1 Summary

This attachment summarizes the data validation review of Sample Delivery Groups (SDGs) 10701502, 10702026 and 10702066 performed on behalf of the General Electric Company (GE) for surface water sampling activities conducted as part of the Baseline Monitoring at the GE-Pittsfield/Housatonic River Site. The review was conducted at a Tier I level and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain-of-custody forms (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1.

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Method 1668C, and Standard Method 2540D. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan – GE-Pittsfield/Housatonic River Site (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, prepared by Arcadis (Revised December 21, 2023);
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines);
- EPA National Functional Guidelines for High Resolution Superfund Methods Data Review OLEM 9240.1-65EPA, 542-R-20-007 (November 2020); and
- Second Revised Baseline Monitoring Plan, Housatonic River – Rest of River, General Electric Company, Pittsfield, Massachusetts, prepared by Anchor QEA (January 2023).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration (C) Qualifiers:
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers:
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers:
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - UB Compound considered non-detect at the listed value due to associated blank contamination.

N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.

R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
PCBs	14	1	1	0	0	0	16
TSS	14	1	0	0	0	0	15

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 4. Holding Time for USEPA Method 1668C

Method	Matrix	Holding Time	Preservation
USEPA Method 1668C	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

2.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In an instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Table 5. Summary of Field Duplicate Analysis

When the laboratory case narrative outlines a quality issue and/or the laboratory applies qualifiers that exhibit potential QC issues beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

3 General Chemistry Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 7. Specified Holding Time

All samples were analyzed within the specified holding time criteria.

3.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

4 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 10. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
PCBs	100%	0
TSS	100%	0

The data package completeness, as determined from the Tier I data review was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

1 Summary

This attachment summarizes the data validation review of Sample Delivery Groups (SDGs) 10704414, 10704693, and 10704779 performed on behalf of the General Electric Company (GE) for surface water sampling activities conducted as part of the Baseline Monitoring at the GE-Pittsfield/Housatonic River Site. The review was conducted at a Tier I level and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain-of-custody forms (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1.

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Method 1668C, and Standard Method 2540D. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan – GE-Pittsfield/Housatonic River Site (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, prepared by Arcadis (Revised December 21, 2023);
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines);
- EPA National Functional Guidelines for High Resolution Superfund Methods Data Review OLEM 9240.1-65EPA, 542-R-20-007 (November 2020); and
- Second Revised Baseline Monitoring Plan, Housatonic River – Rest of River, General Electric Company, Pittsfield, Massachusetts, prepared by Anchor QEA (January 2023).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration (C) Qualifiers:
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers:
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers:
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - UB Compound considered non-detect at the listed value due to associated blank contamination.

N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.

R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
PCBs	16	1	1	0	0	0	18
TSS	16	1	0	0	0	0	17

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Polychlorinated Biphenyl Congener Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 4. Holding Time for USEPA Method 1668C

Method	Matrix	Holding Time	Preservation
USEPA Method 1668C	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 5. Summary of Blank Contamination Qualifications

SDG	Sample Locations	Compounds	Blank	Sample Result	Qualification

Note:
RL = Reporting limit

2.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In an instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Table 6. Summary of Field Duplicate Analysis

Notes:

2.4 Compound Identification

PCB congeners by 1668C are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest". This value should be considered an elevated detection limit based on potential compound identification and quantitation interference. If the EMPC value is above the reporting limit, the qualifier UX has been added to the sample results to indicate the elevated detection limit as EMPC. If the EMPC value is below the reporting limit, the compound is reported as non-detect at the reporting limit and no qualification is added.

2.5 Data Validation Checklist for PCB Congeners

Table 7. Data Validation Checklist for Polychlorinated Biphenyls

PCB Congeners; EPA1668C	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
HIGH RESOLUTION GAS CHROMATOGRAPHY/HIGH RESOLUTION MASS SPECTROMETRY (HRGC/HRMS)					
Tier I Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X		X	
B. Equipment blanks		X	X		
Field/Lab Duplicate (RPD)		X		X	
Dilution Factor		X		X	
Moisture Content	X				X
Ion abundance criteria for each instrument used		X		X	
Reporting limits adjusted to reflect sample dilutions		X		X	

Notes:
%RPD = Relative percent difference
%R = Percent recovery

When the laboratory case narrative outlines a quality issue and/or the laboratory applies qualifiers that exhibit potential QC issues beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

3 General Chemistry Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 8. Specified Holding Time

Method	Matrix	Holding Time	Preservation
Total Suspended Solids (TSS) by SM2540D	Water	7 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criteria.

3.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Table 9. Summary of Field Duplicate Analysis

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
RISING POND DAM/ HR-D1	TSS	5.3	4.8	AC

Notes:
AC = Acceptable
The calculated RPDs between the parent sample and field duplicate were acceptable.

3.3 Data Validation Checklist for General Chemistry

Table 10. Data Validation Checklist for General Chemistry

General Chemistry: SM2540D	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier I Validation					
Holding Times		X		X	
Reporting limits (units)		X		X	
Field/Lab Duplicate (RPD)		X		X	
Reporting limits adjusted to reflect sample dilutions		X		X	

Notes:
%R = Percent recovery
RPD = Relative percent difference

4 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 11. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
PCBs	100%	0
TSS	100%	0

The data package completeness, as determined from the Tier I data review was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

CB Congener Labeled Analyte Summary

Method 1668C

Client Sample ID: **Near Pittsfield WWTP**
Lab Sample ID: 10704779017
Lab File ID: P240919A_04
Matrix: Water
Percent Solids: N/A
Date Collected: 08/15/2024 14:30
Date Received: 08/20/2024 08:40
Date Extracted: 09/16/2024 14:00
Date Analyzed: 09/19/2024 06:53
Method Blank ID: BLANK-114726
Lab Spike ID(s): LCS-114727/LCSD-114728

Prep. Technique: Liquid/Liq
Total Amount Extracted: 1780mL
Dry Weight Extracted: N/A
Extract Volume: 20 uL
Dilution Factor: 1.0
Injection Volume: 1 uL
Injected By: AH5

1 Summary

This attachment summarizes the data validation review of Sample Delivery Groups (SDGs) 10708873, 10709116, and 10709174 and performed on behalf of the General Electric Company (GE) for surface water sampling activities conducted as part of the Baseline Monitoring at the GE-Pittsfield/Housatonic River Site. The review was conducted at a Tier I level and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain-of-custody forms (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1.

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Methods USEPA Method 1668C, and Standard Method 2540D. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan – GE-Pittsfield/Housatonic River Site (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, prepared by Arcadis (Revised December 21, 2023);
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines);

- EPA National Functional Guidelines for High Resolution Superfund Methods Data Review OLEM 9240.1-65EPA, 542-R-20-007 (November 2020); and
- Second Revised Baseline Monitoring Plan, Housatonic River – Rest of River, General Electric Company, Pittsfield, Massachusetts, prepared by Anchor QEA (January 2023).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration (C) Qualifiers:
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers:
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers:
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - UB Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence

audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
PCBs	16	1	1	0	0	0	18
TSS	16	1	0	0	0	0	17

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2 Polychlorinated Biphenyl Congener Analyses

2.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 4. Holding Time for USEPA Method 1668C

Method	Matrix	Holding Time	Preservation
USEPA Method 1668C	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Table 5. Summary of Blank Contamination Qualifications

SDG	Sample Locations	Compounds	Blank	Sample Result	Qualification

Note:
RL = Reporting limit

2.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In an instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

The calculated RPDs between the parent sample and field duplicate were acceptable.

2.4 Compound Identification

PCB congeners by 1668C are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest". This value should be considered an elevated detection limit based on potential compound identification and quantitation interference. If the EMPC value is above the reporting limit, the qualifier UX has been added to the sample results to indicate the elevated detection limit as EMPC. If the EMPC value is below the reporting limit, the compound is reported as non-detect at the reporting limit and no qualification is added.

2.5 Data Validation Checklist for PCB Congeners

When the laboratory case narrative outlines a quality issue and/or the laboratory applies qualifiers that exhibit potential QC issues beyond Tier I it will be added to the checklist above and the usability of the data will be addressed.

3 General Chemistry Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 8. Specified Holding Time

Method	Matrix	Holding Time	Preservation
Total Suspended Solids (TSS) by SM2540D	Water	7 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding time criteria.

3.2 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of two times the RL is applied for water matrices.

Table 9. Summary of Field Duplicate Analysis

4 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 11. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
PCBs	100%	0
TSS	100%	0

The data package completeness, as determined from the Tier I data review was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

1 Summary

This attachment summarizes the data validation review of Sample Delivery Groups (SDGs) 10711384, 10711510, and 10711985 performed on behalf of the General Electric Company (GE) for surface water sampling activities conducted as part of the Baseline Monitoring at the GE-Pittsfield/Housatonic River Site. The review was conducted at Tier I and Tier II levels and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain-of-custody forms (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1.

1. SDG# 10711985 – As per the COC, the sample WOODS POND DAM (LAB DUP)_20241009 (10711985007) was submitted to the laboratory for duplicate analysis. Hence, this sample was not considered as a regular field sample in this data validation report.

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) USEPA Method 1668C and Standard Method 2540D. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan – GE-Pittsfield/Housatonic River Site (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, prepared by Arcadis (Revised December 21, 2023);
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines);
- EPA National Functional Guidelines for High Resolution Superfund Methods Data Review OLEM 9240.1-65EPA, 542-R-20-007 (November 2020); and
- Second Revised Baseline Monitoring Plan, Housatonic River – Rest of River, General Electric Company, Pittsfield, Massachusetts, prepared by Anchor QEA (January 2023).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration (C) Qualifiers

  U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.

  B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - UB Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

The analytical results described above were also subjected to a Tier II data review. The Tier II data review consisted of a review of data package summary forms for identification of quality assurance (QA)/QC deviations and qualification of the data according to the EPA Region I Guidelines. Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I and Tier II data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
PCBs	0	0	0	16	1	1	18
TSS	0	0	0	16	1	0	17

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 4. Holding Time for USEPA Method 1668C

Method	Matrix	Holding Time	Preservation
USEPA Method 1668C	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

2.3 System Performance

System performance and column resolution were acceptable.

2.4 Calibration

Satisfactory instrument calibration is established to ensure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

2.4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

2.4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (20%).

All compounds associated with the calibrations were within the specified control limits.

2.5 Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with labeled compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. Analysis requires isotope dilution compounds exhibit recoveries within the laboratory-established acceptance limits.

All PCB congeners associated with the labeled compound analysis exhibited recoveries within the control limits.

2.6 Internal Standard Performance

Internal standard performance criteria ensure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria require the internal standard compounds exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

2.7 Matrix Spike/Matrix Spike Duplicate Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The RPD between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on samples where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on samples associated with the SDGs# 10711510 and 10711985.

2.8 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the EML. A control limit of 30% for water matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the EML, a control limit of one time the EML is applied for water matrices.

The laboratory duplicate analysis performed on sample Woods Pond Dam exhibited acceptable RPD values.

2.9 Ongoing Precision Result (OPR) / Laboratory Control Sample / Laboratory Control Sample Duplicate Analysis

The ongoing precision result (OPR) / laboratory control sample / laboratory control sample duplicate (LCS/LCSD) analysis is used to assess the accuracy of the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the OPR/LCS/LCSD analysis must exhibit a percent recovery and RPD within the laboratory-established acceptance limits.

All compounds associated with the OPR/LCS/LCSD analysis exhibited recoveries and RPDs within the control limits.

2.10 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In an instance when the parent and/or duplicate sample concentrations are less than or equal to five times the EML, a control limit of two times the EML is applied for water matrices.

Results for duplicate samples are summarized in the following table.

The compounds PCB-194, PCB-195, and PCB-49/69 associated with sample locations RISING POND DAM_20240313 and HR-D1_20240313 exhibited a field duplicate RPD greater than the control limit. The associated sample results from sample locations for the listed analyte were qualified as estimated.

2.11 Compound Identification

PCB congeners by 1668C are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest." This value should be considered an elevated detection limit based on potential compound identification and quantitation interference. If the EMPC value is above the reporting limit, the qualifier UX has been added to the sample results to indicate the elevated detection limit as EMPC. If the EMPC value is below the reporting limit, the compound is reported as non-detect at the reporting limit and no qualification is added.

2.12 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3 General Chemistry Analyses

3.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 8. Specified Holding Times

Method	Matrix	Holding Time	Preservation
Total Suspended Solids (TSS) by SM 2540D	Water	7 days from collection to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

3.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank is calculated for QA blanks containing concentrations greater than the reporting limit (RL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the RL in the associated blanks; therefore, detected sample results were not associated with blank contamination.

3.3 Matrix Spike/Matrix Spike Duplicate / Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.3.1 Matrix Spike/Matrix Spike Duplicate Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MSMSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MSMSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on samples associated with the SDG# 10711384.

3.3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to five times the RL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate

sample concentrations are less than or equal to five times the RL, a control limit of one time the RL is applied for water matrices and two times the RL for soil matrices.

A laboratory duplicate analysis was not performed on a sample within this dataset.

3.4 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Table 9. Summary of Field Duplicate Analysis

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SDG 10711384 RISING POND DAM_20241009/ HR-D1_20241009	TSS	U	U	AC

Note:
AC = Acceptable

The results between the parent sample and field duplicate were acceptable.

3.5 Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All LCS recoveries were within control limits.

3.6 System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

3.7 Data Validation Checklist for General Chemistry

4 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under both the Tier I/II data validation reviews. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 11. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
PCBs	100%	0
TSS	100%	0

The data package completeness, as determined from the Tier I data review, was used in combination with the data quality deviations identified during the Tier II data review to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I and Tier II data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

1 Summary

This attachment summarizes the data validation review of Sample Delivery Groups (SDGs) 10715814, 10715850, 10715851, 10716050, and 10716229 performed on behalf of the General Electric Company (GE) for surface water sampling activities conducted as part of the Baseline Monitoring at the GE-Pittsfield/Housatonic River Site. The review was conducted at a Tier I level and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain-of-custody forms (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1.

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Method 1668C, and Standard Method 2540D. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan – GE-Pittsfield/Housatonic River Site (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, prepared by Arcadis (Revised December 21, 2023);
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines);

- EPA National Functional Guidelines for High Resolution Superfund Methods Data Review OLEM 9240.1-65EPA, 542-R-20-007 (November 2020); and
- Second Revised Baseline Monitoring Plan, Housatonic River – Rest of River, General Electric Company, Pittsfield, Massachusetts, prepared by Anchor QEA (January 2023).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration (C) Qualifiers:
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers:
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers:
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - UB Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence

audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
PCBs	14	1	1	0	0	0	16
TSS	14	0	1	0	0	0	15

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 4. Holding Time for USEPA Method 1668C

Method	Matrix	Holding Time	Preservation
SW-846 USEPA Method 1668C	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

2.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In an instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

The compounds, PCB-179, and PCB-187 associated with sample locations Rising Pond Dam and HR-D1 exhibited a field duplicate RPD greater than the control limit. The associated sample results from sample locations for the listed analyte were qualified as estimated.

2.4 Compound Identification

PCB congeners by 1668C are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest". This value should be considered an elevated detection limit based on potential compound identification and quantitation interference. If the EMPC value is above the reporting limit, the qualifier UX has been added to the sample results to indicate the elevated detection limit as EMPC. If the EMPC value is below the reporting limit, the compound is reported as non-detect at the reporting limit and no qualification is added.

4 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 11. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
PCBs	100%	0
TSS	100%	0

The data package completeness, as determined from the Tier I data review was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.

1 Summary

This attachment summarizes the data validation review of Sample Delivery Groups (SDGs) 10718585, 10718624, 10719281, and 10719470 performed on behalf of the General Electric Company (GE) for surface water sampling activities conducted as part of the Baseline Monitoring at the GE-Pittsfield/Housatonic River Site. The review was conducted at a Tier I level and included review of data package completeness. Field documentation was not included in this review. Included with this assessment are the chain-of-custody forms (Appendix A) and the validation annotated sample analysis data sheets (Appendix B). Analyses were performed on the samples listed in Table 1.

1.2 Data Validation Procedures

Analyses were performed according to United States Environmental Protection Agency (EPA) SW-846 Method 1668C, and Standard Method 2540D. Data were reviewed in accordance with the following documents:

- Field Sampling Plan/Quality Assurance Project Plan – GE-Pittsfield/Housatonic River Site (FSP/QAPP), General Electric Company, Pittsfield, Massachusetts, prepared by Arcadis (Revised December 21, 2023);
- EPA Region I, EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (July 1996, revised December 1996) (EPA Region I Guidelines);

- EPA National Functional Guidelines for High Resolution Superfund Methods Data Review OLEM 9240.1-65EPA, 542-R-20-007 (November 2020); and
- Second Revised Baseline Monitoring Plan, Housatonic River – Rest of River, General Electric Company, Pittsfield, Massachusetts, prepared by Anchor QEA (January 2023).

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with EPA National Functional Guidelines:

- Concentration (C) Qualifiers:
  - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
  - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers:
  - E The compound was quantitated above the calibration range.
  - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers:
  - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
  - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
  - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
  - UB Compound considered non-detect at the listed value due to associated blank contamination.
  - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
  - R The sample results are rejected.

Two facts should be noted by all data users. First, the “R” flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. “R” values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

Section 7.5 of the revised FSP/QAPP states that all analytical data will be validated to a Tier I level following the procedures presented in the EPA Region I Guidelines. The Tier I review consisted of a completeness evidence

audit, as outlined in the EPA Region I CSF Completeness Evidence Audit Program (EPA Region I, July 31, 1991), to ensure that laboratory data and documentation were present. In the event that data packages were determined to be incomplete, the missing information was requested from the laboratory. Upon completion of the Tier I review, the data packages complied with the EPA Region I Tier I data completeness requirements.

Additionally, field duplicates were examined for relative percent difference (RPD) compliance with the criteria specified in the FSP/QAPP. A tabulated summary of the number of sample analyses subject to Tier I data review is presented in the following table.

Table 3. Summary of Sample Analyses Subjected to Tier I and Tier II Data Validation

Parameter	Tier I Only			Tier I &Tier II			Total
	Samples	Duplicates	Blanks	Samples	Duplicates	Blanks	
PCBs	14	1	1	0	0	0	16
TSS	14	1	0	0	0	0	15

When qualification of the sample data was required, the sample results associated with a QA/QC parameter deviation were qualified in accordance with the procedures outlined in EPA Region I Guidelines. When the data validation process identified several quality control deficiencies, the cumulative effect of the various deficiencies was employed in assigning the final data qualifier. The annotated sample analysis data sheets attached to this validation report (Appendix B) reflect any added data qualifiers.

2.1 Holding Times

The specified holding times for the following methods are presented in the following table.

Table 4. Holding Time for USEPA Method 1668C

Method	Matrix	Holding Time	Preservation
SW-846 USEPA Method 1668C	Water	One year from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

2.2 Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

2.3 Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit 30% for water matrices is applied to the RPD between the parent sample and the field duplicate. In an instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

The compounds PCB-183/185, PCB-194, PCB-201 and PCB-203 associated with sample locations Rising Pond Dam and HR-D1 exhibited a field duplicate RPD greater than the control limit. The associated sample results from sample locations for the listed analyte were qualified as estimated.

2.4 Compound Identification

PCB congeners by 1668C are identified by using the compound's ion abundance ratios, signal-to-noise values, and relative retention times.

An EMPC or "estimated maximum possible concentration" designation is given to compounds which have signals eluting within the established retention time window which would, if positively identified, be above the detection limit. The signals do not, however, meet the ion abundance ratio criteria and cannot be identified as the compound of interest. The EMPC value is the estimated concentration of the interferant quantitated "as the compound of interest". This value should be considered an elevated detection limit based on potential compound identification and quantitation interference. If the EMPC value is above the reporting limit, the qualifier UX has been added to the sample results to indicate the elevated detection limit as EMPC. If the EMPC value is below the reporting limit, the compound is reported as non-detect at the reporting limit and no qualification is added.

4 Overall Data Usability

This section summarizes the analytical data in terms of its completeness and usability. Data completeness is defined as the percentage of sample results that have been determined to be usable during the data validation process. The percent usability calculation included analyses evaluated under Tier I data validation review. The percent usability calculation also includes quality control samples (i.e., field/equipment blanks, trip blanks, and field duplicates) to aid in the evaluation of data usability. Data usability is summarized in the following table.

Table 11. Overall Summary of Data Usability

Parameter	Percent Usability	Rejected Data
PCBs	100%	0
TSS	100%	0

The data package completeness, as determined from the Tier I data review was used to determine overall data quality. As specified in the FSP/QAPP, the overall precision, accuracy, representativeness, comparability, and completeness (PARCC) parameters determined from the Tier I data reviews were used as indicators of overall data quality. These parameters were assessed through an evaluation of the results of the field and laboratory QA/QC sample analyses (discussed in this report) to provide a measure of compliance of the analytical data with the Data Quality Objectives specified in the FSP/QAPP.
