Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 21. Summary of Blank Contamination Qualifications

Sample Locations	Analytes	Sample Result	Qualification
PZ-2022-8 (12-16')	1,2,3,4,6,7,8-HpCDD 1,2,3,4,6,7,8-HpCDF 1,2,3,4,7,8,9-HpCDF 1,2,3,4,7,8-HxCDF 1,2,3,6,7,8-HxCDF 1,2,3,7,8,9-HxCDD 1,2,3,7,8-PeCDD 1,2,3,7,8-PeCDF 2,3,4,6,7,8-HxCDF OCDF Total HpCDD Total HpCDF Total HxCDD Total HxCDF Total PeCDD Total PeCDF Total TCDF	Detected sample results <RL and <BAL	““U” at the RL

RL = reporting limit

6.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

System performance and column resolution were acceptable.

6.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

6.4.1 Initial Calibration

A maximum relative standard deviation (RSD) of 15% is allowed for all non-labeled compounds (target) and 30% is allowed for all labeled compounds (internal standards and recovery standards).

6.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibited percent difference (%D) less than the control limit (20%).

All compounds associated with the calibrations were within the specified control limits.

6.5 Labeled Standard Performance

Labeled standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the labeled standards exhibit recoveries within the control limits of 40% to 135%.

All labeled standard responses were within control limits.

6.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on a sample within this SDG.

6.7 Ongoing Precision Result /Laboratory Control Sample Analysis

The Ongoing Precision Result/Laboratory Control Sample (OPR/LCS) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the OPR analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

6.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 50% for soil matrices is applied to the RPD between the parent sample and the field

duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil.

A field duplicate analysis was not performed on a sample within this SDG.

6.9 Compound Identification

PCDD/PCDF compounds are identified by using the compound’s ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest.” This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as “I” (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7 Metals Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 22. Holding Time for Method SW-846 6010C/7470/7471

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
SW-846 7470	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.
SW-846 7471	Soil	28 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

7.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were detected in the associated QA blanks; however, the associated sample results were greater than the BAL and/or were non-detect. Therefore, sample results greater than the BAL resulted in the removal of the laboratory qualifier (B). No other qualification of the sample results was required.

7.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

7.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-Inductively Coupled Plasma (ICP) analytes and all initial calibration verification standard recoveries were within control limits.

All initial and continuing calibration verification standard recoveries were within the control limit.

7.3.2 Lower Limit of Quantitation Check Standard

The lower limit of quantitation check (LLQC) check standard serves to verify the linearity of calibration of the analysis at the reporting limit. The LLQC recoveries must be within 70 to 130%, and 50 to 150% for antimony (Sb), lead (Pb), and thallium (Tl). The LLQC standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the LLQC standard analysis are presented below in the LLQC standards evaluation table (if applicable).

All LLQC standard recoveries were within control limits.

7.3.3 Inductively Coupled Plasma Interference Control Sample

The Interference Control Sample (ICS) verifies the laboratories' interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

7.4 Matrix Spike/Laboratory Duplicate Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

7.4.1 Matrix Spike Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS recovery control limits do not apply for MS performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

All analytes associated with MS/MSD recoveries were within control limits with the exception of the following analyte present in the table below.

Table 23. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample Location	Analyte	MS Recovery	MSD Recovery
PZ-2022-8 (26-30')	Zinc	75% (Acceptable)	74%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with this SDG.

Table 24. Evaluation Criteria for Matrix Spike / Matrix Spike Duplicate Recoveries

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

7.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices

MS/MSD analysis was performed in replacement of the laboratory duplicate analysis. The MS/MSD recoveries exhibited acceptable RPD.

7.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on a sample location within this SDG.

7.6 Laboratory Control Sample Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7.7 Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution performed on sample location PZ-2022-8 (26-30') exhibited %D within the control limit.

7.8 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8 General Chemistry Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 25. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
	Soil		Cool to <6 °C.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9
	Soil	14 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

8.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

8.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration must be greater than 0.995 analytes and all initial and continuing calibration verification standard recoveries must be within the control limits of 85%-115%.

All initial and continuing calibration verification standard recoveries were within the control limit.

8.4 Matrix Spike/Matrix Spike Duplicate /Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on a sample within this SDG.

8.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis was not performed on a sample within this SDG.

8.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less

than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on a sample within this SDG.

8.6 Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120% for water and the laboratory established control limits for soil.

The LCS analysis exhibited recoveries within the control limits.

8.7 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.8 Data Validation Checklist for General Chemistry

General Chemistry: SW9012/SM 4500 S2 F	Reported		Performance Acceptable		Not Required

9 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 26. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	100%	0
SVOCs	99.9%	1
PCBs	100%	0
PEST	100%	0
HERB	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC)

parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Northeast, LLC places the ownership of method, analyte & accreditation compliance upon out subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Northeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Northeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said complicance to Eurofins Environment Testing Northeast, LLC.

Possible Hazard Identification	*Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)*
Unconfirmed	☐ *Return To Client* ☐ *Disposal By Lab* ☐ *Archive For* _____ *Months*

PDI Summary Report for Upland Disposal Facility Area

GE-Pittsfield/Housatonic River Site

Pittsfield, Massachusetts

Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans, Metals, and Miscellaneous Analyses

SDG # 480-196725-1

Analyses Performed By:
Eurofins Lancaster Laboratories LLC,
Lancaster, Pennsylvania, USA

Eurofins Buffalo, Amherst, New York, USA

Eurofins Pittsburgh, Pennsylvania, USA

Report #47170R
Review Level: Tier I/II
Project: 30150026.3000

Appendices

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-196725-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis					
					VOCs	SVOCs	PEST/PCBs/ HERB/OPC	PCDD/ PCDF	MET	MISC
PZ-2022-5 (0-1)	480-196725-1	Soil	04/12/2022		X	X	X	X	X	X
MW-2022-4 (0-1)	480-196725-2	Soil	04/12/2022		X	X	X	X	X	X
PZ-2022-5 (13-16)	480-196725-3	Soil	04/12/2022		X	X	X	X	X	X

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	

Items Reviewed	Reported		Performance Acceptable		Not Required

12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	0	0	0	3	0	0	3
SVOCs	0	0	0	3	0	0	3
PCBs	0	0	0	3	0	0	3
PEST	0	0	0	3	0	0	3
HERB	0	0	0	3	0	0	3
OPC	0	0	0	3	0	0	3
PCDD/PCDF	0	0	0	3	0	0	3
Metals	0	0	0	3	0	0	3
MISC	0	0	0	3	0	0	3

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were analyzed within the specified holding time criterion.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

2.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

2.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

2.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

2.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the continuing calibrations were within the specified control limits.

2.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis

requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

2.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

2.7 Matrix Spike/Matrix Spike Duplicate Analysis

Matrix Spike / Matrix Spike Duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis performed on sample PZ-2022-5 (0-1) exhibiting recoveries outside of the control limits are presented in the following table.

Table 5. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Compounds	MS Recovery	MSD Recovery
PZ-2022-5 (0-1)	2-Butanone (MEK)	<LL but >10%	<LL but >10%
	Acetone	<LL but >10%	<LL but >10%
	Acrolein	<LL but >10%	<LL but >10%
	Acrylonitrile	AC	<LL but >10%
	Ethyl methacrylate	<LL but >10%	<LL but >10%
	Vinyl acetate	<LL but >10%	<10%

Notes:
LL Lower control limit
AC Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 6. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

Samples associated with MS/MSD recoveries exhibiting an RPD greater than the control limit are presented in the following table.

Table 7. Samples with Relative Percent Difference Greater than Control Limits

Sample ID	Compounds
PZ-2022-5 (0-1)	1,1,1-Trichloroethane
	1,1,2,2-Tetrachloroethane
	1,1,2-Trichloroethane
	1,1-Dichloroethane
	1,1-Dichloroethene
	1,2,3-Trichloropropane
	1,2-Dibromo-3-Chloropropane
	1,2-Dichloroethane
	2-Butanone (MEK)
	2-Hexanone
	3-Chloro-1-propene
	4-Methyl-2-pentanone (MIBK)
	Acetone
	Acrolein

Sample ID	Compounds
	Acrylonitrile
	Bromoform
	Carbon disulfide
	Chloroform
	Chloromethane
	Dibromomethane
	Dichlorodifluoromethane
	Ethyl methacrylate
	Iodomethane
	Methylene Chloride
	trans-1,2-Dichloroethene
	trans-1,4-Dichloro-2-butene
	Vinyl acetate
	Vinyl chloride

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 8. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

2.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

2.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil.

A field duplicate sample was not collected within this SDG.

2.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

The laboratory calibrated for the compounds 2-Chloro-1,3-butadiene, 2-Chloroethyl vinyl ether, Acetonitrile, Methacrylonitrile, Methyl methacrylate, and Propionitrile; however, they were not spiked or evaluated in the LCS or MS/MSD. Therefore, these results will be qualified as estimated, J/UJ.

2.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.12 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 9. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criterion.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

3.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

3.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 10. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Initial/Continuing	Compound	Criteria
PZ-2022-5 (0-1) MW-2022-4 (0-1) PZ-2022-5 (13-16)	ICV %D	Benzidine	-28.8%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 11. Initial and Continuing Calibration Evaluation Criteria and Qualifications

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J

Initial/Continuing	Criteria	Sample Result	Qualification
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 30% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
Continuing Calibration	%D >25% (increase/ decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

3.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

3.7 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis performed on sample PZ-2022-5 (0-1) exhibiting recoveries outside of the control limits are presented in the following table.

Table 12. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Compounds	MS Recovery	MSD Recovery
PZ-2022-5 (0-1)	a,a-Dimethylphenethylamine	<10%	<10%
	Benzidine	<10%	<10%
	Famphur	<10%	AC
	p-Phenylene diamine	<10%	<10%

Note:
AC Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 13. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

3.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 14. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery
PZ-2022-5 (0-1) MW-2022-4 (0-1) PZ-2022-5 (13-16)	Prep Batch: 621698	a,a-Dimethylphenethylamine Famphur p-Phenylene diamine	<10%

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 15. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

Note:
Sample results were not qualified as rejected I due to the deviations listed above.

3.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil.

A field duplicate sample was not collected within this SDG.

3.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

3.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 5. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

4.3 System Performance

System performance and column resolution were acceptable.

4.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

4.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. Multiple-point calibrations were performed for Aroclor 1016 and 1260 only. Single-point calibrations were performed for the remaining Aroclors.

4.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

4.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires that both the surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries reported from the primary column were within control limits.

4.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis performed on sample PZ-2022-5 (0-1) exhibited recoveries and RPDs within the control limits.

4.7 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

4.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix.

A field duplicate sample was not collected within this SDG.

4.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

The dual column analysis exhibited an acceptable %RPD between columns.

4.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.11 Data Validation Checklist

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 17. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Water/Soil	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criteria.

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were

greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 18. Summary of Blank Contamination Qualifications

Sample ID	Method	Compounds	Sample Result	Qualification
PZ-2022-5 (0-1) PZ-2022-5 (13-16)	SW-846 8081B	4,4'-DDT (MB)	Detected sample results <RL and <BAL	"U" at the RL
MW-2022-4 (0-1)		Endrin aldehyde (MB)	Detected sample results <RL and <BAL	"U" at the RL

Notes:

5.3 System Performance

System performance and column resolution were acceptable.

5.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

5.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

5.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All compounds associated with the calibrations were within the specified control limits.

5.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. Pesticide – herbicide analysis requires that one of the two pesticide – herbicide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

5.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis performed on sample PZ-2022-5 (0-1) exhibiting recoveries outside of the control limits are presented in the following table.

Table 19. MS/MSD Analysis for Sample Exhibiting Recoveries Outside the Control Limit

Sample ID	Method	Compound	MS Recovery	MSD Recovery
PZ-2022-5 (0-1)	SW-846 8141B	Disulfoton	<10%	<10%

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 20. Evaluation Criteria for MS/MSD Recoveries

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration (D).	Detect	No Action
	Non-detect	

5.7 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

5.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate sample was not collected within this SDG.

5.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

Dual column analysis performed on the field samples exhibited RPDs within the control limit.

5.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 21. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water/Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 22. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
PZ-2022-5 (0-1)	1,2,3,4,7,8,9-HpCDF (MB) 1,2,3,4,7,8-HxCDD (MB) 2,3,7,8-TCDF (MB) Total TCDF (MB)	Detected sample results <RL	“U” at the RL
MW-2022-4 (0-1)	1,2,3,4,7,8,9-HpCDF (MB) 1,2,3,4,7,8-HxCDD (MB) 1,2,3,4,7,8-HxCDF (MB) 2,3,4,6,7,8-HxCDF (MB) Total HpCDF (MB) Total HxCDF (MB)	Detection sample results <RL	“U” at the RL

Sample ID	Compounds	Sample Result	Qualification

Notes:
MB Method blank
RL Reporting limit

6.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

System performance and column resolution were acceptable.

6.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

6.4.1 Initial Calibration

A maximum relative standard deviation (RSD) of 15% is allowed for all non-labeled compounds (target) and 30% is allowed for all labeled compounds (internal standards and recovery standards).

6.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibited percent difference (%D) less than the control limit (20%).

All compounds associated with the calibrations were within the specified control limits.

6.5 Labeled Standard Performance

Labeled standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the labeled standards exhibit recoveries within the control limits of 40% to 135%.

Samples associated with labeled standards exhibiting recoveries outside of the control limits are presented in the following table.

Table 23. Samples Associated with Labeled Standards Exhibiting Recoveries Outside of the Control Limits

Sample ID	Labeled Standard	% Recovery
PZ-2022-5 (0-1)	13C-OCDF	<LL but >10%

Note:
LL Lower control limit

The criteria used to evaluate the labeled standard are presented in the following table. In the case of a labeled standard deviation, the sample results associated with the deviant fraction are qualified as documented in the table below.

Table 24. Evaluation Criteria for Surrogate Recoveries

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

6.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis performed on sample PZ-2022-5 (0-1) exhibiting recoveries outside of the control limits are presented in the following table.

Table 25. MS/MSD Analysis for Sample Exhibiting Recoveries Outside the Control Limit

Sample ID	Compounds	MS Recovery	MSD Recovery
PZ-2022-5 (0-1)	1,2,3,4,6,7,8-HpCDD	AC	>UL
	OCDD	SR>4X	SR>4X

Notes:
AC = Acceptable
UL = Upper control limit
SR>4X = Sample result greater than four times the matrix spike concentration

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 26. Evaluation Criteria for MS/MSD Recoveries

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration (D).	Detect	No Action
	Non-detect	

Samples associated with MS/MSD recoveries exhibiting an RPD greater than the control limit are presented in the following table.

Table 27. Samples with Relative Percent Difference Greater than Control Limits

Sample ID	Compound
PZ-2022-5 (0-1)	1,2,3,4,6,7,8-HpCDD

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 28. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

6.7 Ongoing Precision Result / Laboratory Control Sample Analysis

The Ongoing Precision Result/Laboratory Control Sample (OPR/LCS) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the OPR analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

6.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate sample was not collected within this SDG.

6.9 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7 Metals Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 29. Holding Time for Method SW-846 6010C/7471B

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.

Method	Matrix	Holding Time	Preservation
SW-846 7471B	Soil	28 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

7.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

7.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

7.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All initial and continuing calibration verification standard recoveries were within the control limit.

7.3.2 Lower Limit of Quantitation Check Standard

The lower limit of quantitation check (LLQC) check standard serves to verify the linearity of calibration of the analysis at the reporting limit. The LLQC recoveries must be within 70 to 130%, and 50 to 150% for antimony (Sb), lead (Pb), and thallium (Tl). The LLQC standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the LLQC standard analysis are presented below in the LLQC standards evaluation table (if applicable).

All LLQC standard recoveries were within control limits.

7.3.3 ICP Interference Control Sample

The Interference Control Sample (ICS) verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

7.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

7.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% and RPD of 35%. The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis performed on sample PZ-2022-5 (0-1) exhibiting recoveries outside of the control limits are presented in the following table.

Table 30. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Analyte	MS Recovery	MSD Recovery
PZ-2022-5 (0-1)	Barium	>125%	>125%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with the preparation batch- 621940.

Table 31. Evaluation Criteria for MS/MSD Recoveries

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

Samples associated with MS/MSD recoveries exhibiting an RPD greater than of the control limit are presented in the following table.

Table 32. Samples with Relative Percent Difference Greater than Control Limits

Sample ID	Analyte	MS/MSD RPD
PZ-2022-5 (0-1)	Barium	118%

The criteria used to evaluate MS/MSD RPD are presented in the following table. In the case of a MS/MSD RPD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with the preparation batch- 621940.

Table 33. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
>35% (soil)	Non-detect	UJ
	Detect	J

7.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices

MS/MSD analysis was performed in replacement of the laboratory duplicate analysis. The MS/MSD RPD exceedances are documented in the Section 7.4.

7.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate sample was not collected within this SDG.

7.6 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All LCS recoveries were within control limits, with the exception of the analytes associated with sample locations, as presented in the following table.

Table 34. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Analyte	LCS Recovery
PZ-2022-5 (0-1) MW-2022-4 (0-1) PZ-2022-5 (13-16)	621940	Antimony	70.9%

The criteria used to evaluate LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified.

Table 35. Laboratory Control Sample Recovery Criteria and Qualifications

Control limit	Sample Result	Qualification
LCS (soil) percent recovery < lower limit	Non-detect	UJ
	Detect	J
LCS (soil) percent recovery > upper limit	Non-detect	No Action
	Detect	J

7.7 Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 15% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample

The serial dilution performed on sample PZ-2022-5 (0-1).

All serial dilutions were within control limits, with the exception of the analytes presented in the following table.

Table 36. Samples with Serial Dilution Difference Outside Control Limits

Sample ID	Analyte	Serial Dilution (%D)
PZ-2022-5 (0-1)	Zinc	15.4%

The criteria used to evaluate the serial dilution are presented in the following table. In the case of a serial dilution deviation, the sample results are qualified as documented in the table below.

Table 37. Serial Dilution Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> 15%	Non-detect	UJ
	Detect	J

7.8 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8 General Chemistry Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 38. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.

Method	Matrix	Holding Time	Preservation
	Soil		Cool to <6 °C.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9
	Soil	14 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

8.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

8.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration must be greater than 0.995 analytes and all initial and continuing calibration verification standard recoveries must be within the control limits of 85%-115%.

All initial and continuing calibration verification standard recoveries were within the control limit.

8.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis performed on sample PZ-2022-5 (0-1) exhibiting recoveries outside of the control limits are presented in the following table.

Table 39. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Analyte	MS Recovery	MSD Recovery
PZ-2022-5 (0-1)	Cyanide	<10%	<10%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to the parent sample result for the analyte cyanide associated with this SDG.

Table 40. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

8.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis was not performed on a sample within this SDG.

8.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate sample was not collected within this SDG.

8.6 Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120% for waters and within laboratory established acceptance limits for soils.

The LCS analysis exhibited recoveries within the control limits.

8.7 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.8 Data Validation Checklist for General Chemistry

9 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 41. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	99.4%	1
SVOCs	97.3%	10
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	95.2%	1

Parameter	Percent Usability	Rejected Data
PCDD/PCDF	100%	0
Metals	100%	0
MISC	83.3%	1

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Appendix B

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
*5-	Isotope dilution analyte is outside acceptance limits, low biased.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
^+	Continuing Calibration Verification (CCV) is outside acceptance limits, high biased.
^2	Calibration Blank (ICB and/or CCB) is outside acceptance limits.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Data Validation Report

PDI Summary Report for Upland Disposal Facility Area

GE-Pittsfield/Housatonic River Site

Pittsfield, Massachusetts

Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans, Metals, and Miscellaneous Analyses

SDG # 480-196779-1

Analyses Performed By:
Eurofins Lancaster Laboratories LLC,
Lancaster, Pennsylvania, USA

Eurofins Buffalo, Amherst, New York, USA

Eurofins Pittsburgh, Pennsylvania, USA

Report #47171R
Review Level: Tier I/II
Project: 30150026.3000

Contents

1 Summary 7
1.1 Analytical Data Package Documentation 7
1.2 Data Validation Procedures 8
2 Volatile Organic Compound Analyses 10
2.1 Holding Times 10
2.2 Blank Contamination 11
2.3 Mass Spectrometer Tuning 11
2.4 Calibration 11
2.4.1 Initial Calibration 12
2.4.2 Continuing Calibration 12
2.5 Surrogates/System Monitoring Compounds 13
2.6 Internal Standard Performance 13
2.7 Matrix Spike/Matrix Spike Duplicate Analysis 13
2.8 Laboratory Control Sample Analysis 14
2.9 Field Duplicate Analysis 15
2.10 Compound Identification 15
2.11 System Performance and Overall Assessment 15
2.12 Data Validation Checklist 15
3 Semi-volatile Organic Compound Analyses 17
3.1 Holding Times 17
3.2 Blank Contamination 17

Appendices

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-196779-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis					
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	MET	MISC
PZ-2022-5 (26-30)	480-196779-1	Soil	04/13/2022		X	X	X	X	X	X
FB_041322	480-196779-2	Water	04/13/2022		X	X	X		X	X
MW-2022-4 (12-16)	480-196779-3	Soil	04/13/2022		X	X	X	X	X	X
MW-2022-4 (26-30)	480-196779-4	Soil	04/13/2022		X	X	X	X	X	X
DUP-2-041322	480-196779-5	Soil	04/13/2022	MW-2022-4 (26-30)	X	X	X	X	X	X
MW-2022-4 (45-47)	480-196779-6	Soil	04/13/2022		X	X	X	X	X	X
MW-2022-4 (60-64)	480-196779-7	Soil	04/13/2022		X	X	X	X	X	X

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X

11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	0	0	0	5	1	1	7
SVOCs	0	0	0	5	1	1	7
PCBs	0	0	0	5	1	1	7
PEST	0	0	0	5	1	1	7
HERB	0	0	0	5	1	1	7
OPC	0	0	0	5	1	1	7
PCDD/PCDF	0	0	0	5	1	0	6
Metals	0	0	0	5	1	1	7
MISC	0	0	0	5	1	1	7

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 5. Summary of Blank Contamination Qualifications

Sample ID	Compound	Sample Result	Qualification
DUP-2-041322 MW-2022-4 (60-64)	Acetone (FB)	Detected sample results <RL and <BAL	"U" at the RL

Notes:
FB Field blank
RL Reporting limit

2.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

2.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

2.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

2.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 6. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Initial/Continuing	Compounds	Criteria
FB_041322	CCV %D	Dichlorobromomethane	+32.9%
		2-Hexanone	+27.8%
		Chlorodibromomethane	+41.4%
		Bromoform	+46.5%
		trans-1,4-Dichloro-2-butene	-29.9%
		1,2-Dibromo-3-Chloropropane	+52.1%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 7. Initial and Continuing Calibration Evaluation Criteria and Qualifications

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	

Initial/Continuing	Criteria	Sample Result	Qualification
Initial Calibration	%RSD > 30% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
Continuing Calibration	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

2.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

2.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

2.7 Matrix Spike/Matrix Spike Duplicate Analysis

Matrix Spike / Matrix Spike Duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

2.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 8. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery
FB_041322	621874	1,2-Dibromo-3-Chloropropane	>UL
		2-Hexanone	
		Bromoform	
		Chlorodibromomethane	
		Dichlorobromomethane	
		Ethyl methacrylate	

Note:
UL Upper control limit

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 9. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

2.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

Table 10. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-4 (26-30) / DUP-2-041322	Chloroform	0.50 J	0.78 J	AC

Note:
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

2.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

The laboratory calibrated for the compounds 2-Chloro-1,3-butadiene, 2-Chloroethyl vinyl ether, Acetonitrile, Methacrylonitrile, Methyl methacrylate, and Propionitrile; however, they were not spiked or evaluated in the LCS or MS/MSD. Therefore, these results will be qualified as estimated, J/UJ.

2.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.12 Data Validation Checklist

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 11. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criterion.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing

concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compound 4-chloro-3-methylphenol was detected in the associated field blank- FB_041322; however, the associated sample results were non-detect. No qualification of the sample results was required. All other criteria were met.

3.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

3.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

3.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 12. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Initial/Continuing	Compounds	Criteria
FB_041322	ICV %D	Benzidine	-36.4%
	CCV %D	N-Nitrosodimethylamine	-36.6%
		Hexachlorocyclopentadiene	-34.9%
		4-Nitrophenol	-34.7%
		Benzidine	-61.6%

Sample ID	Initial/Continuing	Compounds	Criteria
		N-Nitrosomorpholine	-26.2%
		a,a-Dimethylphenethylamine	-29.7%
		Sulfotepp	+27.8%
		Phorate	-25.6%
		Disulfoton	-26.5%
		4-Nitroquinoline-1-oxide	-42.4%
		Methapyrilene	-37.9%
PZ-2022-5 (26-30) MW-2022-4 (12-16) MW-2022-4 (26-30) DUP-2-041322 MW-2022-4 (45-47) MW-2022-4 (60-64)	ICV %D	Benzidine	-28.8%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 13. Initial and Continuing Calibration Evaluation Criteria and Qualifications

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 30% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
Continuing Calibration	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ

Initial/Continuing	Criteria	Sample Result	Qualification
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

3.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

3.7 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis performed on sample MW-2022-4 (12-16) exhibiting recoveries outside of the control limits are presented in the following table.

Table 14. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Compounds	MS Recovery	MSD Recovery
MW-2022-4 (12-16)	a,a-Dimethylphenethylamine	<10%	<10%
	Benzidine	<10%	<10%
	p-Phenylene diamine	<10%	<10%

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 15. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

Samples associated with MS/MSD recoveries exhibiting an RPD greater than the control limit are presented in the following table.

Table 165. Samples with Relative Percent Difference Greater than Control Limits

Sample ID	Compounds
MW-2022-4 (12-16)	1,3,5-Trinitrobenzene
	1-Naphthylamine
	2-Acetylaminofluorene
	4-Nitrophenol
	4-Nitroquinoline-1-oxide
	Diethyl phthalate
	Dimethoate

Sample ID	Compounds
	Chlorobenzilate
	Famphur
	Kepone
	N-Nitro-o-toluidine

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 17. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

3.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 18. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery
PZ-2022-5 (26-30) MW-2022-4 (12-16) MW-2022-4 (26-30) DUP-2-041322 MW-2022-4 (45-47) MW-2022-4 (60-64)	Prep Batch: 621866	1-Naphthylamine	<LL but >10%
		2-Naphthylamine	<LL but >10%
		4-Aminobiphenyl	<LL but >10%
		a,a-Dimethylphenethylamine	<10%
		Famphur	<10%
		p-Phenylene diamine	<10%
FB_041322	Prep Batch: 621867	3,3'-Dimethylbenzidine	<LL but >10%
		a,a-Dimethylphenethylamine	<10%
		Kepone	<LL but >10%

Sample ID	Batch	Compounds	LCS Recovery
		Methapyrilene	<LL but >10%
		p-Phenylene diamine	<10%

Note:
LL Lower control limit

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 19. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

Table 20. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-4 (26-30) / DUP-2-041322	All target compounds	U	U	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

3.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

3.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 21. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

Method	Matrix	Holding Time	Preservation
	Soil	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

4.3 System Performance

System performance and column resolution were acceptable.

4.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

4.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. Multiple-point calibrations were performed for Aroclor 1016 and 1260 only. Single-point calibrations were performed for the remaining Aroclors.

4.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

4.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires that both the surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries reported from the primary column were within control limits.

4.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

4.7 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

4.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix. Results for duplicate samples are summarized in the following table.

Table 22. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-4 (26-30) / DUP-2-041322	All target compounds	U	U	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

4.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

The dual column analysis exhibited an acceptable %RPD between columns.

4.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 23. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Water/Soil	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

The analyses that exceeded the holding are presented in the following table.

Table 24. Summary of Holding Time Exceedances

Sample ID	Holding Time	Criteria
FB_041322	The sample extracted on 8th day from collection	7 days from collection to extraction

Sample results associated with sample locations analyzed by analytical method SW-846 8141B were qualified, as specified in the table below. All other holding times were met.

Table 25. Summary of Holding Time Qualifications

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds endrin aldehyde, and methoxychlor were detected in the associated method blank batch- 621775; however, the associated sample is a field blank. Hence, qualification of the sample results was not required.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 26. Summary of Blank Contamination Qualifications

Sample ID	Method	Compound	Sample Result	Qualification
PZ-2022-5 (26-30) MW-2022-4 (12-16) MW-2022-4 (26-30) DUP-2-041322	SW-846 8081B	4,4'-DDT (MB)	Detected sample results <RL and <BAL	"U" at the RL

Sample ID	Method	Compound	Sample Result	Qualification
MW-2022-4 (45-47) MW-2022-4 (60-64)				

Notes:
MB Method blank
RL Reporting limit

5.3 System Performance

System performance and column resolution were acceptable.

5.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

5.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

5.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 6. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Initial/Continuing	Compounds	Criteria
FB_041322	CCV %D	Heptachlor	+22.6%
MW-2022-4 (60-64)	CCV %D	Endrin Ketone	+45.8%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 7. Initial and Continuing Calibration Evaluation Criteria and Qualifications

Initial/Continuing	Criteria	Sample Result	Qualification
Initial Calibration	%RSD > 20% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
Continuing Calibration	%D >15% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J

5.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. Pesticide - herbicide analysis requires that one of the two pesticide - herbicide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

5.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

5.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 29. Samples with Laboratory Control Sample/Laboratory Control Sample Duplicate Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
FB_041322	621775	4,4'-DDT	>UL	Not Analysed
		beta-BHC		
		Endosulfan sulfate		
		Heptachlor		

Note:
UL Upper control limit

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 30. Laboratory Control Sample/Laboratory Control Sample Duplicate Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

5.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 31. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-4 (26-30) / DUP-2-041322	All target compounds	U	U	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

5.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

Dual column analysis performed on the field samples exhibited RPDs within the control limit.

5.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 32. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water/Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 33. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
PZ-2022-5 (26-30)	1,2,3,4,6,7,8-HpCDD (MB) 1,2,3,4,6,7,8-HpCDF (MB) 1,2,3,4,7,8-HxCDD (MB) 1,2,3,4,7,8-HxCDF (MB) 1,2,3,6,7,8-HxCDF (MB) 1,2,3,7,8,9-HxCDD (MB) 1,2,3,7,8,9-HxCDF (MB) 1,2,3,7,8-PeCDD (MB) 1,2,3,7,8-PeCDF (MB) 2,3,4,6,7,8-HxCDF (MB) 2,3,4,7,8-PeCDF (MB) OCDF (MB) Total HpCDD (MB) Total HpCDF (MB) Total HxCDD (MB) Total HxCDF (MB) Total PeCDD (MB) Total PeCDF (MB)	Detected sample results <RL and <BAL	“U” at the RL

Sample ID	Compounds	Sample Result	Qualification
MW-2022-4 (12-16)	1,2,3,4,6,7,8-HpCDD (MB) 1,2,3,4,6,7,8-HpCDF (MB) 1,2,3,4,7,8-HxCDD (MB) 1,2,3,4,7,8-HxCDF (MB) 1,2,3,6,7,8-HxCDF (MB) 1,2,3,7,8,9-HxCDD (MB) 1,2,3,7,8,9-HxCDF (MB) 1,2,3,7,8-PeCDF (MB) 2,3,4,6,7,8-HxCDF (MB) 2,3,4,7,8-PeCDF (MB) 2,3,7,8-TCDF (MB) OCDD (MB) OCDF (MB) Total HpCDD (MB) Total HpCDF (MB) Total HxCDD (MB) Total HxCDF (MB) Total PeCDF (MB) Total TCDF (MB)	Detected sample results <RL and <BAL	“U” at the RL

RL Reporting limit

6.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

System performance and column resolution were acceptable.

6.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

6.4.1 Initial Calibration

A maximum relative standard deviation (RSD) of 15% is allowed for all non-labeled compounds (target) and 30% is allowed for all labeled compounds (internal standards and recovery standards).

6.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibited percent difference (%D) less than the control limit (20%).

All compounds associated with the calibrations were within the specified control limits.

6.5 Labeled Standard Performance

Labeled standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the labeled standards exhibit recoveries within the control limits of 40% to 135%.

All labeled standard responses were within control limits.

6.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

6.7 Ongoing Precision Result / Laboratory Control Sample Analysis

The Ongoing Precision Result/Laboratory Control Sample (OPR/LCS) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the OPR analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

6.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 34. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compounds	Sample Result	Duplicate Result	RPD
MW-2022-4 (26-30) / DUP-2-041322	1,2,3,6,7,8-HxCDD	0.055 J	5.8 U	AC
	2,3,7,8-TCDD	0.035 J	1.2 U	AC
	Total TCDD	0.035 J	1.2 U	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

6.9 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7 Metals Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 35. Holding Time for Method SW-846 6010C/7470A/7471B

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.

Method	Matrix	Holding Time	Preservation
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7471B	Soil	28 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

7.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analyte zinc was detected in the associated method blank batch- 621976; however, the associated sample is a field blank. Hence, qualification of the sample results was not required. All other criteria were met.

7.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

7.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All initial and continuing calibration verification standard recoveries were within the control limit.

7.3.2 Lower Limit of Quantitation Check Standard

The lower limit of quantitation check (LLQC) check standard serves to verify the linearity of calibration of the analysis at the reporting limit. The LLQC recoveries must be within 70 to 130%, and 50 to 150% for antimony (Sb), lead (Pb), and thallium (Tl). The LLQC standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the LLQC standard analysis are presented below in the LLQC standards evaluation table (if applicable).

All LLQC standard recoveries were within control limits.

7.3.3 ICP Interference Control Sample

The Interference Control Sample (ICS) verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

7.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

7.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils and RPD 20% for water matrices and 35% for soil matrices. The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample associated with this SDG.

7.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices

The laboratory duplicate analysis was not performed on sample associated with this SDG.

7.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 36. Field Duplicate Sample Results

Sample ID / Duplicate ID	Analytes	Sample Result	Duplicate Result	RPD
MW-2022-4 (26-30) / DUP-2-041322	Arsenic	2.9	3.2	AC
	Barium	13.4	17.0	24%
	Beryllium	0.23	0.21 J	AC
	Cadmium	0.051 J	0.087 J	AC
	Chromium	4.6	4.0	14%
	Cobalt	7.6	6.9	10%
	Copper	6.1	5.4	AC
	Lead	5.7	6.5	AC
	Nickel	9.6	9.6	AC
	Vanadium	5.3	5.3	0.0%
	Zinc	27.2	28.8	6%

Note:
AC Acceptable

The results and calculated RPDs between the parent sample and field duplicate were acceptable.

7.6 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All LCS recoveries were within control limits, with the exception of the analytes associated with samples, as presented in the following table.

Table 37. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Analytes	LCS Recovery
PZ-2022-5 (26-30) MW-2022-4 (12-16) MW-2022-4 (26-30) DUP-2-041322 MW-2022-4 (45-47)	Prep Batch: 622883	Antimony	69.8%
	Prep Batch: 622170	Mercury	79.0%

Sample ID	Batch	Analytes	LCS Recovery
MW-2022-4 (60-64)			

The criteria used to evaluate LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified.

Table 38. Laboratory Control Sample Recovery Criteria and Qualifications

Control limit	Sample Result	Qualification
LCS (soil) percent recovery < lower limit	Non-detect	UJ
	Detect	J
LCS (soil) percent recovery > upper limit	Non-detect	No Action
	Detect	J

7.7 Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 15% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample

The serial dilution was not performed on sample associated with this SDG.

7.8 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8 General Chemistry Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 39. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
	Soil		Cool to <6 °C.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9
	Soil	14 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

8.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

8.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration must be greater than 0.995 analytes and all initial and continuing calibration verification standard recoveries must be within the control limits of 85%-115%.

All initial and continuing calibration verification standard recoveries were within the control limit.

8.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS analysis performed on sample FB_041322 for the analyte sulfide exhibited recovery within the control limits.

The MS/MSD analysis performed on sample PZ-2022-5 (26-30) for the analyte cyanide exhibiting recoveries outside of the control limits are presented in the following table.

Table 40. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Analyte	MS Recovery	MSD Recovery
PZ-2022-5 (26-30)	Cyanide	0%	43%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to the parent sample result for the analyte cyanide associated with this SDG.

Table 41. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R

Control limit	Sample Result	Qualification
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

8.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis was not performed on a sample within this SDG.

8.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 42. Field Duplicate Sample Results

Sample ID / Duplicate ID	Analytes	Sample Result	Duplicate Result	RPD
MW-2022-4 (26-30) / DUP-2-041322	All target analytes	U	U	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

8.6 Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120% for water and within laboratory established acceptance limits for soils.

The LCS analysis exhibited recoveries within the control limits.

8.7 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.8 Data Validation Checklist for General Chemistry

9 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 43. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	99.5%	2
SVOCs	97.9%	18
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
Metals	100%	0
MISC	92.9%	1

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

480-196779 Chain of Custody

Possible Hazard Identification
X Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☐ Unknown ☐ Radiological

Deliverable Requested: I, II, III, IV, Other (specify)

Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)
☐ Return To Client X Disposal By Lab ☐ Archive For _____ Months

Special Instructions/QC Requirements:

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Northeast, LLC places the ownership of method, analyte & accreditation compliance upon out subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listec above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Northeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Northeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said complicance to Eurofins Environment Testing Northeast, LLC.

Possible Hazard Identification	*Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)*

Appendix B

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
B	Compound was found in the blank and sample.
H	Sample was prepped or analyzed beyond the specified holding time
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Data Validation Report

PDI Summary Report for Upland Disposal Facility Area

GE-Pittsfield/Housatonic River Site
Pittsfield, Massachusetts

Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans, Metals, and Miscellaneous Analyses

SDG # 480-197371-1

Analyses Performed By:
Eurofins Lancaster Laboratories LLC,
Lancaster, Pennsylvania, USA

Eurofins Buffalo, Amherst, New York, USA

Eurofins Pittsburgh, Pennsylvania, USA

Report # 47309R
Review Level: Tier I/II
Project: 30150026.3000

Contents

1 Summary 8

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-197371-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis					
					VOCs	SVOCs	PEST/PCBs/HERB/OPC	PCDD/PCDF	MET	MISC
MW2022-5 (0.0-1.0)	480-197371-1	Soil	04/29/22			X	X	X	X	X
MW2022-5 (0.5)	480-197371-2	Soil	04/29/22		X					
MW2022-5 (12.0-16.0)	480-197371-3	Soil	04/29/22			X	X	X	X	X
MW2022-5 (14.0)	480-197371-4	Soil	04/29/22		X					
MW2022-5 (26.0-30.0)	480-197371-5	Soil	04/29/22			X	X	X	X	X
MW2022-5 (29.0)	480-197371-6	Soil	04/29/22		X					
MW2022-5 (45.0-49.0)	480-197371-7	Soil	04/29/22			X	X	X	X	X
MW2022-5 (46.0)	480-197371-8	Soil	04/29/22		X					

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorus Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X	X		
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance
7.It is noted in the case narrative that Chain-of-Custody (COC) was not received for the samples MW2022-5 (12.0-16.0) (480-197371-3), MW2022-5 (26.0-30.0) (480-197371-5) and MW2022-5 (45.0-49.0) (480-197371-7) received at TAPITT on 5/7/22.

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);

- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	0	0	0	4	0	0	4
SVOCs	0	0	0	4	0	0	4
PCBs	0	0	0	4	0	0	4
PEST	0	0	0	4	0	0	4
HERB	0	0	0	4	0	0	4
OPC	0	0	0	4	0	0	4
PCDD/PCDF	0	0	0	4	0	0	4
Metals	0	0	0	4	0	0	4
MISC	0	0	0	4	0	0	4

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Method	Matrix	Holding Time	Preservation
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were analyzed within the specified holding time criterion.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

2.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

2.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

2.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

2.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 5. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Initial/Continuing	Compound	Criteria
MW2022-5 (0.5) MW2022-5 (14.0) MW2022-5 (29.0) MW2022-5 (46.0)	CCV %D	2-Chloro-1,3-butadiene	31.5%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 6. Initial and Continuing Calibration Evaluation Criteria and Qualifications

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 30% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
Continuing Calibration	%D >25% (increase in sensitivity)	Non-detect	UJ
		Detect	J
	%D >25% (decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R

Initial/Continuing	Criteria	Sample Result	Qualification
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

2.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

2.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

2.7 Matrix Spike/Matrix Spike Duplicate Analysis

Matrix Spike / Matrix Spike Duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis performed on sample MW2022-5 (0.5) exhibiting recoveries outside of the control limits are presented in the following table.

Table 7. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Compounds	MS Recovery	MSD Recovery
MW2022-5 (0.5)	1,1,1,2-Tetrachloroethane	<LL but >10%	AC

Sample ID	Compounds	MS Recovery	MSD Recovery
	1,1,2,2-Tetrachloroethane	<LL but >10%	AC
	1,2-Dibromo-3-Chloropropane	<LL but >10%	<LL but >10%
	2-Butanone (MEK)	<LL but >10%	<LL but >10%
	2-Hexanone	<LL but >10%	<LL but >10%
	3-Chloro-1-propene	<LL but >10%	<LL but >10%
	4-Methyl-2-pentanone (MIBK)	<LL but >10%	<LL but >10%
	Acetone	<LL but >10%	<LL but >10%
	Acrolein	< 10%	< 10%
	Acrylonitrile	<LL but >10%	<LL but >10%
	Bromoform	<LL but >10%	<LL but >10%
	Carbon tetrachloride	<LL but >10%	<LL but >10%
	Chlorobenzene	<LL but >10%	AC
	Chlorodibromomethane	<LL but >10%	<LL but >10%
	cis-1,3-Dichloropropene	<LL but >10%	<LL but >10%

	o-Xylene	<LL but >10%	AC
	Styrene	<LL but >10%	<LL but >10%
	Tetrachloroethene	<LL but >10%	<LL but >10%
	trans-1,3-Dichloropropene	<LL but >10%	<LL but >10%
	trans-1,4-Dichloro-2-butene	<LL but >10%	<LL but >10%
	Trichloroethene	<LL but >10%	AC
	Vinyl acetate	< 10%	< 10%

Notes:
LL Lower control limit

Sample ID	Compounds	MS Recovery	MSD Recovery

AC Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 8. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

Samples associated with MS/MSD recoveries exhibiting an RPD greater than the control limit are presented in the following table.

Table 9. Samples with Relative Percent Difference Greater than Control Limits

Sample ID	Compounds
MW2022-5 (0.5)	1,1,1,2-Tetrachloroethane
	1,1,1-Trichloroethane
	1,1,2,2-Tetrachloroethane
	1,1,2-Trichloroethane
	1,1-Dichloroethane
	1,1-Dichloroethene
	1,2,3-Trichloropropane
	1,2-Dibromo-3-Chloropropane
	1,2-Dichloroethane
	1,2-Dichloropropane

Sample ID	Compounds

	trans-1,2-Dichloroethene
	trans-1,3-Dichloropropene
	trans-1,4-Dichloro-2-butene
	Trichloroethene
	Trichlorofluoromethane
	Vinyl chloride

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 10. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

2.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

2.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil.

A field duplicate sample was not collected within this SDG.

2.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

The laboratory calibrated for the compounds 2-Chloro-1,3-butadiene, 2-Chloroethyl vinyl ether, Acetonitrile, Methacrylonitrile, Methyl methacrylate, and Propionitrile; however, they were not spiked or evaluated in the LCS or MS/MSD. Therefore, these results will be qualified as estimated, J/UJ.

2.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.12 Data Validation Checklist

Table 11. Data validation checklist for VOCs

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 12. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

Note:
s.u. = standard units

All samples were analyzed within the specified holding time criterion.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

3.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

3.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 13. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Initial/Continuing	Compound	Criteria
MW2022-5 (0.0-1.0) MW2022-5 (12.0-16.0) MW2022-5 (26.0-30.0) MW2022-5 (45.0-49.0)	ICV%D	Benzidine	-27.6%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 14. Initial and Continuing Calibration Evaluation Criteria and Qualifications

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J

Continuing Calibration	%D >25% (increase in sensitivity)	Non-detect	UJ
		Detect	J
	%D >25% (decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

3.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

3.7 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis performed on sample MW2022-5 (0.0-1.0) exhibiting recoveries outside of the control limits are presented in the following table.

Table 15. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Compounds	MS Recovery	MSD Recovery
MW2022-5 (0.0-1.0)	1,3-Dinitrobenzene	AC	> UL
	1,4-Dioxane	< 10%	< 10%
	1,4-Naphthoquinone	AC	> UL
	2,4-Dinitrotoluene	> UL	> UL
	2,6-Dichlorophenol	AC	> UL
	2-Chloronaphthalene	AC	> UL
	2-Toluidine	< 10%	< 10%
	4-Aminobiphenyl	< 10%	< 10%
	4-Chloro-3-methylphenol	AC	> UL
	Benzo[a]anthracene	> UL	> UL
	Benzo[a]pyrene	> UL	> UL
	Benzo[g,h,i]perylene	AC	> UL
	Chrysene	AC	> UL
	Diethyl phthalate	AC	> UL
	Ethyl methanesulfonate	< 10%	AC
	Fluoranthene	> UL	> UL
	Indeno[1,2,3-cd]pyrene	AC	> UL
	N-Nitro-o-toluidine	> UL	> UL
	N-Nitrosodiethylamine	AC	< 10%
	N-Nitrosodimethylamine	< 10%	< 10%
	N-Nitrosomethylethylamine	< 10%	< 10%
	Phenanthrene	AC	> UL
	Sulfotepp	AC	> UL
	Thionazin	> UL	> UL

Notes:

AC Acceptable
UL Upper limit

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 16. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

Samples associated with MS/MSD recoveries exhibiting an RPD greater than the control limit are presented in the following table.

Table 17. Samples with Relative Percent Difference Greater than Control Limits

Sample ID	Compounds
MW2022-5 (0.0-1.0)	1,2-Dichlorobenzene
	1,3,5-Trinitrobenzene
	1,4-Naphthoquinone
	2,3,4,6-Tetrachlorophenol
	2,6-Dinitrotoluene
	2-Nitroaniline
	3 & 4 Methylphenol
	3-Methylphenol
	4-Chloro-3-methylphenol
	4-Chlorophenyl phenyl ether
	4-Methylphenol

Sample ID	Compounds
	Chrysene
	Dibenzofuran
	Diethyl phthalate
	Chlorobenzilate
	Fluorene
	Isophorone
	N-Nitrosodi-n-propylamine
	N-Nitrosopiperidine
	Safrole
	Sulfotepp

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 18. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

3.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 19. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery
MW2022-5 (0.0-1.0) MW2022-5 (12.0-16.0) MW2022-5 (26.0-30.0) MW2022-5 (45.0-49.0)	Prep Batch: 624196	Famphur	< 10%
		Pentachlorophenol	> UL

Note:

UL Upper limit

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 20. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil.

A field duplicate sample was not collected within this SDG.

3.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

3.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 22. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

4.3 System Performance

System performance and column resolution were acceptable.

4.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

4.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. Multiple-point calibrations were performed for Aroclor 1016 and 1260 only. Single-point calibrations were performed for the remaining Aroclors.

4.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

4.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires that both the surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries reported from the primary column were within control limits.

4.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis performed on sample MW2022-5 (0.0-1.0) exhibited recoveries and RPDs within the control limits.

4.7 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

4.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix.

A field duplicate sample was not collected within this SDG.

4.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

The dual column analysis exhibited an acceptable %RPD between columns.

4.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.11 Data Validation Checklist

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 24. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Water /Soil	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

The analyses that exceeded the holding are presented in the following table.

Table 25. Summary of Holding Time Exceedances

Sample Locations	Method	Holding Time	Criteria
MW2022-5 (0.0-1.0)	SW-846 8141B	Sample was extracted 56th date from the date of collection	7 days from collection to extraction
MW2022-5 (12.0-16.0) MW2022-5 (26.0-30.0) MW2022-5 (45.0-49.0)	SW-846 8141B	Sample was extracted 10h date from the date of collection	

Sample results associated with sample locations analyzed by analytical method SW-846 8141B were qualified, as specified in the table below. All other holding times were met.

Table 26. Summary of Holding Time Qualifications

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 27. Summary of Blank Contamination Qualifications

Sample ID	Method	Compound	Sample Result	Qualification
MW2022-5 (12.0-16.0) MW2022-5 (26.0-30.0) MW2022-5 (45.0-49.0)	SW-846 8081B	4,4'-DDT (MB)	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RL Reporting limit

5.3 System Performance

System performance and column resolution were acceptable.

5.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

5.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

5.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All Compounds associated with calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 28. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Method	Initial/Continuing	Compound	Criteria
MW2022-5 (0.0-1.0)	8141B	CCV %D	Dimethoate	-19.9%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified as below.

Table 29. Initial and Continuing Calibration Evaluation Criteria and Qualifications

Initial/Continuing	Criteria	Sample Result	Qualification
Initial Calibration	%RSD > 20%or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
Continuing Calibration	%D >15% (increase in sensitivity)	Non-detect	UJ
		Detect	J
	%D >15% (decrease in sensitivity)	Non-detect	UJ
		Detect	J

5.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. Pesticide - herbicide analysis requires that one of the two pesticide - herbicide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

Sample locations associated with surrogates exhibiting recoveries outside of the control limits presented in the following table.

Table 30. Summary of Surrogates Outside Specified Control Limits

Sample Locations	Method	Surrogate	Recovery
MW2022-5 (0.0-1.0)	8081B	DCB Decachlorobiphenyl	D
		Tetrachloro-m-xylene	D

Note:

D Diluted

The criteria used to evaluate the surrogate recoveries are presented in the following table. In the case of a surrogate deviation, the sample results are qualified as documented in the table below.

Table 31. Surrogates Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	No Action
	Detect	J
< LL but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Surrogates diluted below the calibration curve due to the high concentration of a target compounds	Non-detect	UJ[1]
	Detect	J[1]

Note:

[1] A more concentrated analysis was not performed with surrogate compounds within the calibration range; therefore, no determination of extraction efficiency could be made.

5.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis performed on sample MW2022-5 (0.0-1.0) for the analytical method SW-846 8081B,8082A, 8141B,8151A and on sample MW2022-5 (12.0-16.0) for analytical method 8141B exhibiting recoveries outside of the control limits are presented in the following table.

Table 32. MS/MSD Analysis for Sample Exhibiting Recoveries Outside the Control Limit

Sample ID	Method	Compounds	MS Recovery	MSD Recovery
MW2022-5 (0.0-1.0)	SW-846 8081B	4,4'-DDT	> UL	> UL
		beta-BHC	AC	< 10%
		cis-Chlordane	> UL	> UL
		Dieldrin	AC	< 10%
		Endosulfan I	< 10%	< 10%
		Endrin aldehyde	AC	< 10%
		Endrin ketone	< 10%	< 10%
		gamma-BHC (Lindane)	< LL but > 10%	AC
		Heptachlor	< 10%	< 10%
		Methoxychlor	< LL but > 10%	AC
		trans-Chlordane	> UL	AC
MW2022-5 (0.0-1.0)	SW-846 8141B	Dimethoate	< LL but > 10%	< LL but > 10%

Note:
UL Upper limit
AC Acceptable
LL Lower limit

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 33. Evaluation Criteria for MS/MSD Recoveries

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J

Control Limit	Sample Result	Qualification
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration (D).	Detect	No Action
	Non-detect	

Samples associated with MS/MSD recoveries exhibiting an RPD greater than the control limit are presented in the following table.

Table 34. Samples with Relative Percent Difference Greater than Control Limits

Sample ID	Method	Compounds
MW2022-5 (0.0-1.0)	SW-846 8081B	4,4'-DDE
		Aldrin
		gamma-BHC (Lindane)
		Heptachlor epoxide
		trans-Chlordane

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 35. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

5.7 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

5.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent

sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate sample was not collected within this SDG.

5.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

Table 36. Dual Column Analysis Exhibiting RPD Outside the Control Limit

Sample ID	Method	Compounds	RPD
MW2022-5 (12.0-16.0)	8081B	4,4'-DDT	36.4%
MW2022-5 (45.0-49.0)		Endrin aldehyde	39.7%

The criteria used to evaluate the RPD are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 37. Evaluation Criteria for Dual Column Analysis RPD

Control Limit (RPD)	Qualification
>25% to 70%	J
>70% to 100%	JN
>100% [1]	R
>100% to 200% (Interference detected)[2]	J or JN
>50% (PCB sample results less than the RL)	U

When the PCB sample results are less than the RL and the RPD greater than 50% the sample result are raised to the RL and reported as non-detect.

Note 1: If the pattern is confirmed sample results will be qualified as estimated (J). If pattern exhibits interference or if the PCB cannot be positively determined due to weathering the sample results will be qualified as tentative identification estimate (JN).

Note 2: If interference is detected in either column the sample results will be qualified as tentative identification estimate (JN).

Note:

If there is a qualification of an Aroclor and it is at least 10% of the Total PCBs, the qualifier “J” needs to be added to the Total PCB results.

If an Aroclor is qualified as “JN” and contributes more than 50% to the overall Total PCBs result, then the Total PCBs result will be qualified as estimate “J”.

5.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.11 Data Validation Checklist

Table 38. Data validation checklist for SW-846 8081B/8141B/8151A

6 Polychlorinated Dibenzodioxins and Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 39. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water/Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the "B" qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 40. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW2022-5 (26.0-30.0) Prep Batch: 252306	1,2,3,4,6,7,8-HpCDD (MB) 1,2,3,4,6,7,8-HpCDF (MB) 1,2,3,4,7,8-HxCDD (MB) 1,2,3,4,7,8-HxCDF (MB) 1,2,3,6,7,8-HxCDD (MB) 1,2,3,7,8,9-HxCDD (MB) 1,2,3,7,8,9-HxCDF (MB) 1,2,3,7,8-PeCDF (MB) 2,3,7,8-TCDF (MB) OCDD (MB) OCDF (MB) Total HpCDD (MB) Total HpCDF (MB) Total HxCDD (MB) Total HxCDF (MB) Total PeCDF (MB) Total TCDF (MB)	Detected sample results <RL and <BAL	"U" at the RL
MW2022-5 (0.0-1.0) Prep Batch: 253183	1,2,3,7,8-PeCDF (MB)	Detected sample results <RL and <BAL	"U" at the RL
MW2022-5 (12.0-16.0) Prep Batch: 254010	1,2,3,4,6,7,8-HpCDD (MB) 1,2,3,4,6,7,8-HpCDF (MB) 1,2,3,4,7,8,9-HpCDF (MB)	Detected sample results <RL and <BAL	"U" at the RL

Sample ID	Compounds	Sample Result	Qualification
	1,2,3,4,7,8-HxCDF (MB) 1,2,3,6,7,8-HxCDD (MB) 1,2,3,6,7,8-HxCDF (MB) 1,2,3,7,8,9-HxCDD (MB) 1,2,3,7,8-PeCDF (MB) 2,3,4,6,7,8-HxCDF (MB) 2,3,4,7,8-PeCDF (MB) OCDD (MB) OCDF (MB) Total HpCDD (MB) Total HpCDF (MB) Total HxCDD (MB) Total HxCDF (MB) Total PeCDF (MB)		
MW2022-5 (45.0-49.0) Prep Batch :254010	1,2,3,4,6,7,8-HpCDD (MB) 1,2,3,4,6,7,8-HpCDF (MB) 1,2,3,4,7,8,9-HpCDF (MB) 1,2,3,4,7,8-HxCDD (MB) 1,2,3,4,7,8-HxCDF (MB) 1,2,3,6,7,8-HxCDD (MB) 1,2,3,7,8,9-HxCDD (MB) 1,2,3,7,8,9-HxCDF (MB) 1,2,3,7,8-PeCDF (MB) 2,3,4,6,7,8-HxCDF (MB) 2,3,4,7,8-PeCDF (MB) OCDD (MB) OCDF (MB) Total HpCDD (MB) Total HpCDF (MB) Total HxCDD (MB) Total HxCDF (MB) Total PeCDF (MB)	Detected sample results <RL and <BAL	U” at the RL

Notes:

6.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

System performance and column resolution were acceptable.

6.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

6.4.1 Initial Calibration

A maximum relative standard deviation (RSD) of 15% is allowed for all non-labeled compounds (target) and 30% is allowed for all labeled compounds (internal standards and recovery standards).

6.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibited percent difference (%D) less than the control limit (20%).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 41. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Initial/Continuing	Compound	Criteria
MW2022-5 (0.0-1.0)	%RSD	2,3,7,8-TCDF	15.1%
MW2022-5 (26.0-30.0)		2,3,7,8-TCDD	16.7%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified as below.

Table 42. Initial and Continuing Calibration Evaluation Criteria and Qualifications

Initial/Continuing	Criteria	Sample Result	Qualification
Initial Calibration	%RSD > 15 % or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
Continuing Calibration	%D >20% (increase in sensitivity)	Non-detect	UJ
		Detect	J
	%D >20% (decrease in sensitivity)	Non-detect	UJ
		Detect	J

6.5 Labeled Standard Performance

Labeled standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the labeled standards exhibit recoveries within the control limits of 40% to 135%.

ALL labeled standards exhibiting recoveries within the control limits.

6.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis performed on sample MW2022-5 (0.0-1.0) exhibiting recoveries outside of the control limits are presented in the following table.

Table 43. MS/MSD Analysis for Sample Exhibiting Recoveries Outside the Control Limit

Sample ID	Compound	MS Recovery	MSD Recovery
MW2022-5 (0.0-1.0)	OCDD	AC	< LL but > 10%

Notes:
AC = Acceptable
LL = Lower limit

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 44. Evaluation Criteria for MS/MSD Recoveries

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
	Detect	No Action

Control Limit	Sample Result	Qualification
Parent sample concentration > four times the MS/MSD spiking solution concentration (D).	Non-detect	

Samples associated with MS/MSD recoveries exhibiting an RPD greater than the control limit are presented in the following table.

Table 45. Samples with Relative Percent Difference Greater than Control Limits

Sample ID	Compound
MW2022-5 (0.0-1.0)	OCDD

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 46. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

6.7 Ongoing Precision Result /Laboratory Control Sample Analysis

The Ongoing Precision Result/Laboratory Control Sample (OPR/LCS) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the OPR analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

6.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate sample was not collected within this SDG.

6.9 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.11 Data Validation Checklist

7 Metals Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 48. Holding Time for Method SW-846 6010C/7471B

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
SW-846 7471B	Soil	28 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

7.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analyte Copper 0.584(mg/Kg) were detected in the associated QA blanks; however, the associated sample results were greater than the BAL. Therefore, sample results greater than the BAL resulted in the removal of the laboratory qualifier (B). No other qualification of the sample results was required.

7.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

7.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All initial and continuing calibration verification standard recoveries were within the control limit.

7.3.2 Lower Limit of Quantitation Check Standard

The lower limit of quantitation check (LLQC) check standard serves to verify the linearity of calibration of the analysis at the reporting limit. The LLQC recoveries must be within 70 to 130%, and 50 to 150% for antimony (Sb), lead (Pb), and thallium (Tl). The LLQC standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the LLQC standard analysis are presented below in the LLQC standards evaluation table (if applicable).

All LLQC standard recoveries were within control limits.

7.3.3 ICP Interference Control Sample

The Interference Control Sample (ICS) verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

7.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

7.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils and RPD 20% for water matrices and 35% for soil matrices. The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis performed on sample MW2022-5 (0.0-1.0) exhibiting recoveries outside of the control limits are presented in the following table.

Table 49. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Analytes	MS Recovery	MSD Recovery
MW2022-5 (0.0-1.0)	Arsenic	>125%	AC
	Lead	>125%	AC
	Zinc	AC	63%

Note:

AC = Acceptable

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified.

Table 50. Evaluation Criteria for MS/MSD Recoveries

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

Samples associated with MS/MSD recoveries exhibiting an RPD greater than of the control limit are presented in the following table.

Table 51. Samples with Relative Percent Difference Greater than Control Limits

Sample ID	Analyte	MS/MSD RPD
MW2022-5 (0.0-1.0)	Arsenic	117%

The criteria used to evaluate MS/MSD RPD are presented in the following table. In the case of a MS/MSD RPD deviation, the sample results are qualified.

Table 52. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
>35% (soil)	Non-detect	UJ
	Detect	J

7.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices

MS/MSD analysis was performed in replacement of the laboratory duplicate analysis. The MS/MSD RPD exceedances are documented in the Section 7.4.

7.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate sample was not collected within this SDG.

7.6 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All LCS recoveries were within control limits, with the exception of the analytes associated with sample locations, as presented in the following table.

Table 53. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Analyte	LCS Recovery
MW2022-5 (0.0-1.0) MW2022-5 (12.0-16.0) MW2022-5 (26.0-30.0) MW2022-5 (45.0-49.0)	624717	Antimony	66.4%

The criteria used to evaluate LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified.

Table 54. Laboratory Control Sample Recovery Criteria and Qualifications

Control limit	Sample Result	Qualification
LCS (soil) percent recovery < lower limit	Non-detect	UJ
	Detect	J
LCS (soil) percent recovery > upper limit	Non-detect	No Action
	Detect	J

7.7 Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 15% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample

The serial dilution was performed on samples MW2022-5 (0.0-1.0). Serial dilution analysis exhibited acceptable results with the exceptions noted in the table below.

Table 55. Samples with serial dilution differences (%D) Outside Control Limits

Sample ID	Analytes	Serial Dilution (%D)
MW2022-5 (0.0-1.0)	Zinc	22%

The criteria used to evaluate the serial dilution are presented in the following table. In the case of a serial dilution deviation, the sample results are qualified as documented in the table below.

Table 56. Serial dilution Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> 10%	Non-detect	UJ
	Detect	J

7.8 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.9 Data Validation Checklist

Table 57. Data validation checklist for Metals

8 General Chemistry Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 58. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
	Soil		Cool to <6 °C.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9
	Soil	14 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

8.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

8.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration must be greater than 0.995 analytes and all initial and continuing calibration verification standard recoveries must be within the control limits of 85%-115%.

All initial and continuing calibration verification standard recoveries were within the control limit.

8.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis performed on sample MW2022-5 (0.0-1.0) exhibiting recoveries outside of the control limits are presented in the following table.

Table 59. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Analyte	MS Recovery	MSD Recovery
MW2022-5 (0.0-1.0)	Cyanide	41%	<10%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to the parent sample result for the analyte cyanide associated with this SDG.

Table 60. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J

Control limit	Sample Result	Qualification
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

8.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis was not performed on a sample within this SDG.

8.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate sample was not collected within this SDG.

8.6 Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120% for waters and within laboratory established acceptance limits for soil.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

8.7 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.8 Data Validation Checklist for General Chemistry

Table 61. Data validation checklist for General Chemistry

General Chemistry: SW-846 9012B/SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes

9 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 62. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.6%	3
SVOCs	97.8%	11
PCBs	100%	0
PEST	93.5%	6
HERB	100%	0
OPC	75%	7
PCDD/PCDF	100%	0
Metals	100%	0
MISC	87.5%	1

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Possible Hazard Identification
☒ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☐ Unknown ☐ Radiological

Deliverable Requested: I, II, III, IV, Other (specify)

Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)
☐ Return To Client ☒ Disposal By Lab ☐ Archive For _____ Months

Special Instructions/QC Requirements:

Appendices

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-198313-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis					
					VOCs	SVOCs	PEST/ PCBs/ HERB	PCDD/ PCDF	MET	MISC
MW-2022-2 (0-1)	480-198313-1	Soil	05/24/22		X	X	X	X	X	X
MW-2022-2 (12-22)	480-198313-2	Soil	05/24/22			X	X	X	X	X
MW-2022-2 (14)	480-198313-3	Soil	05/24/22		X					
MW-2022-2 (26-32)	480-198313-4	Soil	05/24/22			X	X	X	X	X
MW-2022-2 (28)	480-198313-5	Soil	05/24/22		X					
MW-2022-2 (33-37)	480-198313-6	Soil	05/24/22			X	X	X	X	X
MW-2022-2 (34)	480-198313-7	Soil	05/24/22		X					
DUP-5-052422	480-198313-8	Soil	05/24/22	MW-2022-2 (0-1)	X	X	X	X	X	X
FB-052422	480-198313-9	Water	05/24/22		X	X	X	X	X	X

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and

- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence

audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	0	0	0	4	1	1	6
SVOCs	0	0	0	4	1	1	6
PCBs	0	0	0	4	1	1	6
PEST	0	0	0	4	1	1	6
HERB	0	0	0	4	1	1	6
PCDD/PCDF	0	0	0	4	1	1	6
Metals	0	0	0	4	1	1	6
MISC	0	0	0	4	1	1	6

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were detected in the associated QA blanks; however, the associated sample results were non-detect. No other qualification of the sample results was required.

2.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

2.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

2.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

2.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 5. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Initial/Continuing	Compounds	Criteria
MW-2022-2 (0-1)	CCV %D	Acrolein	-29.7%
MW-2022-2 (14)			
MW-2022-2 (28)			
MW-2022-2 (34)			
DUP-5-052422			
FB-052422	CCV %D	Acrolein	-33.9%
		Acetone	+27.8%
		trans-1,4-Dichloro-2-butene	-41.3%
		1,2-Dibromo-3-Chloropropane	-25.6%
		Acetonitrile	+34.6%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 6. Initial and Continuing Calibration Evaluation Criteria and Qualifications

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J

Initial/Continuing	Criteria	Sample Result	Qualification
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 30% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
Continuing Calibration	%D >25% (increase in sensitivity)	Non-detect	UJ
		Detect	J
	%D >25% (decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:
[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

2.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

2.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits with the exceptions noted in the table below.

Table 7. Summary of Samples with Internal Standard Responses Outside Control Limits

Sample ID	Internal Standard	Response
DUP-5-052422	1,4-Dichlorobenzene-d4	< LL but > 25%

Note:
LL – Lower control limit

The criteria used to evaluate the internal standard responses are presented in the following table. In the case of an internal standard deviation, the compounds quantitated under the deviant internal standard are qualified as documented in the table below.

Table 8. Internal Standard Response Evaluation Criteria and Qualifications

Control limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No action
	Detect	J
< the lower control limit (LL) but > 25%	Non-detect	UJ
	Detect	J
< 25%	Non-detect	R
	Detect	J

Note:
Sample results were not qualified as rejected (R) due to the deviations listed above.

2.7 Matrix Spike/Matrix Spike Duplicate Analysis

Matrix Spike / Matrix Spike Duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

2.8 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits with the exceptions noted in the table below.

Table 9. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery
FB-052422	628289	Vinyl acetate	>UL

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 10. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

2.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

Table 11. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result (µg/Kg)	Duplicate Result (µg/Kg)	RPD
MW-2022-2 (0-1) / DUP-5-052422	All target compounds	U	U	AC

Note:
U – Non detect
AC – Acceptable

The calculated differences between the parent sample and field duplicate were acceptable.

2.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

The laboratory calibrated for the compounds 2-Chloro-1,3-butadiene, 2-Chloroethyl vinyl ether, Acetonitrile, Methacrylonitrile, Methyl methacrylate, and Propionitrile; however, they were not spiked or evaluated in the LCS or MS/MSD. Therefore, these results will be qualified as estimated, J/UJ.

2.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.12 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required

%D Percent difference

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 12. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criterion.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were detected in the associated QA blanks; however, the associated sample results were non-detect. No other qualification of the sample results was required.

3.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

3.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

3.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 13. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Initial/Continuing	Compounds	Criteria
MW-2022-2 (0-1) MW-2022-2 (12-22) MW-2022-2 (26-32) MW-2022-2 (33-37) DUP-5-052422	ICV %D	Benzidine	-27.2%
	CCV %D	Methapyrilene	-33.1%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 14. Initial and Continuing Calibration Evaluation Criteria and Qualifications

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 30% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
Continuing Calibration	%D >25% (increase in sensitivity)	Non-detect	UJ
		Detect	J
	%D >25% (decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

3.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

3.7 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on samples from this SDG.

3.8 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits with the exceptions noted in the table below.

Table 15. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Preparation Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-2 (0-1) MW-2022-2 (12-22) MW-2022-2 (26-32) MW-2022-2 (33-37) DUP-5-052422	627839	4-Aminobiphenyl	< LL but >10%	--
		4-Nitroquinoline-1-oxide	< LL but >10%	--
		Famphur	< 10%	--
		Kepone	< 10%	--
		Methapyrilene	< LL but >10%	--
		N-Nitrosomorpholine	< LL but >10%	--
		N-Nitrosopiperidine	< LL but >10%	--
FB-052422	627913	1,3-Dichlorobenzene	AC	< LL but >10%
		1,4-Dichlorobenzene	AC	< LL but >10%
		Famphur	< LL but >10%	< LL but >10%
		Kepone	< LL but >10%	< LL but >10%
		p-Phenylene diamine	< 10%	< 10%

Note:
LL Lower control limit

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 16. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

Table 17. Samples with Relative Percent Difference Greater than Control Limits

Sample ID	Preparation Batch	Compound
FB-052422	627913	a,a-Dimethylphenethylamine
		Benzidine
		Famphur

The criteria used to evaluate the RPD between the LCS/LCSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 18. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

3.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

Table 19. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result (µg/Kg)	Duplicate Result (µg/Kg)	RPD
MW-2022-2 (0-1) / DUP-5-052422	Benzyl alcohol	54 J	520 U	AC

Note:
U – Non detect
AC – Acceptable

The calculated differences between the parent sample and field duplicate were acceptable.

3.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

3.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 20. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

4.3 System Performance

System performance and column resolution were acceptable.

4.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

4.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. Multiple-point calibrations were performed for Aroclor 1016 and 1260 only. Single-point calibrations were performed for the remaining Aroclors.

4.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

4.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires that both the surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries reported from the primary column were within control limits.

4.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on samples from this SDG.

4.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries and RPDs within the control limits.

4.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix. Results for duplicate samples are summarized in the following table.

Table 21. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result (µg/Kg)	Duplicate Result (µg/Kg)	RPD
MW-2022-2 (0-1) / DUP-5-052422	All target compounds	U	U	AC

Note:
U – Non detect
AC – Acceptable

The calculated differences between the parent sample and field duplicate were acceptable.

4.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

The dual column analysis exhibited an acceptable %RPD between columns.

4.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 22. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8141B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8081B/8151A	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Soil	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria with the exceptions noted in the table below.

Table 23. Summary of Holding Time Exceedances

Sample ID	Holding Time	Criteria
FB-052422	17 Days	7 Days

Sample results associated with sample FB-052422 analyzed by analytical method SW-846 8141B were qualified, as specified in the table below. All other holding times were met.

Table 24. Summary of Holding Time Qualifications

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were detected in the associated QA blanks; however, the associated sample results were greater than the BAL and/or were non-detect. No other qualification of the sample results was required.

5.3 System Performance

System performance and column resolution were acceptable.

5.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at

the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

5.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

5.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 55. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Initial/Continuing	Compounds	Criteria
FB-052422	CCV %D	Methoxychlor	-18.1%
MW-2022-2 (0-1) MW-2022-2 (12-22) MW-2022-2 (26-32) MW-2022-2 (33-37) DUP-5-052422 FB-052422	ICV %D	2,4-D	-15.1%
		Silvex (2,4,5-TP)	-15.6%
DUP-5-052422	CCV %D	2,4-D	+21.5%
		2,4,5-T	+15.8%
MW-2022-2 (0-1) MW-2022-2 (12-22)	CCV %D	Dimethoate	-30.7%
		Methyl parathion	-24.6%
		Ethyl Parathion	-26.4%
MW-2022-2 (26-32) MW-2022-2 (33-37) DUP-5-052422	CCV %D	Dimethoate	-25.7%
		Methyl parathion	-29.8%
		Ethyl Parathion	-35.1%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 66. Initial and Continuing Calibration Evaluation Criteria and Qualifications

Initial/Continuing	Criteria	Sample Result	Qualification
Initial Calibration	%RSD > 20%or a correlation coefficient <0.99	Non-detect	UJ

Initial/Continuing	Criteria	Sample Result	Qualification
		Detect	J
Continuing Calibration	%D >15% (increase in sensitivity)	Non-detect	UJ
		Detect	J
	%D >15% (decrease in sensitivity)	Non-detect	UJ
		Detect	J

5.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. Pesticide - herbicide analysis requires that one of the two pesticide - herbicide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

5.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was performed on sample MW-2022-2 (12-22) for herbicides and on sample DUP-5-052422 for organochlorine pesticides. The MS/MSD analysis exhibited acceptable recoveries.

Samples associated with MS/MSD recoveries exhibiting an RPD greater than the control limit are presented in the following table.

Table 27. Samples with Relative Percent Difference Greater than Control Limits

Sample ID	Compound
DUP-5-052422	beta-BHC

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 28. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

5.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

Samples associated with LCS/LCSD recoveries exhibiting an RPD greater than of the control limit presented in the following table.

Table 29. Samples with Relative Percent Difference Greater than Control Limits

Sample ID	Compound
FB-052422	4,4'-DDE
	alpha-BHC
	beta-BHC
	cis-Chlordane
	delta-BHC
	Dieldrin
	Endrin
	gamma-BHC (Lindane)
	Heptachlor epoxide

The criteria used to evaluate the RPD between the LCS/LCSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 30. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

5.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 31. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result (µg/Kg)	Duplicate Result (µg/Kg)	RPD
MW-2022-2 (0-1) / DUP-5-052422	Heptachlor	2.3 U	0.82 J	AC
	Methoxychlor	2.3 U	0.76 J	AC

Note:
U – Non detect
AC – Acceptable
The calculated differences between the parent sample and field duplicate were acceptable.

5.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

Dual column analysis performed on the field samples exhibited RPDs within the control limit with the exceptions noted in the table below.

Table 32. Dual Column Analysis Exhibiting RPD Outside the Control Limit

Sample ID	Compound	RPD
DUP-5-052422	Heptachlor	116.8%
	Methoxychlor	25.1%
FB-052422	Endrin aldehyde	66.9%

The criteria used to evaluate the RPD are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 33. Evaluation Criteria for Dual Column Analysis RPD

Control Limit (RPD)	Qualification
>25% to 70%	J
>70% to 100%	JN
>100% [1]	R
>100% to 200% (Interference detected)[2]	J or JN
>50% (PCB sample results less than the RL)	U

When the sample results are less than the RL and the RPD greater than 50% the sample result are raised to the RL and reported as non-detect.

Note 1: If the pattern is confirmed sample results will be qualified as estimated (J). If pattern exhibits interference or if the pesticide/herbicide cannot be positively determined due to weathering the sample results will be qualified as tentative identification estimate (JN).

Note 2: If interference is detected in either column the sample results will be qualified as tentative identification estimate (JN).

5.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 34. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water/Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 35. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-2 (12-22) MW-2022-2 (26-32) MW-2022-2 (33-37)	1,2,3,4,6,7,8-HpCDD	Detected sample results <RL and <BAL	“U” at the RL
	OCDD	Detected sample results <RL and <BAL	“U” at the RL
	OCDF	Detected sample results <RL and <BAL	“U” at the RL
	Total HpCDD	Detected sample results <RL and <BAL	“U” at the RL

Notes:

MB – Method blank
RL – Reporting limit

6.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

System performance and column resolution were acceptable.

6.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

6.4.1 Initial Calibration

A maximum relative standard deviation (RSD) of 15% is allowed for all non-labeled compounds (target) and 30% is allowed for all labeled compounds (internal standards and recovery standards).

6.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibited percent difference (%D) less than the control limit (20%).

All compounds associated with the calibrations were within the specified control limits.

6.5 Labeled Standard Performance

Labeled standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the labeled standards exhibit recoveries within the control limits of 40% to 135%.

All labeled standard responses were within control limits.

6.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on samples from this SDG.

6.7 Ongoing Precision Result /Laboratory Control Sample Analysis

The Ongoing Precision Result/Laboratory Control Sample (OPR/LCS) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the OPR analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries and RPDs within the control limits.

6.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 36. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result (ng/Kg)	Duplicate Result (ng/Kg)	RPD
MW-2022-2 (0-1) / DUP-5-052422	1,2,3,4,6,7,8-HpCDD	430	110	119%
	1,2,3,4,6,7,8-HpCDF	98	27	NC
	1,2,3,4,7,8,9-HpCDF	5.7 J	1.9 J	AC
	1,2,3,4,7,8-HxCDD	6.5 J	2.2 J	AC
	1,2,3,4,7,8-HxCDF	4.1 J	2.2 J	AC
	1,2,3,6,7,8-HxCDD	12	3.4 J	AC
	1,2,3,6,7,8-HxCDF	3.5 J	2.0 J	AC
	1,2,3,7,8,9-HxCDD	15	4.5 J	AC
	1,2,3,7,8,9-HxCDF	0.52 J	0.32 J	AC
	1,2,3,7,8-PeCDD	5.2 J	1.5 J	AC
	1,2,3,7,8-PeCDF	0.92 J	1.1 J	AC
	2,3,4,6,7,8-HxCDF	5.2 J	2.1 J	AC
	2,3,4,7,8-PeCDF	2.4 J	1.8 J	AC
	2,3,7,8-TCDD	1.8	1.7	AC

Sample ID / Duplicate ID	Compound	Sample Result (ng/Kg)	Duplicate Result (ng/Kg)	RPD
	2,3,7,8-TCDF	1.6	1.6 U	AC
	OCDD	3800	820	129%
	OCDF	520	110	130%
	Total HpCDD	430	110	119%
	Total HpCDF	100	29	NC
	Total HxCDD	34	10	NC
	Total HxCDF	13	6.6 J	AC
	Total PeCDD	5.2 J	1.5 J	AC
	Total PeCDF	3.3 J	2.9 J	AC
	Total TCDD	1.8	1.7	AC
	Total TCDF	1.6	1.6 U	AC

Notes:
U non-detect
AC Acceptable

The compound 1,2,3,4,6,7,8-HpCDD, OCDD, OCDF and Total HpCDD associated with samples MW-2022-2 (0-1) and DUP-5-052422 exhibited a field duplicate RPD greater than the control limit. Further the compounds 1,2,3,4,6,7,8-HpCDF, Total HpCDF and Total HxCDD associated with samples MW-2022-2 (0-1) and DUP-5-052422 exhibited a field duplicate difference greater than the control limit. The associated sample results were qualified as estimated (J).

6.9 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.11 Data Validation Checklist

7 Metals Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 37. Holding Time for Method SW-846 6010C/7471B

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

Method	Matrix	Holding Time	Preservation
SW-846 7471B	Soil	28 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

7.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

7.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

7.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All initial and continuing calibration verification standard recoveries were within the control limit.

7.3.2 Lower Limit of Quantitation Check Standard

The lower limit of quantitation check (LLQC) check standard serves to verify the linearity of calibration of the analysis at the reporting limit. The LLQC recoveries must be within 70 to 130%, and 50 to 150% for antimony (Sb), lead (Pb), and thallium (Tl). The LLQC standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the LLQC standard analysis are presented below in the LLQC standards evaluation table (if applicable).

All LLQC standard recoveries were within control limits.

7.3.3 ICP Interference Control Sample

The Interference Control Sample (ICS) verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

7.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

7.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils and RPD 20% for water matrices and 35% for soil matrices. The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was performed on samples MW-2022-2 (0-1) and FB-052422. The MS/MSD analysis exhibited acceptable recoveries and RPDs with the exceptions noted in the table below.

Table 38. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Analytes	MS Recovery	MSD Recovery
MW-2022-2 (0-1)	Antimony	< LL but > 30%	< LL but > 30%
	Arsenic	< LL but > 30%	< LL but > 30%
	Beryllium	< LL but > 30%	< LL but > 30%
	Cadmium	< LL but > 30%	< LL but > 30%
	Selenium	< LL but > 30%	< LL but > 30%
	Silver	< LL but > 30%	< LL but > 30%
	Zinc	< LL but > 30%	AC

Note:
AC – Acceptable
LL – Lower control limit

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below. The qualifiers were also applied to sample DUP-5-052422 which is the duplicate sample collected from MW-2022-2 (0-1).

Table 39. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 30%	Non-detect	UJ
	Detect	J
< 30%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

7.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices

The laboratory duplicate analysis was not performed on samples from this SDG.

7.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 40. Field Duplicate Sample Results

Sample ID / Duplicate ID	Analytes	Sample Result (mg/Kg)	Duplicate Result (mg/Kg)	RPD
MW-2022-2 (0-1) / DUP-5-052422	Arsenic	5.8	6.4	AC
	Barium	74.5	82.7	10%
	Beryllium	0.81	0.92	AC
	Cadmium	0.27 J	0.32	AC

Sample ID / Duplicate ID	Analytes	Sample Result (mg/Kg)	Duplicate Result (mg/Kg)	RPD
	Chromium	13.2	14.8	11%
	Cobalt	10.5	11.9	13%
	Copper	12.7	15.2	18%
	Lead	26.5	29.4	10%
	Nickel	17.5	19.5	AC
	Tin	1.5 J	1.5 J	AC
	Vanadium	20.2	22.3	10%
	Zinc	67.0	76.1	13%
	Mercury	0.099	0.11	AC

Note:
AC Acceptable

The calculated differences and RPDs between the parent sample and field duplicate were acceptable.

7.6 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All LCS recoveries were within control limits.

7.7 Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 15% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample

The serial dilution was performed on samples MW-2022-2 (0-1) and FB-052422. Serial dilution analysis exhibited acceptable results with the exceptions noted in the table below.

Table 41. Samples with serial dilution differences (%D) Outside Control Limits

Sample ID	Analytes	Serial Dilution (%D)
MW-2022-2 (0-1)	Barium	34%
	Vanadium	30%
	Zinc	36%

The criteria used to evaluate the serial dilution are presented in the following table. In the case of a serial dilution deviation, the sample results are qualified as documented in the table below.

Table 42. Serial dilution Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> 10%	Non-detect	UJ
	Detect	J

7.8 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8 General Chemistry Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 43. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
	Soil		Cool to <6 °C.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9
	Soil	14 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

8.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

8.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration must be greater than 0.995 analytes and all initial and continuing calibration verification standard recoveries must be within the control limits of 85%-115%.

All initial and continuing calibration verification standard recoveries were within the control limit.

8.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on samples from this SDG.

8.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis was not performed on samples from this SDG.

8.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 44. Field Duplicate Sample Results

Sample ID / Duplicate ID	Analytes	Sample Result (mg/Kg)	Duplicate Result (mg/Kg)	RPD
MW-2022-2 (0-1) / DUP-5-052422	Cyanide, Total	U	U	AC
	Sulfide	U	U	AC

Note:
AC Acceptable
The calculated differences between the parent sample and field duplicate were acceptable.

8.6 Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120% for water and within laboratory established acceptance limits for soil.

The LCS analysis exhibited recoveries within the control limits.

8.7 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.8 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B/SM 4500 S2 F	Reported		Performance Acceptable		Not Required

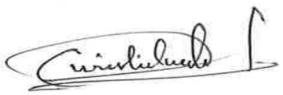
9 Overall Data Usability



This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 45. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	99.7%	1
SVOCs	98.4%	12
PCBs	100%	0
PEST	96.1%	7
HERB	100%	0
PCDD/PCDF	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Appendices

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-198523-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis					
					VOCs	SVOCs	PEST/ PCBs/ HERB	PCDD/ PCDF	MET	MISC
MW-2022-3 (0-1)	480-198523-1	Soil	05/31/22		X	X	X	X	X	X
MW-2022-3 (2-10)	480-198523-2	Soil	05/31/22			X	X	X	X	X
MW-2022-3 (4)	480-198523-3	Soil	05/31/22		X					
MW-2022-3 (12-16)	480-198523-4	Soil	05/31/22			X	X	X	X	X
MW-2022-3 (14)	480-198523-5	Soil	05/31/22		X					

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in

the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	0	0	0	3	0	0	3
SVOCs	0	0	0	3	0	0	3
PCBs	0	0	0	3	0	0	3
PEST	0	0	0	3	0	0	3
HERB	0	0	0	3	0	0	3
PCDD/PCDF	0	0	0	3	0	0	3
Metals	0	0	0	3	0	0	3
MISC	0	0	0	3	0	0	3

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were detected in the associated QA blanks; however, the associated sample results were non-detect. No other qualification of the sample results was required.

2.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

2.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

2.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

2.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 5. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Initial/Continuing	Compound	Criteria
MW-2022-3 (0-1)	CCV %D	Acrolein	-27.2%
MW-2022-3 (4)			
MW-2022-3 (14)			

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 6. Initial and Continuing Calibration Evaluation Criteria and Qualifications

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 30% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
Continuing Calibration	%D >25% (increase in sensitivity)	Non-detect	UJ
		Detect	J
	%D >25% (decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

2.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

2.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

2.7 Matrix Spike/Matrix Spike Duplicate Analysis

Matrix Spike / Matrix Spike Duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was performed on sample MW-2022-3 (0-1). The MS/MSD analysis exhibited acceptable recoveries and RPDs with the exceptions noted in the table below.

Table 7. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Compound	MS Recovery	MSD Recovery
MW-2022-3 (0-1)	Acrolein	< LL but > 10%	< LL but > 10%
	Ethyl methacrylate	< LL but > 10%	< LL but > 10%
	Vinyl acetate	< LL but > 10%	< LL but > 10%

Note:
LL – Lower control limit

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 8. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ

Control Limit	Sample Result	Qualification
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

2.8 Laboratory Control Sample Analysis

The Laboratory Control Sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

2.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. A field duplicate sample was not collected for samples from this SDG.

2.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

The laboratory calibrated for the compounds 2-Chloro-1,3-butadiene, 2-Chloroethyl vinyl ether, Acetonitrile, Methacrylonitrile, Methyl methacrylate, and Propionitrile; however, they were not spiked or evaluated in the LCS or MS/MSD. Therefore, these results will be qualified as estimated, J/UJ.

2.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.12 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 9. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criterion.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were detected in the associated QA blanks; however, the associated sample results were non-detect. No other qualification of the sample results was required.

3.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

3.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

3.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 10. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Initial/Continuing	Compounds	Criteria
MW-2022-3 (0-1) MW-2022-3 (2-10) MW-2022-3 (12-16)	ICV %D	Benzidine	-27.2%
	CCV %D	Benzidine	+37.5%
		Methapyrilene	-29.1%
		Kepone	-73.6%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 11. Initial and Continuing Calibration Evaluation Criteria and Qualifications

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 30% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
Continuing Calibration	%D >25% (increase in sensitivity)	Non-detect	UJ
		Detect	J
	%D >25% (decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

3.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

3.7 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was performed on sample MW-2022-3 (0-1). The MS/MSD analysis exhibited acceptable recoveries and RPDs with the exceptions noted in the table below.

Table 12. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Compound	MS Recovery	MSD Recovery
MW-2022-3 (0-1)	Aramite, Total	< LL but > 10%	< LL but > 10%
	Kepone	< 10%	< 10%

Note:
LL – Lower control limit

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 13. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J

Control Limit	Sample Result	Qualification
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

3.8 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits with the exceptions noted in the table below.

Table 14. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Compounds	LCS Recovery
MW-2022-3 (0-1) MW-2022-3 (2-10) MW-2022-3 (12-16)	Benzo[b]fluoranthene	> UL
	Kepone	< 10%
	Pentachlorophenol	> UL

Note:
UL – Upper control limit

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 15. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. A field duplicate sample was not collected for samples from this SDG.

3.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

3.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 16. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Soil	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

4.3 System Performance

System performance and column resolution were acceptable.

4.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

4.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. Multiple-point calibrations were performed for Aroclor 1016 and 1260 only. Single-point calibrations were performed for the remaining Aroclors.

4.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

4.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires that both the surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries reported from the primary column were within control limits.

4.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was performed on sample MW-2022-3 (0-1). The MS/MSD analysis exhibited acceptable recoveries and RPDs.

4.7 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

4.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix. A field duplicate sample was not collected for samples from this SDG.

4.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

The dual column analysis exhibited an acceptable %RPD between columns.

4.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 17. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Soil	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were detected in the associated QA blanks; however, the associated sample results were greater than the BAL and/or were non-detect. No other qualification of the sample results was required.

5.3 System Performance

System performance and column resolution were acceptable.

5.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

5.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

5.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 18. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Initial/Continuing	Compounds	Criteria
MW-2022-3 (0-1) MW-2022-3 (2-10) MW-2022-3 (12-16)	ICV %D	2,4-D	-15.1%
		Silvex (2,4,5-TP)	-15.6%
	CCV %D	Methyl parathion	-15.1%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 19. Initial and Continuing Calibration Evaluation Criteria and Qualifications

Initial/Continuing	Criteria	Sample Result	Qualification
Initial Calibration	%RSD > 20%or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
Continuing Calibration	%D >15% (increase in sensitivity)	Non-detect	No Action
		Detect	J
	%D >15% (decrease in sensitivity)	Non-detect	UJ
		Detect	J

5.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. Pesticide - herbicide analysis requires that one of the two pesticide - herbicide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

5.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was performed on sample MW-2022-3 (0-1). The MS/MSD analysis exhibited acceptable recoveries and RPDs with the exceptions noted in the table below.

Table 20. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Compound	MS Recovery	MSD Recovery
MW-2022-3 (0-1)	Dimethoate	< LL but > 10%	AC

Note:
LL – Lower control limit
AC – Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 21. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

Table 22. Samples with Relative Percent Difference Greater than Control Limits

Sample ID	Compound
MW-2022-3 (0-1)	delta-BHC
	gamma-BHC (Lindane)
	Dimethoate

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 23. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

5.7 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

5.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix. A field duplicate sample was not collected for samples from this SDG.

5.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

Dual column analysis performed on the field samples exhibited RPDs within the control limit.

5.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.11 Data Validation Checklist

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 24. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 24. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-3 (0-1)	1,2,3,4,6,7,8-HpCDF	Detected sample results <RL and <BAL	“U” at the RL
	2,3,7,8-TCDF

RL – Reporting limit

6.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

System performance and column resolution were acceptable.

6.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

6.4.1 Initial Calibration

A maximum relative standard deviation (RSD) of 15% is allowed for all non-labeled compounds (target) and 30% is allowed for all labeled compounds (internal standards and recovery standards).

6.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibited percent difference (%D) less than the control limit (20%).

All compounds associated with the calibrations were within the specified control limits.

6.5 Labeled Standard Performance

Labeled standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the labeled standards exhibit recoveries within the control limits of 40% to 135%.

All labeled standard responses were within control limits.

6.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was performed on sample MW-2022-3 (0-1). The MS/MSD analysis exhibited acceptable recoveries and RPDs.

6.7 Ongoing Precision Result /Laboratory Control Sample Analysis

The Ongoing Precision Result/Laboratory Control Sample (OPR/LCS) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the OPR analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries and RPDs within the control limits.

6.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix. A field duplicate sample was not collected for samples from this SDG.

6.9 Compound Identification

PCDD/PCDF compounds are identified by using the compound’s ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest.” This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as “I” (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.11 Data Validation Checklist

7 Metals Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 25. Holding Time for Method SW-846 6010C/7471B

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Soil	180 days from collection to analysis	Cool to <6 °C.
SW-846 7471B	Soil	28 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

7.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

7.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

7.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All initial and continuing calibration verification standard recoveries were within the control limit.

7.3.2 Lower Limit of Quantitation Check Standard

The lower limit of quantitation check (LLQC) check standard serves to verify the linearity of calibration of the analysis at the reporting limit. The LLQC recoveries must be within 70 to 130%, and 50 to 150% for antimony (Sb), lead (Pb), and thallium (Tl). The LLQC standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the LLQC standard analysis are presented below in the LLQC standards evaluation table (if applicable).

All LLQC standard recoveries were within control limits.

7.3.3 ICP Interference Control Sample

The Interference Control Sample (ICS) verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

7.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

7.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils and RPD 20% for water matrices and 35% for soil matrices. The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was performed on samples MW-2022-3 (0-1). The MS/MSD analysis exhibited acceptable recoveries and RPDs with the exceptions noted in the table below.

Table 26. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Analytes	MS Recovery	MSD Recovery
MW-2022-3 (0-1)	Zinc	< LL but > 30%	< LL but > 30%

Note:
LL – Lower control limit

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 27. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 30%	Non-detect	UJ
	Detect	J
< 30%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

7.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices

The laboratory duplicate analysis was not performed on samples from this SDG.

7.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix. A field duplicate sample was not collected for samples from this SDG.

7.6 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All LCS recoveries were within control limits.

7.7 Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 15% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample

The serial dilution was performed on samples MW-2022-2 (0-1) and FB-052422. Serial dilution analysis exhibited acceptable results with the exceptions noted in the table below.

Table 28. Samples with serial dilution differences (%D) Outside Control Limits

Sample ID	Analytes	Serial Dilution (%D)
MW-2022-3 (0-1)	Zinc	18%

The criteria used to evaluate the serial dilution are presented in the following table. In the case of a serial dilution deviation, the sample results are qualified as documented in the table below.

Table 29. Serial dilution Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> 15%	Non-detect	UJ
	Detect	J

7.8 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8 General Chemistry Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 30. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Soil	14 days from collection to analysis	Cool to <6 °C.
Sulfide by SM 4500 S2 F	Soil	14 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

8.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

8.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration must be greater than 0.995 analytes and all initial and continuing calibration verification standard recoveries must be within the control limits of 85%-115%.

All initial and continuing calibration verification standard recoveries were within the control limit.

8.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was performed on sample MW-2022-3 (0-1). The MS/MSD analysis exhibited acceptable recoveries and RPDs with the exceptions noted in the table below.

Table 31. Samples with Relative Percent Difference Greater than Control Limits

Sample ID	Analyte
MW-2022-3 (0-1)	Sulfide

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 32. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

8.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis was not performed on samples from this SDG.

8.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix. A field duplicate sample was not collected for samples from this SDG.

8.6 Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120% for water and within laboratory established acceptance limits for soil.

The LCS analysis exhibited recoveries within the control limits.

8.7 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.8 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B/SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes

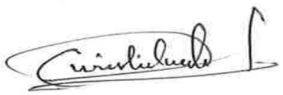
9 Overall Data Usability



This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 33. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	100%	0
SVOCs	99.2%	3
PCBs	100%	0
PEST	100%	0
HERB	100%	0
PCDD/PCDF	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-196120-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis					
					VOCs	SVOCs	PEST/ PCBs/ HERB	PCDD/ PCDF	MET	MISC
PZ-2022-8 (83')	480-196120-1	Soil	03/24/22		X					
PZ-2022-8 (80-84')	480-196120-2	Soil	03/24/22			X	X	X	X	X

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations

and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	1	0	0	0	0	0	1
SVOCs	1	0	0	0	0	0	1
PCBs	1	0	0	0	0	0	1
PEST	1	0	0	0	0	0	1
HERB	1	0	0	0	0	0	1
PCDD/PCDF	1	0	0	0	0	0	1
Metals	1	0	0	0	0	0	1
MISC	1	0	0	0	0	0	1

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
System performance and column resolution		X		X	

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criterion.

3.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.3 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
System performance and column resolution		X		X	

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 6. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Soil	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Holding times		X		X	
Reporting limits (units)		X		X	
System performance and column resolution		X		X	

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 7. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Soil	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

5.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.3 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
System performance and column resolution		X		X	

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 8. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 9. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
PZ-2022-8 (80-84')	1,2,3,4,6,7,8-HpCDD	Detected sample results <RL and <BAL	"U" at the RL
	1,2,3,4,6,7,8-HpCDF		
	1,2,3,4,7,8,9-HpCDF		
	1,2,3,4,7,8-HxCDD		
	1,2,3,4,7,8-HxCDF		
	1,2,3,6,7,8-HxCDD		
	1,2,3,6,7,8-HxCDF		
	1,2,3,7,8,9-HxCDD		
	1,2,3,7,8,9-HxCDF		
	1,2,3,7,8-PeCDD		
	1,2,3,7,8-PeCDF

	2,3,4,7,8-PeCDF		
	OCDD		
	OCDF		
	Total HpCDD		
	Total HpCDF		
	Total HxCDD		
	Total HxCDF		
	Total PeCDD		
	Total PeCDF		
	Total TCDF		

Notes:
MB – Method blank
RL – Reporting limit

6.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.4 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X	X		
System performance and column resolution		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

7 Metals Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 10. Holding Time for Method SW-846 6010C/7471B

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Soil	180 days from collection to analysis	Cool to <6 °C.
SW-846 7471B	Soil	28 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

METALS; SW-846 6010C/7471B	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

8 General Chemistry Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 11. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Soil	14 days from collection to analysis	Cool to <6 °C.
Sulfide by SM 4500 S2 F	Soil	14 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

8.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.3 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B/SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

9 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 12. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	100%	0
SVOCs	100%	0
PCBs	100%	0
PEST	100%	0
HERB	100%	0
PCDD/PCDF	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality.

These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Project Name: GE Woods Pond Parcel	Project #: 48024970		
Site:	SSOW#:		

Analysis Requested

Preservation Codes:

A - HCL	M - Hexane
B - NaOH	N - None
C - Zn Acetate	O - AsNaO2
D - Nitric Acid	P - Na2O4S
E - NaHSO4	Q - Na2SO3
F - MeOH	R - Na2S2O3
G - Amchlor	S - H2SO4
H - Ascorbic Acid	T - TSP Dodecahydrate
I - Ice	U - Acetone
J - DI Water	V - MCAA
K - EDTA	W - pH 4-5
L - EDA	Z - other (specify)

Other:

Sample Identification - Client ID (Lab ID)	Sample Date	Sample Time	Sample Type (C=Comp, G=grab)	Matrix (W=water, S=solid, O=waste/oil, BT=Tissue, A=Air)	Field Filtered Sample (Yes or No)	Perform MS/MSD (Yes or No)	8141B/3541_7d Appendix IX Pesticides	Total Number of containers	Special Instructions/Note:
			Preservation Code:						
PZ-2022-8 (80-84') (480-196120-2)	3/24/22	10:50 Eastern		Solid			X	1	

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Northeast, LLC places the ownership of method, analyte & accreditation compliance upon out subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Northeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Northeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said complicance to Eurofins Environment Testing Northeast, LLC.

Possible Hazard Identification *Unconfirmed*	*Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)* ☐ *Return To Client* ☐ *Disposal By Lab* ☐ *Archive For* _____ *Months*

Appendices

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-196344-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis					
					VOCs	SVOCs	PEST/ PCBs/ HERB	PCDD/ PCDF	MET	MISC
MW-2022-9 (0-1')	480-196344-1	Soil	04/01/22			X	X	X	X	X
MW-2022-9 (0.5')	480-196344-2	Soil	04/01/22		X					
MW-2022-9 (14-18')	480-196344-3	Soil	04/01/22			X	X	X	X	X
MW-2022-9 (14.5')	480-196344-4	Soil	04/01/22		X					
MW-2022-9 (26-30')	480-196344-5	Soil	04/01/22			X	X	X	X	X
MW-2022-9 (29')	480-196344-6	Soil	04/01/22		X					
MW-2022-9 (36-40')	480-196344-7	Soil	04/01/22			X	X	X	X	X
MW-2022-9 (39')	480-196344-8	Soil	04/01/22		X					

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in

the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks

SVOCs	4	0	0	0	0	0	4
PCBs	4	0	0	0	0	0	4
PEST	4	0	0	0	0	0	4
HERB	4	0	0	0	0	0	4
PCDD/PCDF	4	0	0	0	0	0	4
Metals	4	0	0	0	0	0	4
MISC	4	0	0	0	0	0	4

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were analyzed within the specified holding time criterion.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 5. Summary of Blank Contamination Qualifications

Sample ID	Compound	Sample Result	Qualification
MW-2022-9 (39')	Trichloroethene	Detected sample results <RL and <BAL	"U" at the RL

Note:
RL Reporting limit

2.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.4 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Blanks					
A. Method blanks		X	X		
System performance and column resolution		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 6. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criterion.

3.2 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits with the exceptions noted in the table below.

Table 7. Sample Locations with Surrogates Exhibiting Recoveries Outside Control Limits

Sample ID	Surrogate	Recovery
MW-2022-9 (0-1')	2,4,6-Tribromophenol	< 10%

The criteria used to evaluate the surrogate recoveries are presented in the following table. In the case of a surrogate deviation, the sample results are qualified as documented in the table below.

Table 8. Surrogate Recovery Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
< 10%	Non-detect	R
	Detect	J

3.3 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was performed on sample MW-2022-9 (26-30'). The MS/MSD analysis exhibited acceptable recoveries and RPDs with the exceptions noted in the table below.

Table 9. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Compound	MS Recovery	MSD Recovery
MW-2022-9 (26-30')	Benzidine	< 10%	< 10%

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 10. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
< 10%	Non-detect	R
	Detect	J

3.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.5 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Matrix Spike (MS) %R		X	X		
Matrix Spike Duplicate (MSD) %R		X	X		
MS/MSD Precision (RPD)		X		X	
System performance and column resolution		X		X	

Notes:
%R Percent recovery
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 11. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Soil	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
System performance and column resolution		X		X	

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 12. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Soil	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were

greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 13. Summary of Blank Contamination Qualifications

Sample ID	Compound	Sample Result	Qualification
MW-2022-9 (0-1')	4,4'-DDT	Detected sample results <RL and <BAL	"U" at the RL
MW-2022-9 (14-18')	4,4'-DDT	Detected sample results <RL and <BAL	"U" at the RL
MW-2022-9 (26-30')	4,4'-DDT	Detected sample results <RL and <BAL	"U" at the RL
MW-2022-9 (36-40')	4,4'-DDT	Detected sample results <RL and <BAL	"U" at the RL

Note:
RL Reporting limit

5.3 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

Dual column analysis performed on the field samples exhibited RPDs within the control limit with the exceptions noted in the table below.

Table 14. Dual Column Analysis Exhibiting RPD Outside the Control Limit

Sample ID	Compound	RPD
MW-2022-9 (0-1')	trans-Chlordane	132.4%
	4,4'-DDT	114.5%
	Endrin aldehyde	96.2%
	Methoxychlor	174.2%

The criteria used to evaluate the RPD are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 15. Evaluation Criteria for Dual Column Analysis RPD

Control Limit (RPD)	Qualification
>25% to 70%	J
>70% to 100%	JN
>100% [1]	R
>100% to 200% (Interference detected)[2]	J or JN

Control Limit (RPD)	Qualification
>50% (PCB sample results less than the RL)	U

When the sample results are less than the RL and the RPD greater than 50% the sample result are raised to the RL and reported as non-detect.

Note 1: If the pattern is confirmed sample results will be qualified as estimated (J). If pattern exhibits interference or if the pesticide/herbicide cannot be positively determined due to weathering the sample results will be qualified as tentative identification estimate (JN).

Note 2: If interference is detected in either column the sample results will be qualified as tentative identification estimate (JN).

5.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.5 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X	X		
Column (RPD) (If dual column is performed-not confirmation purposes only)		X	X		
System performance and column resolution		X		X	

Notes:
%RSD Relative standard deviation
%R Percent recovery
When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 16. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 17. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-9 (0-1')	1,2,3,4,7,8-HxCDD	Detected sample results <RL and <BAL	“U” at the RL

	Total TCDD		

Notes:
MB – Method blank
RL – Reporting limit

6.3 Compound Identification

PCDD/PCDF compounds are identified by using the compound’s ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest.” This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as “I” (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.5 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required

Blanks					
A. Method blanks		X	X		
System performance and column resolution		X		X	
Compound identification and quantitation		X	X		

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

7 Metals Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 18. Holding Time for Method SW-846 6010C/7471B

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Soil	180 days from collection to analysis	Cool to <6 °C.
SW-846 7471B	Soil	28 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

METALS; SW-846 6010C/7471B	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

8 General Chemistry Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 19. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Soil	14 days from collection to analysis	Cool to <6 °C.
Sulfide by SM 4500 S2 F	Soil	14 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

8.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.3 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B/SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

9 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 20. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	100%	0
SVOCs	96.2%	19
PCBs	100%	0
PEST	100%	0
HERB	100%	0
PCDD/PCDF	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality.

These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

MW-2022-9 (36-40') (480-196344-7)	4/1/22	13:50 Eastern		Solid			X	1	

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Northeast, LLC places the ownership of method, analyte & accreditation compliance upon out subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Northeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Northeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said complicance to Eurofins Environment Testing Northeast, LLC.

Possible Hazard Identification	*Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)*
Unconfirmed	☐ *Return To Client* ☐ *Disposal By Lab* ☐ *Archive For* _____ *Months*

Data Validation Report

PDI Summary Report for Upland Disposal Facility Area

GE-Pittsfield/Housatonic River Site
Pittsfield, Massachusetts

Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans, Metals, and Miscellaneous Analyses

SDG # 480-196619-1

Analyses Performed By:
Eurofins Buffalo,
Amherst, New York, USA
,

Report #47488R
Review Level: Tier I/II
Project: 30150026.3000

Contents

1 Summary 5

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-196619-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis					
					VOCs	SVOCs	PEST/ PCBs/ HERB	PCDD/ PCDF	MET	MISC
MW-2022-8 (0-1)	480-196619-1	Soil	04/07/22		X	X	X	X	X	X
MW-2022-8 (13-15)	480-196619-2	Soil	04/07/22		X	X	X	X	X	X
DUP-1- 040722	480-196619-3	Soil	04/07/22	MW-2022-8 (0-1)	X	X	X	X	X	X
MW-2022-8 (27-30)	480-196619-4	Soil	04/08/22		X	X	X	X	X	X
MW-2022-8 (43-46)	480-196619-5	Soil	04/08/22		X	X	X	X	X	X
MW-2022-8 (58-62)	480-196619-6	Soil	04/08/22		X	X	X	X	X	X
MW-2022-8 (68-70)	480-196619-7	Soil	04/08/22		X	X	X	X	X	X

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in

the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	6	1	0	0	0	0	7
SVOCs	6	1	0	0	0	0	7
PCBs	6	1	0	0	0	0	7
PEST	6	1	0	0	0	0	7
HERB	6	1	0	0	0	0	7
PCDD/PCDF	6	1	0	0	0	0	7
Metals	6	1	0	0	0	0	7
MISC	6	1	0	0	0	0	7

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were analyzed within the specified holding time criterion.

2.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

Table 5. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result (µg/Kg)	Duplicate Result (µg/Kg)	RPD
MW-2022-8 (0-1) / DUP-1- 040722	All target compounds	U	U	AC

Note:
U – Non detect
AC – Acceptable

The calculated differences between the parent sample and field duplicate were acceptable.

2.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.4 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Field Duplicate (RPD)		X		X	

Notes:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 6. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criterion.

3.2 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was performed on sample MW-2022-8 (0-1). The MS/MSD analysis exhibited acceptable recoveries and RPDs with the exceptions noted in the table below.

Table 7. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Compound	MS Recovery	MSD Recovery
MW-2022-8 (0-1)	a,a-Dimethylphenethylamine	< 10%	< 10%
	Benzidine	< 10%	< 10%
	p-Phenylene diamine	< 10%	< 10%

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 8. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
< 10%	Non-detect	R

Control Limit	Sample Result	Qualification
	Detect	J

3.3 Laboratory Control Sample Analysis

The Laboratory Control Sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits with the exceptions noted in the table below.

Table 9. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Compounds	LCS Recovery
MW-2022-8 (0-1) MW-2022-8 (13-15) DUP-1- 040722 MW-2022-8 (27-30) MW-2022-8 (43-46) MW-2022-8 (58-62) MW-2022-8 (68-70)	a,a-Dimethylphenethylamine	< 10%
	p-Phenylene diamine	< 10%

Note:
LL Lower control limit

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 10. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
< 10%	Non-detect	R
	Detect	J

3.4 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

Table 11. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result (µg/Kg)	Duplicate Result (µg/Kg)	RPD
MW-2022-8 (0-1) / DUP-1- 040722	Benzo[a]anthracene	19 J	920 U	AC
	Benzo[b]fluoranthene	30 J	920 U	AC
	Benzo[g,h,i]perylene	26 J	920 U	AC
	Fluoranthene	28 J	920 U	AC
	Indeno[1,2,3-cd]pyrene	23 J	920 U	AC
	Pyrene	27 J	920 U	AC

Note:
U – Non detect
AC – Acceptable

The calculated differences between the parent sample and field duplicate were acceptable.

3.5 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.6 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Laboratory Control Sample (LCS) %R		X	X		
Matrix Spike (MS) %R		X	X		
Matrix Spike Duplicate (MSD) %R		X	X		
MS/MSD Precision (RPD)		X		X	
Field/Lab Duplicate (RPD)		X		X	

Notes:

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					

%R Percent recovery
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 12. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Soil	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix. Results for duplicate samples are summarized in the following table.

Table 13. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result (µg/Kg)	Duplicate Result (µg/Kg)	RPD
MW-2022-8 (0-1) / DUP-1- 040722	All target compounds	U	U	AC

Note:
U – Non detect
AC – Acceptable

The calculated differences between the parent sample and field duplicate were acceptable.

4.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.4 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Field/Lab Duplicate (RPD)		X		X	

Notes:
RPD Relative percent difference
When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 14. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Soil	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 15. Summary of Blank Contamination Qualifications

Sample ID	Compound	Sample Result	Qualification
MW-2022-8 (0-1)	4,4'-DDT	Detected sample results <RL and <BAL	"U" at the RL
	Methoxychlor	Detected sample results <RL and <BAL	"U" at the RL
MW-2022-8 (13-15)	4,4'-DDT	Detected sample results <RL and <BAL	"U" at the RL
DUP-1- 040722	4,4'-DDT	Detected sample results <RL and <BAL	"U" at the RL
	Methoxychlor	Detected sample results <RL and <BAL	"U" at the RL
MW-2022-8 (58-62)	4,4'-DDT	Detected sample results <RL and <BAL	"U" at the RL
MW-2022-8 (68-70)	4,4'-DDT	Detected sample results <RL and <BAL	"U" at the RL

Note:
RL Reporting limit

5.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 16. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result (µg/Kg)	Duplicate Result (µg/Kg)	RPD
MW-2022-8 (0-1) / DUP-1- 040722	4,4'-DDD	0.44 J	1.8 U	AC
	4,4'-DDE	4.7	7.1	AC

Sample ID / Duplicate ID	Compound	Sample Result (µg/Kg)	Duplicate Result (µg/Kg)	RPD

Note:
U – Non detect
AC – Acceptable
The calculated differences between the parent sample and field duplicate were acceptable.

5.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.5 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X	X		
Field Duplicate (RPD)		X		X	

Notes:
%RSD Relative standard deviation
%R Percent recovery
When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 17. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 18. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-8 (0-1)	1,2,3,4,7,8,9-HpCDF	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,4,7,8-HxCDF	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,7,8,9-HxCDD	Detected sample results <RL and <BAL	“U” at the RL
	2,3,4,6,7,8-HxCDF	Detected sample results <RL and <BAL	“U” at the RL
	2,3,4,7,8-PeCDF	Detected sample results <RL and <BAL	“U” at the RL
	Total HxCDF	Detected sample results <RL and <BAL	“U” at the RL
	Total PeCDF	Detected sample results <RL and <BAL	“U” at the RL
MW-2022-8 (13-15)	1,2,3,4,6,7,8-HpCDD	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,4,6,7,8-HpCDF	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,4,7,8,9-HpCDF	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,4,7,8-HxCDF	Detected sample results <RL and <BAL	“U” at the RL

Sample ID	Compounds	Sample Result	Qualification
	1,2,3,6,7,8-HxCDD	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,6,7,8-HxCDF	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,7,8,9-HxCDD	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,7,8-PeCDF	Detected sample results <RL and <BAL	“U” at the RL
	2,3,4,6,7,8-HxCDF	Detected sample results <RL and <BAL	“U” at the RL
	OCDD	Detected sample results <RL and <BAL	“U” at the RL
	OCDF	Detected sample results <RL and <BAL	“U” at the RL

6.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 19. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result (ng/Kg)	Duplicate Result (ng/Kg)	RPD
MW-2022-8 (0-1) / DUP-1- 040722	1,2,3,4,6,7,8-HpCDD	6.2	16	AC
	1,2,3,4,6,7,8-HpCDF	1.9 J	5.1	AC
	1,2,3,4,7,8-HxCDD	0.18 J	0.47 J	AC
	1,2,3,4,7,8-HxCDF	5.2 U	0.61 J	AC
	1,2,3,6,7,8-HxCDD	0.22 J	0.74 J	AC
	1,2,3,6,7,8-HxCDF	0.30 J	0.56 J	AC
	1,2,3,7,8,9-HxCDD	5.2 U	0.70 J	AC
	1,2,3,7,8-PeCDD	0.13 J	0.33 J	AC
	1,2,3,7,8-PeCDF	0.20 J	0.29 J	AC
	2,3,4,6,7,8-HxCDF	5.2 U	0.92 J	AC
	2,3,4,7,8-PeCDF	5.2 U	0.90 J	AC
	2,3,7,8-TCDD	0.90 J	4.2	AC
	2,3,7,8-TCDF	0.18 J	0.64 J	AC

Sample ID / Duplicate ID	Compound	Sample Result (ng/Kg)	Duplicate Result (ng/Kg)	RPD
	OCDD	56	140	86%
	OCDF	4.2 J	11	AC
	Total HpCDD	6.2	16	AC
	Total HpCDF	2.1 J	5.4 J	AC
	Total HxCDD	0.71 J	1.9 J	AC
	Total HxCDF	0.89 J	2.1 J	AC
	Total PeCDD	0.13 J	0.33 J	AC
	Total PeCDF	0.49 J	1.2 J	AC
	Total TCDD	0.90 J	4.2	AC
	Total TCDF	0.18 J	0.64 J	AC

Notes:
U non-detect
AC Acceptable

The compound OCDD associated with samples MW-2022-8 (0-1) and DUP-1-040722 exhibited a field duplicate RPD greater than the control limit. The associated sample results were qualified as estimated (J).

6.4 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.5 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.6 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X	X		
Field Duplicate (RPD)		X	X		
Compound identification and quantitation					

Notes:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

7 Metals Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 20. Holding Time for Method SW-846 6010C/7471B

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Soil	180 days from collection to analysis	Cool to <6 °C.
SW-846 7471B	Soil	28 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

7.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical

method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 21. Field Duplicate Sample Results

Sample ID / Duplicate ID	Analytes	Sample Result (mg/Kg)	Duplicate Result (mg/Kg)	RPD
MW-2022-8 (0-1) / DUP-1- 040722	Antimony	3.4 J	2.9 J	AC
	Arsenic	5.3	8.1	AC
	Barium	22.5	43.5	64%
	Beryllium	0.26	0.34	AC
	Cadmium	0.11 J	0.14 J	AC
	Chromium	6.5	8.3	24%
	Cobalt	7.5	7.9	5%
	Copper	8.5	12.1	35%
	Lead	7.4	15.4	70%
	Nickel	12.6	13.0	AC
	Selenium	1.4 J	1.4 J	AC
	Vanadium	9.0	11.6	25%
	Zinc	37.4	48.2	25%
	Mercury	0.0092 J	0.47	NC

Note:
AC Acceptable

The analytes Barium and Lead associated with samples MW-2022-8 (0-1) and DUP-1-040722 exhibited a field duplicate RPD greater than the control limit. Further, the analytes Mercury associated with samples MW-2022-8 (0-1) and DUP-1-040722 exhibited a field duplicate difference greater than the control limit. The associated sample results were qualified as estimated (J).

7.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.4 Data Validation Checklist

METALS; SW-846 6010C/7470A/7471B	Reported		Performance Acceptable		Not Required

Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	
Field/Lab Duplicate (RPD)		X		X	

Notes:
%R Percent recovery
RPD Relative percent difference
When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

8 General Chemistry Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 22. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Soil	14 days from collection to analysis	Cool to <6 °C.
Sulfide by SM 4500 S2 F	Soil	14 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

8.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the

RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 23. Field Duplicate Sample Results

Sample ID / Duplicate ID	Analytes	Sample Result (mg/Kg)	Duplicate Result (mg/Kg)	RPD
MW-2022-8 (0-1) / DUP-1- 040722	Cyanide, Total	U	U	AC
	Sulfide	U	U	AC

Note:
AC Acceptable
The calculated differences between the parent sample and field duplicate were acceptable.

8.3 System Performance and Overall Assessment

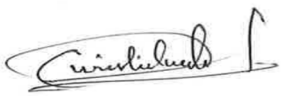
Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.4 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B/SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Field Duplicate (RPD)		X		X	

Notes:
%R Percent recovery
RPD Relative percent difference
When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

9 Overall Data Usability



This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 24. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	100%	0
SVOCs	98.3%	15
PCBs	100%	0
PEST	100%	0
HERB	100%	0
PCDD/PCDF	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Northeast, LLC places the ownership of method, analyte & accreditation compliance upon out subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Northeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Northeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said complicance to Eurofins Environment Testing Northeast, LLC.

Possible Hazard Identification	Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)
Unconfirmed	☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-196848-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semivolatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/ PCBs/ HERB	PCDD/ PCDF	PFAS	MET	MISC
PZ-2022-5 (45-49)	480-196848-1	Soil	4/14/2022		X	X	X	X		X	X
MW-2022-4 (74-78)	480-196848-2	Soil	4/14/2022		X	X	X	X		X	X
PZ-2022-5 (58-62)	480-196848-3	Soil	4/14/2022		X	X	X	X		X	X

Notes:
HERB = herbicides
MET = metals
MISC = miscellaneous analyses (cyanide, sulfide)
PEST = pesticides

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X

Notes:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013 and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017 and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020 and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	3	0	0	0	0	0	0
SVOCs	3	0	0	0	0	0	0
PCBs	3	0	0	0	0	0	0
PEST	3	0	0	0	0	0	0
HERB	3	0	0	0	0	0	0
PCDD/PCDF	3	0	0	0	0	0	0
Metals	3	0	0	0	0	0	0
MISC	3	0	0	0	0	0	0

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Specified Holding Times

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were analyzed within the specified holding time criterion.

2.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on a sample within this SDG.

2.3 Data Validation Checklist

VOCs: SW-846 8260	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Field/Lab Duplicate (RPD)	X				X
Surrogate Spike Recoveries		X		X	
Dilution Factor		X		X	

Notes:
%RSD Relative standard deviation
%R Percent recovery
RPD Relative percent difference
%D Percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

3 Semivolatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Specified Holding Times

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

Note:
s.u. = standard units

All samples were analyzed within the specified holding time criterion.

3.2 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

Sample locations associated with the MS/MSD exhibiting recoveries outside of the control limits are presented in the following table.

Table 6. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample Locations	Compound	MS Recovery	MSD Recovery
PZ-2022-5 (45-49)	a,a-Dimethylphenethylamine	<10%	<10%
	p-Phenylene diamine	<10%	<10%
	Hexachlorocyclopentadiene	AC	<LL but >10%

Note:
AC Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 7. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

Sample locations associated with MS/MSD recoveries exhibiting an RPD greater than the control limit are presented in the following table.

Table 8. Samples with Relative Percent Difference Greater than Control Limits

Sample Locations	Compound
PZ-2022-5 (45-49)	Hexachlorocyclopentadiene
	Famphur

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Table 9. Relative Percent Difference Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

3.3 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 10. Samples with Laboratory Control Sample/Laboratory Control Sample Duplicate Recoveries Outside Control Limits

Sample Locations	Compound	LCS Recovery	LCSD Recovery
PZ-2022-5 (45-49) MW-2022-4 (74-78) PZ-2022-5 (58-62)	a,a-Dimethylphenethylamine	<10%	Not analyzed

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 11. Laboratory Control Sample/Laboratory Control Sample Duplicate Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.4 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil.

A field duplicate analysis was not performed on a sample within this SDG.

3.5 Data Validation Checklist

VOCs: SW-846 8270	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X

Dilution Factor		X		X	
Moisture Content		X		X	

Notes:
%RSD Relative standard deviation
%R Percent recovery
RPD Relative percent difference
%D Percent difference
When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 12. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix.

A field duplicate analysis was not performed on a sample within this SDG.

4.3 Data Validation Checklist

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 14. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Water/Soil	7days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

5.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on a sample within this SDG.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 16. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water/Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the

sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 17. Summary of Blank Contamination Qualifications

Sample Locations	Analytes	Sample Result	Qualification
PZ-2022-5 (45-49)	1,2,3,4,6,7,8-HpCDD 1,2,3,4,6,7,8-HpCDF 1,2,3,4,7,8,9-HpCDF 1,2,3,4,7,8-HxCDF 1,2,3,6,7,8-HxCDF 1,2,3,7,8-PeCDF 2,3,4,6,7,8-HxCDF OCDD OCDF Total HpCDD Total HpCDF Total HxCDF Total PeCDF	Detected sample results <RL and <BAL	““U” at the RL
MW-2022-4 (74-78)	1,2,3,4,6,7,8-HpCDD 1,2,3,4,6,7,8-HpCDF 1,2,3,4,7,8,9-HpCDF 1,2,3,4,7,8-HxCDF 1,2,3,6,7,8-HxCDD 1,2,3,7,8,9-HxCDD 1,2,3,7,8,9-HxCDF 1,2,3,7,8-PeCDF 2,3,4,6,7,8-HxCDF OCDD OCDF Total HpCDD Total HpCDF Total HxCDD Total HxCDF Total PeCDF		
PZ-2022-5 (58-62)	1,2,3,4,6,7,8-HpCDD 1,2,3,4,6,7,8-HpCDF 1,2,3,4,7,8,9-HpCDF 1,2,3,4,7,8-HxCDD 1,2,3,4,7,8-HxCDF 1,2,3,6,7,8-HxCDD 1,2,3,6,7,8-HxCDF 1,2,3,7,8,9-HxCDD 1,2,3,7,8,9-HxCDF 1,2,3,7,8-PeCDD 1,2,3,7,8-PeCDF 2,3,4,6,7,8-HxCDF OCDD		

Sample Locations	Analytes	Sample Result	Qualification
	OCDF Total HpCDD Total HpCDF Total HxCDD Total HxCDF Total PeCDD Total PeCDF		

RL = reporting limit

6.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on a sample within this SDG.

6.4 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.5 Data Validation Checklist

PCDD/PCDF: SW-846 8290	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes

%D Percent difference
When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

7 Metals Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 18. Need a Title

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
SW-846 7470	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.
SW-846 7471	Soil	28 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

7.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Field duplicate analysis was not performed on a sample location within this SDG.

Table 19. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
	Soil		Cool to <6 °C.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9
	Soil	14 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

8.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on a sample within this SDG.

8.3 Data Validation Checklist for General Chemistry

General Chemistry: SW9012/SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

General Chemistry: SW9012/SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Field/Lab Duplicate (RPD)	X				X
Reporting limits adjusted to reflect sample dilutions		X		X	

Notes:
%R Percent recovery
RPD Relative percent difference

9 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 20. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	100%	0
SVOCs	99%	4
PCBs	100%	0
PEST	100%	0
HERB	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample

analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-196984-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semivolatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/ PCBs/ HERB	PCDD/ PCDF	PFAS	MET	MISC
PZ-2022-5 (72-76)	480-196984-1	Soil	4/18/2022		X	X	X	X		X	X
FB-041922	480-196984-2	Soil	4/19/2022		X	X	X	X		X	X
TB-041922	480-196984-3	Soil	4/17/2022		X						

Notes:
HERB = herbicides
MET = metals
MISC = miscellaneous analyses (cyanide, sulfide)
PEST = pesticides

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
4. Methods of analysis		X		X	
5. Reporting limits		X		X

11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Notes:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013 and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017 and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020 and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers

U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.

B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The compound was quantitated above the calibration range.

  D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

  J The compound was positively identified; however, the associated numerical value is an estimated concentration only.

  UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

  JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.

  U Compound considered non-detect at the listed value due to associated blank contamination.

  N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.

  R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	1	0	2	0	0	0	0
SVOCs	1	0	1	0	0	0	0
PCBs	1	0	1	0	0	0	0
PEST	1	0	1	0	0	0	0
HERB	1	0	1	0	0	0	0
PCDD/PCDF	1	0	1	0	0	0	0
Metals	1	0	1	0	0	0	0
MISC	1	0	1	0	0	0	0

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Specified Holding Times

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected in FB-041922 and TB-041922.

All samples were analyzed within the specified holding time criterion.

2.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on a sample within this SDG.

2.3 Data Validation Checklist

VOCs: SW-846 8260	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X	X		
Reporting limits (units)		X		X	
Field/Lab Duplicate (RPD)	X				X
Dilution Factor		X		X	

Notes:
%RSD Relative standard deviation
%R Percent recovery
RPD Relative percent difference
%D Percent difference

3 Semivolatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Specified Holding Times

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

Note:
s.u. = standard units

All samples were analyzed within the specified holding time criterion.

3.2 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 6. Samples with Laboratory Control Sample/Laboratory Control Sample Duplicate Recoveries Outside Control Limits

Sample Locations	Compound	LCS Recovery	LCSD Recovery
PZ-2022-5 (72-76)	a,a-Dimethylphenethylamine	<10%	Not analyzed
	Famphur	<10%	Not analyzed
	Kepone	<10%	Not analyzed
	p-Phenylene diamine	<10%	Not analyzed
FB-041922	Benzidine	<10%	AC
	Kepone	<10%	<LL but >10%
	p-Phenylene diamine	<10%	<10%

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 7. Laboratory Control Sample/Laboratory Control Sample Duplicate Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil.

A field duplicate analysis was not performed on a sample within this SDG.

3.4 System Performance and Overall Assessment

The laboratory case narrative states The minimum response factor (RF) criteria for the continuing calibration verification (CCV) analyzed in batch 480-623230 was outside criteria for the following analyte(s): 4-Nitroquinoline-1-oxide. The associated sample result for this compound in sample FB-041922 was qualified as rejected.

3.5 Data Validation Checklist

VOCs: SW-846 8270	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Laboratory Control Sample (LCS)		X	X		
Field/Lab Duplicate (RPD)	X				X
Dilution Factor		X		X	
Moisture Content		X		X	

Notes:
%RSD Relative standard deviation
%R Percent recovery
RPD Relative percent difference
%D Percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 8. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix.

A field duplicate analysis was not performed on a sample within this SDG.

4.3 Data Validation Checklist

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 10. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8141B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Water/Soil	7days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

5.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on a sample within this SDG.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 12. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water/Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 13. Summary of Blank Contamination Qualifications

Sample Locations	Analytes	Sample Result	Qualification
PZ-2022-5 (72-76)	1,2,3,4,6,7,8-HpCDD 1,2,3,4,6,7,8-HpCDF 1,2,3,4,7,8-HxCDD 1,2,3,6,7,8-HxCDF 1,2,3,7,8,9-HxCDD	Detected sample results <RL and <BAL	““U” at the RL

Sample Locations	Analytes	Sample Result	Qualification
	1,2,3,7,8,9-HxCDF 1,2,3,7,8-PeCDF 2,3,4,6,7,8-HxCDF 2,3,4,7,8-PeCDF OCDD OCDF Total HpCDD Total HpCDF Total HxCDD Total HxCDF Total PeCDF		

RL = reporting limit

6.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on a sample within this SDG.

6.4 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX (JNXB for field blank results that were qualified "B" due to method blank contamination).

6.5 Data Validation Checklist

PCDD/PCDF: SW-846 8290	Reported		Performance Acceptable		Not Required

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

7 Metals Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 14. Need a Title

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
SW-846 7470	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.
SW-846 7471	Soil	28 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

7.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Field duplicate analysis was not performed on a sample location within this SDG.

7.3 Data Validation Checklist

8 General Chemistry Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 15. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
	Soil		Cool to <6 °C.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9
	Soil	14 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

8.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on a sample within this SDG.

8.3 Data Validation Checklist for General Chemistry

Holding Times		X		X	
Reporting limits (units)		X		X	

General Chemistry: SW9012/SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Field/Lab Duplicate (RPD)	X				X
Reporting limits adjusted to reflect sample dilutions		X		X	

Notes:
%R Percent recovery
RPD Relative percent difference

9 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 16. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	99.4%	1
SVOCs	97.8%	8
PCBs	100%	0
PEST	100%	0
HERB	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample

analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Northeast, LLC places the ownership of method, analyte & accreditation compliance upon out subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Northeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Northeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said complicance to Eurofins Environment Testing Northeast, LLC.

Possible Hazard Identification	Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)
Unconfirmed	☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-197008-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis					
					VOCs	SVOCs	PEST/ PCBs/ HERB	PCDD/ PCDF	MET	MISC
PZ-2022-3 (0-1)	480-197008-1	Soil	04/20/22		X	X	X	X	X	X
PZ-2022-3 (13-16)	480-197008-2	Soil	04/20/22		X	X	X	X	X	X
PZ-2022-3 (26-30)	480-197008-3	Soil	04/20/22		X	X	X	X	X	X

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in

the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	3	0	0	0	0	0	3
SVOCs	3	0	0	0	0	0	3
PCBs	3	0	0	0	0	0	3
PEST	3	0	0	0	0	0	3
HERB	3	0	0	0	0	0	3
PCDD/PCDF	3	0	0	0	0	0	3
Metals	3	0	0	0	0	0	3
MISC	3	0	0	0	0	0	3

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were analyzed within the specified holding time criterion.

2.2 Matrix Spike/Matrix Spike Duplicate Analysis

Matrix Spike / Matrix Spike Duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was performed on sample PZ-2022-3 (0-1). The MS/MSD analysis exhibited acceptable recoveries and RPDs with the exceptions noted in the table below.

Table 5. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Compound	MS Recovery	MSD Recovery
PZ-2022-3 (0-1)	Acrolein	< 10%	< 10%
	Vinyl acetate	< 10%	< 10%

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 6. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
< 10%	Non-detect	R
	Detect	J

2.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.4 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Matrix Spike (MS)		X	X		
Matrix Spike Duplicate (MSD)		X	X		
MS/MSD Precision (RPD)		X		X	
System performance and column resolution		X		X	

Notes:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 7. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criterion.

3.2 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was performed on sample PZ-2022-3 (0-1). The MS/MSD analysis exhibited acceptable recoveries and RPDs with the exceptions noted in the table below.

Table 8. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Compound	MS Recovery	MSD Recovery
PZ-2022-3 (0-1)	a,a-Dimethylphenethylamine	< 10%	AC
	Benzidine	< 10%	< 10%
	Kepone	< 10%	< 10%
	p-Phenylene diamine	< 10%	< 10%

Note:
AC Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 9. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
< 10%	Non-detect	R
	Detect	J

3.3 Laboratory Control Sample Analysis

The Laboratory Control Sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits with the exceptions noted in the table below.

Table 10. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Compound	LCS Recovery
PZ-2022-3 (0-1) PZ-2022-3 (13-16) PZ-2022-3 (26-30)	a,a-Dimethylphenethylamine	< 10%
	Famphur	< 10%
	Kepone	< 10%

Sample ID	Compound	LCS Recovery
	p-Phenylene diamine	< 10%

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 11. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
< 10%	Non-detect	R
	Detect	J

3.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.5 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Laboratory Control Sample (LCS)		X	X		
Laboratory Control Sample Duplicate (LCSD)	X				X
LCS/LCSD Precision (RPD)	X				X
Matrix Spike (MS) %R		X	X		
Matrix Spike Duplicate (MSD) %R		X	X		
MS/MSD Precision (RPD)		X		X	
System performance and column resolution		X		X	

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					

Notes:
%R Percent recovery
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 12. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Soil	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Reporting limits (units)		X		X	
System performance and column resolution		X		X	

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 13. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Soil	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

5.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.3 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
System performance and column resolution		X		X	

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 14. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 15. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
PZ-2022-3 (13-16)	1,2,3,4,6,7,8-HpCDF	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,4,7,8,9-HpCDF		
	1,2,3,4,7,8-HxCDD		
	1,2,3,6,7,8-HxCDD		

Sample ID	Compounds	Sample Result	Qualification
	1,2,3,6,7,8-HxCDF		
	1,2,3,7,8,9-HxCDD		
	1,2,3,7,8-PeCDF		
	2,3,4,6,7,8-HxCDF		
	2,3,4,7,8-PeCDF		
	Total HpCDF		
	Total HxCDD		
	Total HxCDF		
	Total PeCDF		
PZ-2022-3 (26-30)	1,2,3,6,7,8-HxCDF	Detected sample results <RL and <BAL	“U” at the RL
	OCDF		
	Total HpCDF		
	Total HxCDD		
	Total HxCDF		
	Total PeCDF		

Notes:
MB – Method blank
RL – Reporting limit

6.3 Compound Identification

PCDD/PCDF compounds are identified by using the compound’s ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest.” This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as “I” (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.5 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X	X		
System performance and column resolution		X		X	
Compound identification and quantitation		X	X		

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

7 Metals Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 16. Holding Time for Method SW-846 6010C/7471B

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Soil	180 days from collection to analysis	Cool to <6 °C.
SW-846 7471B	Soil	28 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

METALS; SW-846 6010C/7471B	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

8 General Chemistry Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 17. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Soil	14 days from collection to analysis	Cool to <6 °C.
Sulfide by SM 4500 S2 F	Soil	14 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

8.2 Matrix Spike/Matrix Spike Duplicate Analysis

Matrix Spike / Matrix Spike Duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was performed on sample PZ-2022-3 (0-1). The MS/MSD analysis exhibited acceptable recoveries and RPDs with the exceptions noted in the table below.

Table 18. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Compound	MS Recovery	MSD Recovery
PZ-2022-3 (0-1)	Cyanide	< 30%	< 30%

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 19. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
< 30%	Non-detect	R
	Detect	J

8.3 System Performance and Overall Assessment

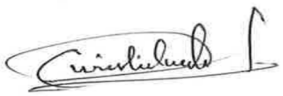
Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.4 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B/SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Matrix Spike (MS) %R		X	X		
Matrix Spike Duplicate (MSD) %R		X	X		
MS/MSD Precision (RPD)		X		X	
Reporting limits (units)		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

9 Overall Data Usability



This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 20. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.8%	2
SVOCs	96.5%	13
PCBs	100%	0
PEST	100%	0
HERB	100%	0
PCDD/PCDF	100%	0
Metals	100%	0
MISC	83.3%	1

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-197073-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis					
					VOCs	SVOCs	PEST/ PCBs/ HERB	PCDD/ PCDF	MET	MISC
PZ-2022-3 (45-47)	480-197073-1	Soil	04/21/22		X	X	X	X	X	X
PZ-2022-3 (60-64)	480-197073-2	Soil	04/21/22		X	X	X	X	X	X
PZ-2022-1 (0-1)	480-197073-3	Soil	04/21/22		X	X	X	X	X	X
PZ-2022-3 (82-86)	480-197073-4	Soil	04/21/22		X	X	X	X	X	X

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in

the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	4	0	0	0	0	0	4
SVOCs	4	0	0	0	0	0	4
PCBs	4	0	0	0	0	0	4
PEST	4	0	0	0	0	0	4
HERB	4	0	0	0	0	0	4
PCDD/PCDF	4	0	0	0	0	0	4
Metals	4	0	0	0	0	0	4
MISC	4	0	0	0	0	0	4

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to <6 °C.

Note:
s.u. = standard units

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
System performance and column resolution		X		X	

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criterion.

3.2 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was performed on sample PZ-2022-1 (0-1). The MS/MSD analysis exhibited acceptable recoveries and RPDs with the exceptions noted in the table below.

Table 6. Samples with Matrix Spike / Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Compound	MS Recovery	MSD Recovery
PZ-2022-1 (0-1)	a,a-Dimethylphenethylamine	< 10%	AC
	Benzidine	< 10%	< 10%
	p-Phenylene diamine	< 10%	< 10%

Note:
AC Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Table 7. Matrix Spike / Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control Limit	Sample Result	Qualification
< 10%	Non-detect	R
	Detect	J

3.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.4 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Reporting limits (units)		X		X	
Matrix Spike (MS) %R		X	X		
Matrix Spike Duplicate (MSD) %R		X	X		
MS/MSD Precision (RPD)		X		X	
System performance and column resolution		X		X	

Notes:
%R Percent recovery
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 8. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Soil	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
System performance and column resolution		X		X	

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 9. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
SW-846 8141B	Soil	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria with the exceptions noted in the table below.

Table 10. Summary of Holding Time Exceedances

Sample ID	Analytical method	Holding Time	Criteria
PZ-2022-3 (45-47) PZ-2022-3 (60-64) PZ-2022-1 (0-1) PZ-2022-3 (82-86)	SW-846 8141B	14 Days	7 Days

Sample results associated with samples analyzed by analytical method SW-846 8141B were qualified, as specified in the table below. All other holding times were met.

Table 11. Summary of Holding Time Qualifications

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

5.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.3 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
System performance and column resolution		X		X	

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 12. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Soil	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 13. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
PZ-2022-3 (45-47)	1,2,3,4,6,7,8-HpCDD	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,4,7,8-HxCDF		
	1,2,3,7,8-PeCDF		
	2,3,4,7,8-PeCDF		
	Total HpCDD		
	Total HxCDD		
	Total HxCDF		
	Total PeCDF		
PZ-2022-3 (60-64)	1,2,3,4,6,7,8-HpCDD	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,4,7,8-HxCDF		
	1,2,3,7,8-PeCDF		

Sample ID	Compounds	Sample Result	Qualification
	2,3,4,7,8-PeCDF		
	OCDF		
	Total HpCDD		
	Total HxCDD		
	Total HxCDF		
	Total PeCDF		
PZ-2022-1 (0-1)	1,2,3,4,6,7,8-HpCDD	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,4,7,8-HxCDF		
	1,2,3,7,8,9-HxCDF		
	1,2,3,7,8-PeCDF		
	2,3,4,6,7,8-HxCDF		
	2,3,4,7,8-PeCDF		
	OCDF		
	Total HpCDD		
	Total HxCDD		
	Total HxCDF		
	Total PeCDF		
PZ-2022-3 (82-86)	1,2,3,4,7,8-HxCDF	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,7,8-PeCDF		
	OCDD		
	OCDF		
	Total HxCDD		
	Total HxCDF		
	Total PeCDF		

Notes:
MB – Method blank
RL – Reporting limit

6.3 Compound Identification

PCDD/PCDF compounds are identified by using the compound’s ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection

limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.5 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X	X		
System performance and column resolution		X		X	
Compound identification and quantitation		X	X		

When the laboratory case narrative outlines a quality issue beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

7 Metals Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 14. Holding Time for Method SW-846 6010C/7471B

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Soil	180 days from collection to analysis	Cool to <6 °C.
SW-846 7471B	Soil	28 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

METALS; SW-846 6010C/7471B	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

8 General Chemistry Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 15. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Soil	14 days from collection to analysis	Cool to <6 °C.
Sulfide by SM 4500 S2 F	Soil	14 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

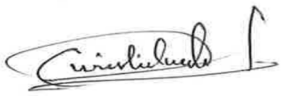
8.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.3 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B/SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

9 Overall Data Usability



This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 16. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	100%	0
SVOCs	99.4%	3
PCBs	100%	0
PEST	100%	0
HERB	100%	0
PCDD/PCDF	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Chain of Custody Record

eurofins | Environment Testing America

Client Information (Sub Contract Lab)	Sampler:	Lab PM: Schove, John R	Carrier Tracking No(s):	COC No: 480-71471.1
Client Contact: Shipping/Receiving	Phone:	E-Mail: John.Schove@et.eurofinsus.com	State of Origin: Massachusetts	Page: Page 1 of 1
Company: Eurofins Lancaster Laboratories Environm		Accreditations Required (See note): State - Massachusetts		Job #: 480-197073-1
Address: 2425 New Holland Pike, ,	Due Date Requested: 5/5/2022			
City: Lancaster	TAT Requested (days):			
State, Zip: PA, 17601				
Phone: 717-656-2300(Tel)	PO #:			
Email:	WO #:			
Project Name: GE Woods Pond Parcel	Project #: 48024970			
Site:	SSOW#:			

Analysis Requested

Preservation Codes:

A - HCL, B - NaOH, C - Zn Acetate, D - Nitric Acid, E - NaHSO4, F - MeOH, G - Amchlor, H - Ascorbic Acid, I - Ice, J - DI Water, K - EDTA, L - EDA, M - Hexane, N - None, O - AsNaO2, P - Na2O4S, Q - Na2SO3, R - Na2S2O3, S - H2SO4, T - TSP Dodecahydrate, U - Acetone, V - MCAA, W - pH 4-5, Z - other (specify)

Other:

Sample Identification - Client ID (Lab ID)	Sample Date	Sample Time	Sample Type (C=Comp, G=grab)	Matrix (W=water, S=solid, O=waste/oil, BT=Tissue, A=Air)	Field Filtered Sample (Yes or No)	Perform MS/MSD (Yes or No)	8290A/8290_P_Sox Dioxin & Furans - 17 Isomers + Totals	Total Number of containers	Special Instructions/Note:
			Preservation Code:						
PZ-2022-3 45-47 (480-197073-1)	4/21/22	09:30 Eastern		Solid			X	1	
PZ-2022-3 60-64 (480-197073-2)	4/21/22	10:40 Eastern		Solid			X	1	
PZ-2022-1 0-1 (480-197073-3)	4/21/22	13:30 Eastern		Solid			X	1	
PZ-2022-3 82-86 (480-197073-4)	4/21/22	14:55 Eastern		Solid			X	1	

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Northeast, LLC places the ownership of method, analyte & accreditation compliance upon out subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Northeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Northeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said complicance to Eurofins Environment Testing Northeast, LLC.

Possible Hazard Identification	Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)
Unconfirmed	☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months
Deliverable Requested: I, II, III, IV, Other (specify) Primary Deliverable Rank: 2	Special Instructions/QC Requirements:

Aramite, Total	ND		420	210	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Benzidine	ND		6400	2700	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Benzo[a]anthracene	ND		220	22	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Benzo[a]pyrene	ND		220	32	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Benzo[b]fluoranthene	ND		220	35	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Benzo[g,h,i]perylene	ND		220	23	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Benzo[k]fluoranthene	ND		220	28	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Benzyl alcohol	ND		420	30	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
bis (2-chloroisopropyl) ether	ND		220	44	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Bis(2-chloroethoxy)methane	ND		220	46	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Bis(2-chloroethyl)ether	ND		220	28	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Bis(2-ethylhexyl) phthalate	ND		220	75	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Butyl benzyl phthalate	ND		220	36	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Chrysene	ND		220	49	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Diallate	ND		420	54	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Dibenz(a,h)anthracene	ND		220	39	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Dibenzofuran	ND		220	26	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Diethyl phthalate	ND		220	28	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Dimethoate	ND		420	53	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Dimethyl phthalate	ND		220	26	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Di-n-butyl phthalate	ND		220	37	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Di-n-octyl phthalate	ND		220	26	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Dinoseb	ND		420	76	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Diphenylamine	ND		420	55	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Disulfoton	ND		420	320	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Chlorobenzilate	ND		420	68	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Ethyl methanesulfonate	ND		420	94	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Famphur	ND		850	210	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Fluoranthene	ND		220	23	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Fluorene	ND		220	26	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Hexachlorobenzene	ND		220	30	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1
Hexachlorobutadiene	ND		220	32	ug/Kg	☼	04/26/22 16:02	04/27/22 20:24	1

Client Sample ID: PZ-2022-3 (45-47)
Date Collected: 04/21/22 09:30
Date Received: 04/22/22 10:30

Lab Sample ID: 480-197073-1
Matrix: Solid
Percent Solids: 75.6
