDF (MB) 1,2,3,4,7,8,9-HpCDF (MB) 1,2,3,6,7,8-HxCDF (MB) OCDD (MB) OCDF (MB) Total HpCDF (MB) Total HxCDF (MB)	Detected sample results <RL and <BAL	“U” at the RL
MW-2022-7	1,2,3,4,6,7,8-HpCDD (MB) 1,2,3,4,6,7,8-HpCDF (MB) 1,2,3,4,7,8,9-HpCDF (MB) 1,2,3,7,8,9-HxCDF (MB) 1,2,3,7,8-PeCDF (MB) OCDD (MB)	Detected sample results <RL and <BAL	“U” at the RL

Sample ID	Compounds	Sample Result	Qualification

RL Reporting limit

6.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

System performance and column resolution were acceptable.

6.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

6.4.1 Initial Calibration

A maximum relative standard deviation (RSD) of 15% is allowed for all non-labeled compounds (target) and 30% is allowed for all labeled compounds (internal standards and recovery standards).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

6.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibited percent difference (%D) less than the control limit (20%).

The continuing calibration %D were within the specified control limits.

6.5 Labeled Standard Performance

Labeled standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the labeled standards exhibit recoveries within the control limits of 40% to 135%.

All labeled standard responses were within control limits.

6.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

6.7 Ongoing Precision Result / Laboratory Control Sample Analysis

The Ongoing Precision Result/Laboratory Control Sample (OPR/LCS) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the OPR analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

6.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on sample associated with this SDG.

6.9 Compound Identification

PCDD/PCDF compounds are identified by using the compound’s ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest.” This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as “I” (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7 Perfluoroalkyl Substances Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 26. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of ten times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

7.3 Mass Calibration

Mass calibration and system performance were acceptable.

7.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

7.4.1 Initial Calibration

The percent relative standard deviation (%RSD) of the response factors (RF) must be less than 20%, or for linear calibration, $R^2 \geq 0.99$. Analytes must be within 70-130% of their true value for each calibration standard.

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

7.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (30%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits.

7.5 Isotopically Labelled Standards

7.5.1 Extracted Internal Standard

Labeled standards must be added to all field samples and QC samples prior to extraction. Extracted Internal Standard (EIS) recoveries must be within the limits of 50% to150% (25% to 150% for poor responding analytes FBA, PFPeA, fluorotelomer sulfonates).

All EIS recoveries were within the specified control limits.

7.5.2 Injection Internal Standards

Injection internal standards are added to the aliquot of sample dilutions, QC samples, and standards just prior to analysis. Peak areas must be within 50-150% of the area measured in the ICAL midpoint standard. On days when ICAL is not performed, the peak areas must be within 50-150% of the peak area measured in daily initial CCV.

Samples associated with internal standards exhibited responses within the control limits.

7.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD less than 30%. The MS/MSD recovery control limits do not apply when the concentration detected in the parent sample exceeds the MS/MSD spike level by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

7.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

7.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water.

A field duplicate analysis was not performed on sample associated with this SDG.

7.9 Compound Identification

PFC analytes are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

All identified compounds met the specified criteria.

7.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8 Metals Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 32. Holding Time for Method SW-846 6010C/7470A/7471B

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.

Method	Matrix	Holding Time	Preservation
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B) from the data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
MW-2022-7	Nickel (MB)	Detected sample results >RL and <BAL	"U" at the detected concentration
MW-2022-8	Nickel (MB)	Detected sample results <RL and <BAL	"U" at the RL

Note:
RL = reporting limit
MB = Method blank

8.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

8.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All initial and continuing calibration verification standard recoveries were within the control limit.

8.3.2 Lower Limit of Quantitation Check Standard

The lower limit of quantitation check (LLQC) check standard serves to verify the linearity of calibration of the analysis at the reporting limit. The LLQC recoveries must be within 70 to 130%, and 50 to 150% for antimony (Sb), lead (Pb), and thallium (Tl). The LLQC standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the LLQC standard analysis are presented below in the LLQC standards evaluation table (if applicable).

All LLQC standard recoveries were within control limits.

8.3.3 ICP Interference Control Sample

The Interference Control Sample (ICS) verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

8.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils and RPD 20% for water matrices and 35% for soil matrices. The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample associated with this SDG.

8.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices

The laboratory duplicate analysis was not performed on sample associated with this SDG.

8.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less

than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

8.6 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All LCS recoveries were within control limits.

8.7 Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 15% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample.

The serial dilution was not performed on sample associated with this SDG.

8.8 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9 General Chemistry Analyses

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 36. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.

Method	Matrix	Holding Time	Preservation
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Cyanide was detected in the associated method blank batch- 669722 and associated calibration blanks; however, the associated sample results were non-detect. No qualification of the sample results was required.

9.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

9.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration must be greater than 0.995 analytes and all initial and continuing calibration verification standard recoveries must be within the control limits of 85%-115%.

All initial and continuing calibration verification standard recoveries were within the control limit.

9.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

9.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the

MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS analysis performed on sample MW-2022-7 for cyanide exhibited recovery within control limits.

9.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis for cyanide exhibited RPD within control limits.

9.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

9.6 Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120% for water and within laboratory established acceptance limits for soils.

The LCS analysis exhibited recoveries within the control limits.

9.7 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.8 Data Validation Checklist for General Chemistry

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 40. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.1%	3
SVOCs	97.6%	6
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Appendix B

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
*1	LCS/LCSD RPD exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

LCMS

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Client Sample ID: MW-2022-8

Appendices

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-208637-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-2	480-208637-1	Water	5/4/2023		X	X	X	X	X	X	X
MW-2022-3	480-208637-2	Water	5/4/2023		X	X	X	X	X	X	X
TRIP BLANK-050423	480-208637-3	Water	5/4/2023		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	0	0	0	2	0	1	3
SVOCs	0	0	0	2	0	0	2
PCBs	0	0	0	2	0	0	2
PEST	0	0	0	2	0	0	2
HERB	0	0	0	2	0	0	2
OPC	0	0	0	2	0	0	2
PCDD/PCDF	0	0	0	2	0	0	2
PFAS	0	0	0	2	0	0	2
Metals	0	0	0	2	0	0	2
MISC	0	0	0	2	0	0	2

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

2.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

2.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

2.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

2.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 5. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compounds	Criteria
MW-2022-2 MW-2022-3 TRIP BLANK-050423	CCV %D	Acetone	+32.1%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 6. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Continuing Calibration Verification (CCV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

2.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

2.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

2.7 Matrix Spike/Matrix Spike Duplicate Analysis

Matrix Spike / Matrix Spike Duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

2.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

2.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

2.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

The laboratory calibrated for the compounds 2-Chloro-1,3-butadiene, 2-Chloroethyl vinyl ether, Acetonitrile, Methacrylonitrile, Methyl methacrylate, and Propionitrile; however, they were not spiked or evaluated in the LCS. Therefore, these results will be qualified as estimated, J/UJ.

2.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 8. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

3.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

3.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 9. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compounds	Criteria
MW-2022-2 MW-2022-3	CCV %D	Hexachlorocyclopentadiene	-30.1%
		Methapyrilene	+27.6%
	Continuing Calibration RRF	4-Nitroquinoline-1-oxide	0.0090

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 10. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Continuing Calibration Verification (CCV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

3.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

3.7 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

3.8 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The 3.8 Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 11. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-2 MW-2022-3	Prep Batch: 668661	1-Naphthylamine	<LL but >10%	<LL but >10%
		2-Picoline	<LL but >10%	AC
		3,3'-Dimethylbenzidine	<10%	<LL but >10%
		4-Aminobiphenyl	<LL but >10%	AC
		a,a-Dimethylphenethylamine	<10%	<10%
		Kepone	<10%	<10%
		Methapyrilene	<LL but >10%	AC
		p-Phenylene diamine	<10%	<10%
		Phorate	AC	>UL
		Famphur	AC	<LL but >10%

Note:
AC Acceptable

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 12. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

Sample locations associated with LCS/LCSD recoveries exhibiting an RPD greater than of the control limit presented in the following table.

Sample Locations	Compound
MW-2022-2 MW-2022-3	2-Naphthylamine 2-Picoline 2-Toluidine

Sample Locations	Compound
	3,3'-Dimethylbenzidine
	4-Aminobiphenyl
	4-Chloroaniline
	Aniline
	Benzidine
	Famphur
	Methapyrilene
	Pyridine

The criteria used to evaluate the RPD between the LCS/LCSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

3.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

3.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

3.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 14. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing

concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

4.3 System Performance

System performance and column resolution were acceptable.

4.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

4.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. Multiple-point calibrations were performed for Aroclor 1016 and 1260 only. Single-point calibrations were performed for the remaining Aroclors. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

4.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The continuing calibration %D were within the specified control limits.

4.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires that both the surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries reported from the primary column were within control limits.

4.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

4.7 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

4.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix.

A field duplicate analysis was not performed on sample associated with this SDG.

4.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

The dual column analysis exhibited an acceptable %RPD between columns.

4.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 16. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criterion.

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

5.3 System Performance

System performance and column resolution were acceptable.

5.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

5.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

5.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

The continuing calibration %D were within the specified control limits.

5.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. Pesticide - herbicide analysis requires that one of the two pesticide - herbicide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

5.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

5.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries and RPDs within the control limits.

5.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on sample associated with this SDG.

5.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

Dual column analysis performed on the field samples exhibited RPDs within the control limit.

5.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 23. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 24. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-2 MW-2022-3	1,2,3,4,6,7,8-HpCDD (MB) 1,2,3,4,6,7,8-HpCDF (MB) 1,2,3,6,7,8-HxCDF (MB) OCDD (MB) OCDF (MB)	Detected sample results <RL and <BAL	“U” at the RL

Notes:
MB Method blank
RL Reporting limit

6.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

System performance and column resolution were acceptable.

6.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

6.4.1 Initial Calibration

A maximum relative standard deviation (RSD) of 15% is allowed for all non-labeled compounds (target) and 30% is allowed for all labeled compounds (internal standards and recovery standards).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

6.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibited percent difference (%D) less than the control limit (20%).

The continuing calibration %D were within the specified control limits.

6.5 Labeled Standard Performance

Labeled standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the labeled standards exhibit recoveries within the control limits of 40% to 135%.

All labeled standard responses were within control limits.

6.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

6.7 Ongoing Precision Result / Laboratory Control Sample Analysis

The Ongoing Precision Result/Laboratory Control Sample (OPR/LCS) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the OPR analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

6.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on sample associated with this SDG.

6.9 Compound Identification

PCDD/PCDF compounds are identified by using the compound’s ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest.” This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as “I” (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7 Perfluoroalkyl Substances Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 26. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of ten times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

7.3 Mass Calibration

Mass calibration and system performance were acceptable.

7.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

7.4.1 Initial Calibration

The percent relative standard deviation (%RSD) of the response factors (RF) must be less than 20%, or for linear calibration, $R^2 \geq 0.99$. Analytes must be within 70-130% of their true value for each calibration standard.

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

7.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (30%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits.

7.5 Isotopically Labelled Standards

7.5.1 Extracted Internal Standard

Labeled standards must be added to all field samples and QC samples prior to extraction. Extracted Internal Standard (EIS) recoveries must be within the limits of 50% to150% (25% to 150% for poor responding analytes FBA, PFPeA, fluorotelomer sulfonates).

All EIS recoveries were within the specified control limits.

7.5.2 Injection Internal Standards

Injection internal standards are added to the aliquot of sample dilutions, QC samples, and standards just prior to analysis. Peak areas must be within 50-150% of the area measured in the ICAL midpoint standard. On days when ICAL is not performed, the peak areas must be within 50-150% of the peak area measured in daily initial CCV.

Samples associated with internal standards exhibited responses within the control limits.

7.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD less than 30%. The MS/MSD recovery control limits do not apply when the concentration detected in the parent sample exceeds the MS/MSD spike level by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

7.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

7.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water.

A field duplicate analysis was not performed on sample associated with this SDG.

7.9 Compound Identification

PFC analytes are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

All identified compounds met the specified criteria.

7.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8 Metals Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 32. Holding Time for Method SW-846 6010C/7470A/7471B

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B) from the data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
MW-2022-3	Zinc (MB)	Detected sample results <RL and <BAL	"U" at the RL

Note:
RL = reporting limit
MB = Method blank

8.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

8.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All initial and continuing calibration verification standard recoveries were within the control limit.

8.3.2 Lower Limit of Quantitation Check Standard

The lower limit of quantitation check (LLQC) check standard serves to verify the linearity of calibration of the analysis at the reporting limit. The LLQC recoveries must be within 70 to 130%, and 50 to 150% for antimony (Sb), lead (Pb), and thallium (Tl). The LLQC standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the LLQC standard analysis are presented below in the LLQC standards evaluation table (if applicable).

All LLQC standard recoveries were within control limits.

8.3.3 ICP Interference Control Sample

The Interference Control Sample (ICS) verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

8.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils and RPD 20% for water matrices and 35% for soil matrices. The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample associated with this SDG.

8.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices

The laboratory duplicate analysis was not performed on sample associated with this SDG.

8.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical

method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

8.6 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All LCS recoveries were within control limits.

8.7 Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 15% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample.

The serial dilution was not performed on sample associated with this SDG.

8.8 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9 General Chemistry Analyses

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 36. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Cyanide was detected in the associated method blank batch- 669722 and associated calibration blanks; however, the associated sample results were non-detect. No qualification of the sample results was required.

9.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

9.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration must be greater than 0.995 analytes and all initial and continuing calibration verification standard recoveries must be within the control limits of 85%-115%.

All initial and continuing calibration verification standard recoveries were within the control limit.

9.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

9.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample associated with this SDG.

9.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis was not performed on a sample within this SDG.

9.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

9.6 Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120% for water and within laboratory established acceptance limits for soils.

The LCS analysis exhibited recoveries within the control limits.

9.7 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip

blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 40. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.2%	3
SVOCs	95.7%	10
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
*+	LCS and/or LCSD is outside acceptance limits, high biased.
*1	LCS/LCSD RPD exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
S1+	Surrogate recovery exceeds control limits, high biased.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Appendices

Appendix A **Chain of Custody**

Appendix B **Annotated Sample Analysis Data Sheets**

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-208391-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-8	480-208391-1	Water	04/26/2023		X	X	X	X	X	X	X
MW-2022-9	480-208391-2	Water	04/27/2023		X	X	X	X	X	X	X
DUP-1	480-208391-3	Water	04/27/2023	MW-2022-9	X	X	X	X	X	X	X
TRIP BLANK 042723	480-208391-4	Water	04/27/2023		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	2	1	1	0	0	0	4
SVOCs	2	1	0	0	0	0	3
PCBs	2	1	0	0	0	0	3
PEST	2	1	0	0	0	0	3
HERB	2	1	0	0	0	0	3
OPC	2	1	0	0	0	0	3
PCDD/PCDF	2	1	0	0	0	0	3
PFAS	2	1	0	0	0	0	3
Metals	2	1	0	0	0	0	3
MISC	2	1	0	0	0	0	3

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

Table 5. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-9 / DUP-1	All target compounds	U	U	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

2.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.4 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Field Duplicate (RPD)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 6. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 7. Samples with Laboratory Control Sample and Laboratory Control Sample Duplicate Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-8 MW-2022-9 DUP-1	Prep Batch: 667747	a,a-Dimethylphenethylamine	<10%	<10%
		p-Phenylene diamine		

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 8. Laboratory Control Sample and Laboratory Control Sample Duplicate Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

Table 9. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-9 / DUP-1	1,2,4-Trichlorobenzene	0.60 J	10 U	AC
	Di-n-butyl phthalate	0.54 J	0.64 J	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

3.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.5 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Laboratory Control Sample (LCS) %R		X	X		
Laboratory Control Sample Duplicate (LCSD) %R		X	X		
Dilution Factor		X		X	
Field Duplicate (RPD)		X		X	

Notes:
%R Percent recovery
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 10. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix. Results for duplicate samples are summarized in the following table.

Table 11. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-9 / DUP-1	All target compounds	U	U	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

4.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.4 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	
Field Duplicate (RPD)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

5 Pesticide/Herbicide Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 12. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criterion.

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 13. Summary of Blank Contamination Qualifications

Sample ID	Method	Compounds	Sample Result	Qualification
MW-2022-8 MW-2022-9 DUP-1	SW-846 8081B	alpha-BHC [MB]	Detected sample results <RL and <BAL	"U" at the RL
MW-2022-8		gamma-BHC (Lindane) [MB]		

Notes:
MB Method blank
RL Reporting limit

5.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 14. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-9 / DUP-1	delta-BHC	0.011 J	0.011 J	AC

Note:
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

5.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.5 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 15. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the "B" qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 16. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-8	1,2,3,4,6,7,8-HpCDF (MB) OCDD (MB) Total HpCDD (MB) Total HpCDF (MB) Total HxCDD (MB) Total HxCDF (MB) Total PeCDF (MB)	Detected sample results <RL and <BAL	"U" at the RL
MW-2022-9	1,2,3,4,6,7,8-HpCDF (MB) OCDD (MB) Total HpCDD (MB) Total HpCDF (MB) Total HxCDD (MB) Total PeCDF (MB)	Detected sample results <RL and <BAL	"U" at the RL
DUP-1	1,2,3,4,6,7,8-HpCDF (MB) 1,2,3,4,7,8-HxCDD (MB) OCDD (MB) Total HpCDD (MB) Total HpCDF (MB) Total HxCDD (MB) Total HxCDF (MB) Total PeCDF (MB)	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank

RL Reporting limit

6.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 17. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compounds	Sample Result	Duplicate Result	RPD
MW-2022-9 / DUP-1	1,2,3,4,6,7,8-HpCDD	0.68 J	0.77 J	AC
	1,2,3,4,7,8,9-HpCDF	0.51 J	0.23 J	AC
	1,2,3,4,7,8-HxCDF	27 U	0.54 J	AC
	1,2,3,6,7,8-HxCDF	27 U	0.26 J	AC
	1,2,3,7,8-PeCDD	27 U	0.11 J	AC
	1,2,3,7,8-PeCDF	0.16 J	0.58 J	AC
	2,3,4,6,7,8-HxCDF	27 U	0.32 J	AC
	2,3,4,7,8-PeCDF	27 U	0.13 J	AC
	2,3,7,8-TCDD	5.4 U	0.11 J	AC
	2,3,7,8-TCDF	5.4 U	0.24 J	AC
	OCDF	2.8 J	2.3 J	AC
	Total PeCDD	0.55 J	0.64 J	AC
	Total TCDD	0.32 J	0.24 J	AC
	Total TCDF	0.87 J	0.35 J	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

6.4 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.5 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.6 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
Dilution Factor		X		X	
Field Duplicate (RPD)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 18. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water. Results for duplicate samples are summarized in the following table.

Table 19. Field Duplicate Sample Result

Sample ID / Duplicate ID	Compounds	Sample Result	Duplicate Result	RPD
MW-2022-9 / DUP-1	Perfluorobutanesulfonic acid (PFBS)	2.8	2.9	AC
	Perfluorobutanoic acid (PFBA)	9.7	11	AC
	Perfluoroheptanoic acid (PFHpA)	88	97	9.7%
	Perfluorohexanesulfonic acid (PFHxS)	0.61 J	0.64 J	AC
	Perfluorohexanoic acid (PFHxA)	26	24	8.0%
	Perfluorononanoic acid (PFNA)	0.88 J	0.92 J	AC
	Perfluorooctanoic acid (PFOA)	65	64	1.6
	Perfluoropentanoic acid (PFPeA)	15	16	6.5%

Notes:
U non-detect

Sample ID / Duplicate ID	Compounds	Sample Result	Duplicate Result	RPD

AC Acceptable

The results and calculated RPDs between the parent sample and field duplicate were acceptable.

7.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.4 Data Validation Checklist

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	
Field Duplicate (RPD)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

8 Metals Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 20. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Zinc was detected in the associated method blank batch- 667665; however, the associated sample results were non-detect. No qualification of the sample results was required.

8.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 21. Field Duplicate Sample Results

Sample ID / Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
MW-2022-9 / DUP-1	Barium	0.0087	0.0086	AC

Note:
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

8.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.5 Data Validation Checklist

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

9 General Chemistry Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 22. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

The analyses that exceeded the holding are presented in the following table.

Table 23. Summary of Holding Time Exceedances

Sample ID	Holding Time	Criteria
MW-2022-8	The sample analyzed on 15th day from collection (Cyanide)	14 days from collection to analysis

Sample results associated with sample locations analyzed by analytical method SW-846 9012B were qualified, as specified in the table below. All other holding times were met.

Table 24. Summary of Holding Time Qualifications

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Cyanide was detected in the associated method blank batch- 654363 and associated calibration blanks; however, the associated sample results were non-detect. No qualification of the sample results was required.

9.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 25. Field Duplicate Sample Results

Sample ID / Duplicate ID	Analytes	Sample Result	Duplicate Result	RPD
MW-2022-9 / DUP-1	Cyanide	U	U	AC
	Sulfide	U	U	AC

Sample ID / Duplicate ID	Analytes	Sample Result	Duplicate Result	RPD

Notes:
U non-detect
AC Acceptable
The results between the parent sample and field duplicate were acceptable.

9.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.5 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B / SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X	X		
Reporting limits (units)		X		X	
Blanks					
A. Instrument Blanks		X	X		
B. Method Blanks		X	X		
Field Duplicate (RPD)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under the Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 26. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	97.5%	4
SVOCs	98.4%	6
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data review were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Appendix B

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
*1	LCS/LCSD RPD exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1-	Surrogate recovery exceeds control limits, low biased.
S1+	Surrogate recovery exceeds control limits, high biased.

LCMS

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
^2	Calibration Blank (ICB and/or CCB) is outside acceptance limits.
B	Compound was found in the blank and sample.
F1	MS and/or MSD recovery exceeds control limits.
H	Sample was prepped or analyzed beyond the specified holding time. This does not meet regulatory requirements.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Appendices

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-208460-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-4D	480-208460-1	Water	04/28/2023		X	X	X	X	X	X	X
TRIP BLANK 042823	480-208460-2	Water	04/28/2023		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	1	0	1	0	0	0	2
SVOCs	1	0	0	0	0	0	1
PCBs	1	0	0	0	0	0	1
PEST	1	0	0	0	0	0	1
HERB	1	0	0	0	0	0	1
OPC	1	0	0	0	0	0	1
PCDD/PCDF	1	0	0	0	0	0	1
PFAS	1	0	0	0	0	0	1
Metals	1	0	0	0	0	0	1
MISC	1	0	0	0	0	0	1

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Acetone was detected in the associated trip blank-TRIP BLANK 042823; however, the associated sample results were non-detect. No qualification of the sample results was required.

2.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.4 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.2.1 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 6. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compounds	Criteria
MW-2022-4D	Continuing Calibration RRF	4-Nitroquinoline-1-oxide	0.0081
		Kepone	0.0010
	CCV %D	Kepone	-97.0%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 7. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Continuing Calibration Verification (CCV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.3 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 8. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery
MW-2022-4D	Prep Batch: 668062	Kepone	<10%
		p-Phenylene diamine	

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 9. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.5 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Laboratory Control Sample (LCS) %R		X	X		
Dilution Factor		X		X	
Continuing calibration RRFs		X	X		
Continuing calibration %Ds		X	X		

Notes:
%R Percent recovery
%D Percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 10. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

5 Pesticide/Herbicide Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 11. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

The analyses that exceeded the holding are presented in the following table.

Table 12. Summary of Holding Time Exceedances

Sample ID	Holding Time	Criteria
MW-2022-4D	The sample extracted on 11th day from collection	7 days from collection to extraction

Sample results associated with sample locations analyzed by analytical method SW-846 8141B were qualified, as specified in the table below. All other holding times were met.

Table 13. Summary of Holding Time Qualifications

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 14. Summary of Blank Contamination Qualifications

Sample ID	Method	Compound	Sample Result	Qualification
MW-2022-4D	SW-846 8081B	4,4'-DDT (MB)	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RL Reporting limit

5.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.4 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X	X		
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 15. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 16. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-4D	1,2,3,4,6,7,8-HpCDF (MB) 1,2,3,4,7,8-HxCDD (MB) OCDD (MB) Total HpCDD (MB) Total HpCDF (MB) Total HxCDD (MB) Total HxCDF (MB) Total PeCDF (MB)	Detected sample results <RL and <BAL	“U” at the RL

Notes:
MB Method blank
RL Reporting limit

6.3 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.5 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 17. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

8 Metals Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 18. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.3 Data Validation Checklist

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

9 General Chemistry Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 19. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Cyanide was detected in the associated method blank batch- 669203 and associated calibration blanks; however, the associated sample results were non-detect. No qualification of the sample results was required.

9.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.4 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B / SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under the Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 20. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	96.3%	2
SVOCs	97.6%	3
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data review were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Annotated Sample Analysis Data Sheets

Definitions/Glossary

Client: ARCADIS U.S. Inc
Job ID: 480-208460-1
Project/Site: GE Woods Pond Parcel

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
*1	LCS/LCSD RPD exceeds control limits.
B	Compound was found in the blank and sample.
H	Sample was prepped or analyzed beyond the specified holding time. This does not meet regulatory requirements.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
S1+	Surrogate recovery exceeds control limits, high biased.

LCMS

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Client Sample ID: MW-2022-4D

Appendices

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-208517-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-4S	480-208517-1	Water	5/1/2023		X	X	X	X	X	X	X
TRIP BLANK 050123	480-208517-2	Water	5/1/2023		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	0	0	0	1	0	1	2
SVOCs	0	0	0	1	0	0	1
PCBs	0	0	0	1	0	0	1
PEST	0	0	0	1	0	0	1
HERB	0	0	0	1	0	0	1
OPC	0	0	0	1	0	0	1
PCDD/PCDF	0	0	0	1	0	0	1
PFAS	0	0	0	1	0	0	1
Metals	0	0	0	1	0	0	1
MISC	0	0	0	1	0	0	1

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

2.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

2.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

2.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

2.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits.

2.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

2.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

2.7 Matrix Spike/Matrix Spike Duplicate Analysis

Matrix Spike / Matrix Spike Duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

2.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

2.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

2.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

The laboratory calibrated for the compounds 2-Chloro-1,3-butadiene, 2-Chloroethyl vinyl ether, Acetonitrile, Methacrylonitrile, Methyl methacrylate, and Propionitrile; however, they were not spiked or evaluated in the LCS. Therefore, these results will be qualified as estimated, J/UJ.

2.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 8. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

3.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

3.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 9. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compounds	Criteria
MW-2022-4S	CCV %D	p-Phenylene diamine	-34.4%
		4-Nitroquinoline-1-oxide	-83.2%
	Continuing Calibration RRF	4-Nitroquinoline-1-oxide	0.0081

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 10. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Continuing Calibration Verification (CCV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

Continuing Calibration	Criteria	Sample Result	Qualification

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

3.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

3.7 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

3.8 Laboratory Control Sample Analysis

The Laboratory Control Sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 11. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery
MW-2022-4S	Prep Batch: 668062	Famphur	<LL but >10%
		Kepone	<10%
		p-Phenylene diamine	<10%

Note:
AC Acceptable

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 12. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

3.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

3.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review,

the overall data quality is within the guidelines specified in the method.

3.12 Data Validation Checklist

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 14. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

4.3 System Performance

System performance and column resolution were acceptable.

4.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

4.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. Multiple-point calibrations were performed for Aroclor 1016 and 1260 only. Single-point calibrations were performed for the remaining Aroclors. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

4.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The continuing calibration %D were within the specified control limits.

4.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires that both the surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries reported from the primary column were within control limits.

4.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

4.7 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

4.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix.

A field duplicate analysis was not performed on sample associated with this SDG.

4.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

The dual column analysis exhibited an acceptable %RPD between columns.

4.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 16. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criterion.

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing

concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
MW-2022-4S	4,4'-DDT	Detected sample results <RL and <BAL	"U" at the RL

RL = reporting limit

5.3 System Performance

System performance and column resolution were acceptable.

5.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All compounds associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

5.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (20%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

5.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 17. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compounds	Criteria
MW-2022-4S	CCV %D (Method 8141)	Phorate	-41.0%

Sample ID	Continuing Calibration	Compounds	Criteria
		Methyl parathion	-24.4%
		Dimethoate	-24.8%
		Disulfoton	-16.0%
		Famphur	-16.2%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 10. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration Verification (CCV)	%D >15% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

5.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. Pesticide - herbicide analysis requires that one of the two pesticide - herbicide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

5.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

5.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries and RPDs within the control limits.

5.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on sample associated with this SDG.

5.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

Dual column analysis performed on the field samples exhibited RPDs within the control limit.

5.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 23. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 24. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-4S	1,2,3,4,6,7,8-HpCDF (MB) OCDD (MB) Total HpCDD (MB) Total HpCDF (MB) Total HxCDD (MB)	Detected sample results <RL and <BAL	“U” at the RL

Sample ID	Compounds	Sample Result	Qualification
	Total HxCDF (MB) Total PeCDF (MB)		

Notes:
MB Method blank
RL Reporting limit

6.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

System performance and column resolution were acceptable.

6.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

6.4.1 Initial Calibration

A maximum relative standard deviation (RSD) of 15% is allowed for all non-labeled compounds (target) and 30% is allowed for all labeled compounds (internal standards and recovery standards).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

6.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibited percent difference (%D) less than the control limit (20%).

The continuing calibration %D were within the specified control limits.

6.5 Labeled Standard Performance

Labeled standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the labeled standards exhibit recoveries within the control limits of 40% to 135%.

All labeled standard responses were within control limits.

6.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

6.7 Ongoing Precision Result / Laboratory Control Sample Analysis

The Ongoing Precision Result/Laboratory Control Sample (OPR/LCS) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the OPR analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

6.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on sample associated with this SDG.

6.9 Compound Identification

PCDD/PCDF compounds are identified by using the compound’s ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest.” This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as “I” (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.11 Data Validation Checklist

7 Perfluoroalkyl Substances Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 26. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of ten times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

7.3 Mass Calibration

Mass calibration and system performance were acceptable.

7.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

7.4.1 Initial Calibration

The percent relative standard deviation (%RSD) of the response factors (RF) must be less than 20%, or for linear calibration, $R^2 \geq 0.99$. Analytes must be within 70-130% of their true value for each calibration standard.

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

7.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (30%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits.

7.5 Isotopically Labelled Standards

7.5.1 Extracted Internal Standard

Labeled standards must be added to all field samples and QC samples prior to extraction. Extracted Internal Standard (EIS) recoveries must be within the limits of 50% to150% (25% to 150% for poor responding analytes FBA, PFPeA, fluorotelomer sulfonates).

All EIS recoveries were within the specified control limits.

7.5.2 Injection Internal Standards

Injection internal standards are added to the aliquot of sample dilutions, QC samples, and standards just prior to analysis. Peak areas must be within 50-150% of the area measured in the ICAL midpoint standard. On days when ICAL is not performed, the peak areas must be within 50-150% of the peak area measured in daily initial CCV.

Samples associated with internal standards exhibited responses within the control limits.

7.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD less than 30%. The MS/MSD recovery control limits do not apply when the concentration detected in the parent sample exceeds the MS/MSD spike level by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

7.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

7.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water.

A field duplicate analysis was not performed on sample associated with this SDG.

7.9 Compound Identification

PFC analytes are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

All identified compounds met the specified criteria.

7.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review,

the overall data quality is within the guidelines specified in the method.

7.11 Data Validation Checklist

8 Metals Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 32. Holding Time for Method SW-846 6010C/7470A/7471B

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

8.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

8.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All initial and continuing calibration verification standard recoveries were within the control limit.

8.3.2 Lower Limit of Quantitation Check Standard

The lower limit of quantitation check (LLQC) check standard serves to verify the linearity of calibration of the analysis at the reporting limit. The LLQC recoveries must be within 70 to 130%, and 50 to 150% for antimony (Sb), lead (Pb), and thallium (Tl). The LLQC standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the LLQC standard analysis are presented below in the LLQC standards evaluation table (if applicable).

All LLQC standard recoveries were within control limits.

8.3.3 ICP Interference Control Sample

The Interference Control Sample (ICS) verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

8.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils and RPD 20% for water matrices and 35% for soil matrices. The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample associated with this SDG.

8.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices

The laboratory duplicate analysis was not performed on sample associated with this SDG.

8.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

8.6 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All LCS recoveries were within control limits.

8.7 Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 15% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample.

The serial dilution was not performed on sample associated with this SDG.

8.8 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.9 Data Validation Checklist

9 General Chemistry Analyses

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 36. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Cyanide was detected in the associated method blank batch- 669584 and associated calibration blanks; however, the associated sample results were non-detect. No qualification of the sample results was required.

9.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

9.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration must be greater than 0.995 analytes and all initial and continuing calibration verification standard recoveries must be within the control limits of 85%-115%.

All initial and continuing calibration verification standard recoveries were within the control limit.

9.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

9.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample associated with this SDG.

9.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis was not performed on a sample within this SDG.

9.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

9.6 Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120% for water and within laboratory established acceptance limits for soils.

The LCS analysis exhibited recoveries within the control limits.

9.7 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.8 Data Validation Checklist for General Chemistry

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 40. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.2%	2
SVOCs	97.6%	3
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0

Parameter	Percent Usability	Rejected Data
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Appendix B

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
S1+	Surrogate recovery exceeds control limits, high biased.

LCMS

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-208542-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-7	480-208542-1	Water	05/02/2023		X	X	X	X	X	X	X
RB-050223	480-208542-2	Water	05/02/2023		X	X	X	X	X	X	X
TRIP BLANK 050223	480-208542-3	Water	05/02/2023		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	1	0	2	0	0	0	3
SVOCs	1	0	1	0	0	0	2
PCBs	1	0	1	0	0	0	2
PEST	1	0	1	0	0	0	2
HERB	1	0	1	0	0	0	2
OPC	1	0	1	0	0	0	2
PCDD/PCDF	1	0	1	0	0	0	2
PFAS	1	0	1	0	0	0	2
Metals	1	0	1	0	0	0	2
MISC	1	0	1	0	0	0	2

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Di-n-butyl phthalate was detected in the associated rinse blank-RB-050223; however, the associated sample results were non-detect. No qualification of the sample results was required.

3.3 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.3.1 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 6. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compound	Criteria
MW-2022-7 RB-050223	Continuing Calibration RRF	4-Nitroquinoline-1-oxide	0.0071

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 7. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J

Continuing Calibration	Criteria	Sample Result	Qualification
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Continuing Calibration Verification (CCV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.4 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 8. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compound	LCS Recovery
MW-2022-7 RB-050223	Prep Batch: 668392	p-Phenylene diamine	<10%

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 9. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ

Control Limit	Sample Result	Qualification
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.5 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.6 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 10. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

PCB-1242 was detected in the associated rinse blank-RB-050223; however, the associated sample results were non-detect. No qualification of the sample results was required.

4.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.4 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Equipment Blanks/Field Blanks		X	X		

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

5 Pesticide/Herbicide Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 11. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criterion.

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Delta-BHC was detected in the associated method blank batch-668392; however, the associated sample results were non-detect. No qualification of the sample results was required.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 12. Summary of Blank Contamination Qualifications

Sample ID	Method	Compound	Sample Result	Qualification
MW-2022-7	SW-846 8081B	4,4'-DDT (RB)	Detected sample results <RL and <BAL	"U" at the RL

Notes:

5.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.4 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Equipment Blanks / Field Blanks		X	X		
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 13. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 14. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-7	1,2,3,4,6,7,8-HpCDD (MB) 1,2,3,7,8-PeCDF (RB) OCDD (MB) Total HpCDD (MB) Total HxCDF (MB) Total PeCDD (MB) Total PeCDF (MB) Total TCDF (MB)	Detected sample results <RL and <BAL	“U” at the RL

6.3 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.
