An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.5 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
B. Equipment Blanks / Field Blanks		X	X		
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 15. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

8 Metals Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 16. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B) from the data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 17. Summary of Blank Contamination Qualifications

Sample ID	Analyte	Sample Result	Qualification
MW-2022-7	Nickle (MB, RB)	Detected sample results <RL and <BAL	“U” at the RL

Notes:
MB Method blank
RB Rinse blank
RL Reporting limit

8.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.4 Data Validation Checklist

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
B. Equipment Blanks / Field Blanks		X	X		

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

9 General Chemistry Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 18. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Cyanide was detected in the associated method blank batch- 669584 and associated calibration blanks; however, the associated sample results were non-detect. No qualification of the sample results was required.

9.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.4 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B / SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Instrument Blanks		X	X		
B. Method Blanks		X	X		

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation

process. The percent usability calculation included analyses evaluated under the Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 19. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	94.4%	3
SVOCs	96.8%	4
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data review were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Appendix B

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
S1+	Surrogate recovery exceeds control limits, high biased.

Dioxin

Qualifier	Qualifier Description
*5-	Isotope dilution analyte is outside acceptance limits, low biased.
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Appendices

Appendix A **Chain of Custody**

Appendix B **Annotated Sample Analysis Data Sheets**

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-208620-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-1D	480-208620-1	Water	05/03/2023		X	X	X	X	X	X	X
MW-2022-1S	480-208620-2	Water	05/03/2023		X	X	X	X	X	X	X
TRIP BLANK 05032023	480-208620-3	Water	05/03/2023		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	2	0	1	0	0	0	3
SVOCs	2	0	0	0	0	0	2
PCBs	2	0	0	0	0	0	2
PEST	2	0	0	0	0	0	2
HERB	2	0	0	0	0	0	2
OPC	2	0	0	0	0	0	2
PCDD/PCDF	2	0	0	0	0	0	2
PFAS	2	0	0	0	0	0	2
Metals	2	0	0	0	0	0	2
MISC	2	0	0	0	0	0	2

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.2.1 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 6. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compound	Criteria
MW-2022-1D	Continuing Calibration RRF	4-Nitroquinoline-1-oxide	0.0068

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 7. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Continuing Calibration Verification (CCV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

Continuing Calibration	Criteria	Sample Result	Qualification

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.3 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 8. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compound	LCS Recovery
MW-2022-1D MW-2022-1S	Prep Batch: 668392	p-Phenylene diamine	<10%

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 9. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.5 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Laboratory Control Sample (LCS) %R		X	X		
Dilution Factor		X		X	
Continuing calibration RRFs		X	X		

Note:
%R Percent recovery

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 10. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

5 Pesticide/Herbicide Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 11. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criterion.

5.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.3 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 12. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 13. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-1D	1,2,3,4,6,7,8-HpCDD (MB) 1,2,3,4,6,7,8-HpCDF (MB) 1,2,3,4,7,8,9-HpCDF (MB) 1,2,3,4,7,8-HxCDF (MB) 1,2,3,6,7,8-HxCDD (MB) 2,3,4,6,7,8-HxCDF (MB) 2,3,7,8-TCDF (MB) OCDD (MB) OCDF (MB) Total HpCDD (MB) Total HpCDF (MB) Total HxCDD (MB) Total HxCDF (MB) Total PeCDD (MB) Total PeCDF (MB) Total TCDF (MB)	Detected sample results <RL and <BAL	“U” at the RL
MW-2022-1S	1,2,3,4,6,7,8-HpCDD (MB) 1,2,3,4,6,7,8-HpCDF (MB) 1,2,3,4,7,8,9-HpCDF (MB) 1,2,3,4,7,8-HxCDD (MB) 1,2,3,4,7,8-HxCDF (MB) 1,2,3,6,7,8-HxCDD (MB) 1,2,3,7,8,9-HxCDD (MB) 1,2,3,7,8-PeCDD (MB) 2,3,4,6,7,8-HxCDF (MB) 2,3,7,8-TCDF (MB)		

Sample ID	Compounds	Sample Result	Qualification
	OCDD (MB) OCDF (MB) Total HpCDD (MB) Total HpCDF (MB) Total HxCDD (MB) Total HxCDF (MB) Total PeCDD (MB) Total PeCDF (MB) Total TCDF (MB)		

Notes:
MB Method blank
RL Reporting limit

6.3 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.5 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 14. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

8 Metals Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 15. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.3 Data Validation Checklist

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

9 General Chemistry Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 16. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is

compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Cyanide was detected in the associated method blank batch- 669722 and associated calibration blanks; however, the associated sample results were non-detect. No qualification of the sample results was required.

9.3 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

9.3.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis performed on sample MW-2022-1D for the analyte sulfide exhibiting recoveries outside of the control limits are presented in the following table.

Table 17. Samples with Matrix Spike and Matrix Spike Duplicate Recoveries Outside Control Limits

Sample ID	Analyte	MS Recovery	MSD Recovery
MW-2022-1D	Sulfide	<30%	<30%

The criteria used to evaluate MS recoveries are presented in the following table. In the case of an MS deviation, the sample results are qualified. The qualifications are applied to the parent sample result for the analyte sulfide associated with this SDG.

Table 18. Matrix Spike and Matrix Spike Duplicate Recovery Evaluation Criteria and Qualifications

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

9.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.5 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B / SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
Matrix Spike (MS) %R		X	X		
Matrix Spike Duplicate (MSD) %R		X	X		

Note:
%R Percent recovery

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under the Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 19. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	97.2%	2
SVOCs	98.8%	3
PCBs	100%	0

Parameter	Percent Usability	Rejected Data
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	75.0%	1

The data package completeness, as determined from the Tier I data review, was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data review were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

eurofins Environment Testing

Client Information (Sub Contract Lab)	Sampler	Lab PM: Schove, John R	COC No: 480-80411 1
Client Contact: Shipping/Receiving	Phone	E-Mail: John Schove@et.eurofinsus com	State of Origin: Massachusetts	Page: Page 1 of 1
Company: TestAmerica Laboratories, Inc.		Accreditations Required (See note): NELAP - New York, State - Massachusetts	Job #: 480-208620-1
Address: 530 Community Drive, Suite 11,	Due Date Requested: 5/18/2023		
City: South Burlington	TAT Requested (days):		
State, Zip: VT, 05403			
Phone: 802-660-1990(Tel) 802-660-1919(Fax)	PO #:		
Email	WO #:		
Project Name: GE Woods Pond Parcel	Project #: 48024970		
Site	SSOW#:		

Analysis Requested

Preservation Codes:
A - HCL, B - NaOH, C - Zn Acetate, D - Nitric Acid, E - NaHSO4, F - MeOH, G - Amchlor, H - Ascorbic Acid, I - Ice, J - DI Water, K - EDTA, L - EDA, M - Hexane, N - None, O - AsNaO2, P - Na2O4S, Q - Na2SO3, R - Na2S2O3, S - H2SO4, T - TSP Dodecahydrate, U - Acetone, V - MCAA, W - pH 4-5, Y - Trizma, Z - other (specify)
Other:

Sample Identification - Client ID (Lab ID)	Sample Date	Sample Time	Sample Type (C=Comp, G=grab)	Matrix (W=water, S=solid, O=waste/oil, BT=Tissue, A=Air)	Field Filtered Sample (Yes or No)	Perform MS/MSD (Yes or No)	PFC_IDA/3535_IVWT NY 21 PFAS	Total Number of containers	Special Instructions/Note:
			Preservation Code:						
MW-2022-1D (480-208620-1)	5/3/23	11:15 Eastern		Water			X	2	
MW-2022-1D (480-208620-1MS)	5/3/23	11 15 Eastern	MS	Water			X	2	
MW-2022-1D (480-208620-1MSD)	5/3/23	11:15 Eastern	MSD	Water			X	2	
MW-2022-1S (480-208620-2)	5/3/23	15 20 Eastern		Water			X	2	

Note Since laboratory accreditations are subject to change, Eurofins Environment Testing Northeast, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories This sample shipment is forwarded under chain-of-custody If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Northeast, LLC laboratory or other instructions will be provided Any changes to accreditation status should be brought to Eurofins Environment Testing Northeast, LLC attention immediately If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Northeast, LLC

Possible Hazard Identification: Unconfirmed	Sample Disposal (A fee may be assessed if samples are retained longer than 1 month): ☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months
Deliverable Requested I, II, III, IV, Other (specify) Primary Deliverable Rank 2	Special Instructions/QC Requirements

Appendix B

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
E	Result exceeded calibration range.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
S1+	Surrogate recovery exceeds control limits, high biased.

LCMS

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
*5-	Isotope dilution analyte is outside acceptance limits, low biased.
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Data Validation Report

PDI Summary Report for Upland Disposal Facility Area

GE-Pittsfield/Housatonic River Site
Pittsfield, Massachusetts

Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses

SDG # 480-208715-1

Analyses Performed By:
Eurofins Buffalo
Amherst, New York, USA

Eurofins Burlington, South Burlington, Vermont, USA

Eurofins Pittsburgh, Pennsylvania, USA

Eurofins Lancaster Laboratories Environmental Testing, LLC
Pennsylvania, USA

Report #50620R
Review Level: Tier I
Project: 30181915 Task 0003

Appendix B **Annotated Sample Analysis Data Sheets**

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-208715-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-6	480-208715-1	Water	05/05/2023		X	X	X	X	X	X	X
TRIP BLANK 05052023	480-208715-2	Water	05/05/2023		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	1	0	1	0	0	0	2
SVOCs	1	0	0	0	0	0	1
PCBs	1	0	0	0	0	0	1
PEST	1	0	0	0	0	0	1
HERB	1	0	0	0	0	0	1
OPC	1	0	0	0	0	0	1
PCDD/PCDF	1	0	0	0	0	0	1
PFAS	1	0	0	0	0	0	1
Metals	1	0	0	0	0	0	1
MISC	1	0	0	0	0	0	1

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 6. Summary of Blank Contamination Qualifications

Sample ID	Compound	Sample Result	Qualification
MW-2022-6	Pyridine (MB)	Detected sample results <RL and <BAL	“U” at the RL

Notes:
MB Method blank
RL Reporting limit

3.3 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.3.1 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 7. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compound	Criteria
MW-2022-6	Continuing Calibration RRF	4-Nitroquinoline-1-oxide	0.0061

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 8. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.4 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample/laboratory control sample (LCS/LCSD) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 9. Samples with Laboratory Control Sample and Laboratory Control Sample Duplicate Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-6	Prep Batch: 669158	a,a-Dimethylphenethylamine	<10%	AC
		Kepone	<10%	<10%
		p-Phenylene diamine	<10%	<10%

Note:
AC Acceptable

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 10. Laboratory Control Sample and Laboratory Control Sample Duplicate Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.5 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.6 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
Laboratory Control Sample (LCS) %R		X	X		
Laboratory Control Sample Duplicate (LCSD) %R		X	X		
Dilution Factor		X		X	
Continuing calibration RRFs		X	X		

Note:
%R Percent recovery

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 11. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

5 Pesticide/Herbicide Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 12. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criterion.

5.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.3 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 13. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 14. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-6	1,2,3,4,6,7,8-HpCDF (MB) OCDD (MB) OCDF (MB)	Detected sample results <RL and <BAL	“U” at the RL

Sample ID	Compounds	Sample Result	Qualification
	Total HpCDF (MB) Total HxCDD (MB) Total HxCDF (MB) Total PeCDD (MB) Total PeCDF (MB) Total TCDF (MB)		

Notes:
MB Method blank
RL Reporting limit

6.3 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.5 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 15. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

8 Metals Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 16. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.3 Data Validation Checklist

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

9 General Chemistry Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 17. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is

compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Cyanide was detected in the associated method blank batch- 668997 and associated calibration blanks; however, the associated sample results were non-detect. No qualification of the sample results was required.

9.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.4 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B / SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under the Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 18. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	96.3%	2
SVOCs	96.8%	4
PCBs	100%	0

Parameter	Percent Usability	Rejected Data
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data review were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Appendix B

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
*+	LCS and/or LCSD is outside acceptance limits, high biased.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
S1-	Surrogate recovery exceeds control limits, low biased.
S1+	Surrogate recovery exceeds control limits, high biased.

LCMS

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Appendices

Appendix A Chain of Custody
Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-208637-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-3	480-214414-1	Water	10/30/2023		X	X	X	X	X	X	X
TRIP BLANK 103023	480-214414-2	Water	10/30/2023		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	0	0	0	1	0	1	2
SVOCs	0	0	0	1	0	0	1
PCBs	0	0	0	1	0	0	1
PEST	0	0	0	1	0	0	1
HERB	0	0	0	1	0	0	1
OPC	0	0	0	1	0	0	1
PCDD/PCDF	0	0	0	1	0	0	1
PFAS	0	0	0	1	0	0	1
Metals	0	0	0	1	0	0	1
MISC	0	0	0	1	0	0	1

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

2.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

2.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

2.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

2.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits.

2.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

2.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

2.7 Matrix Spike/Matrix Spike Duplicate Analysis

Matrix Spike / Matrix Spike Duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

2.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

2.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

2.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

The laboratory calibrated for the compounds 2-Chloro-1,3-butadiene, 2-Chloroethyl vinyl ether, Acetonitrile, Methacrylonitrile, Methyl methacrylate, and Propionitrile; however, they were not spiked or evaluated in the LCS. Therefore, these results will be qualified as estimated, J/UJ.

2.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 6. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-3	Pyridine (MB)	Detected sample results <RL and <BAL	“U” at the RL

Notes:
MB Method blank
RL Reporting limit

3.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

3.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

3.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 7. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compounds	Criteria
MW-2022-3	CCV %D	Pentachlorophenol	-41.1%
		4-Nitroquinoline-1-oxide	-80.7%
		3,3'-Dimethylbenzidine	-27.3%
		2,3,5,6-Tetrachlorophenol	-40.1%
		Methapyrilene	+27.6%
	Continuing Calibration RRF	4-Nitroquinoline-1-oxide	0.0041
		Pentachlorophenol	0.0404

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 8. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Continuing Calibration Verification (CCV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

3.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

3.7 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

3.8 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The 3.8 Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 9. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-3	Prep Batch: 690138	1,3-Dinitrobenzene	<LL but >10%	Not analyzed
		1-Naphthylamine	<LL but >10%	Not analyzed
		2,4,5-Trichlorophenol	<LL but >10%	Not analyzed
		2,4,6-Trichlorophenol	<LL but >10%	Not analyzed
		2,4-Dichlorophenol	<LL but >10%	Not analyzed
		2,4-Dinitrotoluene	<LL but >10%	Not analyzed
		2,6-Dichlorophenol	<LL but >10%	Not analyzed
		2,6-Dinitrotoluene	<LL but >10%	Not analyzed
		2-Methylnaphthalene	<LL but >10%	Not analyzed
		2-Naphthylamine	<LL but >10%	Not analyzed
		3,3'-Dimethylbenzidine	<LL but >10%	Not analyzed
		3-Methylcholanthrene	<10%	Not analyzed
		4-Bromophenyl phenyl ether	<LL but >10%	Not analyzed
		Acenaphthylene	<LL but >10%	Not analyzed

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
		Anthracene	<LL but >10%	Not analyzed
		Benzo[a]anthracene	<LL but >10%	Not analyzed
		Benzo[b]fluoranthene	<LL but >10%	Not analyzed
		Benzo[k]fluoranthene	<LL but >10%	Not analyzed
		Butyl benzyl phthalate	<LL but >10%	Not analyzed
		Dibenzofuran	<LL but >10%	Not analyzed
		Dimethyl phthalate	<LL but >10%	Not analyzed
		Famphur	<LL but >10%	Not analyzed
		Fluoranthene	<LL but >10%	Not analyzed
		Fluorene	<LL but >10%	Not analyzed
		Hexachloropropene	<LL but >10%	Not analyzed
		Kepone	<LL but >10%	Not analyzed
		Naphthalene	<LL but >10%	Not analyzed
		Phenanthrene	<LL but >10%	Not analyzed
		p-Phenylene diamine	<10%	Not analyzed
		Pyrene	<LL but >10%	Not analyzed

Note:
AC Acceptable

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 10. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

The sample and QC were reanalyzed due to the LCS failures outside holding time. The primary analysis will be reported and qualified as documented in the table above.

3.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

3.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

3.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 11. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

4.3 System Performance

System performance and column resolution were acceptable.

4.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

4.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. Multiple-point calibrations were performed for Aroclor 1016 and 1260 only. Single-point calibrations were performed for the remaining Aroclors. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

4.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The continuing calibration %D were within the specified control limits.

4.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires that both the surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries reported from the primary column were within control limits.

4.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

4.7 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

4.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix.

A field duplicate analysis was not performed on sample associated with this SDG.

4.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

The dual column analysis exhibited an acceptable %RPD between columns.

4.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 12. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criterion.

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were detected in the associated QA blanks; however, the associated sample results were greater than the BAL and/or were non-detect. No qualification of the sample results was required.

5.3 System Performance

System performance and column resolution were acceptable.

5.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

5.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

5.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Sample Locations	Initial/Continuing	Compound	Criteria
MW-2022-3	CCV %D	Phorate (8141B)	+19.1%
		Sulfotepp (8141B)	+21.5%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 205% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J

Initial/Continuing	Criteria	Sample Result	Qualification
Continuing Calibration	%D >15% (increase in sensitivity)	Non-detect	No Action
		Detect	J
	%D >15% (decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

5.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. Pesticide - herbicide analysis requires that one of the two pesticide - herbicide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

Sample locations associated with surrogates exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Surrogate	Recovery
MW-2022-3	Tributyl phosphate (8141B)	>UL
	Triphenylphosphate (8141B)	AC
	2,4-Dichlorophenylacetic acid (8151A)	>UL

Notes:

AC = Acceptable

The criteria used to evaluate the surrogate recoveries are presented in the following table. In the case of a surrogate deviation, the sample results associated with the deviant fraction are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J

Control Limit	Sample Result	Qualification
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Surrogates diluted below the calibration curve due to the high concentration of a target compound.	Non-detect	J[1]
	Detect	

Note:

[1] A more concentrated analysis was not performed with surrogate compounds within the calibration range; therefore, no determination of extraction efficiency could be made.

5.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

5.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Compound	LCS Recovery	LCSD Recovery
MW-2022-3	Disulfoton (8141B)	>UL	>UL

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

5.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on sample associated with this SDG.

5.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

Dual column analysis performed on the field samples exhibited RPDs within the control limit.

5.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 13. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 14. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-3	1,2,3,4,6,7,8-HpCDD 1,2,3,4,6,7,8-HpCDF 1,2,3,4,7,8,9-HpCDF 1,2,3,4,7,8-HxCDF	Detected sample results <RL and <BAL	“U” at the RL

6.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

System performance and column resolution were acceptable.

6.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

6.4.1 Initial Calibration

A maximum relative standard deviation (RSD) of 15% is allowed for all non-labeled compounds (target) and 30% is allowed for all labeled compounds (internal standards and recovery standards).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

6.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibited percent difference (%D) less than the control limit (20%).

The continuing calibration %D were within the specified control limits.

6.5 Labeled Standard Performance

Labeled standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the labeled standards exhibit recoveries within the control limits of 40% to 135%.

All labeled standard responses were within control limits.

6.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

6.7 Ongoing Precision Result / Laboratory Control Sample Analysis

The Ongoing Precision Result/Laboratory Control Sample (OPR/LCS) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the OPR analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

6.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on sample associated with this SDG.

6.9 Compound Identification

PCDD/PCDF compounds are identified by using the compound’s ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection

limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.11 Data Validation Checklist

7 Perfluoroalkyl Substances Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 15. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of ten times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

7.3 Mass Calibration

Mass calibration and system performance were acceptable.

7.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

7.4.1 Initial Calibration

The percent relative standard deviation (%RSD) of the response factors (RF) must be less than 20%, or for linear calibration, $R^2 \geq 0.99$. Analytes must be within 70-130% of their true value for each calibration standard.

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

7.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (30%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits.

7.5 Isotopically Labelled Standards

7.5.1 Extracted Internal Standard

Labeled standards must be added to all field samples and QC samples prior to extraction. Extracted Internal Standard (EIS) recoveries must be within the limits of 50% to150% (25% to 150% for poor responding analytes FBA, PFPeA, fluorotelomer sulfonates).

All EIS recoveries were within the specified control limits.

7.5.2 Injection Internal Standards

Injection internal standards are added to the aliquot of sample dilutions, QC samples, and standards just prior to analysis. Peak areas must be within 50-150% of the area measured in the ICAL midpoint standard. On days when ICAL is not performed, the peak areas must be within 50-150% of the peak area measured in daily initial CCV.

Samples associated with internal standards exhibited responses within the control limits.

7.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD less than 30%. The MS/MSD recovery control limits do not apply when the concentration detected in the parent sample exceeds the MS/MSD spike level by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

7.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

7.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water.

A field duplicate analysis was not performed on sample associated with this SDG.

7.9 Compound Identification

PFC analytes are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

All identified compounds met the specified criteria.

7.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8 Metals Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 16. Holding Time for Method SW-846 6010C/7470A/7471B

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

8.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

8.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All initial and continuing calibration verification standard recoveries were within the control limit.

8.3.2 Lower Limit of Quantitation Check Standard

The lower limit of quantitation check (LLQC) check standard serves to verify the linearity of calibration of the analysis at the reporting limit. The LLQC recoveries must be within 70 to 130%, and 50 to 150% for antimony (Sb), lead (Pb), and thallium (Tl). The LLQC standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the LLQC standard analysis are presented below in the LLQC standards evaluation table (if applicable).

All LLQC standard recoveries were within control limits.

8.3.3 ICP Interference Control Sample

The Interference Control Sample (ICS) verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

8.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils and RPD 20% for water matrices and 35% for soil matrices. The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample associated with this SDG.

8.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices

The laboratory duplicate analysis was not performed on sample associated with this SDG.

8.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

8.6 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All LCS recoveries were within control limits.

8.7 Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 15% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample.

The serial dilution was not performed on sample associated with this SDG.

8.8 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9 General Chemistry Analyses

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 17. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Cyanide was detected in the associated method blank batch; however, the associated sample results were non-detect. No qualification of the sample results was required.

9.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

9.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration must be greater than 0.995 analytes and all initial and continuing calibration verification standard recoveries must be within the control limits of 85%-115%.

All initial and continuing calibration verification standard recoveries were within the control limit.

9.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

9.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample associated with this SDG.

9.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis was not performed on a sample within this SDG.

9.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

9.6 Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120% for water and within laboratory established acceptance limits for soils.

The LCS analysis exhibited recoveries within the control limits.

9.7 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 18. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.2%	2
SVOCs	96.8%	4

Parameter	Percent Usability	Rejected Data
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Appendix B

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
B	Compound was found in the blank and sample.
E	Result exceeded calibration range.
H	Sample was prepped or analyzed beyond the specified holding time. This does not meet regulatory requirements.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1-	Surrogate recovery exceeds control limits, low biased.

GC Semi VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1+	Surrogate recovery exceeds control limits, high biased.

LCMS

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-214502-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-1D	480-214502-1	Water	11/1/2022		X	X	X	X	X	X	X
MW-2022-DUP-110123	480-214502-2	Water	11/1/2023	MW-2022-1D	X	X	X	X	X	X	X
TRIP BLANK 110123	480-214502-3	Water	11/1/2023		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	1	1	1	0	0	0	3
SVOCs	1	1	0	0	0	0	2
PCBs	1	1	0	0	0	0	2
PEST	1	1	0	0	0	0	2
HERB	1	1	0	0	0	0	2
OPC	1	1	0	0	0	0	2
PCDD/PCDF	1	1	0	0	0	0	2
PFAS	1	1	0	0	0	0	2
Metals	1	1	0	0	0	0	2
MISC	1	1	0	0	0	0	2

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

Table 5. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-1D / MW-2022-DUP-110123	All target compounds	U	U	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

2.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.4 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Field Duplicate (RPD)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 6. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 7. Samples with Laboratory Control Sample and Laboratory Control Sample Duplicate Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-1D MW-2022-DUP-110123	Prep Batch: 690504	3-Methylcholanthrene	<10%	Not analyzed
		a,a-Dimethylphenethylamine		
		p-Phenylene diamine		

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 8. Laboratory Control Sample and Laboratory Control Sample Duplicate Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

Table 9. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-1D / MW-2022-DUP-110123	All compounds	U	U	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

3.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.5 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Laboratory Control Sample (LCS) %R		X	X		
Dilution Factor		X		X	
Field Duplicate (RPD)		X		X	

Notes:
%R Percent recovery
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 10. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix. Results for duplicate samples are summarized in the following table.

Table 11. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-1D / MW-2022-DUP-110123	All target compounds	U	U	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

4.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.4 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	
Field Duplicate (RPD)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

5 Pesticide/Herbicide Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 12. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criterion.

5.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 13. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-2022-1D / MW-2022-DUP-110123	All compounds	U	U	AC

Note:
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

5.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.4 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	
Field Duplicate (RPD)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 15. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the "B" qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 16. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-1D	1,2,3,4,6,7,8-HpCDF 1,2,3,4,7,8,9-HpCDF 1,2,3,4,7,8-HxCDF 1,2,3,7,8,9-HxCDD 1,2,3,7,8-PeCDF OCDD Total HpCDF Total HxCDD Total HxCDF Total PeCDF	Detected sample results <RL and <BAL	"U" at the RL
MW-2022-DUP-110123	1,2,3,7,8,9-HxCDD 1,2,3,7,8-PeCDF OCDD Total HxCDD Total PeCDF	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RL Reporting limit

6.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 17. Field Duplicate Sample Results

Sample ID / Duplicate ID	Compounds	Sample Result	Duplicate Result	RPD
MW-2022-1D / MW-2022-DUP-110123	1,2,3,4,7,8-Hexachlorodibenzo-p-Dioxin	0.83 J	24 U	AC
	1,2,3,6,7,8-Hexachlorodibenzofuran	0.76 J	24 U	AC
	1,2,3,6,7,8-Hexachlorodibenzo-p-Dioxin	0.34 J	24 U	AC
	1,2,3,7,8,9-Hexachlorodibenzofuran	0.62 J	24 U	AC
	2,3,7,8-Tetrachlorodibenzo-p-dioxin	0.29 J	1.2 J	AC
	Octachlorodibenzofuran	0.56 J	0.74 J	AC
	Tetrachlorodibenzo-p-dioxins, Total	0.29 J	1.2 J	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

6.4 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as “I” (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.5 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.6 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
Dilution Factor		X		X	
Field Duplicate (RPD)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 18. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water. Results for duplicate samples are summarized in the following table.

Table 19. Field Duplicate Sample Result

Sample ID / Duplicate ID	Compounds	Sample Result	Duplicate Result	RPD
MW-2022-1D / MW-2022-DUP-110123	Perfluorobutane sulfonic acid (PFBS)	1.3 J	1.3 J	AC
	Perfluoroheptane sulfonic acid (PFHpS)	0.28 J	0.21 J	AC
	Perfluorohexane sulfonic acid (PFHxS)	12	13	8.0 %
	Perfluorohexanoic acid (PFHxA)	2.2	2	AC
	Perfluorooctane sulfonic acid (PFOS)	80	75	6.4 %
	Perfluorooctanoic acid (PFOA)	1.3 J	1.1 J	AC
	Perfluoropentanoic acid (PFPeA)	0.63 J	1.5 J	AC

Notes:
U non-detect
AC Acceptable

The results and calculated RPDs between the parent sample and field duplicate were acceptable.

7.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.4 Data Validation Checklist

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	
Field Duplicate (RPD)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

8 Metals Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 20. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less

than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 21. Field Duplicate Sample Results

Sample ID / Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
MW-2022-1D / MW-2022-DUP-110123	Barium	0.014	0.014	0.0 %
	Chromium	0.004 U	0.0012 J	AC
	Cobalt	0.0023 J	0.0024 J	4.2 %
	Mercury	0.000075 J	0.0001 J	AC

Note:
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

8.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.4 Data Validation Checklist

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required

Field Duplicate (RPD)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

9 General Chemistry Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 22. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

Table 25. Field Duplicate Sample Results

Sample ID / Duplicate ID	Analytes	Sample Result	Duplicate Result	RPD
MW-2022-1D / MW-2022-DUP-110123	Cyanide	U	U	AC
	Sulfide	U	U	AC

Notes:
U non-detect
AC Acceptable

The results between the parent sample and field duplicate were acceptable.

9.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.4 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B / SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X	X		
Reporting limits (units)		X		X	
Blanks					
A. Instrument Blanks		X	X		
B. Method Blanks		X	X		
Field Duplicate (RPD)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under the Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 26. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.2%	2
SVOCs	97.6%	6
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0

Parameter	Percent Usability	Rejected Data
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data review were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Northeast, LLC places the ownership of method analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Northeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Northeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Northeast, LLC.

Appendix B

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1+	Surrogate recovery exceeds control limits, high biased.

LCMS

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-214549-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-9	480-214549-1	Water	11/2/2023		X	X	X	X	X	X	X
TRIPBLANK 110223	480-214549-2	Water	11/2/2023		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	1	0	1	0	0	0	2
SVOCs	1	0	0	0	0	0	1
PCBs	1	0	0	0	0	0	1
PEST	1	0	0	0	0	0	1
HERB	1	0	0	0	0	0	1
OPC	1	0	0	0	0	0	1
PCDD/PCDF	1	0	0	0	0	0	1
PFAS	1	0	0	0	0	0	1
Metals	1	0	0	0	0	0	1
MISC	1	0	0	0	0	0	1

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X	X		
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 6. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

Table 7. Samples with MS/MSD Recoveries Outside Control Limits

Sample ID	Batch	Compounds	MS Recovery	MSD Recovery
MW-2022-9	Prep Batch: 690823	3-Methylcholanthrene	<10%	<10%
		a,a-Dimethylphenethylamine	<10%	<10%
		p-Phenylene diamine	<10%	<10%

Note:
AC Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 8. MS/MSD Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.3 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 7. Samples with Laboratory Control Sample and Laboratory Control Sample Duplicate Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-9	Prep Batch: 690823/	3-Methylcholanthrene	<10%	Not analyzed
		a,a-Dimethylphenethylamine		
		p-Phenylene diamine		

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 8. Laboratory Control Sample and Laboratory Control Sample Duplicate Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.5 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
MS/MSD %R		X	X		
Laboratory Control Sample (LCS) %R		X	X		
Dilution Factor		X		X	

Notes:
%R Percent recovery
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 8. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

5 Pesticide/Herbicide Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 9. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criterion.

5.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.3 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 10. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the "B" qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 11. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-9	OCDD	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RL Reporting limit

6.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.4 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
A. Method Blanks		X	X		
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 12. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

8 Metals Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 13. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.3 Data Validation Checklist

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

9 General Chemistry Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 14. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.3 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B / SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X	X		
Reporting limits (units)		X		X	
Blanks					
A. Instrument Blanks		X	X		
B. Method Blanks		X	X		
Field Duplicate (RPD)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under the Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 15. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.2%	2
SVOCs	98.8%	3
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0

Parameter	Percent Usability	Rejected Data
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data review were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
F1	MS and/or MSD recovery exceeds control limits.

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
E	Result exceeded calibration range.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1+	Surrogate recovery exceeds control limits, high biased.

LCMS

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
^+	Continuing Calibration Verification (CCV) is outside acceptance limits, high biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Client Sample ID: MW-2022-9

GE-Pittsfield/Housatonic River Site
Pittsfield, Massachusetts

Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans, Metals, and Miscellaneous Analyses

SDG # 480-214568-1

Analyses Performed By:
Eurofins Buffalo
Amherst, New York, USA

Eurofins Burlington, South Burlington, Vermont, USA

Eurofins Pittsburgh, Pennsylvania, USA

Eurofins Lancaster Laboratories Environmental Testing, LLC
Pennsylvania, USA

Report #52675R
Review Level: Tier I/II
Project: 30181915 Task 0002

Contents

1 Summary 7
1.1 Analytical Data Package Documentation 7
1.2 Data Validation Procedures 8
2 Volatile Organic Compound Analyses 10
2.1 Holding Times 10
2.2 Blank Contamination 11
2.3 Mass Spectrometer Tuning 11
2.4 Calibration 11
2.4.1 Initial Calibration 11
2.4.2 Continuing Calibration 11
2.5 Surrogates/System Monitoring Compounds 12
2.6 Internal Standard Performance 12
2.7 Matrix Spike/Matrix Spike Duplicate Analysis 12
2.8 Laboratory Control Sample Analysis 12
2.9 Field Duplicate Analysis 12
2.10 Compound Identification 13
2.11 System Performance and Overall Assessment 13
2.12 Data Validation Checklist 13
3 Semi-volatile Organic Compound Analyses 15
3.1 Holding Times 15
3.2 Blank Contamination 15
3.3 Mass Spectrometer Tuning 15
3.4 Calibration 15
3.4.1 Initial Calibration 16
3.4.2 Continuing Calibration 16
3.5 Surrogates/System Monitoring Compounds 17
3.6 Internal Standard Performance 17
3.7 Matrix Spike/Matrix Spike Duplicate Analysis 17
3.8 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis 17
3.9 Field Duplicate Analysis 18
3.10 Compound Identification 18
3.11 System Performance and Overall Assessment 19

3.12 Data Validation Checklist 19
4 Polychlorinated Biphenyl Analyses 20
4.1 Holding Times 20
4.2 Blank Contamination 21
4.3 System Performance 21
4.4 Calibration 21
4.4.1 Initial Calibration 21
4.4.2 Continuing Calibration 21
4.5 Surrogates/System Monitoring Compounds 22
4.6 Matrix Spike/Matrix Spike Duplicate Analysis 22
4.7 Laboratory Control Sample Analysis 22
4.8 Field Duplicate Analysis 22
4.9 Compound Identification 22
4.10 System Performance and Overall Assessment 23
4.11 Data Validation Checklist 23
5 Pesticide/Herbicide Analyses 24
5.1 Holding Times 24
5.2 Blank Contamination 24
5.3 System Performance 25
5.4 Calibration 25
5.4.1 Initial Calibration 25
5.4.2 Continuing Calibration 25
5.5 Surrogates/System Monitoring Compounds 26
5.6 Matrix Spike/Matrix Spike Duplicate Analysis 27
5.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis 28
5.8 Field Duplicate Analysis 28
5.9 Compound Identification 28
5.10 System Performance and Overall Assessment 29
5.11 Data Validation Checklist 29
6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis 30
6.1 Holding Times 30
6.2 Blank Contamination 30
6.3 Mass Spectrometer Tuning 31

6.4 Calibration 31
6.4.1 Initial Calibration 31
6.4.2 Continuing Calibration 31
6.5 Labeled Standard Performance 32
6.6 Matrix Spike/Matrix Spike Duplicate Analysis 32
6.7 Ongoing Precision Result / Laboratory Control Sample Analysis 32
6.8 Field Duplicate Analysis 32
6.9 Compound Identification 32
6.10 System Performance and Overall Assessment 33
6.11 Data Validation Checklist 33
7 Perfluoroalkyl Substances Analyses 35
7.1 Holding Times 35
7.2 Blank Contamination 35
7.3 Mass Calibration 35
7.4 Calibration 35
7.4.1 Initial Calibration 35
7.4.2 Continuing Calibration 36
7.5 Isotopically Labelled Standards 36
7.5.1 Extracted Internal Standard 36
7.5.2 Injection Internal Standards 36
7.6 Matrix Spike/Matrix Spike Duplicate Analysis 36
7.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis 36
7.8 Field Duplicate Analysis 37
7.9 Compound Identification 37
7.10 System Performance and Overall Assessment 37
7.11 Data Validation Checklist 37
8 Metals Analyses 39
8.1 Holding Times 39
8.2 Blank Contamination 39
8.3 Calibration 39
8.3.1 Initial Calibration and Continuing Calibration 39
8.3.2 Lower Limit of Quantitation Check Standard 40
8.3.3 ICP Interference Control Sample 40

8.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis 40
8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis 40
8.4.2 Laboratory Duplicate Analysis 40
8.5 Field Duplicate Analysis 40
8.6 Laboratory Control Sample Analysis 41
8.7 Serial Dilution 41
8.8 System Performance and Overall Assessment 41
8.9 Data Validation Checklist 41
9 General Chemistry Analyses 42
9.1 Holding Times 42
9.2 Blank Contamination 43
9.3 Calibration 43
9.3.1 Initial Calibration and Continuing Calibration 43
9.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis 43
9.4.1 Matrix Spike/Matrix Spike Duplicate Analysis 43
9.4.2 Laboratory Duplicate Analysis 44
9.5 Field Duplicate Analysis 44
9.6 Laboratory Control Sample (LCS) Analysis 44
9.7 System Performance and Overall Assessment 44
9.8 Data Validation Checklist for General Chemistry 44

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-214568-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-2	480-214568-1	Water	11/3/2023		X	X	X	X	X	X	X
TRIPBLANK 110323	480-214568-2	Water	11/3/2023		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	

Items Reviewed	Reported		Performance Acceptable		Not Required

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	0	0	0	1	0	1	2
SVOCs	0	0	0	1	0	0	1
PCBs	0	0	0	1	0	0	1
PEST	0	0	0	1	0	0	1
HERB	0	0	0	1	0	0	1
OPC	0	0	0	1	0	0	1
PCDD/PCDF	0	0	0	1	0	0	1
PFAS	0	0	0	1	0	0	1
Metals	0	0	0	1	0	0	1
MISC	0	0	0	1	0	0	1

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

2.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

2.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

2.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

2.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits.

2.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

2.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

2.7 Matrix Spike/Matrix Spike Duplicate Analysis

Matrix Spike / Matrix Spike Duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

2.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

2.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

2.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

The laboratory calibrated for the compounds 2-Chloro-1,3-butadiene, 2-Chloroethyl vinyl ether, Acetonitrile, Methacrylonitrile, Methyl methacrylate, and Propionitrile; however, they were not spiked or evaluated in the LCS. Therefore, these results will be qualified as estimated, J/UJ.

2.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.12 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

3.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

3.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 6. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compounds	Criteria
MW-2022-2	Continuing Calibration RRF	4-Nitroquinoline-1-oxide	0.0032

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 7. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Continuing Calibration Verification (CCV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Continuing Calibration	Criteria	Sample Result	Qualification

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

3.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

3.7 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

3.8 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The 3.8 Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 9. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-2	Prep Batch: 690138	3,3'-Dimethylbenzidine	<LL but >10%	Not analyzed
		3-Methylcholanthrene	<10%	Not analyzed
		a,a-Dimethylphenethylamine	<10%	Not analyzed
		Methapyrilene	<LL but >10%	Not analyzed
		p-Phenylene diamine	<10%	Not analyzed

Note:
AC Acceptable

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 10. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

3.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

3.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 11. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

4.3 System Performance

System performance and column resolution were acceptable.

4.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

4.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. Multiple-point calibrations were performed for Aroclor 1016 and 1260 only. Single-point calibrations were performed for the remaining Aroclors. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

4.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The continuing calibration %D were within the specified control limits.

4.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires that both the surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries reported from the primary column were within control limits.

4.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

4.7 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

4.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix.

A field duplicate analysis was not performed on sample associated with this SDG.

4.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

The dual column analysis exhibited an acceptable %RPD between columns.

4.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.11 Data Validation Checklist

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 12. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criterion.

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing

concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were detected in the associated QA blanks; however, the associated sample results were greater than the BAL and/or were non-detect. No qualification of the sample results was required.

5.3 System Performance

System performance and column resolution were acceptable.

5.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

5.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

5.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Sample Locations	Initial/Continuing	Compound	Criteria
MW-2022-2	CCV %D	Disulfoton (8141B)	+40.1%
		Sulfotepp	+17.8%
		Famphur (8141B)	-37.1%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 205% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
Continuing Calibration	%D >15% (increase in sensitivity)	Non-detect	No Action
		Detect	J
	%D >15% (decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

5.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. Pesticide - herbicide analysis requires that one of the two pesticide - herbicide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries reported from the primary column were within control limits.

Sample locations associated with surrogates exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Surrogate	Recovery
MW-2022-2	Tributyl phosphate (8141B)	>UL
	Triphenylphosphate (8141B)	AC

Notes:

AC = Acceptable

The criteria used to evaluate the surrogate recoveries are presented in the following table. In the case of a surrogate deviation, the sample results associated with the deviant fraction are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Surrogates diluted below the calibration curve due to the high concentration of a target compound.	Non-detect	J[1]
	Detect	

Note:

[1] A more concentrated analysis was not performed with surrogate compounds within the calibration range; therefore, no determination of extraction efficiency could be made.

5.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

5.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Compound	LCS Recovery	LCSD Recovery
MW-2022-2	Disulfoton (8141B) Phorate (8141B)	>UL	Not analyzed

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

5.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on sample associated with this SDG.

5.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the

primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

Dual column analysis performed on the field samples exhibited RPDs within the control limit.

5.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 13. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the "B" qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 14. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-2	1,2,3,7,8,9-HxCDD OCDD Total HxCDD	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RL Reporting limit

6.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

System performance and column resolution were acceptable.

6.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

6.4.1 Initial Calibration

A maximum relative standard deviation (RSD) of 15% is allowed for all non-labeled compounds (target) and 30% is allowed for all labeled compounds (internal standards and recovery standards).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

6.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibited percent difference (%D) less than the control limit (20%).

The continuing calibration %D were within the specified control limits.

6.5 Labeled Standard Performance

Labeled standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the labeled standards exhibit recoveries within the control limits of 40% to 135%.

All labeled standard responses were within control limits.

6.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

6.7 Ongoing Precision Result / Laboratory Control Sample Analysis

The Ongoing Precision Result/Laboratory Control Sample (OPR/LCS) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the OPR analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

6.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on sample associated with this SDG.

6.9 Compound Identification

PCDD/PCDF compounds are identified by using the compound’s ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.11 Data Validation Checklist

7 Perfluoroalkyl Substances Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 15. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of ten times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

7.3 Mass Calibration

Mass calibration and system performance were acceptable.

7.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

7.4.1 Initial Calibration

The percent relative standard deviation (%RSD) of the response factors (RF) must be less than 20%, or for linear calibration, $R^2 \geq 0.99$. Analytes must be within 70-130% of their true value for each calibration standard.

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

7.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (30%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits.

7.5 Isotopically Labelled Standards

7.5.1 Extracted Internal Standard

Labeled standards must be added to all field samples and QC samples prior to extraction. Extracted Internal Standard (EIS) recoveries must be within the limits of 50% to150% (25% to 150% for poor responding analytes FBA, PFPeA, fluorotelomer sulfonates).

All EIS recoveries were within the specified control limits.

7.5.2 Injection Internal Standards

Injection internal standards are added to the aliquot of sample dilutions, QC samples, and standards just prior to analysis. Peak areas must be within 50-150% of the area measured in the ICAL midpoint standard. On days when ICAL is not performed, the peak areas must be within 50-150% of the peak area measured in daily initial CCV.

Samples associated with internal standards exhibited responses within the control limits.

7.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD less than 30%. The MS/MSD recovery control limits do not apply when the concentration detected in the parent sample exceeds the MS/MSD spike level by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

7.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

7.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water.

A field duplicate analysis was not performed on sample associated with this SDG.

7.9 Compound Identification

PFC analytes are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

All identified compounds met the specified criteria.

7.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8 Metals Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 16. Holding Time for Method SW-846 6010C/7470A/7471B

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

8.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

8.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All initial and continuing calibration verification standard recoveries were within the control limit.

8.3.2 Lower Limit of Quantitation Check Standard

The lower limit of quantitation check (LLQC) check standard serves to verify the linearity of calibration of the analysis at the reporting limit. The LLQC recoveries must be within 70 to 130%, and 50 to 150% for antimony (Sb), lead (Pb), and thallium (Tl). The LLQC standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the LLQC standard analysis are presented below in the LLQC standards evaluation table (if applicable).

All LLQC standard recoveries were within control limits.

8.3.3 ICP Interference Control Sample

The Interference Control Sample (ICS) verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

8.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils and RPD 20% for water matrices and 35% for soil matrices. The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample associated with this SDG.

8.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices

The laboratory duplicate analysis was not performed on sample associated with this SDG.

8.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less

than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

8.6 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All LCS recoveries were within control limits.

8.7 Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 15% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample.

The serial dilution was not performed on sample associated with this SDG.

8.8 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9 General Chemistry Analyses

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 17. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.

Method	Matrix	Holding Time	Preservation
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Cyanide was detected in the associated method blank batch; however, the associated sample results were non-detect. No qualification of the sample results was required.

9.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

9.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration must be greater than 0.995 analytes and all initial and continuing calibration verification standard recoveries must be within the control limits of 85%-115%.

All initial and continuing calibration verification standard recoveries were within the control limit.

9.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

9.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the

MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample associated with this SDG.

9.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis was not performed on a sample within this SDG.

9.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

9.6 Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120% for water and within laboratory established acceptance limits for soils.

The LCS analysis exhibited recoveries within the control limits.

9.7 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 18. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.2%	2
SVOCs	96.8%	4
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Northeast, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Northeast, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Northeast, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Northeast, LLC.

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1+	Surrogate recovery exceeds control limits, high biased.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

GE-Pittsfield/Housatonic River Site
Pittsfield, Massachusetts

Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans, Metals, and Miscellaneous Analyses

SDG # 480-214796-1

Analyses Performed By:
Eurofins Buffalo
Amherst, New York, USA

Eurofins Burlington, South Burlington, Vermont, USA

Eurofins Pittsburgh, Pennsylvania, USA

Eurofins Lancaster Laboratories Environmental Testing, LLC
Pennsylvania, USA

Report #52688R
Review Level: Tier I/II
Project: 30181915 Task 0002

Contents

1 Summary 7
1.1 Analytical Data Package Documentation 7
1.2 Data Validation Procedures 8
2 Volatile Organic Compound Analyses 10
2.1 Holding Times 10
2.2 Blank Contamination 11
2.3 Mass Spectrometer Tuning 11
2.4 Calibration 11
2.4.1 Initial Calibration 11
2.4.2 Continuing Calibration 11
2.5 Surrogates/System Monitoring Compounds 12
2.6 Internal Standard Performance 12
2.7 Matrix Spike/Matrix Spike Duplicate Analysis 12
2.8 Laboratory Control Sample Analysis 12
2.9 Field Duplicate Analysis 12
2.10 Compound Identification 13
2.11 System Performance and Overall Assessment 13
2.12 Data Validation Checklist 13
3 Semi-volatile Organic Compound Analyses 15
3.1 Holding Times 15
3.2 Blank Contamination 15
3.3 Mass Spectrometer Tuning 15
3.4 Calibration 15
3.4.1 Initial Calibration 16
3.4.2 Continuing Calibration 16
3.5 Surrogates/System Monitoring Compounds 17
3.6 Internal Standard Performance 17
3.7 Matrix Spike/Matrix Spike Duplicate Analysis 17
3.8 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis 17
3.9 Field Duplicate Analysis 18
3.10 Compound Identification 18
3.11 System Performance and Overall Assessment 19

3.12 Data Validation Checklist 19
4 Polychlorinated Biphenyl Analyses 20
4.1 Holding Times 20
4.2 Blank Contamination 21
4.3 System Performance 21
4.4 Calibration 21
4.4.1 Initial Calibration 21
4.4.2 Continuing Calibration 21
4.5 Surrogates/System Monitoring Compounds 22
4.6 Matrix Spike/Matrix Spike Duplicate Analysis 22
4.7 Laboratory Control Sample Analysis 22
4.8 Field Duplicate Analysis 22
4.9 Compound Identification 22
4.10 System Performance and Overall Assessment 23
4.11 Data Validation Checklist 23
5 Pesticide/Herbicide Analyses 24
5.1 Holding Times 24
5.2 Blank Contamination 24
5.3 System Performance 25
5.4 Calibration 25
5.4.1 Initial Calibration 25
5.4.2 Continuing Calibration 25
5.5 Surrogates/System Monitoring Compounds 27
5.6 Matrix Spike/Matrix Spike Duplicate Analysis 27
5.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis 27
5.8 Field Duplicate Analysis 28
5.9 Compound Identification 28
5.10 System Performance and Overall Assessment 28
5.11 Data Validation Checklist 28
6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis 30
6.1 Holding Times 30
6.2 Blank Contamination 30
6.3 Mass Spectrometer Tuning 31

6.4 Calibration 31
6.4.1 Initial Calibration 31
6.4.2 Continuing Calibration 31
6.5 Labeled Standard Performance 31
6.6 Matrix Spike/Matrix Spike Duplicate Analysis 32
6.7 Ongoing Precision Result / Laboratory Control Sample Analysis 32
6.8 Field Duplicate Analysis 32
6.9 Compound Identification 32
6.10 System Performance and Overall Assessment 33
6.11 Data Validation Checklist 33
7 Perfluoroalkyl Substances Analyses 34
7.1 Holding Times 34
7.2 Blank Contamination 35
7.3 Mass Calibration 35
7.4 Calibration 35
7.4.1 Initial Calibration 35
7.4.2 Continuing Calibration 35
7.5 Isotopically Labelled Standards 35
7.5.1 Extracted Internal Standard 35
7.5.2 Injection Internal Standards 36
7.6 Matrix Spike/Matrix Spike Duplicate Analysis 36
7.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis 36
7.8 Field Duplicate Analysis 36
7.9 Compound Identification 36
7.10 System Performance and Overall Assessment 36
7.11 Data Validation Checklist 37
8 Metals Analyses 38
8.1 Holding Times 38
8.2 Blank Contamination 39
8.3 Calibration 39
8.3.1 Initial Calibration and Continuing Calibration 39
8.3.2 Lower Limit of Quantitation Check Standard 39
8.3.3 ICP Interference Control Sample 39

8.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis 40
8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis 40
8.4.2 Laboratory Duplicate Analysis 40
8.5 Field Duplicate Analysis 40

Appendices

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-214796-1 performed on behalf of the General Electric Company (GE) for soil sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier and Tier II Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-5	480-214796-1	Water	11/9/2023		X	X	X	X	X	X	X
TRIPBLANK 110923	480-214796-2	Water	11/9/2023		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	

Items Reviewed	Reported		Performance Acceptable		Not Required

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 7471B, 9012B, and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	0	0	0	1	0	1	2
SVOCs	0	0	0	1	0	0	1
PCBs	0	0	0	1	0	0	1
PEST	0	0	0	1	0	0	1
HERB	0	0	0	1	0	0	1
OPC	0	0	0	1	0	0	1
PCDD/PCDF	0	0	0	1	0	0	1
PFAS	0	0	0	1	0	0	1
Metals	0	0	0	1	0	0	1
MISC	0	0	0	1	0	0	1

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

2.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

2.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

2.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

2.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits.

2.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

2.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

2.7 Matrix Spike/Matrix Spike Duplicate Analysis

Matrix Spike / Matrix Spike Duplicate (MS/MSD) data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

2.8 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

2.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

2.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

The laboratory calibrated for the compounds 2-Chloro-1,3-butadiene, 2-Chloroethyl vinyl ether, Acetonitrile, Methacrylonitrile, Methyl methacrylate, and Propionitrile; however, they were not spiked or evaluated in the LCS. Therefore, these results will be qualified as estimated, J/UJ.

2.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.12 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required

3 Semi-volatile Organic Compound Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

3.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (30%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05). The initial calibration standard must exhibit a percent difference (%D) less than the control limit (25%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

3.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (25%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Table 6. Summary of Compounds Outside Specified Calibration Control Limits

Sample ID	Continuing Calibration	Compounds	Criteria
MW-2022-5	Continuing Calibration RRF	4-Nitroquinoline-1-oxide	0.0037
	Continuing Calibration %D	Benzidine	-25.3%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Table 7. Continuing Calibration Evaluation Criteria and Qualifications

Continuing Calibration	Criteria	Sample Result	Qualification
Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Continuing Calibration Verification (CCV)	%D >25% (increase/decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R

Continuing Calibration	Criteria	Sample Result	Qualification
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

3.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

3.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

3.7 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

3.8 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The 3.8 Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 8. Samples with Laboratory Control Sample Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-5	Prep Batch: 690138	3,3'-Dimethylbenzidine	<LL but >10%	Not analyzed
		3-Methylcholanthrene	<10%	Not analyzed
		Famphur	<LL but >10%	Not analyzed
		Hexachloropropene	<LL but >10%	Not analyzed
		p-Phenylene diamine	<10%	Not analyzed

Note:
AC Acceptable

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of an LCS deviation, the sample results are qualified as documented in the table below.

Table 9. Laboratory Control Sample Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.9 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices or 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water/three times the RL is applied for soil. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

3.10 Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

3.11 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.12 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required

4 Polychlorinated Biphenyl Analyses

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 10. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

4.3 System Performance

System performance and column resolution were acceptable.

4.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

4.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. Multiple-point calibrations were performed for Aroclor 1016 and 1260 only. Single-point calibrations were performed for the remaining Aroclors. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

4.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The continuing calibration %D were within the specified control limits.

4.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires that both the surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries reported from the primary column were within control limits.

4.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

4.7 Laboratory Control Sample Analysis

The laboratory control sample (LCS) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

4.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrix.

A field duplicate analysis was not performed on sample associated with this SDG.

4.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

The dual column analysis exhibited an acceptable %RPD between columns.

4.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5 Pesticide/Herbicide Analyses

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 11. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criterion.

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing

concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 12. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-5	Aldrin (8081B) Endosulfan I (8081B)	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RL Reporting limit

5.3 System Performance

System performance and column resolution were acceptable.

5.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

All Aroclors associated with calibrations were within the specified control limits for initial calibration and continuing calibration, as described below.

5.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99. The initial calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

5.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Sample Locations	Initial/Continuing	Compound	Criteria
MW-2022-5	CCV %D	Disulfoton (8141B)	+49.0%
		Sulfotepp (8141B)	+20.4%
		Famphur (8141B)	-30.4%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 205% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
Continuing Calibration	%D >15% (increase in sensitivity)	Non-detect	No Action
		Detect	J
	%D >15% (decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

Note:

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

5.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. Pesticide - herbicide analysis requires that one of the two pesticide - herbicide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries reported from the primary column were within control limits.

5.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

5.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Compound	LCS Recovery	LCSD Recovery
MW-2022-5	Dieldrin (8081B)	>UL	Not analyzed
	Disulfoton (8141B)	AC	>UL

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J

Control Limit	Sample Result	Qualification
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

5.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on sample associated with this SDG.

5.9 Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (RPD) of detected sample results must be less than 25%.

Dual column analysis performed on the field samples exhibited RPDs within the control limit.

5.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 13. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 14. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-5	1,2,3,4,6,7,8-HpCDD 1,2,3,4,6,7,8-HpCDF 1,2,3,4,7,8,9-HpCDF 1,2,3,7,8,9-HxCDF Total HpCDD	Detected sample results <RL and <BAL	“U” at the RL

Sample ID	Compounds	Sample Result	Qualification
	Total HpCDF Total HxCDF Total PeCDD Total PeCDF		

Notes:
MB Method blank
RL Reporting limit

6.3 Mass Spectrometer Tuning

Mass spectrometer performance was acceptable.

System performance and column resolution were acceptable.

6.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

6.4.1 Initial Calibration

A maximum relative standard deviation (RSD) of 15% is allowed for all non-labeled compounds (target) and 30% is allowed for all labeled compounds (internal standards and recovery standards).

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

6.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibited percent difference (%D) less than the control limit (20%).

The continuing calibration %D were within the specified control limits.

6.5 Labeled Standard Performance

Labeled standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the labeled standards exhibit recoveries within the control limits of 40% to 135%.

All labeled standard responses were within control limits.

6.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

6.7 Ongoing Precision Result / Laboratory Control Sample Analysis

The Ongoing Precision Result/Laboratory Control Sample (OPR/LCS) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the OPR analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

6.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate analysis was not performed on sample associated with this SDG.

6.9 Compound Identification

PCDD/PCDF compounds are identified by using the compound’s ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest.” This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as “I” (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7 Perfluoroalkyl Substances Analyses

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 15. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of ten times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

7.3 Mass Calibration

Mass calibration and system performance were acceptable.

7.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

7.4.1 Initial Calibration

The percent relative standard deviation (%RSD) of the response factors (RF) must be less than 20%, or for linear calibration, $R^2 \geq 0.99$. Analytes must be within 70-130% of their true value for each calibration standard.

The initial calibration (ICAL) and the ICV %D were within the specified control limits.

7.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (30%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits.

7.5 Isotopically Labelled Standards

7.5.1 Extracted Internal Standard

Labeled standards must be added to all field samples and QC samples prior to extraction. Extracted Internal Standard (EIS) recoveries must be within the limits of 50% to150% (25% to 150% for poor responding analytes FBA, PFPeA, fluorotelomer sulfonates).

All EIS recoveries were within the specified control limits.

7.5.2 Injection Internal Standards

Injection internal standards are added to the aliquot of sample dilutions, QC samples, and standards just prior to analysis. Peak areas must be within 50-150% of the area measured in the ICAL midpoint standard. On days when ICAL is not performed, the peak areas must be within 50-150% of the peak area measured in daily initial CCV.

Samples associated with internal standards exhibited responses within the control limits.

7.6 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD less than 30%. The MS/MSD recovery control limits do not apply when the concentration detected in the parent sample exceeds the MS/MSD spike level by a factor of four or greater.

The MS/MSD analysis was not performed on sample associated with this SDG.

7.7 Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

7.8 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water.

A field duplicate analysis was not performed on sample associated with this SDG.

7.9 Compound Identification

PFC analytes are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

All identified compounds met the specified criteria.

7.10 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8 Metals Analyses

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 16. Holding Time for Method SW-846 6010C/7470A/7471B

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

8.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

8.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All initial and continuing calibration verification standard recoveries were within the control limit.

8.3.2 Lower Limit of Quantitation Check Standard

The lower limit of quantitation check (LLQC) check standard serves to verify the linearity of calibration of the analysis at the reporting limit. The LLQC recoveries must be within 70 to 130%, and 50 to 150% for antimony (Sb), lead (Pb), and thallium (Tl). The LLQC standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the LLQC standard analysis are presented below in the LLQC standards evaluation table (if applicable).

All LLQC standard recoveries were within control limits.

8.3.3 ICP Interference Control Sample

The Interference Control Sample (ICS) verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

8.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

8.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils and RPD 20% for water matrices and 35% for soil matrices. The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample associated with this SDG.

8.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices

The laboratory duplicate analysis was not performed on sample associated with this SDG.

8.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

8.6 Laboratory Control Sample Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All LCS recoveries were within control limits.

8.7 Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 15% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample.

The serial dilution was not performed on sample associated with this SDG.

8.8 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9 General Chemistry Analyses

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 17. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analyte listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 18. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-5	Cyanide, Total (MB)	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RL Reporting limit

9.3 Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

9.3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration must be greater than 0.995 analytes and all initial and continuing calibration verification standard recoveries must be within the control limits of 85%-115%.

All initial and continuing calibration verification standard recoveries were within the control limit.

9.4 Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

9.4.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125% for water matrices and laboratory control limits for soils. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the

MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on sample associated with this SDG.

9.4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate analysis was not performed on a sample within this SDG.

9.5 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices and 50% for soil matrix is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices. Results for duplicate samples are summarized in the following table.

A field duplicate analysis was not performed on sample associated with this SDG.

9.6 Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120% for water and within laboratory established acceptance limits for soils.

The LCS analysis exhibited recoveries within the control limits.

9.7 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 19. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.2%	2
SVOCs	97.6%	3
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Annotated Sample Analysis Data Sheets

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1+	Surrogate recovery exceeds control limits, high biased.

LCMS

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
I	Value is EMPC (estimated maximum possible concentration).
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit

Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-214617-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-7	480-214617-1	Water	11/06/23		X	X	X	X	X	X	X
TRIPBLANK 110623	480-214617-2	Water	11/06/23		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	1	0	1	0	0	0	2
SVOCs	1	0	0	0	0	0	1
PCBs	1	0	0	0	0	0	1
PEST	1	0	0	0	0	0	1
HERB	1	0	0	0	0	0	1
OPC	1	0	0	0	0	0	1
PCDD/PCDF	1	0	0	0	0	0	1
PFAS	1	0	0	0	0	0	1
Metals	1	0	0	0	0	0	1
MISC	1	0	0	0	0	0	1

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X	X		
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 6. Samples with Laboratory Control Sample and Laboratory Control Sample Duplicate Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-7	Prep Batch: 691406	3-Methylcholanthrene	<10%	Not analyzed
		p-Phenylene diamine		

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 8. Laboratory Control Sample and Laboratory Control Sample Duplicate Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review,

the overall data quality is within the guidelines specified in the method.

3.4 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Laboratory Control Sample (LCS) %R		X	X		
Dilution Factor		X		X	

Notes:
%R Percent recovery
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 7. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

5 Pesticide/Herbicide Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 8. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criterion.

5.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.3 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 9. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 10. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-7	OCDD	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,4,6,7,8-HpCDF	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,6,7,8-HxCDD	Detected sample results <RL and <BAL	“U” at the RL
	Total HpCDF	Detected sample results <RL and <BAL	“U” at the RL
	Total HxCDD	Detected sample results <RL and <BAL	“U” at the RL
	Total HxCDF	Detected sample results <RL and <BAL	“U” at the RL

Notes:
MB Method blank
RL Reporting limit

6.3 Compound Identification

PCDD/PCDF compounds are identified by using the compound’s ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest.” This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as “I” (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.5 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 11. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

8 Metals Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 12. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.3 Data Validation Checklist

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

9 General Chemistry Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 13. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.3 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B / SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under the Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 14. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.2%	2
SVOCs	98.8%	2
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data review were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Data Validation Report

Upland Disposal Facility Conceptual Design Plan

GE-Pittsfield/Housatonic River Site
Pittsfield, Massachusetts

Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses

SDG # 480-214702-1

Analyses Performed By:
Eurofins Buffalo
Amherst, New York, USA

Eurofins Burlington, South Burlington, Vermont, USA

Eurofins Pittsburgh, Pennsylvania, USA

Eurofins Lancaster Laboratories Environmental Testing, LLC
Pennsylvania, USA

Report #52695R
Review Level: Tier I
Project: 30181915 Task 0003

Contents

1 Summary 4
1.1 Analytical Data Package Documentation 4
1.2 Data Validation Procedures 5
2 Volatile Organic Compound Analyses 7
2.1 Holding Times 7
2.2 System Performance and Overall Assessment 8
2.3 Data Validation Checklist 8
3 Semi-volatile Organic Compound Analyses 8
3.1 Holding Times 8
3.2 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis 9
3.3 System Performance and Overall Assessment 9
3.4 Data Validation Checklist 10
4 Polychlorinated Biphenyl Analyses 10
4.1 Holding Times 10
4.2 System Performance and Overall Assessment 11
4.3 Data Validation Checklist 11
5 Pesticide/Herbicide Analyses 11
5.1 Holding Times 11
5.2 System Performance and Overall Assessment 12
5.3 Data Validation Checklist 12
6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis 12
6.1 Holding Times 12
6.2 Blank Contamination 13
6.3 Compound Identification 13
6.4 System Performance and Overall Assessment 14
6.5 Data Validation Checklist 14
7 Perfluoroalkyl Substances Analyses 14
7.1 Holding Times 15
7.2 System Performance and Overall Assessment 15
7.3 Data Validation Checklist 15
8 Metals Analyses 15
8.1 Holding Times 16

8.2 System Performance and Overall Assessment 16
8.3 Data Validation Checklist 16
9 General Chemistry Analyses 16
9.1 Holding Times 17
9.2 Blank Contamination 17
9.3 System Performance and Overall Assessment 17
9.4 Data Validation Checklist for General Chemistry 17
10 Overall Data Usability 18

Appendix A Chain of Custody
Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-214702-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-4D	480-214702-1	Water	11/07/23		X	X	X	X	X	X	X
TRIPBLANK 110723	480-214702-2	Water	11/07/23		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	1	0	1	0	0	0	2
SVOCs	1	0	0	0	0	0	1
PCBs	1	0	0	0	0	0	1
PEST	1	0	0	0	0	0	1
HERB	1	0	0	0	0	0	1
OPC	1	0	0	0	0	0	1
PCDD/PCDF	1	0	0	0	0	0	1
PFAS	1	0	0	0	0	0	1
Metals	1	0	0	0	0	0	1
MISC	1	0	0	0	0	0	1

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X	X		
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 6. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 7. Samples with Laboratory Control Sample and Laboratory Control Sample Duplicate Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-4D	Prep Batch: 691460	3-Methylcholanthrene	<10%	<10%
		a,a-Dimethylphenethylamine	<10%	AC
		p-Phenylene diamine	<10%	<10%

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 8. Laboratory Control Sample and Laboratory Control Sample Duplicate Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.4 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Laboratory Control Sample (LCS) %R		X	X		
Laboratory Control Sample Duplicate (LCSD) %R		X	X		
Dilution Factor		X		X	

Notes:
%R Percent recovery
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 9. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

5 Pesticide/Herbicide Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 10. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criterion.

5.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.3 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 11. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the "B" qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 12. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-4D	1,2,3,4,6,7,8-HpCDD	Detected sample results <RL and <BAL	"U" at the RL
	1,2,3,4,6,7,8-HpCDF	Detected sample results <RL and <BAL	"U" at the RL
	1,2,3,6,7,8-HxCDD	Detected sample results <RL and <BAL	"U" at the RL
	2,3,4,7,8-PeCDF	Detected sample results <RL and <BAL	"U" at the RL
	OCDD	Detected sample results <RL and <BAL	"U" at the RL
	Total HpCDD	Detected sample results <RL and <BAL	"U" at the RL
	Total HpCDF	Detected sample results <RL and <BAL	"U" at the RL
	Total HxCDD	Detected sample results <RL and <BAL	"U" at the RL
	Total PeCDF	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RL Reporting limit

6.3 Compound Identification

PCDD/PCDF compounds are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as "I" (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.5 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 13. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

8 Metals Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 14. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.3 Data Validation Checklist

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

9 General Chemistry Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 15. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Table 16. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-4D	Cyanide	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RL Reporting limit

9.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.4 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B / SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Blanks					
A. Method Blanks		X	X		

General Chemistry: SW-846 9012B / SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Reporting limits (units)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under the Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 17. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.2%	2
SVOCs	98.8%	3
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data review were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Northeast LLC places the ownership of method analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Northeast LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Northeast LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Northeast LLC.

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-214702-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-6	480-214772-	Water	11/08/23		X	X	X	X	X	X	X
MW-22-8	480-214772-	Water	11/08/23		X	X	X	X	X	X	X
TRIPBLANK 110823	480-214772-	Water	11/08/23		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	2	0	1	0	0	0	3
SVOCs	2	0	0	0	0	0	2
PCBs	2	0	0	0	0	0	2
PEST	2	0	0	0	0	0	2
HERB	2	0	0	0	0	0	2
OPC	2	0	0	0	0	0	2
PCDD/PCDF	2	0	0	0	0	0	2
PFAS	2	0	0	0	0	0	2
Metals	2	0	0	0	0	0	2
MISC	2	0	0	0	0	0	2

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X	X		
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 6. Samples with Laboratory Control Sample and Laboratory Control Sample Duplicate Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-6 MW-2022-8	Prep Batch: 691637	3-Methylcholanthrene	<10%	Not Analyzed
		a,a-Dimethylphenethylamine	<10%	Not Analyzed
		p-Phenylene diamine	<10%	Not Analyzed

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 7. Laboratory Control Sample and Laboratory Control Sample Duplicate Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.4 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Laboratory Control Sample (LCS) %R		X	X		
Laboratory Control Sample Duplicate (LCSD) %R	X				X
Dilution Factor		X		X	

Notes:
%R Percent recovery
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 8. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

5 Pesticide/Herbicide Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 9. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

All samples were analyzed within the specified holding time criterion.

5.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.3 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 10. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 11. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-6	1,2,3,4,6,7,8-HpCDD	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,6,7,8-HxCDF	Detected sample results <RL and <BAL	“U” at the RL
	1,2,3,7,8,9-HxCDD	Detected sample results <RL and <BAL	“U” at the RL
	2,3,4,6,7,8-HxCDF	Detected sample results <RL and <BAL	“U” at the RL
	2,3,4,7,8-PeCDF	Detected sample results <RL and <BAL	“U” at the RL
	OCDD	Detected sample results <RL and <BAL	“U” at the RL
	OCDF	Detected sample results <RL and <BAL	“U” at the RL
	Total HpCDD	Detected sample results <RL and <BAL	“U” at the RL
	Total HpCDF	Detected sample results <RL and <BAL	“U” at the RL
	Total HxCDD	Detected sample results <RL and <BAL	“U” at the RL
	Total HxCDF	Detected sample results <RL and <BAL	“U” at the RL
	Total PeCDF	Detected sample results <RL and <BAL	“U” at the RL
MW-22-8	1,2,3,6,7,8-HxCDF	Detected sample results <RL and <BAL	“U” at the RL
	OCDD	Detected sample results <RL and <BAL	“U” at the RL

Sample ID	Compounds	Sample Result	Qualification
MW-22-8	Total HxCDF	Detected sample results <RL and <BAL	“U” at the RL

6.3 Compound Identification

PCDD/PCDF compounds are identified by using the compound’s ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest.” This value should be considered an elevated detection limit based on potential compound identification and quantitation interference.

Sample results qualified by the laboratory as “I” (Value is EMPC (estimated maximum possible concentration)) have been qualified as estimated, tentatively identified. The reported qualifier will be JNX.

6.4 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

6.5 Data Validation Checklist

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method Blanks		X	X		

PCDD/PCDF: SW-846 8290A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 12. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

8 Metals Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 13. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.3 Data Validation Checklist

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

9 General Chemistry Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 14. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.3 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B / SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under the Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 15. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.2%	3
SVOCs	98.8%	6
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and

completeness (PARCC) parameters determined from the Tier I data review were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Appendices

Appendix A Chain of Custody

Appendix B Annotated Sample Analysis Data Sheets

1 Summary

This document summarizes the data validation review of Sample Delivery Group (SDG) 480-214852-1 performed on behalf of the General Electric Company (GE) for water sampling activities conducted as part of the Pre-Design Investigation for the Upland Disposal Facility associated with the Rest of River Remedial Action at the GE Company/Housatonic River Site in Pittsfield, Massachusetts. The review was conducted at Tier I levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain of custody (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1 for the following parameters as noted: Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), Pesticides, Herbicides, Organophosphorous Compounds, Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans (PCDD/PCDF), Perfluoroalkyl Substances (PFAS), Metals, and Miscellaneous Analyses.

Table 1. Summary of Samples Subjected to Tier I Data Validation

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis						
					VOCs	SVOCs	PEST/PCBs /HERB/OPC	PCDD/ PCDF	PFAS	MET	MISC
MW-2022-4S	480-214852-1	Water	11/10/23		X	X	X	X	X	X	X
RB-111023	480-214852-2	Water	11/10/23		X	X	X	X	X	X	X
TRIPBLANK 111023	480-214852-3	Water	11/10/23		X						

Notes:
VOCs = Volatile Organic Compounds
SVOCs = Semi-volatile Organic Compounds
PEST = Pesticides
PCBs = Polychlorinated Biphenyls
HERB = Herbicides
OPC = Organophosphorous Compounds
PCDD/PCDFs = Polychlorinated Dibenzodioxins/Polychlorinated Dibenzofurans
PFAS = Perfluoroalkyl Substances
MET = Metals
MISC = Miscellaneous analyses (cyanide, sulfide)

1.1 Analytical Data Package Documentation

The table below is the evaluation of the data package completeness.

Table 2. Evaluation of Data Package Completeness

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

Note:
QA = Quality Assurance

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods 8260C, 8270D, 8081B, 8141B, 8151A, 8082A, 8290A, 6010C, 7470A, 9012B, 537 (modified) and Standard Method 4500 S2 F. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, ARCADIS (Revision 5 submitted by GE on July 2, 2013, and approved by EPA on July 23, 2013);
- Addendum to the FSP/QAPP, General Electric Company, Pittsfield, Massachusetts, Arcadis (submitted by GE on August 23, 2017, and approved by EPA on August 28, 2017;
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines); and
- Revised Pre-Design Investigation Work Plan for Reach 5A Floodplain Residential properties (submitted by GE on July 9, 2020, and approved by EPA on July 23, 2020).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration I Qualifiers
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - U Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A

tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
VOCs	1	0	2	0	0	0	3
SVOCs	1	0	1	0	0	0	2
PCBs	1	0	1	0	0	0	2
PEST	1	0	1	0	0	0	2
HERB	1	0	1	0	0	0	2
OPC	1	0	1	0	0	0	2
PCDD/PCDF	1	0	1	0	0	0	2
PFAS	1	0	1	0	0	0	2
Metals	1	0	1	0	0	0	2
MISC	1	0	1	0	0	0	2

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

2.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 4. Holding Time for Method SW-846 8260C

Method	Matrix	Holding Time	Preservation
SW-846 8260C	Water	14 days from collection to analysis (preserved) 7 days from collection to analysis (non-preserved)	Cool to <6 °C; preserved to a pH of less than 2 s.u.

Note:
s.u. standard units

Note: The target compound 2-chloroethyl vinyl ether degrades in the presence of acid used to preserve the aqueous samples. Therefore, all sample results for 2-chloroethyl vinyl ether have been qualified as rejected.

All samples were analyzed within the specified holding time criterion.

2.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

2.3 Data Validation Checklist

VOCs: SW-846 8260C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times/Preservation		X	X		
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

3 Semi-volatile Organic Compound Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

3.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 5. Holding Time for Method SW-846 8270D

Method	Matrix	Holding Time	Preservation
SW-846 8270D	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

3.2 Laboratory Control Sample/Laboratory Control Sample Duplicate Analysis

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

Samples associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Table 6. Samples with Laboratory Control Sample and Laboratory Control Sample Duplicate Recoveries Outside Control Limits

Sample ID	Batch	Compounds	LCS Recovery	LCSD Recovery
MW-2022-4S RB-111023	Prep Batch: 691971	3-Methylcholanthrene	<10%	Not Analyzed
		a,a-Dimethylphenethylamine	<10%	Not Analyzed
		Kepone	<10%	Not Analyzed
		p-Phenylene diamine	<10%	Not Analyzed

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Table 7. Laboratory Control Sample and Laboratory Control Sample Duplicate Recovery Criteria and Qualifications

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

3.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.4 Data Validation Checklist

SVOCs: SW-846 8270D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY/MASS SPECTROMETRY (GC/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Laboratory Control Sample (LCS) %R		X	X		
Dilution Factor		X		X	

Notes:
%R Percent recovery
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

4 Polychlorinated Biphenyl Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

4.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 8. Holding Time for Method SW-846 8082A

Method	Matrix	Holding Time	Preservation
SW-846 8082A	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

4.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

4.3 Data Validation Checklist

PCBs; SW-846 8082A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

5 Pesticide/Herbicide Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

5.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 9. Holding Time for Method SW-846 8081B/8141B/8151A

Method	Matrix	Holding Time	Preservation
SW-846 8081B/8151A	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.
SW-846 8141B	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C.

Note: The holding time for method SW-846 8141B is stated in the QAPP as 14 days; however, the method technical holding time is 7 days to extraction. The technical holding time of 7 days will be applied for this data review.

Table 10. Holding Time Exceedances for Method SW-846 8081B/8141B/8151A

Sample Locations	Holding Time	Criteria
MW-2022-4S RB-111023	9 days	<7 days

Sample results associated with sample locations analyzed by analytical method SW-846 8081 were qualified, as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

5.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the “B” qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 11. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-4S	Aldrin	Detected sample results <RL and <BAL	“U” at the RL

Notes:
MB Method blank
RL Reporting limit

5.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

5.4 Data Validation Checklist

SW-846 8081B/8141B/8151A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
GAS CHROMATOGRAPHY (GC/ECD)					
Tier I Validation					
Holding times		X	X		
Blanks					
A. Method Blanks		X	X		
B. Rinsate Blanks		X	X		
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

6 Polychlorinated Dibenzodioxins And Polychlorinated Dibenzofurans Analysis

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

6.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 12. Holding Time for Method SW-846 8290A

Method	Matrix	Holding Time	Preservation
SW-846 8290A	Water	30 days from collection to extraction (one year if kept frozen) and 45 days from extraction to analysis	Cool to <6 °C.

All samples were prepared and analyzed within the specified holding time criterion.

6.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (ten times for OCDD/F & total homologues) is calculated for QA blanks containing concentrations greater than the estimated detection limit (EDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the EDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B). The equipment blank is not subject to method blank contamination evaluation, and the "B" qualifiers were maintained. No other qualification of the sample results was required. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 13. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-4S	1,2,3,4,6,7,8-HpCDF	Detected sample results <RL and <BAL	"U" at the RL
	1,2,3,4,7,8,9-HpCDF	Detected sample results <RL and <BAL	"U" at the RL
	2,3,4,6,7,8-HxCDF	Detected sample results <RL and <BAL	"U" at the RL
	OCDD	Detected sample results <RL and <BAL	"U" at the RL
	Total HpCDF	Detected sample results <RL and <BAL	"U" at the RL
	Total HxCDF	Detected sample results <RL and <BAL	"U" at the RL

Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

7 Perfluoroalkyl Substances Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

7.1 Holding Times

The specified holding times for the following methods are presented in the table below.

Table 14. Holding Time for Method 537

Method	Matrix	Holding Time	Preservation
USEPA Method 537 (Modified)	Water	28 days from collection to extraction and 28 days from extraction to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criterion.

7.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

7.3 Data Validation Checklist

PFAS: USEPA MODIFIED 537	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
LIQUID CHROMATOGRAPHY/TANDEM MASS SPECTROMETRY (LC/MS/MS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Dilution Factor		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

8 Metals Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

8.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 15. Holding Time for Method SW-846 6010C/7470A

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Preserved to a pH of less than 2.
SW-846 7470A	Water	28 days from collection to analysis	Preserved to a pH of less than 2.

All samples were analyzed within the specified holding time criterion.

8.2 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

8.3 Data Validation Checklist

METALS; SW-846 6010C/7470A	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Inductively Coupled Plasma-Atomic Emission Spectrometry (ICP-AES) Atomic Absorption – Manual Cold Vapor (CV)					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

9 General Chemistry Analyses

The Tier I evaluation consisted of data package completeness, chain of custody/sample analysis, laboratory case narrative, and holding times. Any deviations identified in the laboratory case narrative that would result in potential data use limitations are evaluated below and qualification applied accordingly.

9.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 16. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Cyanide by SW-846 9012B	Water	14 days from collection to analysis	Cool to <6 °C; preserved to a pH of greater than 12.
Sulfide by SM 4500 S2 F	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9.

All samples were analyzed within the specified holding time criterion.

9.2 Blank Contamination

Table 17. Summary of Blank Contamination Qualifications

Sample ID	Compounds	Sample Result	Qualification
MW-2022-4S	Cyanide	Detected sample results <RL and <BAL	"U" at the RL

Notes:
MB Method blank
RL Reporting limit

9.3 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

9.4 Data Validation Checklist for General Chemistry

General Chemistry: SW-846 9012B / SM 4500 S2 F	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Blanks					
A. Method Blanks		X	X		
Reporting limits (units)		X		X	

Note:
RPD Relative percent difference

When the laboratory case narrative outlines a quality issue beyond Tier I, it will be added to the checklist above and the usability of the data will be addressed.

10 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under the Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 18. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
VOCs	98.2%	3
SVOCs	98.8%	8
PCBs	100%	0
PEST	100%	0
HERB	100%	0
OPC	100%	0
PCDD/PCDF	100%	0
PFAS	100%	0
Metals	100%	0
MISC	100%	0

The data package completeness, as determined from the Tier I data review, was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data review were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

Slug Tests Reports

MW-2022-1S Falling Head

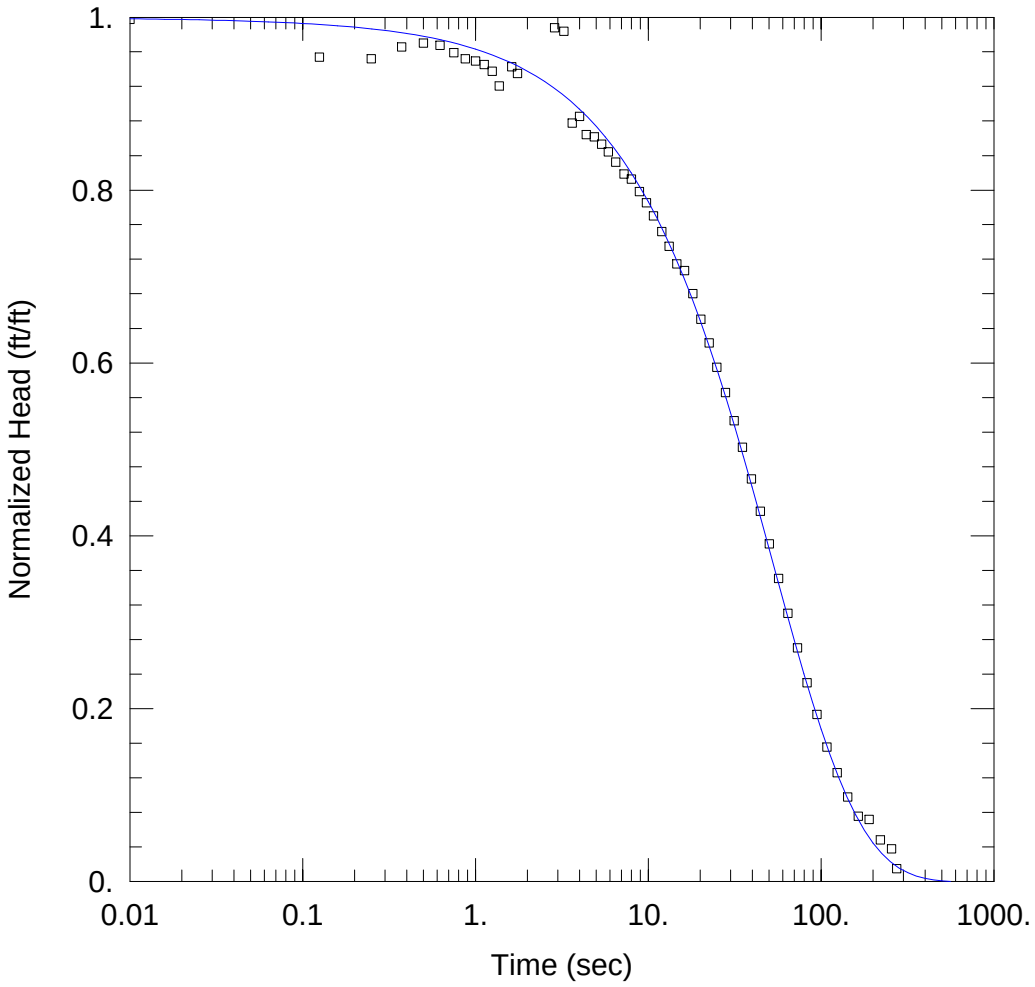
Prepared By:	Prepared For:
Arcadis	General Electric
Project:	**Location:**
30132437	Lee, MA

SOLUTION

Aquifer Model: Unconfined
Solution Method: KGS Model

Kr = 0.34 ft/day Ss = 0.046 ft^{-1}
Kz/Kr = 1.

AQUIFER DATA



Saturated Thickness: 3.75 ft

WELL DATA (MW-2022-1S)

Initial Displacement: 0.63 ft
Static Water Column Height: 3.75 ft
Total Well Penetration Depth: 3.75 ft
Screen Length: 3.75 ft
Casing Radius: 0.083 ft
Well Radius: 0.25 ft

MW-2022-1D Rising Head

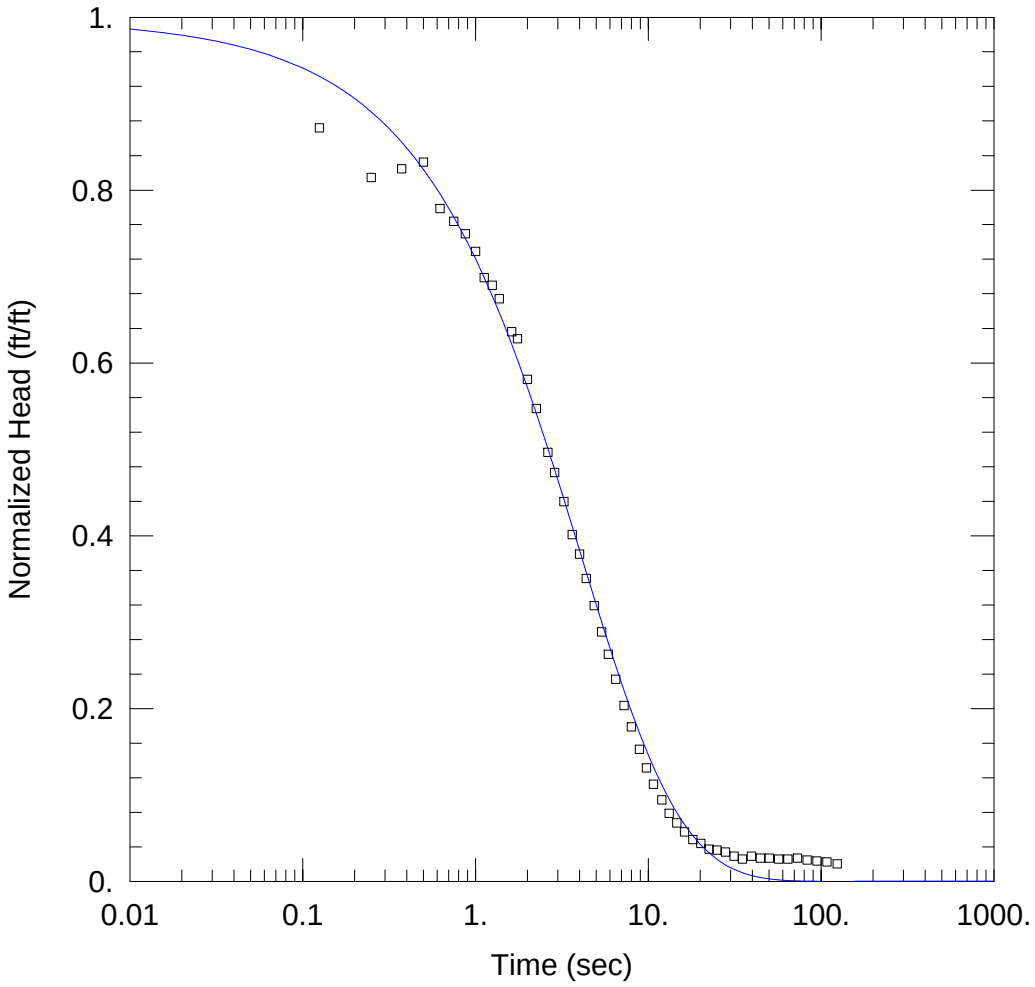
Prepared By:	Prepared For:
Arcadis	General Electric
Project:	**Location:**
30132437	Lee, MA

SOLUTION

Aquifer Model: Unconfined
Solution Method: KGS Model

Kr = 2.3 ft/day Ss = 1.6E-5 ft^{-1}
Kz/Kr = 1.

AQUIFER DATA



Saturated Thickness: 21.96 ft

WELL DATA (MW-2022-1D)

Initial Displacement: 1.17 ft
Static Water Column Height: 21.96 ft
Total Well Penetration Depth: 21.96 ft
Screen Length: 8.27 ft
Casing Radius: 0.083 ft
Well Radius: 0.25 ft

MW-2022-2 Rising Head

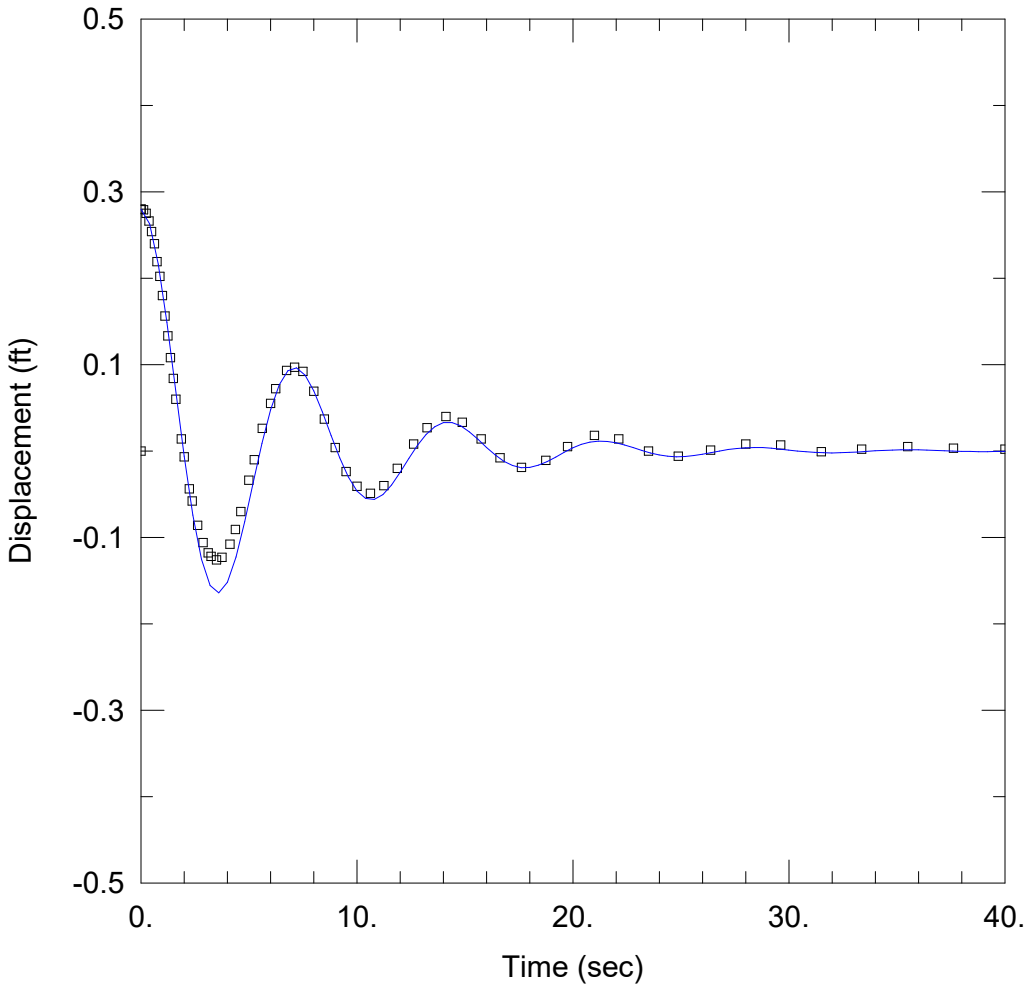
Prepared By:	Prepared For:
Arcadis	General Electric
Project:	**Location:**
30132437	Lee, MA

SOLUTION

Aquifer Model: Unconfined
Solution Method: KGS Model

Kr = 30. ft/day Ss = 0.00011 ft^{-1}
Kz/Kr = 1.

AQUIFER DATA



Saturated Thickness: 12.45 ft

WELL DATA (MW-2022-2)

Initial Displacement: 0.89 ft
Static Water Column Height: 12.45 ft
Total Well Penetration Depth: 12.45 ft
Screen Length: 9.48 ft
Casing Radius: 0.083 ft
Well Radius: 0.25 ft

MW-2022-4D Rising Head

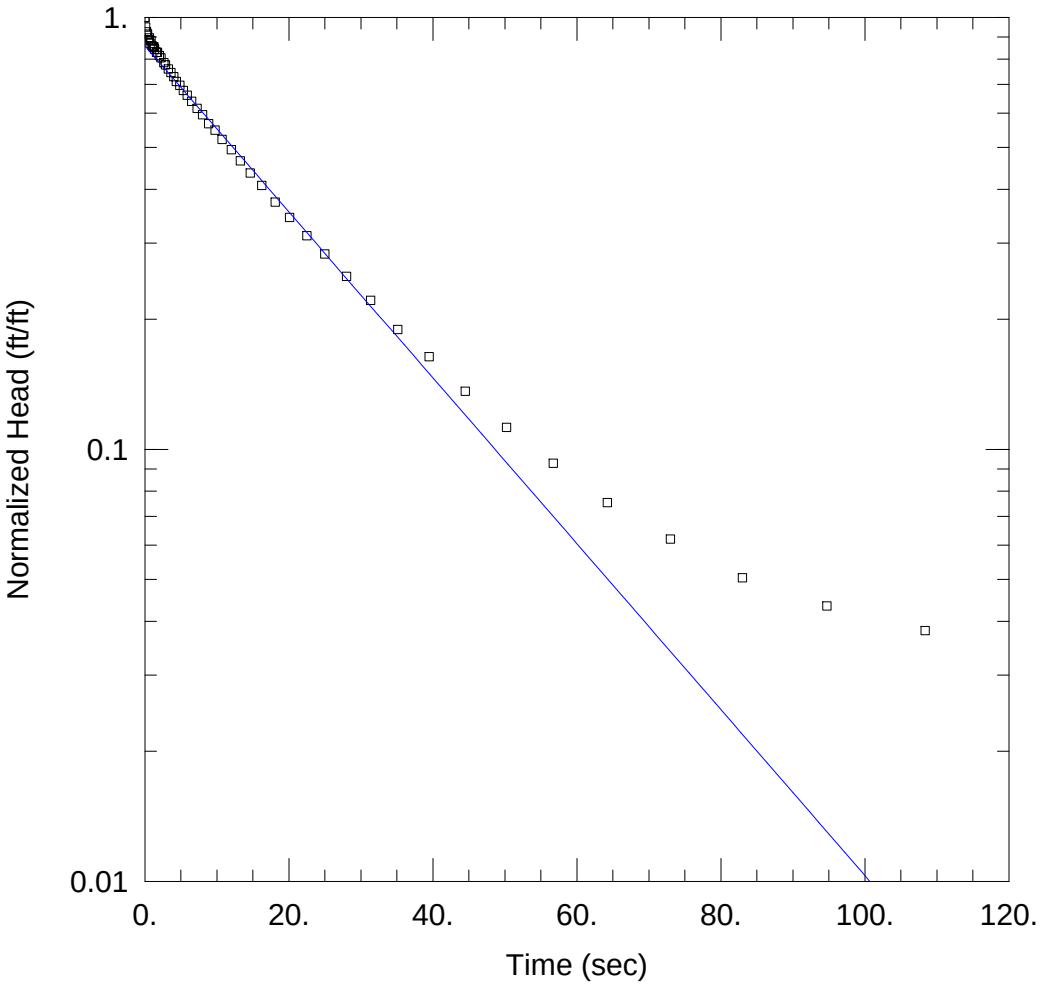
Prepared By:	Prepared For:
Arcadis	General Electric
Project:	**Location:**
30132437	Lee, MA

SOLUTION

Aquifer Model: Unconfined
Solution Method: Springer-Gelhar

K = 400. ft/day Le = 40. ft

AQUIFER DATA



Saturated Thickness: 40.65 ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-2022-4D)

Initial Displacement: 0.28 ft
Static Water Column Height: 40.65 ft
Total Well Penetration Depth: 40.65 ft
Screen Length: 7.38 ft
Casing Radius: 0.083 ft
Well Radius: 0.25 ft

MW-2022-5 Rising Head

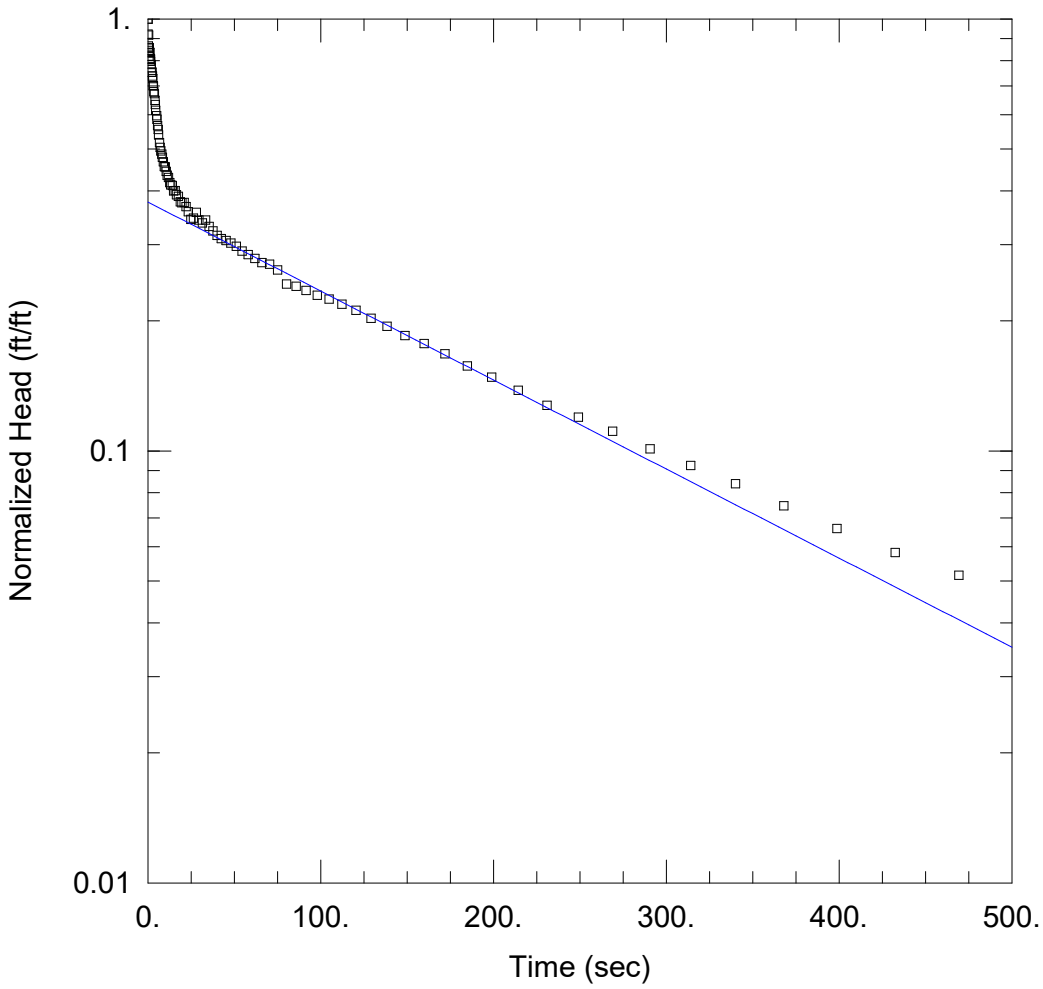
Prepared By:	Prepared For:
Arcadis	General Electric
Project:	**Location:**
30132437	Lee, MA

SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 5.3 ft/day y0 = 0.97 ft

AQUIFER DATA



Saturated Thickness: 11.1 ft (Kz/Kr): 1.

WELL DATA (MW-2022-5)

Initial Displacement: 1.13 ft
Static Water Column Height: 11.1 ft
Total Well Penetration Depth: 11.1 ft
Screen Length: 9.31 ft
Casing Radius: 0.083 ft
Well Radius: 0.25 ft

MW-2022-7 Rising Head

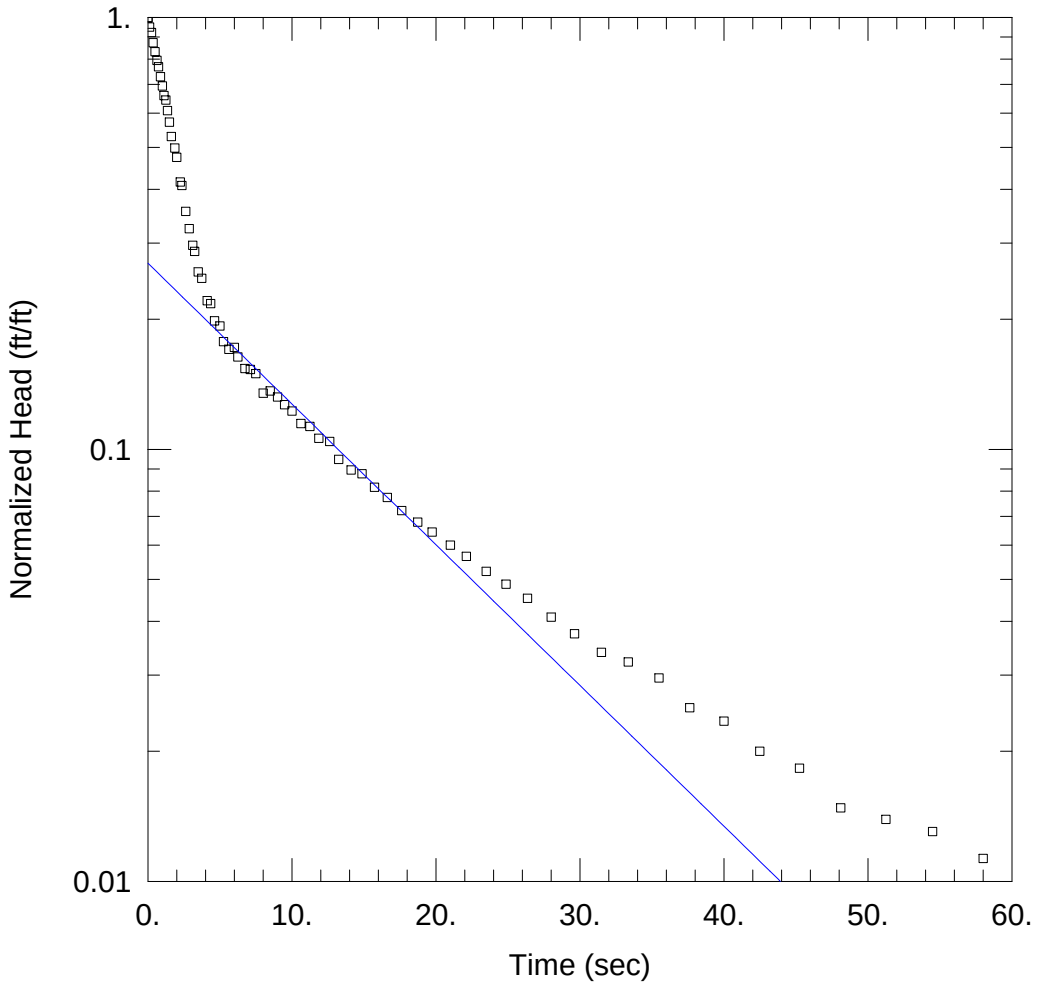
Prepared By:	Prepared For:
Arcadis	General Electric
Project:	**Location:**
30132437	Lee, MA

SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 1.48 ft/day y0 = 0.57 ft

AQUIFER DATA



Saturated Thickness: 6.27 ft Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-2022-7)

Initial Displacement: 1.513 ft
Static Water Column Height: 6.27 ft
Total Well Penetration Depth: 6.27 ft
Screen Length: 6.27 ft
Casing Radius: 0.083 ft
Well Radius: 0.25 ft

MW-2022-9 Rising Head

Prepared By:	Prepared For:
Arcadis	General Electric
Project:	**Location:**
30132437	Lee, MA

SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 38. ft/day y0 = 0.31 ft

AQUIFER DATA

Saturated Thickness: 5.57 ft (Kz/Kr): 1.

WELL DATA (MW-2022-9)

Initial Displacement: 1.15 ft
Static Water Column Height: 5.57 ft
Total Well Penetration Depth: 5.57 ft
Screen Length: 5.57 ft
Casing Radius: 0.083 ft
Well Radius: 0.25 ft

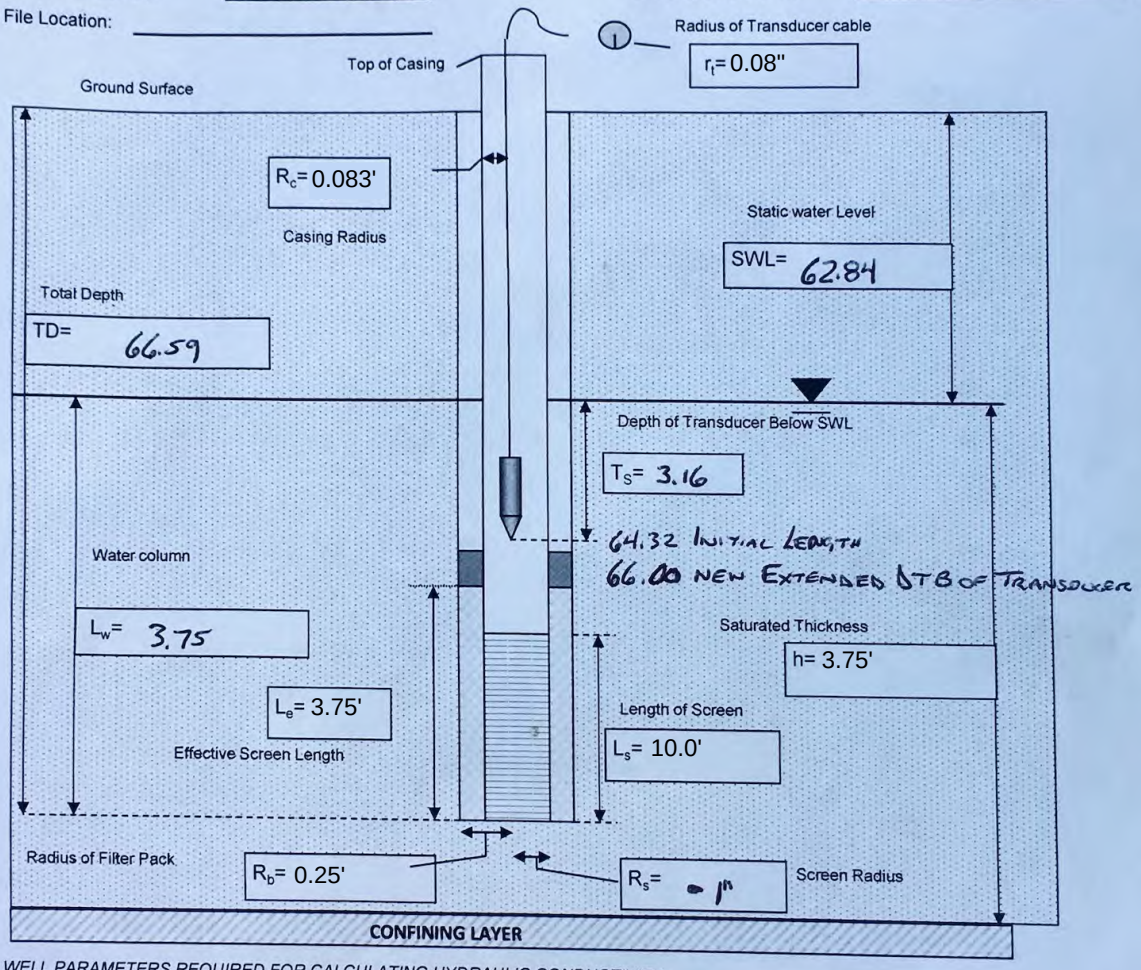
SLUG TEST LOG

Site Name: GE UDF | Project No: 30181915 | Page: 1 of 3



Test Well ID: MW-2022-15 | Observation Well ID (if different): — | Date: 7.20.23

Completed By: T. McCLENAHAN | Weather: SUN, LT. WIND 80°

Test Type & No: Rising 2, 4 Falling 1, 3 | Pressure Transducer SN: 2144226

Data File Name(s): MW15 072023 | Barologger Serial No (if used):

File Location:

WELL PARAMETERS REQUIRED FOR CALCULATING HYDRAULIC CONDUCTIVITY:

L_e = Effective screen length, including the sand pack
L_s = True screen length
L_w = Length of water column in Well (TD-SWL)
R_s = Screen radius
R_b = Radius of filter Pack or borehole
R_c = Casing radius
r_t = Radius of the transducer cable (can be ignored if less than 1/8 inch)

T_s = Depth the transducer is submerged below the SWL
SWL = Static water level
TD = Total depth of well/screen from reference point
h = Saturated thickness of aquifer
H_o = Initial head change at instant the slug test is started.
Aquifer Type = Confined or unconfined

COMMON CONVERSIONS:

1 foot = 12 inches
1 foot^3 ≈ 7.48 gallons
1 gallon ≈ 3.785 Liters
1 psi ≈ 2.3 feet of water

ARCADIS

SLUG TEST DATA 7.20.23 PAGE 2

MW-15

Test Number:	1	Test Duration:	19 MIN
Start Test Time:	1552	End Time:	1611
Rising / Falling (circle)	Falling	Slug Volume/ Length & Diameter:	1.5" x 1.81' .165G
SWL Time / Depth (ft)	~~3.16~~ 62.84 1545		
T_s Baseline Depth & Pressure:	3.16		
Max. Displacement (H_0) :	N/A		

Test Number:	2	Test Duration:	15 MIN
Start Test Time:	1614	End Time:	1629
Rising / Falling (circle)	Rising	Slug Volume/ Length & Diameter:	1.5" x 1.81' .165G
SWL Time / Depth (ft)	~~62.84~~ — N/A		
T_s Baseline Depth & Pressure:	(TM) 3.16 N/A		
Max. Displacement (H_0) :	N/A		

Manual Depth to Water Measurements:

Time	Depth to Water (ft)
15:53:10	
WATER LEVEL IS NOT ABOVE TOP OF SLUG AT FIRST READING	

Time	Depth to Water (ft)
NO MANUAL READINGS - LEFT SLUG IN WELL FOR THESE ATTEMPTS	

NOTES: G = GALLONS

THEORETICAL HEAD CHANGE

Slug Volume (gallon)	Slug Volume (ml)	Well Casing Diameter (inches)	Theoretical Initial Displacement (feet)
0.25	946	2	1.56
0.5	1893	2	3.13
1	3785	2	6.25
0.5	1893	4	0.77
1	3785	4	1.54
2	7570	4	3.08
1	3785	6	0.68
2	7570	6	1.36
3	11355	6	2.04

$$Displacement = \frac{Slug\ Volume}{Casing\ Area}$$

$$Slug\ Volume_{(cylinder)} = h\pi r^2$$

$$Casing\ Area = \pi r^2$$

Note: formulas based on consistent units
h = height (length)
r = radius (½ diameter)
$\pi \approx 3.1416$

SLUG TEST LOG

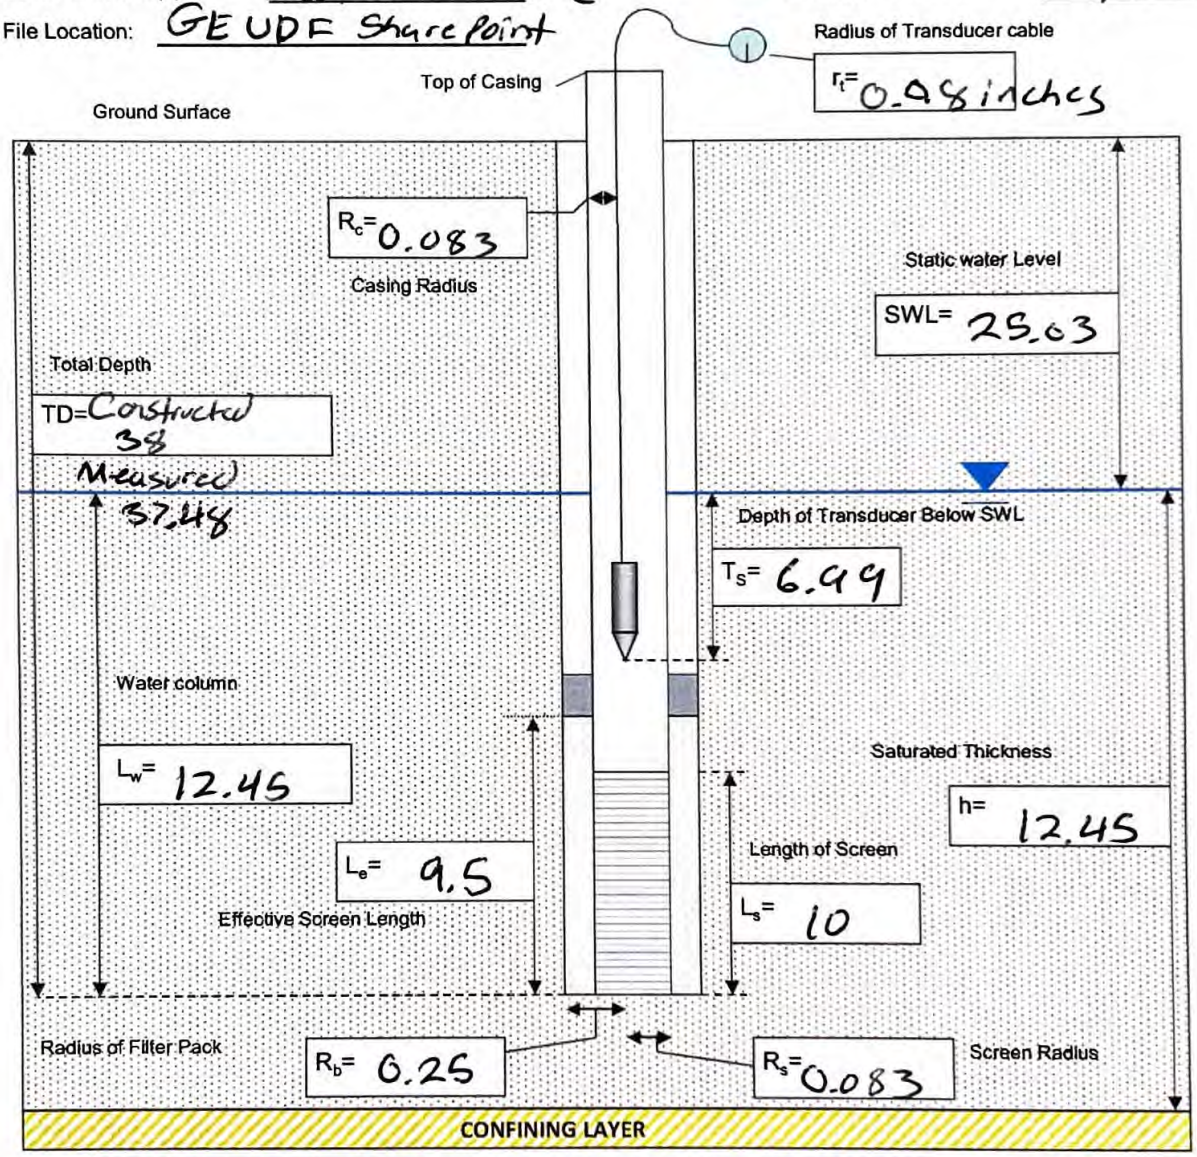
Site Name: GEUDF - Lec, MA Project No: 30150026 Page: 1 of 4



Test Well ID: MW-2022-2 Observation Well ID (if different): N/A Date: 6/1/22

Completed By: E Green Weather: 60's, Cloudy

Test Type & No: Rising 3 Falling 3 Pressure Transducer SN: 2057253

Data File Name(s): MW-2022-2_X14 Barologger Serial No (if used): N/A

File Location: GE UDF SharePoint

WELL PARAMETERS REQUIRED FOR CALCULATING HYDRAULIC CONDUCTIVITY:

L_e = Effective screen length, including the sand pack
L_s = True screen length
L_w = Length of water column in Well (TD-SWL)
R_s = Screen radius
R_b = Radius of filter Pack or borehole
R_c = Casing radius
r_t = Radius of the transducer cable (can be ignored if less than 1/8 inch)
T_s = Depth the transducer is submerged below the SWL
SWL = Static water level
TD = Total depth of well/screen from reference point
h = Saturated thickness of aquifer
H_o = Initial head change at instant the slug test is started.
Aquifer Type = Confined or unconfined

COMMON CONVERSIONS:

1 foot = 12 inches
1 foot^3 ≈ 7.48 gallons
1 gallon ≈ 3.785 Liters
1 psi ≈ 2.3 feet of water

Test Well ID: MW-2022-7 Observation Well ID (if different): N/A Date: 6/2/22

Completed By: E Greco Weather: 60's Cloudy

Test Type & No: Rising 3 Falling 0 Pressure Transducer SN: 2057253

Data File Name(s): MW-2022-7.xle Barologger Serial No (if used): N/A

File Location: GE UDF Sharepoint

WELL PARAMETERS REQUIRED FOR CALCULATING HYDRAULIC CONDUCTIVITY:

L_e = Effective screen length, including the sand pack
L_s = True screen length
L_w = Length of water column in Well (TD-SWL)
R_s = Screen radius
R_b = Radius of filter Pack or borehole
R_c = Casing radius
r_t = Radius of the transducer cable (can be ignored if less than 1/8 inch)
T_s = Depth the transducer is submerged below the SWL
SWL = Static water level
TD = Total depth of well/screen from reference point
h = Saturated thickness of aquifer
H_o = Initial head change at instant the slug test is started.
Aquifer Type = Confined or unconfined

COMMON CONVERSIONS:

1 foot = 12 inches
1 foot^3 ≈ 7.48 gallons
1 gallon ≈ 3.785 Liters
1 psi ≈ 2.3 feet of water

SLUG TEST LOG

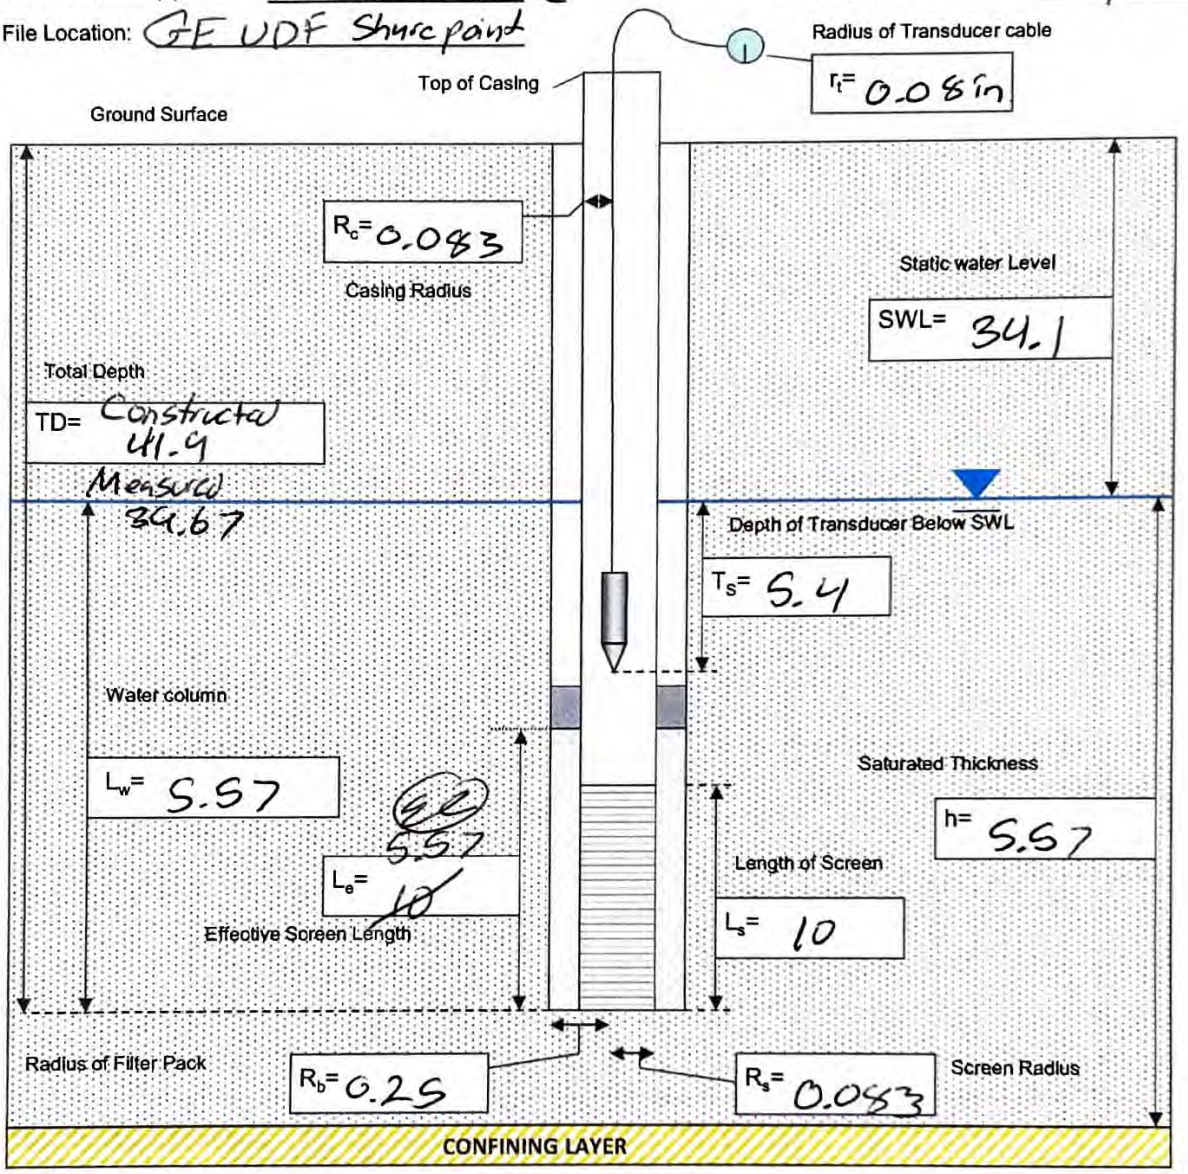
Site Name: GE UDF-Lee, MA Project No: 30150026 Page: 1 of 3



Test Well ID: MW-2022-9 Observation Well ID (if different): N/A Date: 6/1/22

Completed By: E Grey Weather: 60's, Cloudy

Test Type & No: Rising 3 Falling 0 Pressure Transducer SN: 2057253

Data File Name(s): MW-2022-9.xle Barologger Serial No (if used): N/A

File Location: GE UDF Sharepoint

WELL PARAMETERS REQUIRED FOR CALCULATING HYDRAULIC CONDUCTIVITY:

L_e = Effective screen length, including the sand pack
L_s = True screen length
L_w = Length of water column in Well (TD-SWL)
R_s = Screen radius
R_b = Radius of filter Pack or borehole
R_c = Casing radius
r_t = Radius of the transducer cable (can be ignored if less than 1/8 inch)
T_s = Depth the transducer is submerged below the SWL
SWL = Static water level
TD = Total depth of well/screen from reference point
h = Saturated thickness of aquifer
H_o = Initial head change at instant the slug test is started.
Aquifer Type = Confined or unconfined

COMMON CONVERSIONS:

1 foot = 12 inches
1 foot^3 ≈ 7.48 gallons
1 gallon ≈ 3.785 Liters
1 psi ≈ 2.3 feet of water

1 Introduction and Background

1.1 Introduction

This Phase IA Cultural Resources Assessment (CRA) Report has been prepared on behalf of the General Electric Company (GE) to present the results of the initial cultural resources data collection as part of pre-design investigation (PDI) activities for the Upland Disposal Facility (UDF) and UDF support area associated with the Rest of River (ROR) Remedial Action. The ROR area consists of the portion of the Housatonic River and its backwaters and floodplain (excluding portions of certain residential properties) downstream of the confluence of the East and West Branches of the Housatonic River. On December 16, 2020, the U.S. Environmental Protection Agency (EPA) issued to GE a Revised Final Resource Conservation and Recovery Act (RCRA) Permit Modification (Revised Permit), which set forth the Remedial Action selected by EPA to address polychlorinated biphenyls (PCBs) in the ROR. The Revised Permit included a provision for GE to construct and utilize a UDF at a largely disturbed industrial site in the ROR area, but outside the 500-year floodplain of the River, for the disposal of certain of the sediments and soils to be removed as part of the Remedial Action.

The UDF will be constructed on a 75-acre property in the Town of Lee, Massachusetts (Figure 1) that was formerly part of an active sand and gravel quarry and that GE acquired from The Lane Construction Corporation (Lane) in April 2021. Figure 2 shows the extent of the property acquired by GE (referred to herein as the GE Parcel). That figure also shows the maximum limits of consolidated material for the UDF and the associated operational area surrounding and encompassing the limits of the consolidated material (jointly referred to herein as the UDF area). Finally, the figure shows the potential UDF support area, which is currently undefined but may include temporary facilities such as sediment dewatering and material handling areas (referred to herein as UDF support area).

On November 24, 2021, pursuant to the Revised Permit and the associated *Final Revised Rest of River Statement of Work* (Anchor QEA et al. 2021), GE submitted a Pre-Design Investigation Work Plan for the UDF (Arcadis and AECOM 2021). Section 5.2.8 of that Work Plan provided that GE would conduct an initial Phase IA CRA of the UDF area and described the scope of those initial CRA activities. That Work Plan was conditionally approved by EPA on February 25, 2022.[1] GE subsequently carried out the CRA activities described in that Work Plan. Those activities are described in this Report. In addition, this Report contains a plan for supplemental CRA investigations in three relatively less disturbed areas of the GE Parcel, located outside of the disposal or operational areas, that could potentially be used for UDF support activities and that have the potential to contain archaeological resources.

[1] Separately, on January 17, 2022, GE submitted a Supplemental Phase IA CRA Work Plan for the overall areas that will be affected by the ROR Remedial Action apart from the UDF. That Work Plan was conditionally approved by EPA on April 20, 2022, and those CRA activities are currently ongoing.

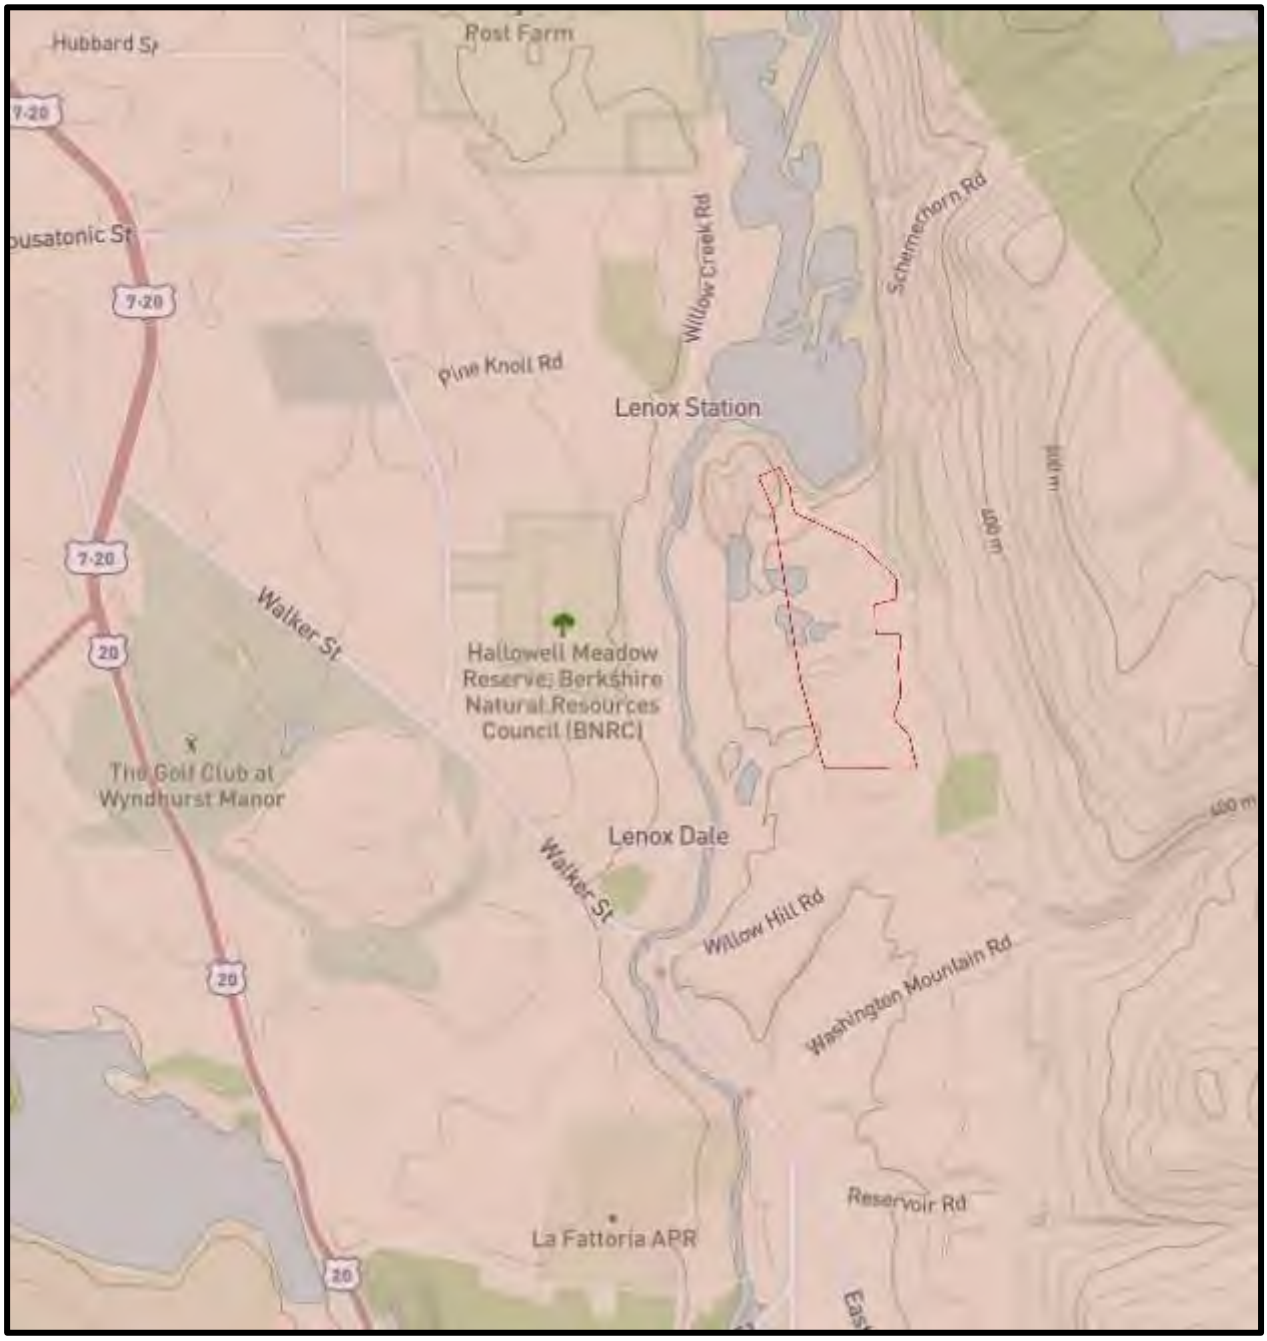

Figure 1. Location of the GE Parcel in Lee, Massachusetts.

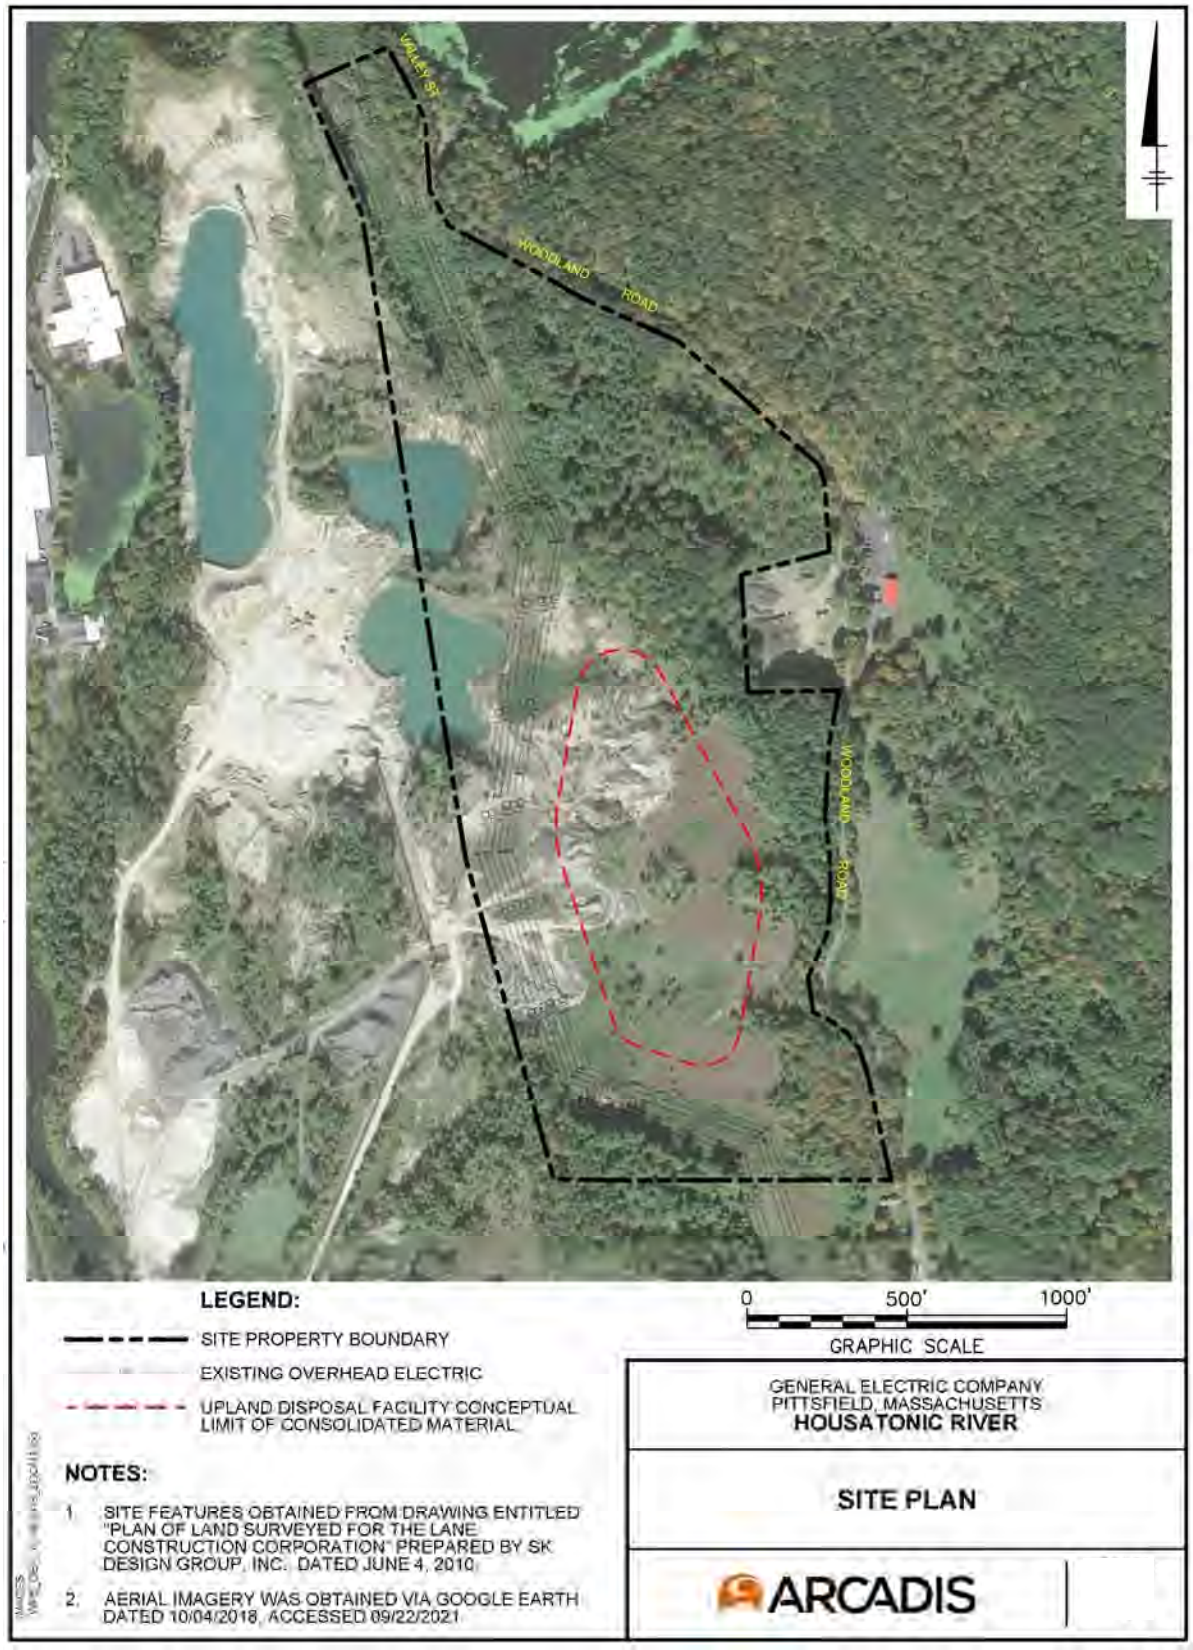

Figure 2. General Layout of the Upland Disposal Facility in Lee, Massachusetts.

1.2 Scope of the UDF Area CRA

This section describes the Phase 1A CRA activities described in Section 5.2.8 of the UDF PDI Work Plan and subsequently conducted for the UDF area and UDF support area.

The Area of Potential Effects (APE) for both archaeological resources and historic architectural resources was defined based on the location and extent of the UDF area and UDF support area.

Desktop and on-line reviews were conducted of the Massachusetts Historical Commission's (MHC's) files and databases, including the Massachusetts Cultural Resource Information System (MACRIS), the Massachusetts State Historic Preservation Plan, and the MHC State Reconnaissance Survey Reports, as well as the files of local historical organizations, including the Lenox Historical Society, the Lee Historical Society, the Lee Library, and the Stockbridge Library – Museum and Archives, to determine whether the UDF area or UDF support area contains or could affect cultural resources included in those files or databases. Additionally, historical aerial photography, historic maps, and soils and geological mapping were reviewed for evidence of past environmental characteristics and land use patterns.

Coordination with the MHC and with Native American tribal representatives regarding the locations of cultural resources and traditional cultural properties in the vicinity of the GE Parcel was conducted through EPA's outreach efforts to consulting parties as well as through AECOM's contacts with representatives of the following tribes: Stockbridge Munsee Band of Mohican Indians; Wampanoag Tribe of Gay Head (Aquinnah); Schaghticoke Tribal Nation; and Schaghticoke Indian Tribe.

Two field inspections were made in March and June of 2022 to visually assess and document the environmental characteristics of the project area and to search for visible above-ground cultural resources; no subsurface investigations were conducted during this phase of the investigation except for one hand auger boring described in Section 5.1. For both field inspections, AECOM's archaeologist was accompanied by an archaeologist from EPA's support contractor and a representative of the Wampanoag Tribe of Gay Head (Aquinnah).

Based on the information gathered during these research tasks, an investigation was made of the potential for the APE to contain unidentified potentially significant cultural resources. For purposes of this CRA, potentially significant cultural resources mean cultural resources that are listed or could potentially meet the criteria for listing on the National Register of Historic Places (NRHP), resources that are listed on the Massachusetts State Register of Historic Places (SRHP) and included on the State Inventory of Historic and Archaeological Assets, and potentially significant scientific, prehistorical, historical, or archaeological data subject to the Archaeological and Historic Preservation

Act.[2] This assessment was conducted using the approach previously developed for the 2008 Initial Phase IA CRA (URS 2008), which incorporated data on soil types, slope, land use, and the location of known archaeological sites to identify the potential for the occurrence of pre-contact or historic archaeological resources, using the following categories and criteria:

High Potential

- water source within 150 meters (m)
- well drained sandy soils
- level to fairly level topography (0 – 3%)
- none to minimal disturbance
- known sites in the immediate area
- In addition, for historic-period archaeological site potential, areas within 100 m of major historic transportation networks

Moderate Potential

- water source within 150 to 300 m
- well drained to fairly well drained, sandy to cobbly soils
- moderate slopes (3 – 8%)
- minimal to moderate disturbance
- known sites in the vicinity

Low /NoPotential

- water source greater than 300 m
- poorly drained soils
- moderate to extensive disturbance
- steep slopes (> 8%)
- no known sites in the vicinity

Investigation of known or suspected historic structures within the historic architectural APE was accomplished by examining existing historic structure inventories. The locations of any such structures were plotted for systematic comparison with the location of the GE Parcel, and aerial photography and maps were examined to identify the locations of additional structures. Because, as will be described in more detail below, the APE did not extend beyond the limits of the GE Parcel and no historic structures occur within it, no additional field inspections were required.

[2] Such resources include properties of traditional religious and cultural importance that fall into any of the foregoing categories.

1.3 APE Definition

The Archaeological APE is defined as all portions of the GE Parcel that may experience ground disturbance as a result of remediation activities. Although the approximate limits of the disposal facility within the property have been identified, the exact layout of possible access and support facilities has not yet been developed. For purposes of the Phase IA CRA, the Archaeological APE was therefore defined as the entire GE Parcel. This APE may be refined for future studies when the designs for the UDF are better developed.

It was anticipated that the Historic Architectural APE would encompass the Archaeological APE and adjacent locations within sight of areas involved in remediation, as well as areas which could be indirectly impacted by factors such as noise or vehicle movements. The construction and operation of the UDF will occur within a setting that is visually isolated from adjacent areas, and the existence of ongoing gravel removal and transportation activities for over 75 years suggests that new impacts to historic structures outside of the GE Parcel would be very unlikely. For these reasons, the Historic Architectural APE for the UDF is also defined by the limits of the GE Parcel.

2 Environmental Setting

The GE Parcel is located at the northern edge of the Town of Lee in Berkshire County, Massachusetts, which is on the western edge of the State and is bordered by Connecticut (south), New York (west), and Vermont (north). It is positioned in steep dissected terrain between the western slopes of October Mountain and the Housatonic River, which flows south through the Central Valley region between the Berkshire Plateau and the Taconic Mountains. The main stem of the river is formed by the confluence of the East and West Branches of the Housatonic River in Pittsfield. The East Branch begins in Dalton and Hinsdale from headwater tributaries. The West Branch starts at Onota and Pontoosuc Lakes in Pittsfield and Lanesboro and is augmented by flows from the Southwest Branch. Below the confluence, the river generally flows south through Berkshire County for approximately 10 miles to Woods Pond, the first significant impoundment. Woods Pond is an impoundment created in 1890 and is located just north of the GE Parcel. Downstream of Woods Pond, the river continues south through western Massachusetts and south/southeast through Connecticut before emptying into Long Island Sound at Stratford, Connecticut.

As can be seen in Figure 3, the topography of the GE Parcel is highly irregular, which is the result of decades of sand and gravel mining that have removed and rearranged large volumes of soil. This can also be seen in the soils map prepared by the Natural Resources Conservation Service (Figure 4). The entire area planned to be used for the consolidated materials disposal (approximately half of the parcel) is mapped as gravel pits, and an additional 25% of the parcel is classified as sandy and gravelly soils of 15% to 35% slopes

Figure 5 illustrates the appearance of the southern portion of the GE Parcel, which has been partially reclaimed and stabilized after gravel removal; and Figure 6 provides a panoramic view of the deeply dissected central portion of the parcel.

3 Cultural and Historical Setting

The following sections summarize the pre-contact and historic period contexts of the general region around the project.

3.1 Paleoindian Period

Human occupation of northeastern North America began soon after the continental ice sheet began to recede northward, once again exposing land. Current evidence suggests that approximately 13,000 years before the present (B.P.), humans began moving into what is now New England. This first period of prehistory lasted until approximately 9,500 B.P. Archaeological sites dating to this time period are most commonly recognized by the presence of distinctive biface stone tools called fluted points. Because of extreme age and low population densities, Paleoindian sites are relatively rare and have often been disturbed by more recent natural events and human activities.

Although relatively few Paleoindian sites have been excavated in the Northeast, there have been documented discoveries in the general region near the Housatonic drainage. In 1977, the American Indian Archaeological Institute (AIAI) excavated a site known as 6LF21 on the Shepaug River in northwestern Connecticut (Moeller 1980), and this site produced a radiocarbon date of 10,190 RCY B.P. More recently, the Hidden Creek site in Mashantucket, Connecticut (Jones & Forrest 2003) has yield evidence of Paleoindian occupations. Most of the evidence for Paleoindian occupations in the region comes from isolated finds of the distinctive fluted points from scattered locations. Many finds appear to be associated with former post-glacial lake basins (Lavin 1984). In particular, surveys by the AIAI near Robbins Swamp in northwestern Connecticut have identified a number of Paleoindian sites around the margins of this rich ecological zone (Nicholas 1988).

3.2 Early Archaic Period

Prior to 1970, there was virtually no evidence of any Northeastern sites dating to the Early or Middle Archaic periods. In the last three decades, considerable information has been obtained to fill in that gap, but the picture is still incomplete. There are still relatively few excavated, radiocarbon-dated Early Archaic sites in the Northeast. Most have been identified by the presence of projectile points analogous to dated types such as Palmer, Kirk, Charleston, MacCorkle, LeCroy, St. Albans, and Kanawha, which have been found in stratified Southeastern sites.

Archaeologists are beginning to be able to identify distinctive regional characteristics in the Early Archaic artifact forms and assemblage characteristics. Excavations in northwestern Connecticut around Robbins Swamp in the Upper Housatonic drainage just south of the Massachusetts border suggest that these early Holocene occupations tended to cluster in resource rich locales such as former glacial lake basins (Nicholas 1988). Approximately 35 Early Archaic components were identified along with a number of Paleoindian sites, suggesting early intensive exploitation of this

extensive wetlands complex. Some of the Early Archaic sites were identified by the presence of diagnostic types such as Kirk, bifurcate, and Kanawha points, and others by the presence of distinctive scraper and graver forms. Early site/landform associations range from lake shoreline and upper river terraces to wetland margins and upland springs, and include large, multiple, early component sites, and small, single-component, special-activity sites (Nicholas 1988:271).

Nicholas has been a frequent and vocal proponent of the idea that early Holocene occupations in the Northeast were much more abundant than previously thought, and that they operated within an environment that was much more productive than originally described. He has identified former glacial lake basins as locations that are likely to have been established as resource rich mosaics within a changing and somewhat unpredictable early Holocene landscape (Nicholas 1988).

3.3 Middle Archaic Period

The Middle Archaic is associated with warmer and drier climatic conditions. By this period, modern floral communities were established and characterized by mast-producing hardwoods. Rivers stabilized during this time and wetland and lake areas were reduced in size. Hunting continued to be important, and fish may have become a more predictable resource.

Clear identification of the chronological position of Middle Archaic artifacts in the Northeast was not established until Dincauze reported on the excavations at the stratified Neville site on the Merrimack River in New Hampshire (Dincauze 1976). These excavations documented the existence of the Neville stemmed point type dating to between 7,800 and 7,000 B.P., and the Stark stemmed point type dating between about 7,600 and 6,400 B.P. (Dincauze 1976). The Neville and Stark point types are similar in style and age to the Stanly and Morrow Mountain types that Coe (1964) defined earlier in the Southeast. In addition, the Merrimack point type was identified as dating to the end of the Middle Archaic period close to 6,000 B.P.

The Neville and Stark types have proved to be relatively common throughout New England. Dincauze and Mulholland (1977) have presented a synthetic model of Middle Archaic settlement for southern New England. They suggest that site types of this period involve large-group occupations that maximize proximity to a variety of seasonal resources, as evidenced by the tool assemblages and recovered faunal materials at these sites. An increase in the number of sites in aquatic resource environments is noted, and these sites are frequently located at falls or rapids where anadromous fish comprised an important seasonal resource (Dincauze 1976). The accumulated data for the Middle Archaic period in the Northeast suggest that, during this period, the prehistoric inhabitants were forming themselves into distinct bands and were settling into defined territories. These bands were establishing base camps and were occupying a greater variety of special-purpose sites in a carefully planned seasonal round (Snow 1980:183).

3.4 Late/Terminal Archaic Period

Archaeologists recognize the Late Archaic period as one in which the numbers and types of sites increase dramatically—what Snow (1980:187) describes as the Late Archaic "florescence." Based on his early work in New York, Ritchie recognized two major Late Archaic trajectories, the Lamoka and the Laurentian, which overlap in both time and space. Both are also represented in New England, but in different distributions.

Following Tuck's (1978) definition of the Lamoka/Sylvan/Squibnocket complexes of central and southern New York and New England as the "Mast Forest Archaic," Snow (1980:226) proposed that the Laurentian complex and related assemblages in northern New England and the St. Lawrence drainage be designated as the "Lake Forest Archaic." As Snow describes them, these two complexes coexisted at times during which each was more common within a particular geographic region. This scheme supposes that there was a "marginal belt of tension between the two coeval zones that persisted throughout the Late Archaic" (Snow 1980:227).

Although Snow (1980) suggests that the Lake Forest Archaic sites are primarily a northern New England manifestation, and only appear in sparse numbers in western Massachusetts and Connecticut between 5,500 and 4,500 B.P., Pfeiffer (1984) has compiled evidence that the Lake Forest Archaic in southern New England is a widespread tradition firmly dated to the period between 5,000 and 4,200 B.P. Pfeiffer notes that "the Late Archaic period also witnessed an increase in the importance of gathering activities, the employment of storage, and an expanded duration of settlement" (1984:85).

In addition to the Lake Forest Archaic assemblages, southern New England also has widespread and long-term evidence of Snow's Mast Forest tradition—what other researchers have often called the "Narrow-Stemmed" or "Narrow-Point" traditions. Although some researchers have proposed that the Laurentian, or Lake Forest, tradition coexisted with the Narrow Point tradition (Ritchie 1969; Dincauze 1975; Snow 1980), others (McBride 1984a:247-248) consider the Lake Forest (Laurentian, Golet phase) as temporally distinct from the Mast Forest (Narrow Point, Tinkham phase).

Mast Forest Archaic sites are numerous and occur in a "wide variety of local settings" (Snow 1980:230). The settlement system likely consisted of "central based wandering" by highly territorial groups (Dincauze 1974:48, 1975:25; Snow 1980; McBride 1984a, 1984b:65). Population aggregations occurred along major drainages and interior wetlands, with movement between habitation sites prescribed by seasonal availability of resources (Dincauze 1974:48, 1975:25; McBride 1984a, 1984b:65; Snow 1980).

The end of the Archaic has also been commonly called "Transitional" in reference to its presumed transitional status between the Archaic and Woodland periods. Since research continues to indicate that there is actually a great deal of cultural and biological continuity between the Archaic and the

Woodland periods, Snow (1980:235) has suggested that the label "Terminal Archaic" is more appropriate.

As Snow defines it, the hallmark of the early part of the Terminal Archaic in eastern and southern New York is the Susquehanna tradition of broad stemmed projectile points and their associated assemblages. These points include a number of regional varieties, including the Genesee, Perkiomen, Snook Kill, and Susquehanna Broad types in New York and Atlantic/Wayland points in Massachusetts. This Susquehanna tradition of broad stemmed projectile points is analogous to Coe's (1964) Savannah River type from the southeastern United States. Characteristics of the Susquehanna Tradition include a riverine adaptation and a predilection for the fine-grained lithic resources of the Piedmont province including rhyolite, felsite, argillite, and slate (Dincauze 1975:27; Turnbaugh 1975:54). The latter portion of the Terminal Archaic period is marked by the appearance of narrow, tapered Orient Fishtail projectile points.

3.5 Early and Middle Woodland Period

Early Woodland cultures in southern New England show considerable variation from the patterns seen in central and western New York. Sites in the latter region show much greater participation in widespread trade networks that extended from the Gulf of Mexico to the Great Lakes. Exotic seashells, distinctive types of stone, and native metals such as copper and lead moved between the far-flung reaches of the network. This trade network was also associated with an elaborate mortuary ceremonialism that included burying many of the exotic traded items in graves with the dead. The presumed core of this system was the Adena tradition of the Ohio River drainage, to which numerous elaborate sites with well stocked graves have been attributed.

Evidence of the Adena tradition is more limited in the Early Woodland Meadowood tradition of southern New England. In addition to Meadowood projectile points, Adena, Rossville, and Lagoon points and Vinette I ceramics are also associated with this time period. Rossville and Lagoon points are particularly common on Early Woodland sites in the coastal areas of southern New England and Long Island Sound.

Narrow points are commonly assigned to the Late Archaic period; however, Swigart (1974) has dated points of this type in the Housatonic drainage to 2,700-2,500 B.P., which would place them in the Early Woodland period. Furthermore, Lavin, McBride, and others have suggested that the Narrow Point technological tradition may have even continued into Contact and historic periods (McBride 1984a:105; Lavin 1984).

Just as the Early Woodland Meadowood phase is associated with the Ohio Valley Adena network, Middle Woodland sites appear to have been associated to some degree with the Middle Woodland

Hopewell interaction sphere. However, exotic trade items from the Hopewell network are less common in southern New England and eastern New York than they are in the west (Snow 1980:287).

3.6 Late Woodland Period

Following the apparent decline in settlement activity during the Early Woodland and the early part of the Middle Woodland period in the Northeast, the next millennium witnessed an intensification of subsistence and settlement patterns that culminated in the relatively sedentary villages of agriculturalists encountered by the first European explorers. This span of time has been traditionally designated by archaeologists as the latter portion of the Middle Woodland period from 1,650 B.P. to 1,000 B.P. and the Late Woodland period from 1,000 B.P. to substantive contact with Europeans. This report will break from tradition somewhat and will end the Middle Woodland at about 1,200 B.P (A.D. 750).

A division between Middle and Late Woodland at this point in time correlates with the widespread appearance of maize in the archaeological record throughout much of the eastern United States. Snow (1980:261) has previously suggested that the Kipp Island and Hunters Home phases reflect the increasing isolation of the Northeast from the rest of the Eastern Woodlands. Interestingly, this is also a period in which the Hudson drainage shows increasing linkages with southern New England. These linkages include increasing amounts of chert moving into the Housatonic and Connecticut River drainages, as well as "New York" ceramic traditions extending east into the upper Housatonic drainage (e.g., see Cassedy and Lavin 2007).

By the Late Woodland period, the archaeological antecedents of historically recognized Native American groups can be recognized. North, central, and western New York were occupied by groups believed to be ancestral to the Iroquois; in these areas, large, nucleated, semipermanent sedentary villages developed. In contrast, eastern New York and western New England were occupied by smaller, somewhat less permanent settlements ancestral to the Algonkians (Late Woodland settlement patterns in both areas were still more sedentary than in previous periods).

Late Woodland sites are recognized by a series of distinctive incised and collared ceramic types and by triangular projectile points. The larger Levanna point type was most common early in the period and was later accompanied by the smaller Madison type.

3.7 Contact/Native American Historic Period

The chronological end of the Late Woodland period is about 350 B.P (A.D. 1600), but it varies by region, depending on the timing of European exploration and settlement. The next two centuries are often referred to as the Contact Period, and in southern New England the term "Final Woodland" is preferred by some. Both labels refer to the phase when Native lifestyles were radically changed by factors such as war, disease, trade, and acculturation.

At the time of European contact in the early seventeenth century, the upper Hudson and Housatonic valleys were occupied by the Mahican horticulturalists and fishermen culturally affiliated with their Algonkian neighbors to the east. Some ethnohistoric data indicate they lived in stockaded hilltop villages containing three to 16 elongated wigwam longhouses (Snow 1980:88). In addition to these villages, "when at fishing or hunting stations, the Mahican probably lived in single-family wigwams" (Snow 1980:88).

For many years, the Mahican occupied a pivotal position both culturally and geographically in the conflicts between the Iroquois Confederacy and the Algonkian tribes of New England (Brasser 1978). At one point, the Mahican occupied lands on both sides of the upper Hudson River, but they lost control of the area on the west side of the river in 1628 as a result of warfare with the Iroquois. In the 1660s, they were forced to abandon almost all of the Hudson Valley and many of them clustered with other related western New England Algonkians in settlements along the upper Housatonic River in western Massachusetts.

3.8 Settlement and Revolutionary War Era

The lower Housatonic was settled in the 1640s, but it took almost a hundred years for permanent settlements to expand north into what is now Berkshire County, Massachusetts. In 1733, Sheffield was the first town in the county to be incorporated, followed by Stockbridge in 1739, Great Barrington in 1742, and Pittsfield in 1753. Lee and Lenox incorporated a decade or two later.

In 1734, John Sergeant initiated a mission amongst the Mahican, who at the time were living in two communities along the Housatonic – one they called Skatehook (in Sheffield) and the other Wnahktukook (at what is now Stockbridge). To consolidate the settlements, the Massachusetts legislature established a six-square-mile township for the Mahican; and as Field (1829:239) reports, "the design was to include the fine alluvial grounds at Wnahktukook, already cleared and cultivated to some extent, where a party of the Indians then lived . . . ."

By the 1780s, the Mahican had lost control over most of their land, and most of the tribe moved west into Oneida County, New York, and in the 19th century eventually into Wisconsin. The Mahican joined Munsee refugees on a jointly held reservation in Wisconsin, where the two tribes remain together today under the name "Stockbridge-Munsee Band of Mohican Indians."

By the Revolutionary War era in the late 18th century, Euro-American settlements were well established in all towns of the project area. Forests were being cleared and small farms dotted both the valleys and the hillsides. Many of the suitable water power locations had small grist mills, saw mills, and furnaces established at them, such as at Lenox Furnace (Lenox Dale), Lee, and South Lee.

3.9 From the Revolution into the Nineteenth Century

After peace was established between the U.S. and England, settlement of the region expanded dramatically. Settlers took advantage of the agricultural potential of the valley and its transportation corridor, and industrial development at prime mill sites along the river and its tributaries soon followed.

For the first several decades of the nineteenth century, wagons and stages were the only effective means of transporting goods and people, as the shallow depths and multiple rapids along the upper Housatonic were not conducive to large-scale reliable boat transport both upstream and downstream along the river. This situation changed with the creation of railroad links with New York and New England in the 1840s.

Throughout the nineteenth century, the project area witnessed an intensification of industrial development along the river. The number, size, and variety of mills all increased, with woolen and cotton mills, paper mills, turning factories, and iron and glass furnaces being built in Lee, South Lee, Glendale, and Housatonic (additional industry was located in Pittsfield upstream from the project area). By end of the century, paper mills came to dominate the industries along the river. As industry was expanding in the Berkshires, agriculture was declining throughout the nineteenth century due to soil exhaustion and western competition.

In addition to transporting industrial products to wide markets, the railroad also made the region easily accessible to New York City, and wealthy families from began vacationing in the Berkshires and eventually many built homes there. In 1845, Samuel Gray Ward came from Boston to Stockbridge to turn an older house into a relatively palatial structure, Highwood, which is recognized as the first of dozens of mansions, quaintly called "cottages," which were erected there and in Lenox and, to a lesser degree, in Great Barrington. In addition, artists began flocking here and by mid-century, the tradition of a Berkshire cultural center had taken hold.

3.10 Twentieth Century

Industrial development that had begun in the nineteenth century expanded even more in the twentieth century. Electronics plants were constructed in the region, and paper mills continued to flourish in Lee and Housatonic. Stanley Electric Manufacturing Company was acquired by General Electric in 1903, and the operation produced small-scale transformers, flat irons, electric fans and small motors.

The era known as the Gilded Age continued up to World War I, and wealthy outsiders continued to vacation and build mansions in the Berkshires (by 1900, there were over 75 in Lenox), providing substantial employment opportunities for many local people. However, the imposition of the federal income tax in 1913 marked a turning point in the construction of new mansions (NPS 2002:73). Over

the next few decades, many were converted to other uses such as seminaries, schools, offices, or museums. At the same time, the coming of the automobile opened up new opportunities for middle class tourism in the Berkshires that continue today.

For the better part of the twentieth century, Pittsfield was inextricably linked to GE, which at one point provided jobs for 75% of Pittsfield's workforce. Pittsfield's population in 1930 had grown to more than 50,000, and industrial expansion related to World War II swelled the population even further, as munitions and plastics were also produced. By the 1950s, GE was building the largest transformers in the world, but the transformer operation closed down in 1986.

4 Results of Background Research

4.1 Introduction

Most of the useful background information was already consolidated within the MHC's MACRIS database. The State Historic Preservation Plan, State Reconnaissance Survey Reports, and databases of local historical organizations did not provide additional details relevant to the GE Parcel. Historic maps provided information on previous roads and structures in the area, and previous archaeological reports for nearby projects were also examined.

4.2 MACRIS Database

Figure 7 illustrates the search results from the MHC's MACRIS database for a one-mile radius around the center of the GE Parcel, which shows that there are no previously documented historic structures or archaeological sites located within the APE. The closest documented NRHP-listed resource is the Lenox Station historic railroad facility, which is located approximately ¼ mile northwest of the northern end of the GE Parcel, on the western side the Housatonic River and Woods Pond. Also in that general area is recorded archaeological site BK-188, which is listed as an isolated find spot (the green square that plots that resource is a broad marker indicating it was recovered somewhere in that general area). The Valley Mill bridge mapped approximately ¼ mile west of the APE spans the Housatonic River from Crystal Street, and the remaining blue dots depict the location of various inventoried historic structures that are located ¾ mile to one mile south and west of the GE Parcel.

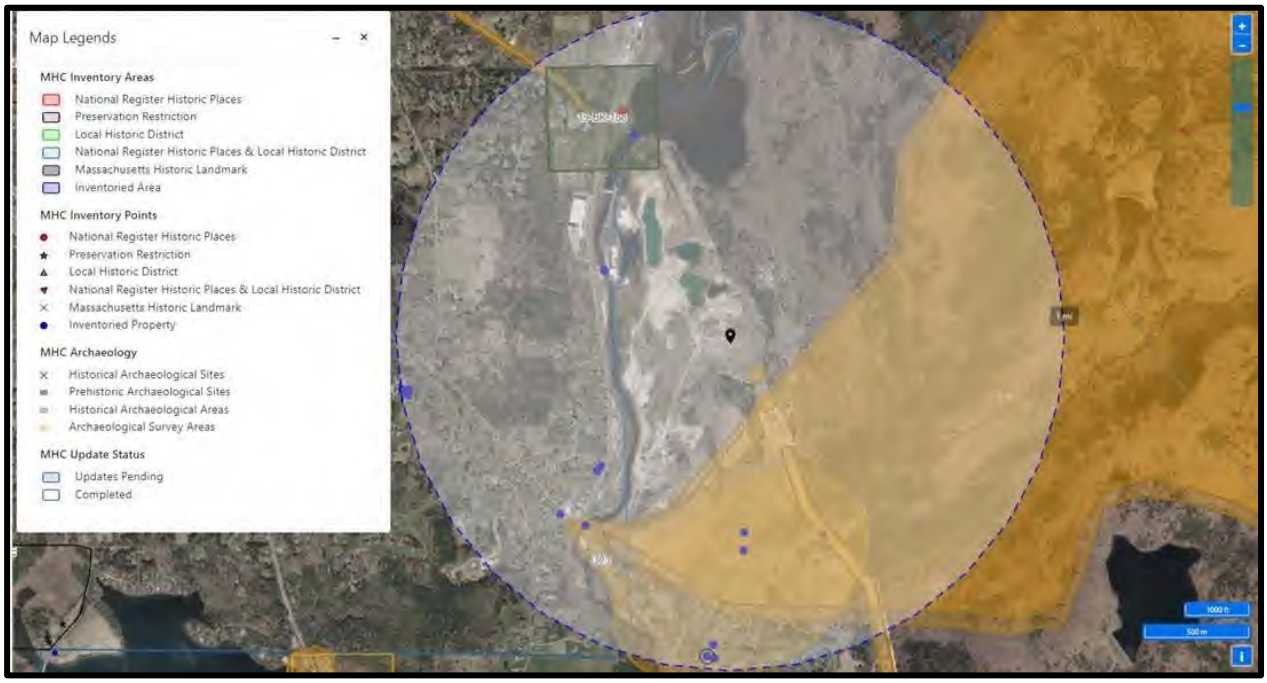

Figure 7. MACRIS Search Results Map Generated May 10, 2022.

4.3 Historic Maps

The earliest available historic map that depicts the area at a useful scale is the 1876 Beers map of Lee, which is reproduced in Figure 8. This map depicts the residence of "J. Toole" on the western side of Woodland Road, in the outparcel adjacent to the GE Parcel that is currently the location of a local construction company. Near the southeast corner of the UDF property are depicted the houses of "Mrs. Flynn," "Wm Perry," and "R. Landers."

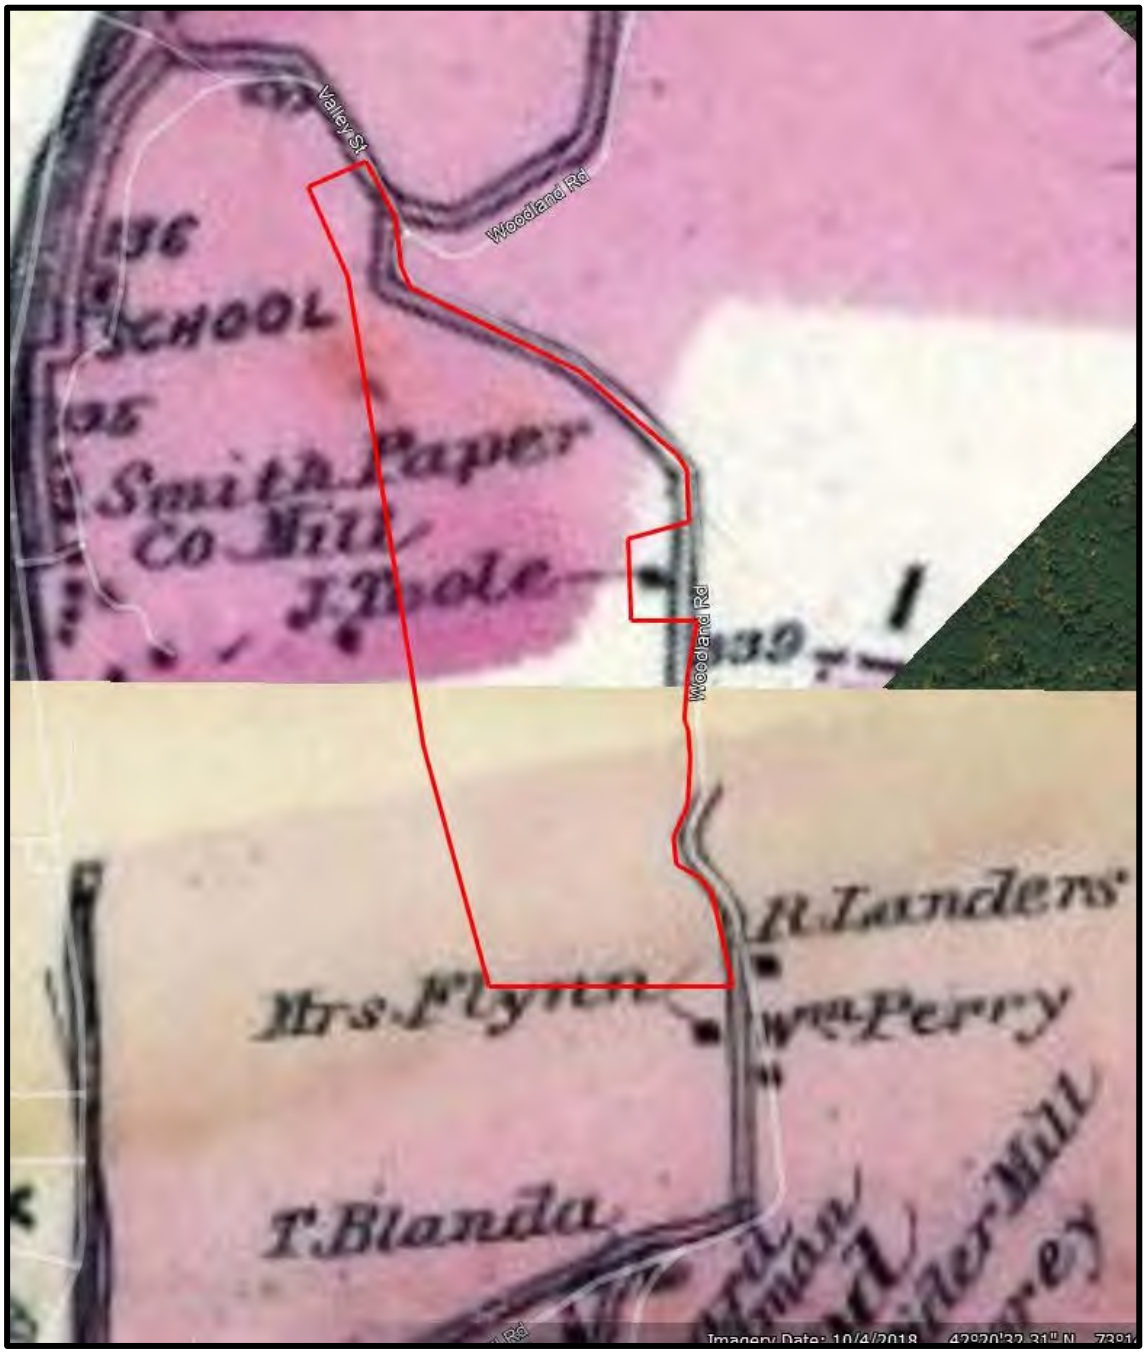

Figure 8. 1876 Beers Map of Lee (GE Parcel Shown Approximately in Red).

The next available historic map is from 1890 (Figure 9) and it shows "James Toola" at the previous "J. Toole" location, "Richard Landers" at the "R. Landers" location, and "Michael Crowley" in the approximate location of the "Mrs. Flynn" house. The scale of this map appears to be somewhat distorted, as shown by the location of "Wm. Perry" well to the south of where Wm Perry's house was previously mapped in 1876.

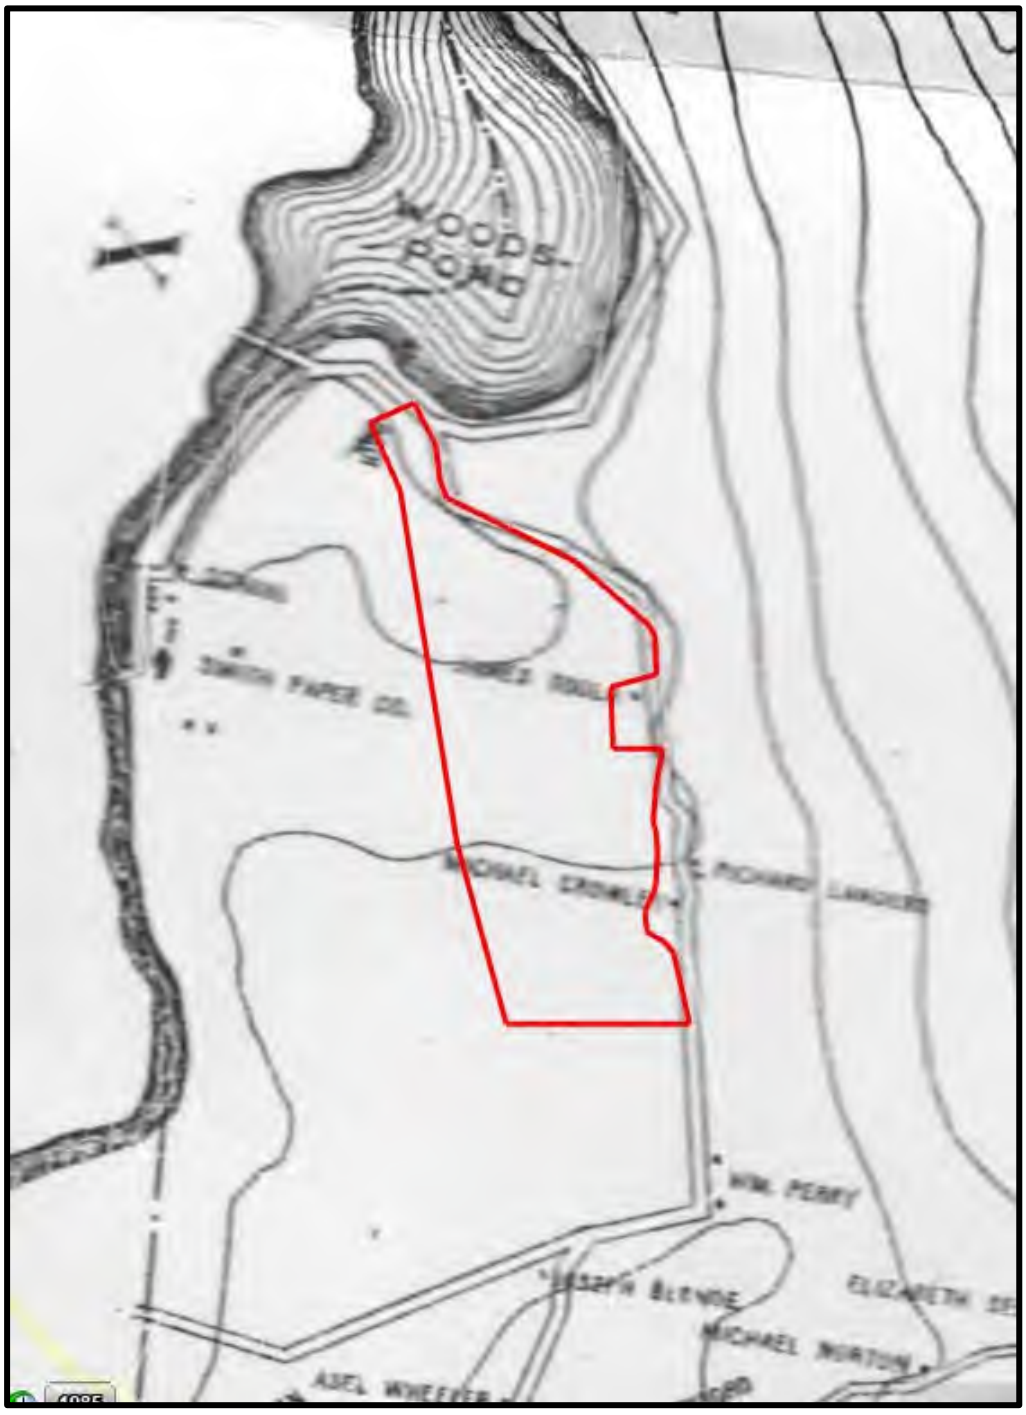

Figure 9. 1890 Map of Lee (GE Parcel Shown Approximately in Red).

The 1897 USGS topographic map for this area (Figure 10) depicts the Landers, Perry, and Crowley structures along Woodland Road (see red arrow), but no structure is mapped further north where the Toole/Toola location was previously depicted.

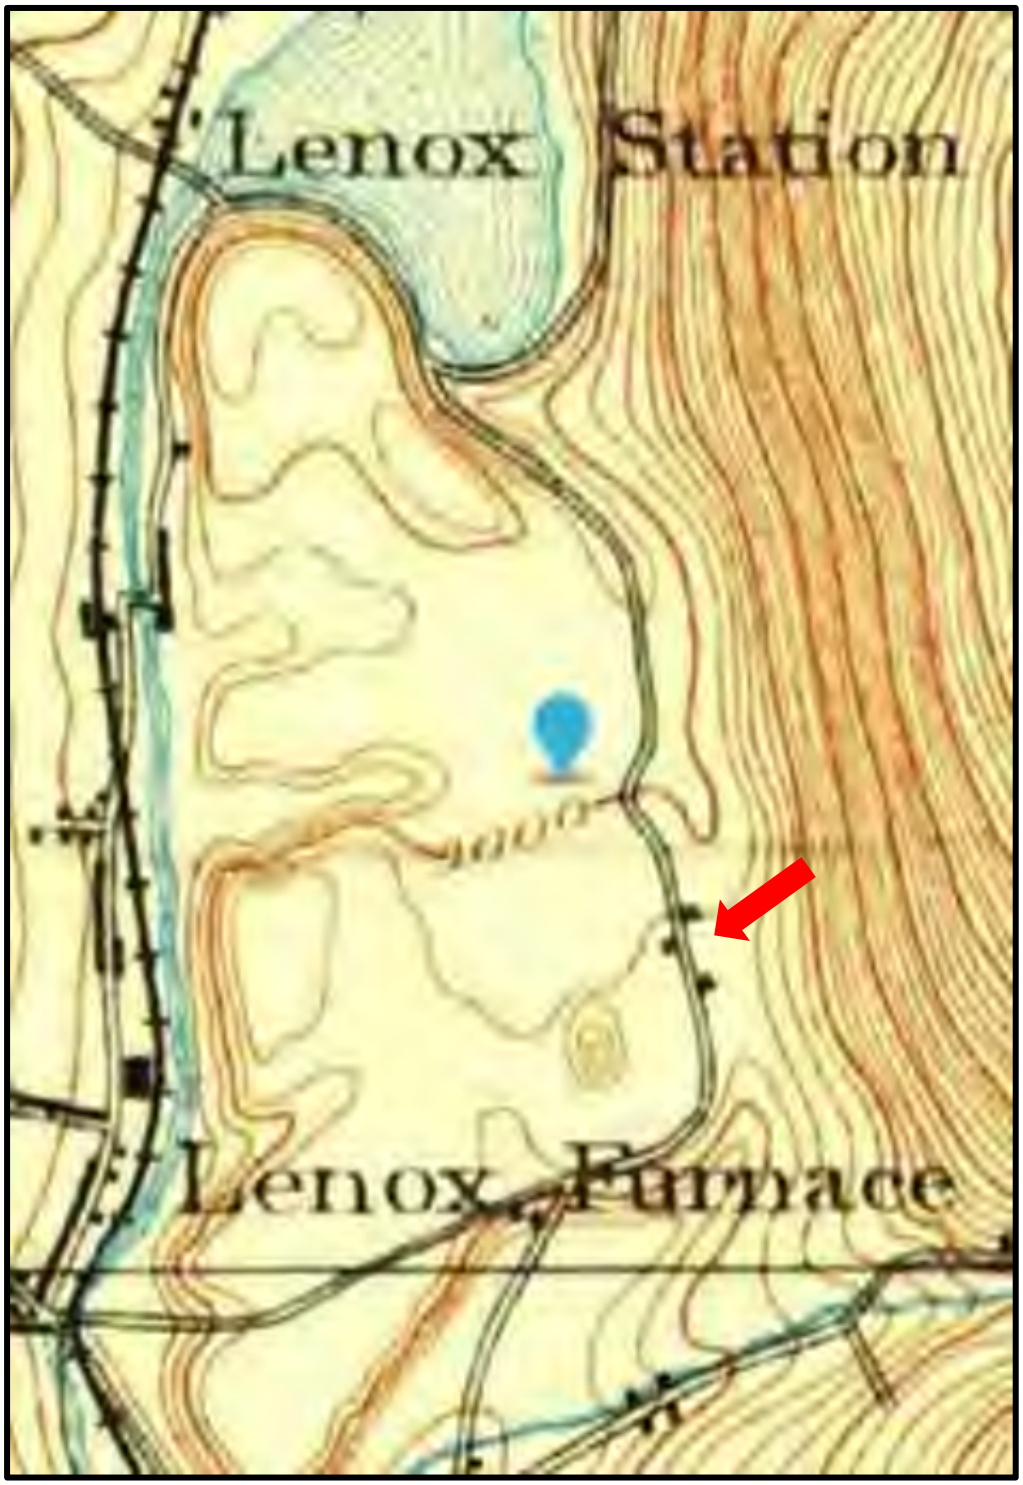

Figure 10. 1897 Becket, MA topographic quadrangle map

Despite the omission of the Toole/Toola structure from the 1897 map, the updated 1945 USGS topographic map does depict a structure in that general location (Figure 11). No structures are shown within the GE Parcel, but the map does illustrate the placement of the electric transmission line that still crosses the property from southeast to northwest, and evidence of gravel pit excavations can be seen in the multiple topographic depressions. This documents that the GE Parcel has been the location of active gravel removals for over 75 years.

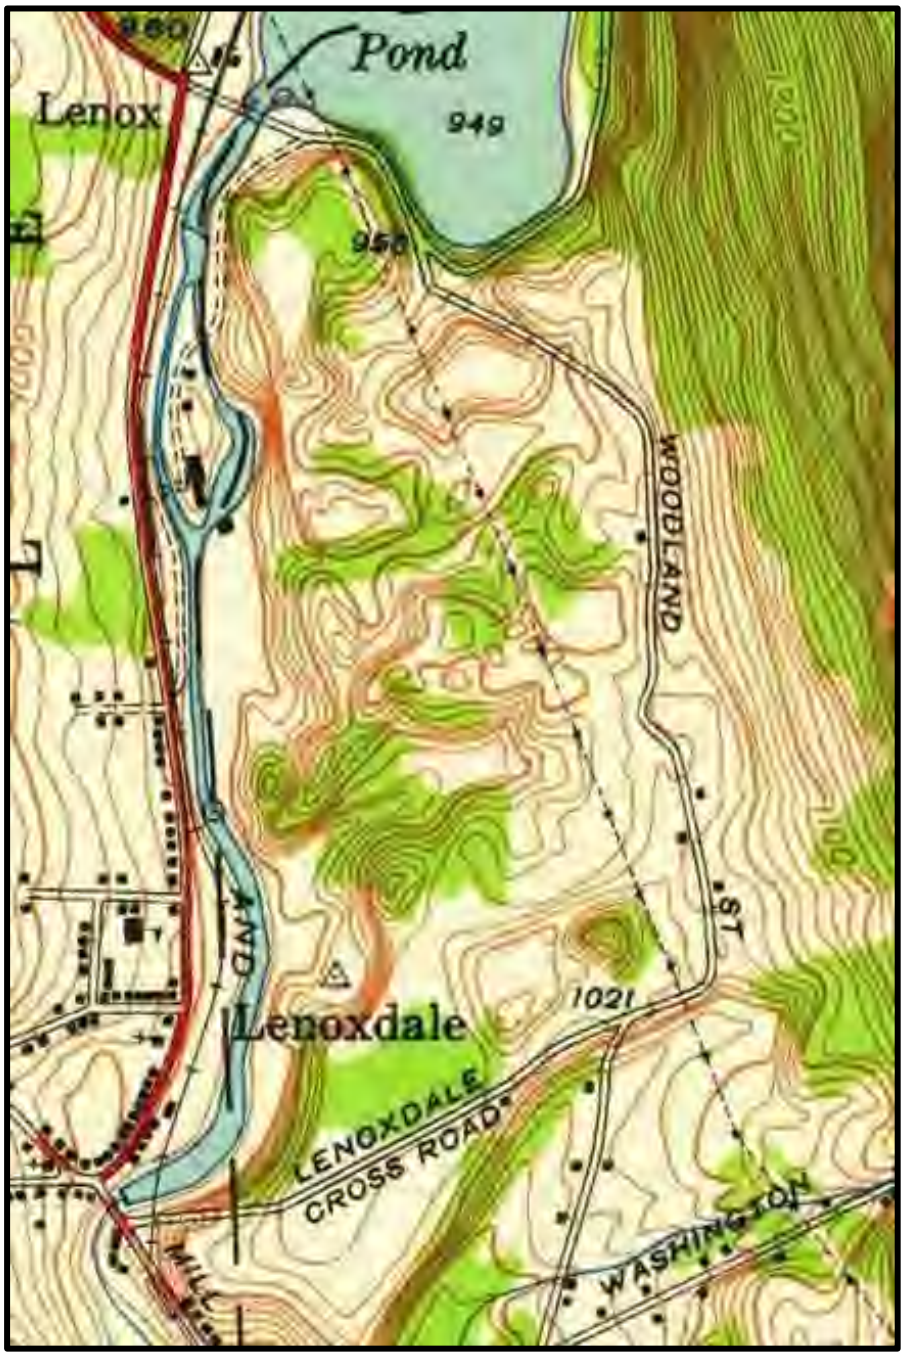

Figure 11. 1945 East Lee, MA topographic quadrangle map.

4.4 Previous Studies

As depicted previously in Figure 7, a previous archaeological survey is recorded in the MACRIS files as having covered the transmission line southeast of the GE Parcel. This survey was conducted by Heritage Consultants, LLC and did not document any archaeological sites near the GE Parcel.

In 2008, GE submitted to EPA a report entitled *Initial Phase IA Cultural Resources Assessment (CRA) for the Housatonic Rest of River Project* (URS 2008). The Initial Phase IA CRA was conducted to assess the potential for archaeological and historical resources to exist in the portions of the Housatonic River and its floodplain that could potentially be affected by implementation of Corrective Measures selected by EPA – namely, Reaches 5 through 8. Because that report was focused on areas in and adjacent to the River, it did not include any information specific to the current UDF site.

5 Results of Field Inspections

5.1 March Field Inspection in Advance of Geotechnical Boring Activity

In March 2022, AECOM senior archaeologist Daniel Cassedy conducted a field inspection of the locations of proposed soil borings that were planned to be placed within the GE Parcel to obtain geotechnical information and establish monitoring wells. This inspection covered the cleared and previously mined areas as well as a portion of the wooded strip along Woodland Road. Conditions during the field inspection were rainy and there was no snow cover. As previously noted, archaeological representatives of an EPA contractor and the Wampanoag Tribe were present during this inspection.

This visual inspection documented that almost all the proposed boring locations were situated in locations previously disturbed by mining operations. One exception was at the planned location of monitoring well MW 2022-1, which is situated in a wooded strip along the eastern edge of the parcel near Woodland Road (Figure 12). The use of a three-inch hand-operated bucket auger revealed a relatively undisturbed soil profile of dark brown sandy loam A horizon over yellow brown silty sand and brown sand B horizons (Figure 13). The auger hole terminated at 60 cm below the surface when large glacial pebbles and small cobbles were encountered.

The EPA and Wampanoag archaeological representatives concurred with AECOM's recommendation that the area around MW 2022-1 had archaeological potential and should be systematically surveyed prior to any future substantive earth moving that might be planned, but that the proposed monitoring well to be placed at the location of the three-inch bucket auger sampling should not have a notable impact on any potentially significant archaeological resources. There was also concurrence that excavation of a 50 cm x 50 cm (20 in x 20 in) shovel test pit at that location prior to geotechnical boring would in fact disturb more ground than the proposed boring and would therefore not be justified. The boring was to be conducted by a tracked boring machine and would result in eight-inch diameter sized holes. No other earth-moving activities were planned as part of the geotechnical boring operation.

5.2 June Field Inspection of the Vegetated Margins of the GE Parcel

In June 2022, Dr. Cassedy conducted an additional field inspection of the remainder of the GE Parcel. This inspection covered the vegetated margins along the entire eastern side along Woodland Road. He was joined again by EPA and Wampanoag archaeological representatives. Conditions at the time were clear, warm, and dry. This field inspection did not identify any visible above-ground cultural resources, and it documented that much of the wooded areas were situated in steeply sloping terrain, with intermittent evidence of past mining soil removals.

Figure 12. Location of Monitoring Well 2022-1. Mark Andrews, Wampanoag Aquinnah Cultural Resources Monitor, and Ray Pasquariello, HDR Archaeologist in the background.

Figure 13. Sandy B-horizon soils from hand-auger hole at Monitoring Well 2022-1.

During this inspection, the various areas and conditions at the GE Parcel were evaluated in terms of whether they have a high, moderate, or low/no potential to contain archaeological resources. In general, the GE Parcel showed evidence of widespread disturbance, and all areas at that parcel were determined to have no or low potential to contain archaeological resources, with the exception that three separate areas of relatively level terrain were identified that appeared to be less modified and located in settings that might contain archaeological sites. These have been designated as Areas A, B, and C and are all located outside of operational area and the main disposal facility limits of consolidated material, but could potentially be affected by UDF support activities. Those areas are shown on Figure 14 and are described below.

Figure 14. Areas of Archaeological Potential within the GE Parcel (Outlined in Yellow).

Area A is in the northern portion of the GE Parcel on a high terrace or knoll situated between the transmission line corridor and Woodland Road. It overlooks a small vernal pool wetland to the south (Figure 15). It is covered by a mixture of mature trees and slopes gradually to the north and west and is considered to have high archaeological potential for pre-contact period sites.

Area B is located in a narrow strip of woods along the eastern edge of the property between a steep gravel mine berm and Woodland Road. This is the area where the location of monitoring well MW 2022-1 was inspected in March 2022 and determined to be in a level area of moderate archaeological potential (Figure 16) for both pre-contact and historic period sites.

Area C occupies the southeastern corner of the parcel and is situated on a relatively level knoll with large mature pine trees and small hardwoods (Figure 17). In addition to having potential for pre-contact resources, it is also in the general vicinity of some residential structures depicted on nineteenth century maps. Area C is considered to have high archaeological potential for both pre-contact and historic period sites.

Figure 17. View South of Level Knoll in Area C.

.

6 Plan for Supplemental CRA Investigations

This CRA identified no previously recorded or visible cultural resources within the overall APE. However, three locations within portions of the GE Parcel that could potentially be used for UDF support activities, identified above as Areas A, B, and C, have a potential to contain archaeological resources. In accordance with the UDF PDI Work Plan and EPA's February 25, 2022 conditional approval letter, this section presents GE's supplemental plan to further investigate whether those three areas contain potentially significant cultural resource.

This supplemental project will include additional background research on relevant prior studies and available environmental data to provide a context within which to interpret any archaeological remains that may be identified in the three areas of interest. It will then involve survey fieldwork in those three areas. All work will be performed by or under the direct supervision of individuals meeting the Secretary of the Interior's professional qualifications standards for archaeologists (36 CFR 61).

6.1 Background Research

To date, AECOM has conducted background research to provide an assessment of the available data concerning potential archaeological resources at the GE Parcel. This research has consisted of a review of archaeological site and inventory records, as well as examination of historic maps, aerial photographs, soils data, and historical documentary evidence. These data will help orient the archaeologists during fieldwork, and the results of additional research in the MHC's inventory will be contextualized in relation to previous relevant research to provide an adequate discussion of archaeological resources that may be encountered by the survey fieldwork.

Prior to the fieldwork, AECOM will develop more detailed prehistoric and historic contexts as well as outline the developmental history of GE Parcel, focusing on the three less modified areas described above. Information will be provided on the boundaries and extent of disturbances and modifications within the areas to be surveyed. Historic maps and aerial images will be georeferenced in a geographic information system (GIS) to illustrate archaeological sensitivity and indicate the extent of previous disturbances.

6.2 Field Investigations

All fieldwork will be conducted in accordance with MHC archaeological guidelines. AECOM will first conduct a systematic visual inspection of Areas A, B, and C to verify current field conditions and refine the field survey strategy as needed. It will then conduct field surveys of those three areas. Specifically, AECOM will excavate 50-centimeter square shovel test pits (STPs) spaced at 10-meter intervals across each of those areas. Soils will be removed in 10-centimeter levels within the natural or cultural stratigraphy (whichever is smaller) of each STP. All soils will be screened through ¼-inch

hardware mesh screens to recover artifacts, if any. Quantitative and qualitative characteristics for each stratum will be recorded in the field. Data will include depths in centimeters, soil texture, horizon designation, soil color using a Munsell chart, stratum/level information, and type/number of artifacts recovered, as well as relevant comments on the location of the STP (landform, vegetative cover, etc.). Artifacts will be bagged immediately and labelled with provenience information (project information, STP number, stratum and level, depth, date, and initials of the excavator). The locations of all STPs and identified features will be mapped using a hand-held, sub-meter accurate GPS unit, and photographs documenting the work will be taken with appropriate scales and caption boards.

In the case of an unanticipated discovery of human remains during the project, AECOM will follow all relevant state and federal law and recommendations regarding treatment of human remains. AECOM recognizes the importance of providing careful and respectful treatment for human remains recovered as an unanticipated discovery or as part of this archaeological investigation. In the event of an unanticipated discovery of human remains, AECOM will follow the following protocols:

1) Should human remains or evidence of possible burials be encountered, work in the general area of the discovery will stop immediately and the location will be immediately secured and protected from damage and disturbance.

2) Human remains and associated artifacts will be left in place and not disturbed. No skeletal remains or materials associated with the remains will be collected or removed until appropriate consultation has taken place and a plan of action has been developed.

3) The county coroner/medical examiner, local law enforcement, the MHC, and the appropriate Indian Nations will be notified immediately. The coroner and local law enforcement will make the official ruling on the nature of the remains, being either forensic or archaeological. If human remains are determined to be Native American, the remains will be left in place and protected from further disturbance until a plan for their avoidance or removal can be generated. AECOM will consult with the MHC and appropriate Indian Nations to develop a plan of action that is consistent with the Native American Graves Protection and Repatriation Act (NAGPRA) guidance.

4) If human remains are determined to be non-Native American, the remains will be left in place and protected from further disturbance until a plan for their avoidance or removal can be generated in accordance with MHC's "Policy and Guidelines for Non-Native Human Remains Which are Over 100 Years Old or Older" and in a manner consistent with the ACHP Policy Statement Regarding Treatment of Burial Sites, Human Remains and Funerary Objects (February 23, 2007). Consultation with the MHC and other appropriate parties will be required to determine a plan of action.

6.3 Laboratory Analysis and Curation

Any archaeological artifacts and samples recovered will be returned to the AECOM laboratory for professional analysis and cataloging. Artifacts will be cleaned and labeled. Any artifact needing conservation will be removed from the collection for separate processing and evaluation. After the artifacts are dry, they will be separated by class and placed in individual 4-ml polyethylene bags labeled with provenience information in permanent marker. The individual bags will be placed within a large bag(s) for the entire provenience. All bags will be labeled and will be pierced for air circulation.

Any artifacts recovered from the investigation will be fully inventoried and cataloged. This information will be used to establish the contemporaneity of contexts and strata, as well as to determine whether assemblages represent primary or secondary deposits. At a minimum, basic analyses performed on these artifacts from any given archeological context will include the identification of key characteristics for each object, including general form and function (e.g., nail – architectural), material composition (ceramic, glass, metal, etc.), manufacturing technique, date of manufacture, maker's marks (if present), and the total number of artifacts with such characteristic within a specific context.

Any artifacts recovered from intact deposits will additionally undergo more intensive analyses designed to facilitate the interpretation of these materials and the context in which they were found. Additional artifact characteristics will be recorded for identified vessels, including those related to methods of decoration, motifs, and use-wear. Efforts will also be made to more accurately date all diagnostic artifacts, and to utilize those data to establish *terminus post quem* (TPQ) and *terminus ante quem* (TAQ) dates for specified archeological deposits.

At the conclusion of this supplemental investigation, any artifacts recovered and project records will be prepared for permanent curation with a qualified curation facility. All artifacts will be delivered in archivally stable Hollinger Record Storage Boxes or an equivalent. Artifacts within the boxes will be packaged in labeled, vented, zipper-sealed polyethylene bags. Along with the artifact collection and a paper catalog, an electronic format copy of the final catalog will be provided. In addition, all notes, photographs, drawings, maps, and both original and duplicate copies (photo-reproduced onto acid-free paper) of all field documentation and notes will be curated.

6.4 Reporting

Following an assessment of the field data collected and the laboratory analysis, AECOM will produce a draft report presenting the results of the survey of Areas A, B, and C. That report will be prepared to meet the standards of the MHC reporting guidelines (950 CMR 70.14). At a minimum, the report will include the following: an abstract (consistent with the State Archaeologist's memorandum on archaeological abstracts), introduction, background research methods, description and justification

of the research design, field testing methods, field results, laboratory procedures and analyses and discussion, conclusions and recommendations for further work (if any), bibliography, and lists of tables, figures, and photographs. AECOM will include maps created in GIS depicting the locations of the areas surveyed, historic maps showing development and past land use, and field results. All figures and field photographs will be prepared consistent with professional practices and the State Archaeologist's memorandum on cartography and photography.

6.5 Schedule

The field data collection will be initiated within 30 days after EPA approval of this work plan for supplemental archaeological investigations and will be completed within approximately 30 days after initiation. Thereafter, AECOM will conduct the laboratory processing and report preparation. A report on these supplemental investigations will be included in the Interim PDI Summary Report to be included with the UDF Conceptual Design Plan (currently due on December 6, 2022).

Abstract

For the 75-acre property in Lee, MA owned by the General Electric Company and required by the United States Environmental Protection Agency to be used for an engineered disposal facility for excavated sediments and soils under an environmental cleanup plan, an intensive archaeological survey was conducted to search for archaeological resources. Most of the property has been disturbed by past sand and gravel mining, but three separate relatively undisturbed areas were investigated using a systematic grid of shovel test pits (STPs) spaced at 10-meter intervals as an intensive archaeological survey. A total of 116 STPs were excavated and no evidence of archaeological artifacts or cultural features was identified within the GE property. This report constitutes a revised report on that intensive survey.

1 Introduction and Background

1.1 Introduction

This Revised Phase IB Intensive Archaeological Survey Report has been prepared on behalf of the General Electric Company (GE) to present the results of the additional cultural resources data collection conducted as part of pre-design investigation (PDI) activities for the area that will contain the Upland Disposal Facility (UDF) and UDF support facilities associated with the Rest of River (ROR) Remedial Action specified in the final Revised Resource Conservation and Recovery Act Corrective Action Permit that the U.S. Environmental Protection Agency (EPA) issued to GE on December 16, 2020 (Revised Permit). This report constitutes a revision of the *Phase IB Intensive Archaeological Survey Report*, submitted to EPA on December 6, 2022 as Appendix L to GE's *Interim Pre-Design Investigation Data Summary Report for Upland Disposal Facility Area* (Interim PDI Data Summary). That prior report has been revised to address comments from EPA included in an April 18, 2023 conditional approval letter for the Interim PDI Data Summary. As noted in that letter, the term "Phase IB" is appropriate under the federal program governing the Revised Permit activities, but it is not recognized terminology by the Commonwealth of Massachusetts. Using the terminology of the Massachusetts Historical Commission (MHC), this report is an archaeological intensive survey report under 950 CMR 70.04 and 70.14.

The UDF will be constructed on a 75-acre property in the Town of Lee, Massachusetts (Figure 1) that was formerly part of an active sand and gravel quarry and that GE acquired from The Lane Construction Corporation (Lane) in April 2021. Figure 2 shows the extent of the property acquired by GE (referred to herein as the GE Parcel). That figure also shows the maximum limits of consolidated material for the UDF and the associated operational area surrounding and encompassing the limits of the consolidated material (jointly referred to herein as the UDF area). In addition, the GE Parcel will contain a UDF support area, which remains undefined and not shown on the figure, and which may include temporary facilities such as sediment dewatering and material handling areas. The UDF support area will be defined in the Final Design Plan for the UDF

On November 24, 2021, GE submitted a Pre-Design Investigation Work Plan for the UDF (Arcadis and AECOM 2021). Section 5.2.8 of that Work Plan provided that GE would conduct an initial Phase IA Cultural Resources Assessment (CRA) of the UDF area and described the scope of those initial CRA activities; those investigations were comparable to a reconnaissance survey as defined in 950 CMR 70.04. That Work Plan was conditionally approved by EPA on February 25, 2022. GE subsequently carried out the Phase IA CRA activities described in that Work Plan. The results of that research were presented in a *Phase IA Cultural Resources Assessment Report for Upland Disposal Facility Area* (UDF

Phase IA CRA Report), dated July 8, 2022. EPA provided conditional approval of that report in a letter dated September 7, 2022. Those activities are also summarized again in this report.[1]

The Phase IA reconnaissance survey did not identify any previously recorded or visible cultural resources within the GE Parcel. However, three locations within portions of the GE Parcel that could potentially be used for UDF support activities were identified as having a potential to contain archaeological resources. Accordingly, GE's UDF Phase IA CRA Report included a work plan for a supplemental investigation to further assess whether those three areas contain potentially significant cultural resources. Following EPA's approval of that report, the supplemental investigation (which, as noted above, is termed a Phase IB survey for federal purpose and an intensive archaeological survey as defined in 950 CMR 70.04 and 70.14) was conducted in October 2022, and its results are presented in this revised report.

[1] On a separate track, Phase IA CRA reconnaissance survey activities have been performed for the overall areas that will be affected by the ROR Remedial Action. The results of those activities were presented in a *Revised Supplemental Phase IA Cultural Resources Assessment Report for the Housatonic Rest of River* (Revised Phase IA CRA Report for ROR; AECOM 2023), submitted to EPA in March 2023.

Figure 1. Location of the GE Parcel in Lee, Massachusetts.

Figure 2. General Layout of the Upland Disposal Facility in Lee, Massachusetts.

1.2 Scope of the Initial UDF Area CRA

This section describes the Phase IA CRA (reconnaissance survey) activities described in Section 5.2.8 of the UDF PDI Work Plan and subsequently conducted for the UDF area and UDF support area. It contains largely the same information presented in Section 1.2 of the approved UDF Phase IA CRA Report.

The Area of Potential Effects (APE) for both archaeological resources and historic architectural resources was defined based on the location and extent of the UDF area and UDF support area. The Archaeological APE was defined as all portions of the GE Parcel that may experience ground disturbance as a result of remediation activities. For purposes of the Phase IA CRA, the Archaeological APE was defined as the entire GE Parcel, subject to refinement for future studies when the designs for the UDF are better developed. The Historic Architectural APE for the UDF was also defined by the limits of the GE Parcel.

Desktop and on-line reviews were conducted of the MHC's files and databases, including the Massachusetts Cultural Resource Information System (MACRIS), the Massachusetts State Historic Preservation Plan, and the MHC State Reconnaissance Survey Reports, as well as the files of local historical organizations, including the Lenox Historical Society, the Lee Historical Society, the Lee Library, and the Stockbridge Library – Museum and Archives, to determine whether the UDF area or UDF support area contains or could affect cultural resources included in those files or databases. Additionally, historical aerial photography, historic maps, and soils and geological mapping were reviewed for evidence of past environmental characteristics and land use patterns.

Coordination with the MHC and with Native American tribal representatives regarding the locations of cultural resources and traditional cultural properties in the vicinity of the GE Parcel was conducted through EPA's outreach efforts to consulting parties as well as through AECOM's contacts with representatives of the Stockbridge Munsee Band of Mohican Indians and Wampanoag Tribe of Gay Head (Aquinnah). Requests for input were sent to the Schaghticoke Tribal Nation and Schaghticoke Indian Tribe in Connecticut, but no responses were received.

Two field inspections were made in March and June of 2022 to visually assess and document the environmental characteristics of the project area and to search for visible above-ground cultural resources; no subsurface investigations were conducted during this phase of the investigation except for one hand auger boring described in Section 5.1. For both field inspections, AECOM's archaeologist was accompanied by an archaeologist from EPA's support contractor and a representative of the Wampanoag Tribe of Gay Head (Aquinnah).

Based on the information gathered during these research tasks, an assessment was made of the potential for the APE to contain unidentified potentially significant cultural resources. For purposes of the CRA, potentially significant cultural resources mean cultural resources that are listed or could

potentially meet the criteria for listing on the National Register of Historic Places (NRHP), resources that are listed on the Massachusetts State Register of Historic Places (SRHP) and included on the State Inventory of Historic and Archaeological Assets, and potentially significant scientific, pre-contact, historical, or archaeological data subject to the Archaeological and Historic Preservation Act.[2]

Investigation to identify known or suspected historic structures within the Historic Architectural APE was initiated by examining existing historic structure inventories. The locations of any such structures were plotted for systematic comparison with the location of the GE Parcel, and aerial photography and maps were examined to identify the locations of additional structures. Because, as noted above, this APE did not extend beyond the limits of the GE Parcel and no historic structures occur within it, no additional field inspections were required.

1.3 Results of the Initial Phase IA CRA and Proposed Supplemental Investigations

As noted above, the Phase IA CRA (reconnaissance survey) identified no previously recorded or visible cultural resources within the overall APE. However, three locations within portions of the GE Parcel that could potentially be used for UDF support activities, designated as Areas A, B, and C (shown on Figure 3), were identified as having a potential to contain archaeological resources. In accordance with the UDF PDI Work Plan and EPA's February 25, 2022 conditional approval letter, GE prepared a supplemental plan for an intensive survey to further investigate whether those three areas contain potentially significant cultural resource. That plan was conditionally approved by EPA on September 7, 2022. The additional data were gathered in October of 2022 and are described in this revised report.

[2] Such resources include properties of traditional religious and cultural importance that fall into any of the foregoing categories.

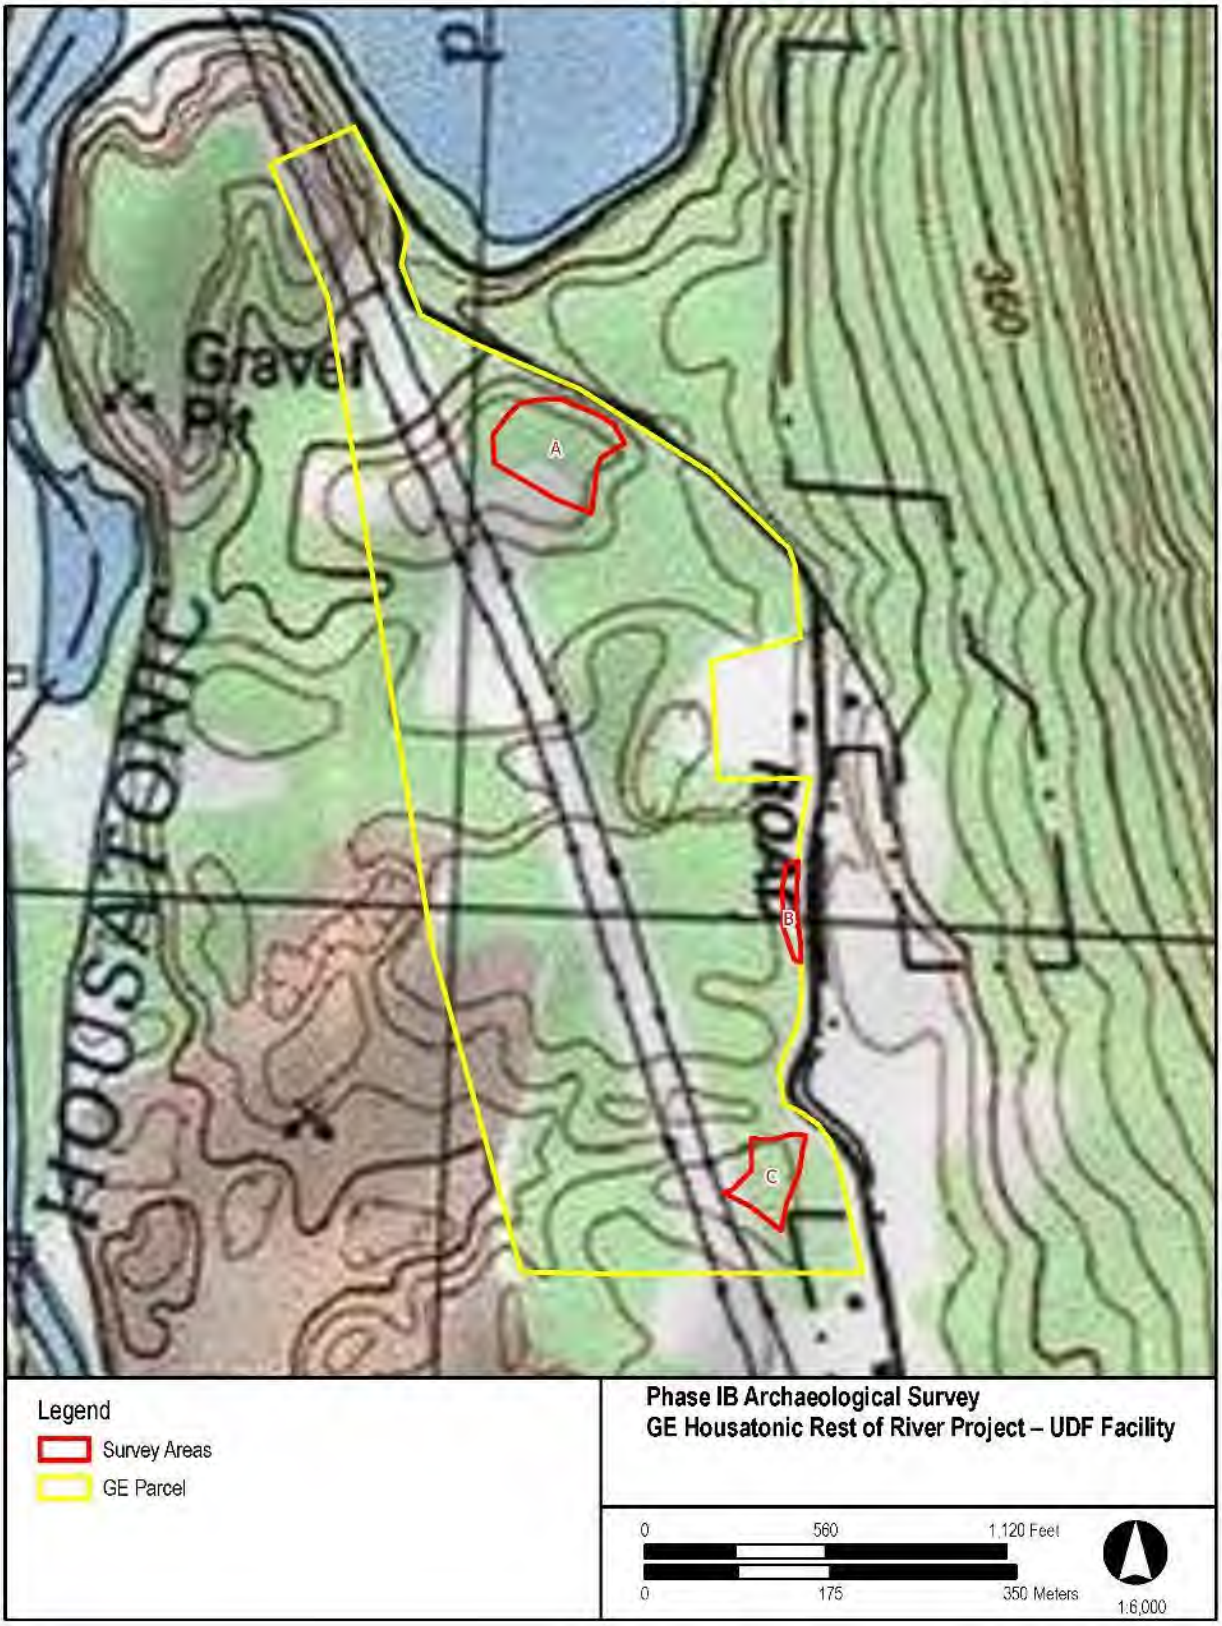

Figure 3. USGS Topographic Quadrangle Map of Project Area.

2 Research Design & Methods

The goal of the supplemental investigation was to confirm whether the three areas at the GE Parcel identified as having the potential to contain significant archaeological sites actually contain such resources. This supplemental investigation included additional background research on relevant prior studies and available environmental data to provide a context within which to interpret any archaeological remains that may be identified in the three areas of interest. It then involved a systematic archaeological field survey in those three areas. This research sought to identify the location and character of any archaeological sites and to assess the potential significance of any sites found.

2.1 Background Research

AECOM conducted background research to provide an assessment of the available data concerning potential archaeological resources at the GE Parcel. This research consisted of a review of archaeological site and inventory records, as well as examination of historic maps, aerial photographs, soils data, and historical documentary evidence. Prior to the fieldwork, AECOM developed pre-contact and historic contexts and reviewed the developmental history of the GE Parcel, focusing on the three less-modified areas singled out for intensive survey. In addition, David Bondanza of Lane was contacted to seek information about past mining and possible archaeological resources on the property, but he did not have any additional information beyond what was available through other sources.

2.2 Field Investigations

All fieldwork was conducted in accordance with MHC archaeological guidelines. The field crew first conducted a systematic visual inspection of Areas A, B, and C to verify current field conditions and refine the field survey strategy as needed. They then conducted field surveys of those three areas, which included excavation of 50-centimeter (cm) square shovel test pits (STPs) spaced at 10-meter intervals across each of those areas.

Prior to fieldwork, a 10-meter grid was pre-plotted for each area using ArcGIS, and this information was loaded into hand-held, sub-meter accurate Trimble 6000 Series Geo XT GPS units. In the field, archaeologists navigated to each potential STP location using the Trimble. If the location of the STP needed to be offset, the location was updated on the Trimble using real-time correction. If real-time correction was not available in the field, the data were post-processed in the office using base stations. STP pre-plotted locations that fell on excessive slope or areas of obvious disturbance were not dug but were documented in the log.

For all STPs excavated, soils were removed in 10-centimeter levels within the natural or cultural stratigraphy (whichever was smaller) of each STP. All soils were screened through ¼-inch hardware

mesh screens to search for artifacts. Quantitative and qualitative characteristics for each soil stratum were recorded in the field. Data included depths in centimeters, soil texture, horizon designation, soil color, stratum/level information, and any artifacts recovered, as well as relevant comments on the location of the STP (landform, vegetative cover, etc.). Descriptions of each soil horizon was recorded in standard United States Department of Agriculture pedological terms, with soil color recorded in reference to the Munsell standard. and photographs documenting the work were taken with appropriate scales and caption boards.

2.3 Laboratory Analysis and Curation

No artifacts were recovered during the field survey, so no laboratory analysis was needed. All notes, photographs, drawings, maps, and both original and duplicate copies (photo-reproduced onto acid-free paper) of all field documentation and notes will be maintained.

2.4 Reporting

Following an assessment of the field data collected, AECOM produced a report presenting the results of the intensive survey of Areas A, B, and C. That report, originally submitted in December 2022 and revised herein in response to EPA's comments, has been prepared to meet the standards of the MHC reporting guidelines (950 CMR 70.14)

3 Environmental Setting

This section describes the environmental setting of the GE Parcel. It is similar to Section 2 of the UDF Phase IA CRA Report, but it describes the mapped soil types in more detail and includes a figure that shows the locations of the areas (Areas A, B, and C) that were subject to supplemental investigations.

The GE Parcel is located at the northern edge of the Town of Lee in Berkshire County, Massachusetts, which is on the western edge of the State and is bordered by Connecticut (south), New York (west), and Vermont (north). It is positioned in steep dissected terrain between the western slopes of October Mountain and the Housatonic River, which flows south through the Central Valley region between the Berkshire Plateau and the Taconic Mountains. The main stem of the river is formed by the confluence of the East and West Branches of the Housatonic River in Pittsfield. The East Branch begins in Dalton and Hinsdale from headwater tributaries. The West Branch starts at Onota and Pontoosuc Lakes in Pittsfield and Lanesboro and is augmented by flows from the Southwest Branch. Below the confluence, the river generally flows south through Berkshire County for approximately 10 miles to Woods Pond, the first significant impoundment. Woods Pond is an impoundment created in 1890 and is located just north of the GE Parcel. Downstream of Woods Pond, the river continues south through western Massachusetts and south/southeast through Connecticut before emptying into Long Island Sound at Stratford, Connecticut.

As can be seen in Figure 3 (above), the topography of the GE Parcel is highly irregular, which is the result of decades of sand and gravel mining that have removed and rearranged large volumes of soil. This can also be seen in the soils map prepared by the Natural Resources Conservation Service (Figure 4). The entire area planned to be used for the consolidated materials disposal (approximately half of the parcel) is mapped as gravel pits, and an additional 25% of the parcel is classified as sandy and gravelly soils of 15% to 35% slopes

Specific soil types mapped in the areas chosen for intensive archaeological survey (Figure 4) include Copake sandy loams (3-15% slopes), Groton-Hinckley soils (25% slope), and Hero loam (3-8% slopes). The Copake series is described by the NRCS as well-drained soils formed in loamy mantled stratified drift and glacial outwash. They are found on glacial outwash plains, terraces, kames, eskers, and moraines. Groton-Hinckley soils are sandy and gravelly glaciofluvial deposits developed on outwash deltas, outwash terraces, moraines, eskers, kames, outwash plains, kame terraces. Hero loam soils are gravelly, moderately well drained deposits formed in loamy sand over sandy and gravelly glacial outwash. They are nearly level and gently sloping soils on glaciofluvial landforms.

Figure 5 illustrates the appearance of the southern portion of the GE Parcel, which has been partially reclaimed and stabilized after sand and gravel removal; and Figure 6 provides a panoramic view of the deeply dissected central portion of the parcel.

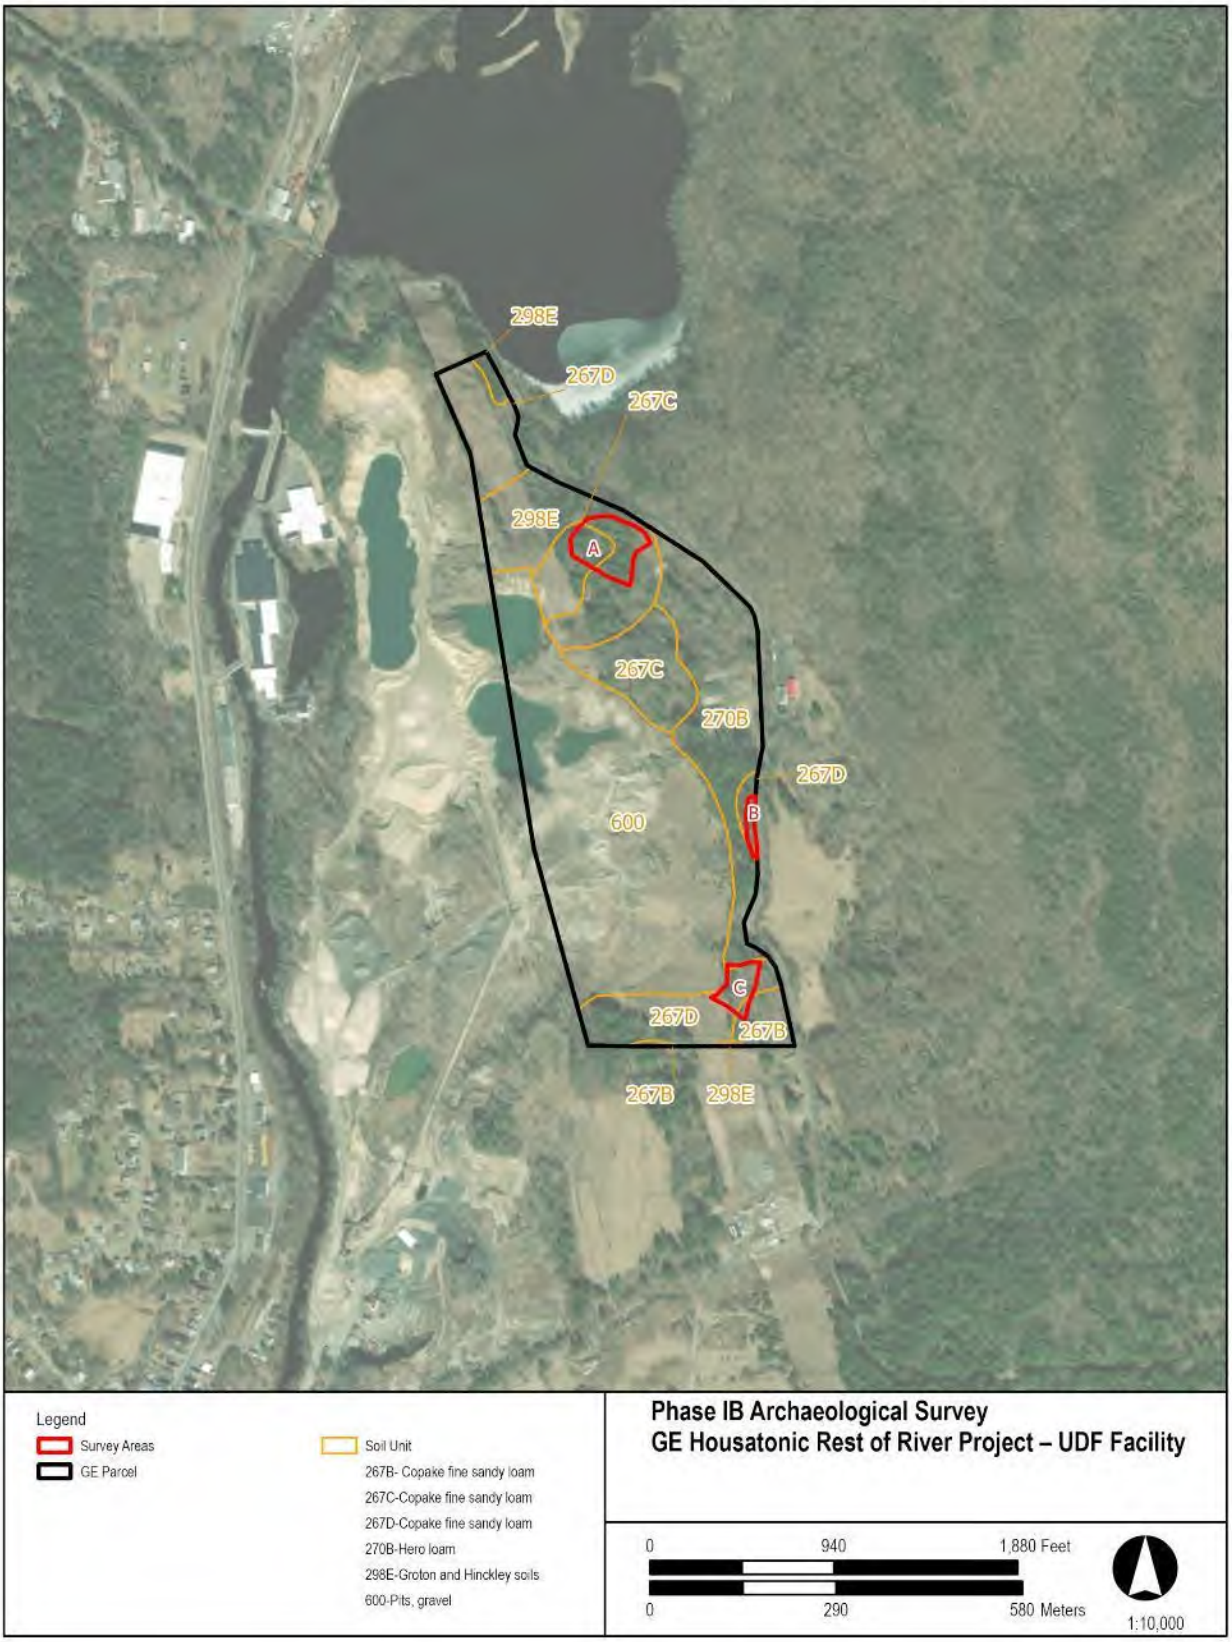

Figure 4. NRCS Soils Map of Project Area.

Figure 5. View Northwest from Southeast Corner of Parcel Near Well PZ-7.

Figure 6. View South of Open Mined Area in Center of Parcel.

4 Cultural and Historical Contexts

This section summarizes the pre-contact and historic period contexts of the general region around the project. It contains similar information to that presented in Section 3 of the UDF Phase IA CRA Report, with some updates that were previously provided in Section 3 of the March 2023 Revised Phase IA CRA Report for the ROR.

A description of the cultural contexts provides a framework for discovering, investigating, evaluating, and managing archeological sites. It is designed to:

- Summarize the current state of knowledge about a type of resource or related categories of resources;
- Provide the basis for understanding expected resource types, their location, age, size, and their expected data classes within a given geographic area; and
- Provide the basis for evaluating the relative significance of resources of the same or similar type, if found.

This section begins with a summary of previous archaeological research projects in the area, and this is followed by sections summarizing the pre-contact and historic period contexts of the general region around the project.

4.1 Previous Research in the Region

Most of the previous cultural resource research in the region has been associated with transportation and utility projects, and most of these were concentrated in two zones: in Pittsfield north of the current project, and along a narrow corridor in South Lee and Stockbridge. This section provides brief summaries of known projects arranged in chronological sequence.

The Institute for Conservation Archaeology at Harvard prepared a Phase I Reconnaissance Study for proposed water pollution control projects in Lee (Mulholland et al. 1977). This study highlighted the potential for historic sites relating to the factories and mills along the Housatonic and its tributaries, but no field studies were conducted.

In 1983, Dunn Geoscience conducted a Stage 1B Archaeological Survey for the realignment of Route 7 (Upper North Street) in Pittsfield, including examination of pre-contact site 19BK99, which was identified as a small Late Archaic hunting camp.

UMass Archaeological Services conducted site examinations of six archaeological sites (four pre-contact and two historic) in Pittsfield in 1988 in association with the Route 7 Bypass project (Bernstein and Savulis 1988). That same year, the Boston University Office of Public Archaeology

conducted a reconnaissance for six miles of corridor in Pittsfield for the Tennessee Gas Pipeline NOREX project (Jones and Seasholes 1988). This corridor crosses the Housatonic River near the south end of the Audubon Sanctuary, near the mouth of Sykes Brook. A subsequent survey in 1990 identified a pre-contact site (19BK185) east of the river near Court Hill, north of Sackett Brook.

In 1992, the Public Archaeology Laboratory, Inc. (PAL) surveyed a proposed GE/Altresco gas pipeline route in Pittsfield (Nassaney and Leveille 1992). This short pipeline route extended from the Altresco Plant on the northeast side of Pittsfield around the east and south sides of the city, crossing the Housatonic River alongside Holmes Road. Four pre-contact sites were identified. Also in 1992, the State Archaeologist's office conducted a brief walkover survey of site 19BK154 at Melville's Arrowhead estate on Holmes Road (Simon 1992). This survey confirmed the presence of pre-contact artifacts on the property.

In 1991 and 1992, a series of survey and site examination projects were conducted for Tennessee Gas Pipeline Company's Northeast Settlement Expansion Project. The northern end of Segment 2 extended northwest along the valley of Hop Brook and crossed the Housatonic River (and the current APE) between Lee and South Lee. Surveys and site examinations for Segment 2 were done by the BU Office of Public Archaeology (Jones 1992; Jones and Berkland 1992; McDermott and Macomber 1991; Macomber 1992; Macomber et al. 1992). These studies resulted in the identification of six pre-contact sites and these sites include multiple Late Archaic, Early Woodland, and Late Woodland components.

UMass Archaeological Services conducted the studies for Segment 7 of the Northeast Settlement pipeline project, which began at the end of Segment 2 north of the river near Church Street and extended northwest into New York (Holmes et al. 1992a, 1992b, 1992c). The Segment 7 studies identified six sites along the pipeline route just north of Stockbridge, including two significant pre-contact sites near Kampoosa Bog, which drains south into the Housatonic River. Phase 3 data recovery excavations were conducted at these two sites prior to construction (Johnson and Mulholland 1995). They documented that the margins of Kampoosa Bog have been occupied for over 6,000 years, with notable occupations relating to the Snook Kill/Atlantic tradition and the Late Woodland period (Johnson and Mulholland 1995:22).

PAL conducted an intensive archaeological survey of a portion of the Housatonic River in Pittsfield in 2005 in connection with EPA's performance of remediation in the portion of the river known as the 1½ Mile Reach. A report on that survey was submitted to the U.S. Army Corps of Engineers and EPA in January of 2006 (PAL 2006). The project area included both sides of the Housatonic River from the Pomeroy Avenue Bridge upstream of the Confluence of the East and West Branches to that Confluence. Field investigations included the excavation of 62 fifty-cm shovel test pits at 10-meter intervals along the river floodplain. No evidence of any archaeological sites was identified or recovered during the survey.

In 2008, URS (now AECOM) prepared a Phase IA CRA Report for the Housatonic Rest of River Project (URS 2008) to assess the potential for archaeological and historical resources to exist in the portions of the Housatonic River and its floodplain that could potentially be affected by implementation of future remediation activities in the ROR. The Initial Phase IA CRA Report included background information on the environmental setting, pre-history, and history of the project area and region; a description of previous cultural resource studies and types of known cultural resources; and a preliminary assessment of the potential for each section of the project to contain as-yet unidentified cultural resources. That 2008 report has recently been updated (AECOM 2023).

In 2011, the University of Massachusetts-Amherst Archaeological Services, conducted reconnaissance and intensive archaeological surveys for upgrades along the 1371 transmission line in Lee, which is crosses the GE UDF parcel from northwest to southeast. No archaeological sites were reported within the ROR area by that survey (Donta, Blake and Barker 2011).

AECOM conducted survey and construction monitoring in 2018 and 2019 for a stormwater drainage improvement project that the Town of Stockbridge implemented on the north side of the Housatonic River behind the town offices in the former Stockbridge School building and in Bidwell Park (Campetti 2021). A scattering of both pre-contact and post-contact artifacts were recovered from disturbed topsoil and fill soils in Bidwell Park, but no intact archaeological sites were identified there.

PAL conducted an intensive archaeological survey for Phase I of the Lee Bikeway in 2019. The route of that project extended along the east bank of the Housatonic River from the I-90 interchange north to West Park Street, but no archaeological sites were reported.

Recent projects in Stockbridge conducted by the Stockbridge Munsee THPO included surveys of potential burial grounds and placing a headstone for Mohican ancestors in the Town Cemetery. In addition, in 2021, the THPO continued research for the Ox Roast/King Solomon Uhhaunnuhwaunnuhmut homesite excavation near Laurel Hill at the site of the 1783 Ox Roast presented by George Washington to thank the Mohican people for their service in the Revolutionary War. An archaeological survey at the location of the 1739 Meetinghouse, or today's chime tower, also took place in 2021.

4.2 Historical Context

4.2.1 Paleoindian Period

Human occupation of northeastern North America began soon after the continental ice sheet began to recede northward, once again exposing land. Current evidence suggests that approximately 13,000 years before the present (B.P.), humans began moving into what is now New England. This first period of prehistory lasted until approximately 9,500 B.P. Archaeological sites dating to this time period are most commonly recognized by the presence of distinctive biface stone tools called fluted

points. Because of extreme age and low population densities, Paleoindian sites are relatively rare and have often been disturbed by more recent natural events and human activities.

Although relatively few Paleoindian sites have been excavated in the Northeast, there have been documented discoveries in the general region near the Housatonic drainage. In 1977, the American Indian Archaeological Institute (AIAI) excavated a site known as 6LF21 on the Shepaug River in northwestern Connecticut (Moeller 1980), and this site produced a radiocarbon date of 10,190 RCY B.P. More recently, the Hidden Creek site in Mashantucket, Connecticut (Jones & Forrest 2003) has yield evidence of Paleoindian occupations. Most of the evidence for Paleoindian occupations in the region comes from isolated finds of the distinctive fluted points from scattered locations. Many finds appear to be associated with former post-glacial lake basins (Lavin 1984). In particular, surveys by the AIAI near Robbins Swamp in northwestern Connecticut have identified a number of Paleoindian sites around the margins of this rich ecological zone (Nicholas 1988).

4.2.2 Early Archaic Period

Prior to 1970, there was virtually no evidence of any Northeastern sites dating to the Early or Middle Archaic periods. In the last three decades, considerable information has been obtained to fill in that gap, but the picture is still incomplete. There are still relatively few excavated, radiocarbon-dated Early Archaic sites in the Northeast. Most have been identified by the presence of projectile points analogous to dated types such as Palmer, Kirk, Charleston, MacCorkle, LeCroy, St. Albans, and Kanawha, which have been found in stratified Southeastern sites.

Archaeologists are beginning to be able to identify distinctive regional characteristics in the Early Archaic artifact forms and assemblage characteristics. Excavations in northwestern Connecticut around Robbins Swamp in the Upper Housatonic drainage just south of the Massachusetts border suggest that these early Holocene occupations tended to cluster in resource rich locales such as former glacial lake basins (Nicholas 1988). Approximately 35 Early Archaic components were identified along with a number of Paleoindian sites, suggesting early intensive exploitation of this extensive wetlands complex. Some of the Early Archaic sites were identified by the presence of diagnostic types such as Kirk, bifurcate, and Kanawha points, and others by the presence of distinctive scraper and graver forms. Early site/landform associations range from lake shoreline and upper river terraces to wetland margins and upland springs, and include large, multiple, early component sites, and small, single-component, special-activity sites (Nicholas 1988:271).

Nicholas has been a frequent and vocal proponent of the idea that early Holocene occupations in the Northeast were much more abundant than previously thought, and that they operated within an environment that was much more productive than originally described. He has identified former glacial lake basins as locations that are likely to have been established as resource rich mosaics within a changing and somewhat unpredictable early Holocene landscape (Nicholas 1988).

4.2.3 Middle Archaic Period

The Middle Archaic is associated with warmer and drier climatic conditions. By this period, modern floral communities were established and characterized by mast-producing hardwoods. Rivers stabilized during this time and wetland and lake areas were reduced in size. Hunting continued to be important, and fish may have become a more predictable resource.

Clear identification of the chronological position of Middle Archaic artifacts in the Northeast was not established until Dincauze reported on the excavations at the stratified Neville site on the Merrimack River in New Hampshire (Dincauze 1976). These excavations documented the existence of the Neville stemmed point type dating to between 7,800 and 7,000 B.P., and the Stark stemmed point type dating between about 7,600 and 6,400 B.P. (Dincauze 1976). The Neville and Stark point types are similar in style and age to the Stanly and Morrow Mountain types that Coe (1964) defined earlier in the Southeast. In addition, the Merrimack point type was identified as dating to the end of the Middle Archaic period close to 6,000 B.P.

The Neville and Stark types have proved to be relatively common throughout New England. Dincauze and Mulholland (1977) have presented a synthetic model of Middle Archaic settlement for southern New England. They suggest that site types of this period involve large-group occupations that maximize proximity to a variety of seasonal resources, as evidenced by the tool assemblages and recovered faunal materials at these sites. An increase in the number of sites in aquatic resource environments is noted, and these sites are frequently located at falls or rapids where anadromous fish comprised an important seasonal resource (Dincauze 1976). The accumulated data for the Middle Archaic period in the Northeast suggest that, during this period, the pre-contact inhabitants were forming themselves into distinct bands and were settling into defined territories. These bands were establishing base camps and were occupying a greater variety of special-purpose sites in a carefully planned seasonal round (Snow 1980:183).

4.2.4 Late/Terminal Archaic Period

Archaeologists recognize the Late Archaic period as one in which the numbers and types of sites increase dramatically—what Snow (1980:187) describes as the Late Archaic "florescence." Based on his early work in New York, Ritchie recognized two major Late Archaic trajectories, the Lamoka and the Laurentian, which overlap in both time and space. Both are also represented in New England, but in different distributions.

Following Tuck's (1978) definition of the Lamoka/Sylvan/Squibnocket complexes of central and southern New York and New England as the "Mast Forest Archaic," Snow (1980:226) proposed that the Laurentian complex and related assemblages in northern New England and the St. Lawrence drainage be designated as the "Lake Forest Archaic." As Snow describes them, these two complexes coexisted at times during which each was more common within a particular geographic region. This

scheme supposes that there was a "marginal belt of tension between the two coeval zones that persisted throughout the Late Archaic" (Snow 1980:227).

Although Snow (1980) suggests that the Lake Forest Archaic sites are primarily a northern New England manifestation, and only appear in sparse numbers in western Massachusetts and Connecticut between 5,500 and 4,500 B.P., Pfeiffer (1984) has compiled evidence that the Lake Forest Archaic in southern New England is a widespread tradition firmly dated to the period between 5,000 and 4,200 B.P. Pfeiffer notes that "the Late Archaic period also witnessed an increase in the importance of gathering activities, the employment of storage, and an expanded duration of settlement" (1984:85).

In addition to the Lake Forest Archaic assemblages, southern New England also has widespread and long-term evidence of Snow's Mast Forest tradition—what other researchers have often called the "Narrow-Stemmed" or "Narrow-Point" traditions. Although some researchers have proposed that the Laurentian, or Lake Forest, tradition coexisted with the Narrow Point tradition (Ritchie 1969; Dincauze 1975; Snow 1980), others (McBride 1984a:247-248) consider the Lake Forest (Laurentian, Golet phase) as temporally distinct from the Mast Forest (Narrow Point, Tinkham phase).

Mast Forest Archaic sites are numerous and occur in a "wide variety of local settings" (Snow 1980:230). The settlement system likely consisted of "central based wandering" by highly territorial groups (Dincauze 1974:48, 1975:25; Snow 1980; McBride 1984a, 1984b:65). Population aggregations occurred along major drainages and interior wetlands, with movement between habitation sites prescribed by seasonal availability of resources (Dincauze 1974:48, 1975:25; McBride 1984a, 1984b:65; Snow 1980).

The end of the Archaic has also been commonly called "Transitional" in reference to its presumed transitional status between the Archaic and Woodland periods. Since research continues to indicate that there is actually a great deal of cultural and biological continuity between the Archaic and the Woodland periods, Snow (1980:235) has suggested that the label "Terminal Archaic" is more appropriate.

As Snow defines it, the hallmark of the early part of the Terminal Archaic in eastern and southern New York is the Susquehanna tradition of broad stemmed projectile points and their associated assemblages. These points include a number of regional varieties, including the Genesee, Perkiomen, Snook Kill, and Susquehanna Broad types in New York and Atlantic/Wayland points in Massachusetts. This Susquehanna tradition of broad stemmed projectile points is analogous to Coe's (1964) Savannah River type from the southeastern United States. Characteristics of the Susquehanna Tradition include a riverine adaptation and a predilection for the fine-grained lithic resources of the Piedmont province including rhyolite, felsite, argillite, and slate (Dincauze 1975:27;

Turnbaugh 1975:54). The latter portion of the Terminal Archaic period is marked by the appearance of narrow, tapered Orient Fishtail projectile points.

4.2.5 Early and Middle Woodland Period

Early Woodland cultures in southern New England show considerable variation from the patterns seen in central and western New York. Sites in the latter region show much greater participation in widespread trade networks that extended from the Gulf of Mexico to the Great Lakes. Exotic seashells, distinctive types of stone, and native metals such as copper and lead moved between the far-flung reaches of the network. This trade network was also associated with an elaborate mortuary ceremonialism that included burying many of the exotic traded items in graves with the dead. The presumed core of this system was the Adena tradition of the Ohio River drainage, to which numerous elaborate sites with well stocked graves have been attributed.

Evidence of the Adena tradition is more limited in the Early Woodland Meadowood tradition of southern New England. In addition to Meadowood projectile points, Adena, Rossville, and Lagoon points and Vinette I ceramics are also associated with this time period. Rossville and Lagoon points are particularly common on Early Woodland sites in the coastal areas of southern New England and Long Island Sound.

Narrow points are commonly assigned to the Late Archaic period; however, Swigart (1974) has dated points of this type in the Housatonic drainage to 2,700-2,500 B.P., which would place them in the Early Woodland period. Furthermore, Lavin, McBride, and others have suggested that the Narrow Point technological tradition may have even continued into Contact and historic periods (McBride 1984a:105; Lavin 1984).

Just as the Early Woodland Meadowood phase is associated with the Ohio Valley Adena network, Middle Woodland sites appear to have been associated to some degree with the Middle Woodland Hopewell interaction sphere. However, exotic trade items from the Hopewell network are less common in southern New England and eastern New York than they are in the west (Snow 1980:287).

4.2.6 Late Woodland Period

Following the apparent decline in settlement activity during the Early Woodland and the early part of the Middle Woodland period in the Northeast, the next millennium witnessed an intensification of subsistence and settlement patterns that culminated in the relatively sedentary villages of agriculturalists encountered by the first European explorers. This span of time has been traditionally designated by archaeologists as the latter portion of the Middle Woodland period from 1,650 B.P. to 1,000 B.P. and the Late Woodland period from 1,000 B.P. to substantive contact with Europeans. This report will break from tradition somewhat and will end the Middle Woodland at about 1,200 B.P (A.D. 750).

A division between Middle and Late Woodland at this point in time correlates with the widespread appearance of maize in the archaeological record throughout much of the eastern United States. Snow (1980:261) has previously suggested that the Kipp Island and Hunters Home phases reflect the increasing isolation of the Northeast from the rest of the Eastern Woodlands. Interestingly, this is also a period in which the Hudson drainage shows increasing linkages with southern New England. These linkages include increasing amounts of chert moving into the Housatonic and Connecticut River drainages, as well as "New York" ceramic traditions extending east into the upper Housatonic drainage (e.g., see Cassedy and Lavin 2007).

By the Late Woodland period, the archaeological antecedents of historically recognized Native American groups can be recognized. North, central, and western New York were occupied by groups believed to be ancestral to the Iroquois; in these areas, large, nucleated, semipermanent sedentary villages developed. In contrast, eastern New York and western New England were occupied by smaller, somewhat less permanent settlements ancestral to the Algonkians (Late Woodland settlement patterns in both areas were still more sedentary than in previous periods).

Late Woodland sites are recognized by a series of distinctive incised and collared ceramic types and by triangular projectile points. The larger Levanna point type was most common early in the period and was later accompanied by the smaller Madison type.

4.2.7 Contact/Native American Historic Period

The chronological end of the Late Woodland period is about 350 B.P (A.D. 1600), but it varies by region, depending on the timing of European exploration and settlement. The next two centuries are often referred to as the Contact Period, and in southern New England the term "Final Woodland" is preferred by some. Both labels refer to the phase when Native lifestyles were radically changed by factors such as war, disease, trade, and acculturation.

Around the time of European contact, Wnahktukuk (later, Stockbridge) was a significant settlement for the Mohicans[3] who occupied the Housatonic and Hudson River Valleys when the Dutch, and later, English, entered their lands. Prior to establishment of the settlement at Stockbridge, the Mohicans occupied a pivotal position both culturally and geographically in the conflicts between the Iroquois Confederacy and the Algonkian tribes of New England (Brasser 1978). The Mohican lands extended from what is now Lake Champlain south to the lower Hudson River (Mahicannituck), west to Schoharie Creek and east into Massachusetts, Vermont and Connecticut. Control of the area on the west side of the Hudson was lost in 1628 as a result of warfare with the Mohawks of the

[3] Dunn (1994:8) notes that many alternate spellings of "Mahican" have been used over the years, including Mohican, Mahikan, and Mahiecan, but they are not to be confused with the Mohegan of Connecticut. Mahican is the most common form used by the seventeenth century Dutch who were first in contact with the Hudson Valley group, but the current indigenous descendants use "Mohican".

Haudenosaunee Confederacy. In the 1660s, the Mohicans were forced to abandon almost all of the Hudson Valley, and many of them clustered with other related western New England Algonkians in settlements along the upper Housatonic River in western Massachusetts.

Some ethnohistoric data indicate that the Mohicans lived in stockaded hilltop villages containing three to 16 elongated wigwam longhouses (Snow 1980:88). In addition to these villages, "when at fishing or hunting stations, [they] probably lived in single-family wigwams" (Snow 1980:88).

The Euroamerican documentary record concerning the Native American communities and villages of the upper Housatonic Valley is sparse. During the seventeenth century, there was a somewhat persistent, though incorrect, Euroamerican perception that the upper portions of the Housatonic were a "hideous, howling wilderness" (Smith 1946). Though this misperception did not accurately characterize the settlements of ancestral Mohicans and others, a lack of English and Dutch administrative control over the lands east of the Berkshires escarpment was advantageous for Mohican sachems Konkapot and Umpachenee who established a new political center in the upper Housatonic that attracted Native people from the Mohican diaspora (Binzen 2004).

4.2.8 Settlement and Revolutionary War Era

The lower Housatonic was settled in the 1640s, but it took almost a hundred years for permanent settlements to expand north into what is now Berkshire County, Massachusetts. In 1733, Sheffield was the first town in the county to be incorporated, followed by Stockbridge in 1739, Great Barrington in 1742, and Pittsfield in 1753. Lee and Lenox incorporated a decade or two later.

The colonial government history of Stockbridge begins with the 1735 establishment of Wnahktukuk as an "Indian Praying Town," ostensibly for the benefit of Mohicans living there, primarily to encourage them to take up European religion and lifeways (Barber 1841). John Sergeant initiated a mission amongst the Mohicans, who at the time were living in two communities along the Housatonic – one they called Skatehook (in Sheffield, Connecticut) and the other Wnahktukook (now Stockbridge). To consolidate the settlements, the Massachusetts legislature established a six-square-mile township for the natives; and as Field (1829:239) reports, "the design was to include the fine alluvial grounds at Wnahktukook, already cleared and cultivated to some extent, where a party of the Indians then lived . . . ."

In 1739, the first formal survey of the Stockbridge land granted 42 plots of the best land to fewer than ten Native American proprietors, and plots of less desirable land to only six English settlers, permitted to settle there to provide examples of proper "civilized" living (Labadia et al. 2009; Miles 1999). These unfair and hostile practices contributed to the Mohican population of Stockbridge dwindling throughout the eighteenth century. By 1774, roughly one-third of Stockbridge lands were still Native-owned, and in 1784, the majority of the remaining Stockbridge Native Americans

established the settlement of New Stockbridge in New York. The last few Native Americans remaining in Stockbridge sold their remaining pieces of land in 1809 and 1818 (Miles 1999). This was despite the role that Mohican men played in fighting during the Revolutionary War, for which George Washington commended their efforts and bravery (Rindfleish 2016). Forty-two of the 332 Stockbridge men volunteering to fight were Mohican men (BCHC 1998). In the 19th century, the Mohican joined Munsee refugees on a jointly held reservation in Wisconsin, where the two tribes remain together today under the name "Stockbridge-Munsee Band of Mohican Indians."

By the Revolutionary War era in the late 18th century, Euroamerican settlements were well established in all towns of the ROR area. Forests were being cleared and small farms dotted both the valleys and the hillsides. Many of the suitable water power locations had small grist mills, saw mills, and furnaces established at them, such as at Lenox Furnace (Lenox Dale), Lee, and South Lee.

4.2.9 From the Revolution into the Nineteenth Century

After peace was established between the U.S. and England, settlement of the region expanded dramatically. Settlers took advantage of the agricultural potential of the valley and its transportation corridor, and industrial development at prime mill sites along the river and its tributaries soon followed.

For the first several decades of the nineteenth century, wagons and stages were the only effective means of transporting goods and people, as the shallow depths and multiple rapids along the upper Housatonic were not conducive to large-scale reliable boat transport both upstream and downstream along the river. This situation changed with the creation of railroad links with New York and New England in the 1840s.

Throughout the nineteenth century, the project area witnessed an intensification of industrial development along the river. The number, size, and variety of mills all increased, with woolen and cotton mills, paper mills, turning factories, and iron and glass furnaces being built in Lee, South Lee, Glendale, and Housatonic (additional industry was located in Pittsfield upstream from the ROR project area). By end of the century, paper mills came to dominate the industries along the river. As industry was expanding in the Berkshires, agriculture was declining throughout the nineteenth century due to soil exhaustion and western competition.

In addition to transporting industrial products to wide markets, the railroad also made the region easily accessible to New York City, and wealthy families from began vacationing in the Berkshires and eventually many built homes there. In 1845, Samuel Gray Ward came from Boston to Stockbridge to turn an older house into a relatively palatial structure, Highwood, which is recognized as the first of dozens of mansions, quaintly called "cottages," which were erected there and in Lenox and, to a

lesser degree, in Great Barrington. In addition, artists began flocking here and by mid-century, the tradition of a Berkshire cultural center had taken hold.

4.2.10 Twentieth Century

Industrial development that had begun in the nineteenth century expanded even more in the twentieth century. Electronics plants were constructed in the region, and paper mills continued to flourish in Lee and Housatonic. Stanley Electric Manufacturing Company was acquired by General Electric in 1903, and the operation produced small-scale transformers, flat irons, electric fans, and small motors.

The era known as the Gilded Age continued up to World War I, and wealthy outsiders continued to vacation and build mansions in the Berkshires (by 1900, there were over 75 in Lenox), providing substantial employment opportunities for many local people. However, the imposition of the federal income tax in 1913 marked a turning point in the construction of new mansions (NPS 2002:73). Over the next few decades, many were converted to other uses such as seminaries, schools, offices, or museums. At the same time, the coming of the automobile opened up new opportunities for middle class tourism in the Berkshires that continue today.

For the better part of the twentieth century, Pittsfield was inextricably linked to GE, which at one point provided jobs for 75% of Pittsfield's workforce. Pittsfield's population in 1930 had grown to more than 50,000, and industrial expansion related to World War II swelled the population even further, as munitions and plastics were also produced. By the 1950s, GE was building the largest transformers in the world, but the transformer operation closed down in 1986.

5 Results of Background Research

5.1 Introduction

This section presents the results of the background research on potential cultural resources at the GE Parcel. It is similar to Section 4 of the UDF Phase IA CRA Report, but it also adds and discusses several historic maps and aerial photographs, shows on most of the figures the locations of Areas A, B, and C, which were subject to supplemental investigations, and includes a new summary in Section 5.4.

Most of the useful background information was already consolidated within the MHC's MACRIS database. The State Historic Preservation Plan, State Reconnaissance Survey Reports, and databases of local historical organizations did not provide additional details relevant to the GE Parcel. Historic maps provided information on previous roads and structures in the area, and previous archaeological reports for nearby projects were also examined, as described in Section 4.1.

5.2 MACRIS Database

Figure 7 illustrates the search results from the MACRIS database for a one-mile radius around the center of the GE Parcel, which shows that there are no previously documented historic structures or archaeological sites located within the APE. The closest documented NRHP-listed resource is Lenox Station, which is located approximately ¼ mile northwest of the northern end of the GE Parcel, on the western side the Housatonic River. Also in that general area is recorded archaeological site BK-188, which is listed as an isolated find spot. The Valley Mill bridge mapped approximately ¼ mile west of the APE spans the Housatonic River from Crystal Street, and the remaining blue dots depict the location of various inventoried historic structures that are located ¾ mile to one mile south and west of the GE Parcel. The 2011 UMass-Amherst survey of portions of the power line corridor (see Section 4.1) that crosses the GE Parcel is plotted as a tan linear strip.

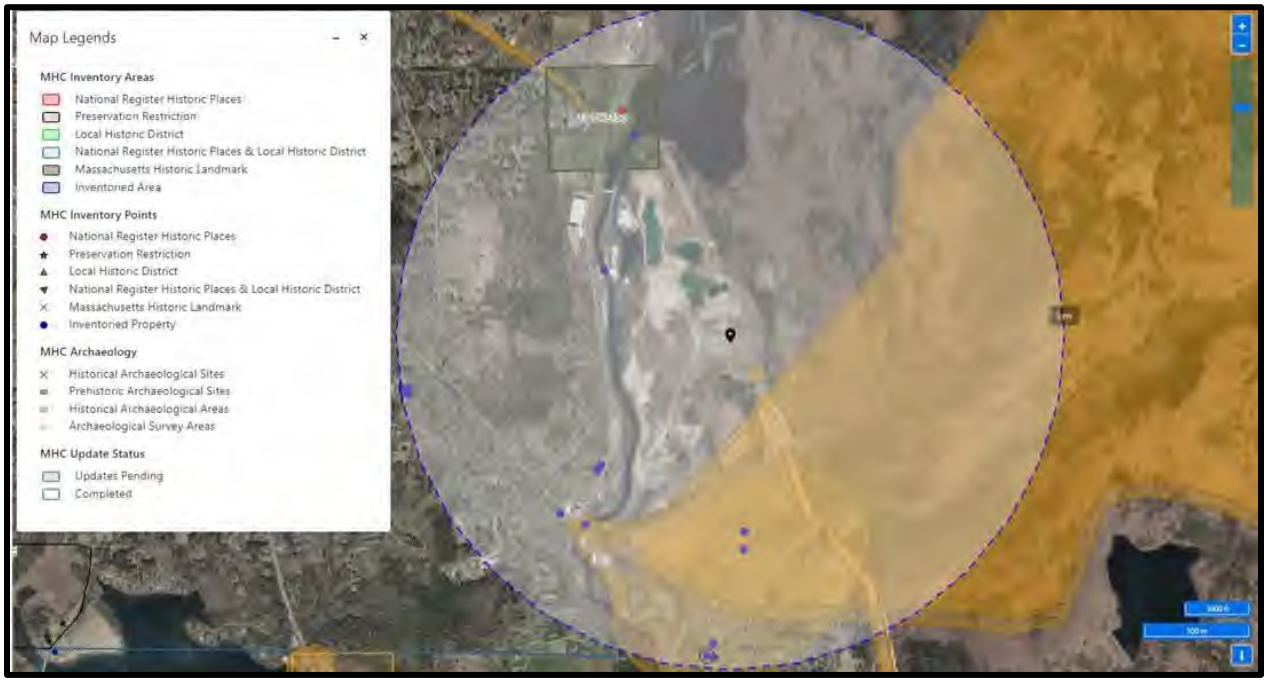

Figure 7. MACRIS Search Results Map Generated May 10, 2022.

5.3 Historic Maps

The earliest available historic map that depicts the area at a useful scale is the 1858 Wallings map of Lee, which is reproduced in Figure 8, but the alignment of Washburn Road is not consistently depicted. This map depicts the residence of "S. Washburn" on the western side of Woodland Road, just north of the outparcel that is adjacent to the GE property and currently the location of a local construction company. As will be seen in later, more accurate maps, that structure is more likely located within the outparcel rather than within the GE property. The 1858 map also indicates that just outside the southeast corner of the UDF property are depicted the houses of "W. Trumbull, "Snow", and "J. Mack". No other roads or developments are visible within the UDF parcel.

Eighteen years, later, the 1876 Beers map of Lee (Figure 9) depicts the same four structures as was plotted on the Wallings map, but they are all listed with different owners. The residence of "J. Toole" is in the outparcel adjacent to the GE Parcel on the western side of Woodland Road, and near the southeast corner of the UDF property are depicted the houses of "Mrs. Flynn," "R. Landers", and "Wm Perry".

The next available historic map is from 1890 (Figure 10) and it shows "James Toola" at the previous "J. Toole" location, "Richard Landers" at the "R. Landers" location, and "Michael Crowley" in the approximate location of the "Mrs. Flynn" house from 1876. The scale of this map appears to be somewhat distorted, as shown by the location of "Wm. Perry" well to the south of where his house was previously mapped in 1876.

The 1893 USGS topographic map for this area (Figure 11) also depicts the Landers, Perry, and Crowley structures along Woodland Road (see red arrow), but no structure is mapped further north where the Toole/Toola location was previously depicted in the outparcel.

Despite the omission of the Toole/Toola structure from the 1893 map, the updated 1943 USGS topographic map does depict a structure in that general location (Figure 12). No structures are shown within the GE Parcel, but the map does illustrate the placement of the electric transmission line that still crosses the property from southeast to northwest, and evidence of gravel pit excavations can be seen in the multiple topographic depressions. This documents that the GE Parcel and the adjacent properties have been the location of gravel removals for over 75 years. A 1959 aerial photograph shows the three archaeological survey areas as largely open and unvegetated (Figure 13). The spatial extent of the clearing and mining over the last four decades of the 20th century is clearly visible in a 2001 aerial image shown in Figure 14.

5.4 Summary of Background Information

The background research has documented that the project is situated in a dissected upland terrain that has seen little historic settlement or intensive land use prior to the extraction of sand and gravel in the last half of the twentieth century. Pre-contact sites are known at other locations in the region closer to the floodplain of the Housatonic River and its tributaries, but fewer substantial sites have been found in the uplands. Smaller resource extraction camps might have been expected on relatively level terrace landforms adjacent to isolated wetlands and small streams, although, as discussed below, no evidence of such camps was found.

6 Results of Field Survey

6.1 Introduction

Field work at Areas A, B, and C was conducted on October 3 through 6 of 2022. Nicholas Smith of AECOM served as Field Director under the overall supervision of Dr. Daniel Cassedy, while Nikole Ghirardi, Luka Eglesia, and Christopher DiMaiolo of AECOM served as Field Technicians. Mark Andrews with the Wampanoag Tribe of Gay Head (Aquinnah) accompanied AECOM archaeologists intermittently in the field, and archaeologists from HDR Inc, Kimberly Smith (October 4-5) and Ray Pasquariello (October 3 and 6), each spent two days in the field. In addition, Richard Fisher of EPA visited the project on October 3, and Jeff Bendremer from the Stockbridge-Munsee Band of Mohican Indians visited the project on October 6.

Weather conditions were generally overcast and dry with temperatures in the mid-50s on both October 3 and 4. On October 5, the temperature rose to the low 60s for a high, but rain entered the area and continued intermittently throughout the day. Temperatures rose to the mid-70s by October 6 and rain left the area. Overall, three days during the field survey period were overcast but dry and on one day it rained intermittently throughout.

As described previously, the October field survey focused on three separate areas of relatively level terrain were had been previously identified as less modified and located in settings that might contain archaeological sites, such as a terrace overlooking a vernal pool or wetland. These were designated as Areas A, B, and C and are all located outside of the operational area and the main disposal facility limits of consolidated material, but could potentially be affected by UDF support activities. Those areas are shown on Figure 15 and are described in more detail in the subsections below. The fieldwork methods are described in Section 2.2. During the survey, 116 STPs were excavated across the three areas, including 79 in Area A, eight in Area B, and 29 in Area C. Each STP was backfilled after recordation. Detailed information on the depth and stratigraphy of each STP is provided in Attachment 1.

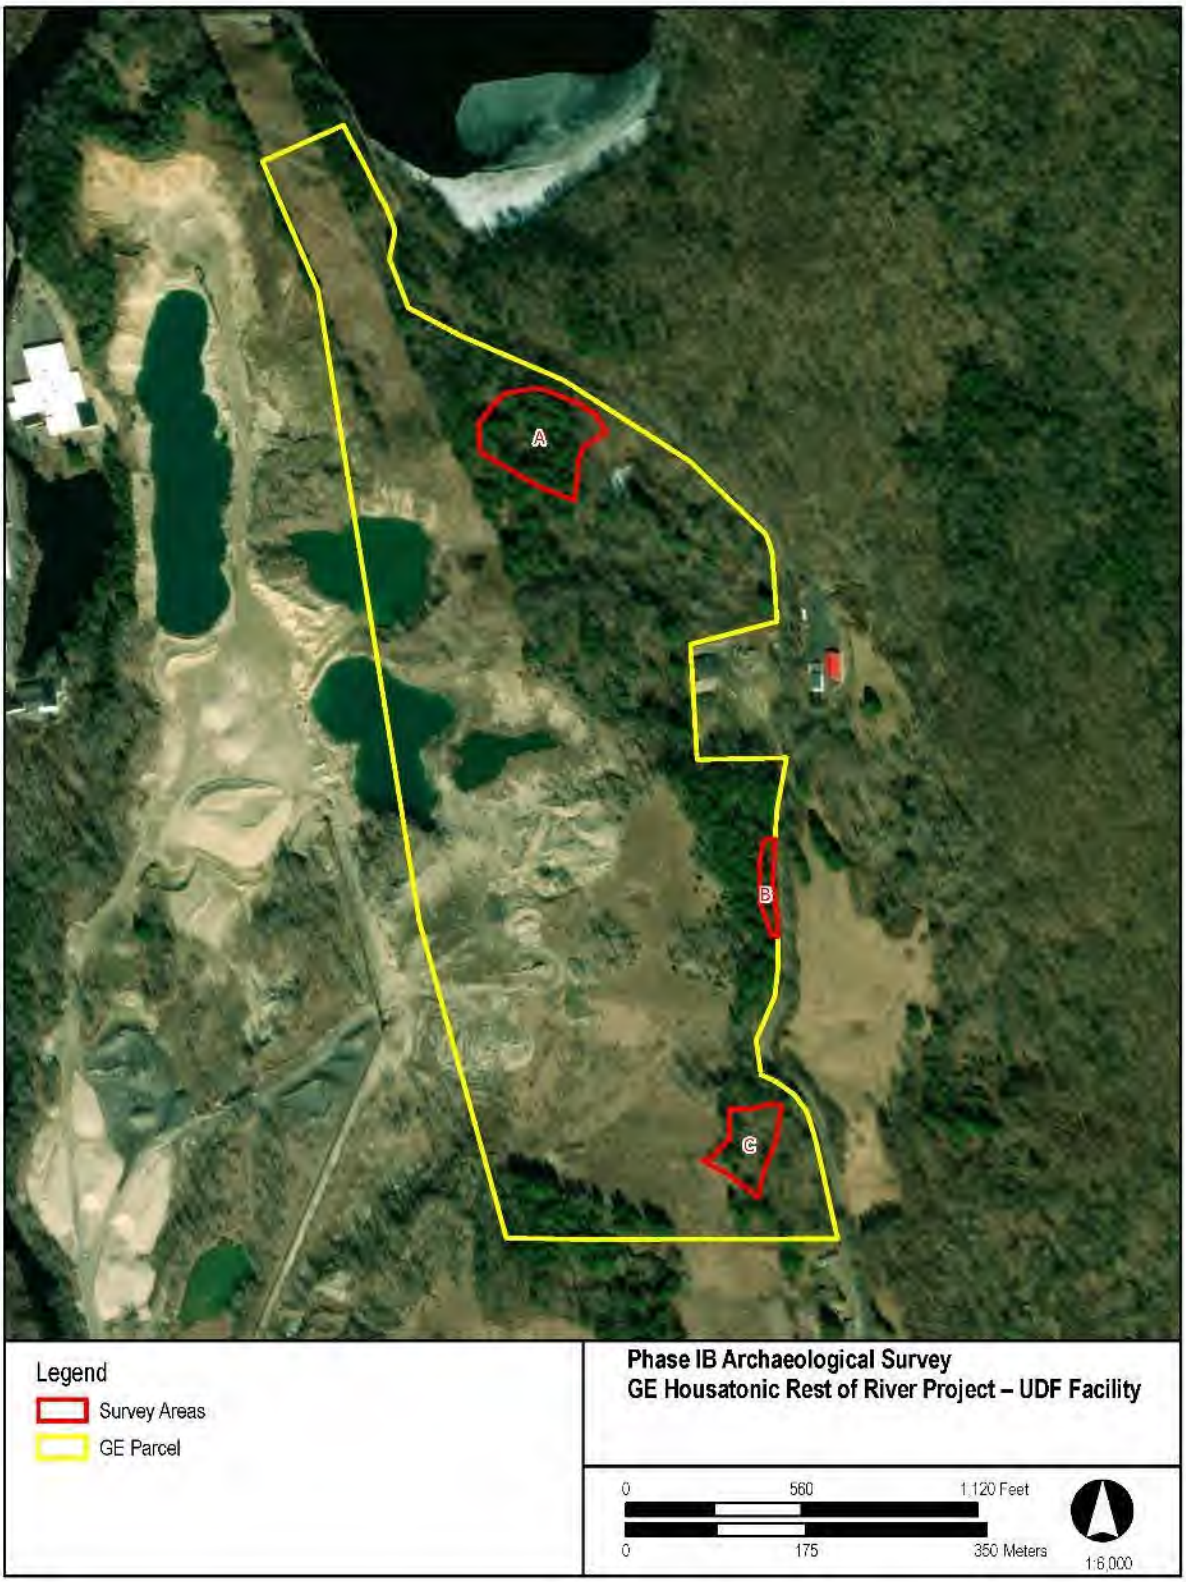

Figure 15. Areas of Intensive Archaeological Survey within the GE Parcel.

6.2 Area A

Area A is in the northern portion of the GE parcel on a high terrace or knoll situated between the transmission line corridor and Woodland Road (see Figure 3 above). The area is covered by a mixture of mature trees, scrub brush, and various weeds (Figure 16 through Figure 19). An apparent man-made ridge runs along the northern edge of the terrace parallel to the corresponding hillslope. Area A overlooks a small wetland to the south that has been found to meet the criteria for a vernal pool (Figure 20). Eighty-seven (87) potential STP locations were pre-plotted on a 10-meter grid pattern based upon map topography. Following field reconnaissance to refine the field strategy, 79 STPs were excavated in this area and eight were not dug due to steep slopes (Figure 21).

STP depths in Area A ranged from 19 to 80 cm deep, with an average of 48 cm. Most exhibited similar soil profiles, representative examples of which are depicted in Figure 22 through Figure 24). The upper-most stratum ranged from 10 to 50 cm in depth and typically consisted of dark brown or very dark grayish brown sandy loam with 5% to 70% gravel and cobble content. This layer was designated as an Ap horizon due to disturbance noted within the soil structure, but it is not likely that the area was ever used for widespread cultivation.[4] In a majority of the STPs, the Ap horizon was directly above a Bw horizon, but occasionally an AB or E horizon layer was noted. The AB horizons observed coincided with higher root content and consisted of brown or dark yellowish brown sandy loam that contained 15-50% gravel and cobble content. Observed E horizons consisted of either yellowish brown or reddish-brown sandy loam or loam containing 30% gravels.

Subsoils were encountered at an average depth of 12-43 cm. This Bw horizon consisted of yellowish brown, strong brown, or reddish-brown sandy loams or loamy sand with up to 70% gravels and cobbles. The Bw layer was not observed in all STPs, and several STPs showed the A horizon directly above a C horizon, which was reached in 45 STPs at an average depth of 39-cm (24-54 cm). The C horizon consisted of varying values of yellowish brown, pale brown, light brownish gray to strong brown sand or loamy sand. Once this horizon was reached, a noticeable drop in cobble and gravel content was noted.

No pre-contact or historic period artifacts or features were encountered in any of these STPs.

[4] The soil horizon nomenclature used in this report follows the standard soil survey terminology used by the Natural Resources Conservation Service of the U.S. Department of Agriculture.

6.3 Area B

Area B is located on a narrow strip of woods along the eastern edge of the GE parcel between a gravel pit berm and Woodland Road. The area is covered by a mixture of mature trees, scrub brush, and various weeds. The berm runs along the western edge of the terrace parallel to the corresponding hillslope (Figure 25 through Figure 27). Sixteen STP locations were pre-plotted, but during the reconnaissance, it was determined that the pre-plotted STP locations based on topographic maps had been laid on a heavy eastern trending slope. In consultation with HDR archaeologists, the pre-plotted STPs were not excavated, but eight STPs were placed at 10-meter intervals along a single transect along the top of the narrow strip of level terrain adjacent to the berm (Figure 28).

STP depths in Area B ranged from 25 to 60 cm. Most shovel tests exhibited similar soil profiles and extended to an average depth of 43 cm. Representative examples of Area B STPs are depicted in Figure 29 and Figure 30. The upper-most stratum typically consisted of black or very dark grayish brown sandy loam with 20% to 30% gravel and cobble content extending 13 to 22 cm deep. This layer was designated as an Ap horizon due to disturbance noted within the soil structure. In seven of the units, the Ap horizon was directly above a Bw horizon, but in one STP an E horizon layer was noted. This E horizon consisted of a yellowish-brown sandy loam containing 35% gravels.

Subsoils were encountered in all eight STPs at an average depth of 19 cm (13-28 cm). The Bw horizon consisted of yellowish brown or pale brown sandy loam with up to 45% gravels and cobbles within it. A C horizon of light yellowish brown loamy sand was encountered at a depth of 41 cm.

No pre-contact or historic period artifacts or features were encountered in any of these STPs.

6.4 Area C

Area C is in the southeastern corner of the GE Parcel and is situated on a relatively level knoll with large pine trees and small hardwoods with scrub brush dominating the edges of the knoll (Figure 31 through Figure 33). A berm runs along the western edge of the knoll parallel to the corresponding heavy sloping edge. Thirty-seven STPs were pre plotted on a 10-meter grid pattern based on map topography. Twenty-nine STPs were ultimately excavated (eight STPs were not dug due to steep slope and push piles) (Figure 34). Most STPs exhibited similar profiles and extended 30 to 55 cm in depth. Representative examples of Area C STPs are depicted in Figure 35 through Figure 37. The top stratum was 8 to 22 cm deep and typically consisted of dark to very dark brown or very dark grayish brown sandy loam with 0 to 20% gravel and cobble content. This layer was designated as an Ap horizon due to disturbance noted within the soil structure.

In most STPs, the Ap horizon was directly above a Bw horizon. Occasionally an AB horizon layer was noted that consisted of dark brown or dark yellowish brown sandy loam containing 20-30% gravel and cobble content. The Bw subsoil was typically encountered between 10 and 36 cm and consisted of yellowish brown to dark yellowish brown sandy loams or loamy sand with up to 50-70% gravels and cobbles. This subsoil layer was not observed in all STPs, and several STPs showed the Ap or AB horizon directly above the C horizon at 25-44 cm. This C horizon consisted of yellowish brown to light yellowish brown coarse sand or loamy sand.

No pre-contact or historic period artifacts or features were encountered in any of these STPs.

7 Conclusions and Recommendations

The initial Phase IA CRA (reconnaissance survey in MHC terminology) completed in June of 2022 identified no previously recorded or visible cultural resources within the GE Parcel. However, three locations (designated as Areas A, B, and C), situated within portions of the parcel that could potentially be used for UDF support activities, were identified as having a potential to contain archaeological resources. In accordance with the EPA-approved supplemental work plan, additional investigations were undertaken in October 2022 to further investigate whether those three areas contain potentially significant cultural resources. These investigations included completion of an intensive archaeological field survey that covered the three areas with a grid of STPs spaced at 10-m intervals.

This intensive field survey identified no archaeological artifacts or features within Areas A, B, and C. It is concluded that no significant cultural resources will be affected by development of the UDF or UDF support areas within the GE Parcel. In this situation, no further CRA studies of the GE Parcel are needed or recommended.
