Re: Ringwood Mines/Landfill Superfund Site
2018 Annual Groundwater, Mine Water, and Surface Water Sampling

Dear Mr. Gowers:

Cornerstone Engineering Group, LLC, on behalf of Ford Motor Company (Ford), completed the 2018 Annual Sampling Event for groundwater, mine water, and surface water at the above referenced Site, which includes sampling within all three Land Areas of Concern (AC), the Peter's Mine Pit (PMP) Area, the O'Connor Disposal Area (OCDA) and the Cannon Mine Pit (CMP) Area. The work was completed in accordance with a Work Plan dated August 1, 2017, and as modified by an electronic mail approval from USEPA, dated June 20, 2018, to eliminate analysis for semi-volatile organic compounds (SVOCs), with the exception of 1,4-dioxane, and polychlorinated biphenyls (PCBs) in surface water samples. Analysis of these compounds in surface water was eliminated based on previous sampling results that have consistently demonstrated that these constituents are non-detect and therefore continued analysis for these parameters provides no useful information.

A synoptic round of water levels at all accessible monitoring wells was completed on August 20, 2018 prior to the initiation of groundwater sampling. The sampling was performed during the period August 21 through August 31, 2018, with resampling of eight locations (All four depths of the Cannon Mine Shaft, wells OB-20B, RW-6, RW-6A and SC-01) for VOCs only on September 5, 2018 due to the presence of air bubbles in the VOC vials associated with the original samples.

Groundwater monitoring well, mine structure, and surface water sampling locations are illustrated on Figure 1 (see Attachment A, Figures). In addition, groundwater monitoring well construction details are provided in Table 1 and water level measurements are provided in Table 2.

Sample Collection and Analyses

Groundwater samples were collected using the low-flow sampling methodology, consistent with previously approved and implemented practices, and field sampling data sheets are attached for reference (see Attachment B). As documented during previous sampling events, several of the bedrock wells exhibit poor recharge resulting in very low purge rates and, in some cases, inadequate volume for the collection of the full suite of parameters. To maximize sample volume, optimized purge rates established during prior sampling events were used. Also, per approval from USEPA, some locations required the collection of samples over a 24-hour period for collection of sufficient volume, and/or the volume collected was dedicated to a prioritized list of analytes. Details regarding purge rates, sampling times, and the locations at which inadequate sample volume prohibited the analysis for the full suite of parameters (and, in this event, which parameters were analyzed) are provided in Table 3. Field data sheets are provided in Attachment B.

Groundwater, mine water and surface water samples were sent under chain of custody to Test America Laboratories for analysis of Target Analyte List (TAL) inorganic compounds, Target Compound List (TCL) organic compounds (plus tentatively identified compounds (TICs) and wet chemistry. Samples were not analyzed for pesticides based on prior approval from the USEPA dated April 2, 2007. In addition, as previously stated, as approved by USEPA by electronic mail dated June 20, 2018, surface water samples were not analyzed for PCBs or SVOCs, with the exception of 1,4-dioxane, which was included and analyzed. With the exception of the elimination of analysis for SVOCs and PCBs in surface water, the above list of analyses is consistent with the analytical work scope during prior annual sampling events.

Samples were analyzed using the following methodology:

- Volatile Organics + 15 TICs – USEPA Method 8260B
- Semi-Volatile Organics + 15 TICs – USEPA Method 8270C
- 1,4-dioxane - USEPA Method 8270D SIM with Isotope Dilution
- Metals (total and dissolved)– USEPA Methods 6020A/7470A
- Total Cyanide - USEPA Method 9012B
- PCBs – USEPA Methods 8082
- Alkalinity, total (as CaCO3) – USEPA Method SM20 2320B
- Chloride – USEPA Methods 300/9056
- Sulfate – USEPA Methods 300/9056

Samples were analyzed for the full suite of parameters above unless otherwise noted in Table 3, and as described above relating to inadequate sample volume.

Cadena, Inc. conducted a level 2 validation of the laboratory analytical results for the sample delivery groups (SDGs) generated by Test America during this sampling event. A copy of the laboratory and data validation reports is provided in Attachments C and D, respectively.

Groundwater Elevation Data

Prior to sampling, a synoptic round of water levels at the groundwater monitoring wells was conducted on August 20, 2018. Groundwater elevation data from this round of water level measurements are presented on Figures 2 through 6 (Attachment A, Figures). These figures present groundwater contours as follows:

- Figure 2 – PMP Area overburden groundwater
- Figure 3 – PMP Area shallow bedrock groundwater
- Figure 4 –OCDA overburden groundwater
- Figure 5 – CMP Area shallow bedrock groundwater
- Figure 6 – CMP Area deep bedrock groundwater

As shown in Figures 2 and 4, the groundwater flow gradient in the overburden is generally to the south-southeast from the PMP Area towards the OCDA. As shown in Figure 3, the groundwater flow gradient in the shallow bedrock in the PMP Area is generally to the southeast. The groundwater flow gradient in the shallow and deep bedrock in the CMP Area is primarily from the bedrock ridge towards the southeast with a component of flow to the southwest as shown in Figures 5 and 6. The flow gradients in each of the three land ACs is consistent with the findings of the Site-Related Groundwater Remedial Investigation (RI) as outlined in the RI Report dated January 2015.

Analytical Data

The results of the 2018 Annual Sampling Event are summarized in the tables identified below. Analytical data are organized by providing summary tables of detected parameters (i.e., only those locations and parameters for which there were detected constituents), followed by tabulation of the complete data sets (i.e., all locations and parameters). Note that Tables 13A and 13B summarize the current and historic (2004-2018) benzene, 1,4-dioxane, chloroethane, arsenic, and lead concentrations in both groundwater and mine structures, respectively. These tables are provided for consistency with Table 13 from the Site-Related Groundwater RI Report dated January 2015 for ease of comparison of historical and current data for these parameters. Last, the data have been organized by Land AC - PMP Area, OCDA, CMP Area, Sally's Pond Area, surface water, mine structures, and quality control data.

More specifically, the full suite of tables prepared to summarize the data and following this letter report include:

Results Summary

The results of the 2019 Annual Sampling Event are summarized in the sections that follow organized by Land AC, Sally's Pond Area, surface water, mine structures, and quality control data.

Peters Mine Pit Area - Groundwater

- The only volatile organic compound (VOC) reported above its respective New Jersey Groundwater Quality Standard (NJGWQS) is benzene and the only VOC detected above its New Jersey Interim Generic Groundwater Quality Criterion (NJIGGWQC)

is chloroethane (See Table 5A). Benzene and chloroethane were reported at generally low levels consistent with historical concentrations.

- VOC TICs were also reported at various well locations at low levels, all "J" qualified (i.e., estimated values), and similar to historical concentrations.
- To facilitate review of the organic compound data, Figures 7 and 8 (see Attachment A) present the benzene and 1,4-dioxane data (discussed below) superimposed on the overburden and shallow bedrock groundwater contour maps.
- As a point of reference for chloroethane, the USEPA Regional Screening Level for tap water for this compound is 21,000 micrograms per liter (ug/L) compared to the NJIGGWQC of 5 ug/L. The highest reported concentration for chloroethane during this sampling round was 180 ug/L at OB-27. Therefore, chloroethane concentrations were not added to the figures to help maintain clarity.

- With the exception of 1,4-dioxane and hexachlorobenzene (See Table 5B), semi-volatile organic compounds (SVOCs) were detected only sporadically, at low levels, and none were detected above NJGWQS.

  - SVOC TICs were also reported sporadically at low, "J" qualified levels, and similar to historical concentrations (See Table 5B).
  - 1,4-dioxane was reported above its NJGWQS of 0.4 ug/L in 16 samples as shown in Table 5B and as illustrated on Figures 7 and 8. The recent sampling results are consistent with historical data with most, but not all, of the reported concentrations generally low at less than 10 ug/L. The results for six locations are qualified with a "B" indicating that 1,4-dioxane was also detected in the field blank associated with these samples (see discussion under Quality Control Samples).
  - While the 1,4-dioxane results remain generally consistent with historical values, the August 2018 results may be biased high due to detectable concentration in the field blank. Those locations with higher concentrations (e.g., RW-3, RW-3DS, RW-3DD, RW-11) were identified during prior sampling events and the results during this sampling event are also consistent with historical results.
  - Hexachlorobenzene concentrations (0.027, 0.027 and 0.034 ppb) at three locations (one overburden, two bedrock) were marginally above its NJGWQS of 0.02 ppb. However, these data are qualified with an "*" indicating that the Relative Percent Difference (RPD) of the Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) exceeds the control limits. This indicates that the results are biased high. Since the reported concentrations

only marginally exceed the NJGWQS, the true concentration may not exceed the NJGWQS.

- No PCBs were detected in any of the groundwater samples (see Table 5F).

- Analyses were performed for both total (unfiltered) and dissolved (filtered) metals. The only metals reported above their respective NJGWQS are aluminum, arsenic, iron, manganese, sodium and one instance of total lead (not dissolved). The results for these metals are shown in Table 5C and summarized as follows:

    - Aluminum was reported above its NJGWQS in several bedrock and overburden wells and in total and filtered samples, with fewer detections in filtered samples. Aluminum is naturally occurring and an abundant secondary metal in the soil/groundwater system at the Site.
    - Total arsenic was reported above its 3 ug/L NJGWQS in 11 samples and dissolved arsenic was reported above the NJGWQS in 10 of those samples at levels consistent with historical data and typically at well locations where groundwater exhibited reducing geochemical conditions.
    - Iron and manganese were reported above their respective NJGWQS in a number of samples, in both the total and dissolved (filtered samples) forms. Iron and manganese are naturally occurring secondary metals that are prevalent in the overburden and bedrock aquifers at this former iron mine Site.
    - Sodium, a commonly occurring secondary metal, was reported above its NJGWQS in both total and dissolved forms in eight samples.

- As shown in Table 5C, of the wet chemistry parameters, sulfate was reported above its NJGWQS in one sample. Sulfate is naturally occurring and a common analyte in natural groundwater systems.

O'Connor Disposal Area - Groundwater

- There were no VOCs reported above their respective NJGWQS and the only VOC TIC reported was a low "J" qualified concentration of indane (See Table 6A).

- As shown in Table 6A, hexachlorobenzene, was reported marginally above its NJGWQS (0.03 ppb as compared to the NJGWQS of 0.02 ppb) at well OB-18, however, this constituent was not detected in the duplicate sample (OB-18 DUP).

- As also shown in Table 6A and Figure 9, 1,4-dioxane was reported above its 0.4 ug/L NJGWQS at one location, well OB-17, at a concentration that is comparable to prior sampling events. The data at and around well OB-17 continue to indicate that this is

a localized occurrence given the absence of 1,4-dioxane, other than a trace concentration at well OB-14, B elsewhere in the OCDA.

- As shown in Table 6A, PCBs were not detected in any of the OCDA groundwater samples.

- Analyses were performed for both total (unfiltered) and dissolved (filtered) metals. The only metals reported above their respective NJGWQS are aluminum, arsenic, iron, manganese and sodium (See Table 6B). The results for these metals are summarized as follows:

    - Total aluminum was reported above its NJGWQS in two samples. All dissolved aluminum results were below the NJGWQS for this naturally occurring secondary metal.
    - Total arsenic was reported above its 3 ug/L NJGWQS in one sample. Dissolved arsenic was not detected above the NJGWQS in any of the groundwater samples indicating that the total arsenic concentration is associated with particulates in the groundwater samples.
    - Iron and manganese were reported above their respective NJGWQS in a number of samples, in both total and dissolved form, with most of the exceedances being total iron or manganese indicating that the reported concentration are reflective of elevated particulates in the groundwater samples. Iron and manganese are naturally occurring secondary metals that are prevalent in both the overburden and bedrock aquifers at this former iron mine Site.
    - Sodium, a commonly occurring secondary metal, was reported above its NJGWQS at one well location in both total and dissolved forms.
    - As also shown in Table 6B, none of the wet chemistry parameters were detected at concentrations above their respective NJGWQS.

Cannon Mine Pit Area – Groundwater

- As shown in Table 7A and Figures 10 and 11, VOCs are reported sporadically, and with the exception of acetone, which is a common laboratory artifact, typically at low "J" qualified concentrations. Benzene was reported above its 1 ug/L NJGWQS at two well locations at concentrations of 1.4 and 2.8 ug/L and VOC TICs were reported at three well locations at low, "J" qualified concentrations.

- As shown in Table 7B, SVOCs and SVOC TICs are reported only sporadically, at low, typically "J" qualified levels, with no compounds reported above NJGWQS except for 1,4-dioxane at three well locations and benzo(a)anthracene at one well location. As also shown in Table 7B and Figures 10 and 11, 1,4-dioxane was reported above the NJGWQS of 0.4 ug/L in three samples collected at depth from bedrock wells RW-2(279-289), RW-2(452-462) and RW-8 (206-216). These results are generally consistent with historical groundwater quality data, although this is the first time that 1,4-dioxane was reported marginally above its 0.4 ug/L NJGWQS at RW-8(206-216) at a concentration of 0.44 ug/L.

- As also shown in Table 7B, PCBs were not detected in any of the samples.

- Analyses were performed for both total (unfiltered) and dissolved (filtered) metals. The only metals reported above their respective NJGWQS are aluminum, arsenic, iron, manganese, and sodium (See Table 7C). The results for these metals are summarized as follows:

    - Aluminum (total) was detected in two samples above its NJGWQS. The dissolved results were below the standard, indicating that the total results are associated with particulates in the groundwater samples.

    - Arsenic was reported above its 3 ug/L NJGWQS at three bedrock well locations in both the total and dissolved forms and at one location in its total form only. The one location (RW-2-279-289) at which total arsenic was reported at 7.1 ug/L is higher than historical values, however, the dissolved concentration (1.2J ug/L) is consistent with historical concentrations as are the other results. Arsenic is naturally occurring and prevalent within the bedrock formations and mine tailings at the Site.

    - Iron and manganese were reported above their respective NJGWQS in a number of samples, in both total and dissolved form, with most of the exceedances being total iron or manganese indicating that the reported concentration are reflective of elevated particulates in the groundwater samples. Iron and manganese are naturally occurring secondary metals that are prevalent in both the overburden and bedrock aquifers at this former iron mine Site.

    - Sodium, a commonly occurring secondary metal, was reported above the NJGWQS in six groundwater samples, both in the total and dissolved forms.

- As shown in Table 7C, of the wet chemistry parameters, chloride and sodium were each reported in two samples above their respective NJGWQS.

Sally's Pond Area – Groundwater

- As shown in Table 8A, there were no VOCs or SVOCs reported above their respective NJGWQS in any of the four groundwater sampling locations; wells OB-10, OB-29, RW-12 (55-65) and RW-12 (130-140). One VOC and three SVOC TICs were reported sporadically and at low, "J" qualified concentrations.

- As also shown in Table 8D, 1,4-dioxane was not detected in any of the four Sally's Pond Area groundwater samples.

- As also shown in Table 8A, PCBs were not detected above NJGWQS in any of the samples.

- Analyses were performed for both total (unfiltered) and dissolved (filtered) metals. The only metals detected above their respective NJGWQS are aluminum, arsenic, iron, and sodium (See Table 8B). The results for these metals are summarized as follows:

    - Total aluminum was reported above its NJGWQS in two samples. All the dissolved results were below the NJGWQS again illustrating the effect of particulates in the groundwater samples.

    - Arsenic was reported above its NJGWQS in groundwater at two well locations in both the total and filtered samples. Arsenic is also naturally occurring and prevalent within the bedrock formations and mine tailings at the Site.

    - Total iron was reported above its NJGWQS in groundwater at two well locations. Iron is naturally occurring and prevalent in both the overburden and bedrock aquifers at this former min Site.

    - Sodium, a commonly occurring secondary metal, was reported above its NJGWQS in groundwater at one well location, in the total and filtered samples.

- As also shown in Table 8B, of the wet chemistry parameters, sulfate was reported in one sample above its respective NJGWQS.

Overall, the collective August 2018 groundwater analytical results are consistent with historical data, and continue to demonstrate only sporadic, low-level, and localized site-related constituents and various inorganics in groundwater that are also naturally occurring in the aquifer systems at the Site. 1,4-dioxane was reported sporadically in overburden groundwater at generally low levels, and at somewhat higher levels in the mine water at the

base of the PMP Air Shaft and at several adjacent and downgradient PMP Area bedrock well locations, with the distribution generally consistent with the results of prior sampling events.

Mine Water

- Seven samples of mine water were collected for analyses; three different depth intervals in the PMP Air Shaft (50, 180, and 230 feet) and four different depth intervals in the CMP Mine Shaft (50, 100, 160, and 275 ft).

- As shown in Table 9A, the only VOC reported in mine water above its NJGWQS is benzene in the PMP Air Shaft at the 180′ and 230′ depth intervals at concentrations consistent with historical results. In addition, chloroethane was reported above its NJIGGWQC in the same two depth intervals at concentrations that are also consistent with historical results. VOC TICs were also reported within the 180′ and 230′ depth intervals in the PMP Air shaft at low levels, mostly "J" qualified, which is also similar to historical results.

- 1,4-dioxane was reported above its NJGWQS at the PMP Air Shaft 50′, 180′ and 230′ depth intervals at concentrations that are comparable to historical results. The result from the 50-foot interval at 0.41 ug/L is flagged with a "B" because 1,4-dioxane was found in the field blank on the day this sample was collected at a concentration of 0.26 ug/L. The data therefore indicate that the result reported in the 50′ depth interval sample may be biased high.

- Also consistent with historical data, 1,4-dioxane was reported at trace concentrations below its 0.4 ug/L NJGWQS in the CMP Shaft at the 50, 100, 160 and 275 ft. depth intervals. These results are also flagged with a "B" because 1,4-dioxane was found in the field blank on the day these samples were collected at a concentration of 0.26 ug/L. The data therefore indicate that these results may be biased high.

- No other SVOCs were reported above NJGWQS in the PMP Air Shaft or CMP Shaft mine water. SVOC TICs were reported sporadically at "J" qualified values in two out of the seven mine water samples.

- As also shown in Table 9A, PCBs were not reported in any of the PMP Air Shaft or CMP Shaft mine water samples.

- Analyses were performed for both total (unfiltered) and dissolved (filtered) metals. The metals reported above their respective NJGWQS are arsenic, iron, manganese, lead, sodium and zinc (See Table 9B). The results for these metals are summarized as follows:

- Total arsenic was reported above its NJGWQS in the PMP Air Shaft 230-foot interval. However, all dissolved arsenic results were below the 3 ug/L NJGWQS.

- Total iron was reported above its NJGWQS in all the mine water samples which is to be expected at this former iron mine Site. Dissolved iron was reported above its NJGWQS in the majority of samples where mine water is more reducing but not at samples collected from the CMP shaft 50' and 275' interval and especially the PMP Air Shaft 50-foot interval where mine water is more oxidized, and iron would occur in particulate form.

- Manganese was reported above its NJGWQS in both total and dissolved forms in each sample except the PMP Air Shaft 50' depth interval sample. Iron and manganese are naturally occurring and prevalent in both the overburden and bedrock aquifers at this former iron mine Site.

- Lead was reported in the total form above its NJGWQS in two samples from the PMP Air Shaft. None of the dissolved lead concentrations were above the NJGWQS, indicating that the reported concentrations are associated with particulates in these samples.

- Sodium, a commonly occurring secondary metal, was reported above its NJGWQS in each of the CMP Shaft mine water samples.

- Total zinc was reported above its NJGWQS in the 160' and 275' depth intervals in the CMP Shaft samples and at the 180' depth interval in the PMP Air Shaft samples. Dissolved zinc concentrations were all below the NJGWQS indicating that the reported concentrations are attributable to particulates.

- As shown in Table 9B, no wet chemistry parameters were reported above their respective NJGWQS.

Surface Water

- Surface water sampling locations are shown in Figure 12. As previously stated, the 2018 annual monitoring event included the collection of samples from nine additional downstream surface water locations that were first included in the 2017 annual event and that were not typically monitored in the past.

- As summarized below, the samples from the additional surface water sampling locations indicate no VOC or SVOC concentrations above applicable New Jersey Surface Water Quality Standards (NJSWQS) and only sporadic total metals

concentrations above applicable inorganic SWQS which are attributable to particulates in the collected sample, as discussed further below.

- As shown in Table 10A and Figure 12, of the 27 surface water samples collected, the only VOC reported slightly above its NJSWQS is benzene in two samples (specifically, the SR-3 Seeps 1 and 2), and the values are both "J" qualified indicating trace estimated concentrations.

- Consistent with historic data, no VOC TICs were detected in any surface water sample.

- As shown in Table 10A and on Figure 12, low, single digit or lower (range of 0.4 to 1.6 ug/L), concentrations of 1,4-dioxane were reported in nine of the 27 surface water samples with concentrations declining from the immediate vicinity of the PMP Area to non-detect downstream of Sally's Pond.

- There is no NJSWQS for 1,4-dioxane therefore, for purposes of comparison, a surrogate screening value of 22,000 ug/L from the Michigan Department of Environmental Quality (MDEQ Rule 57 Water Quality Values) has been approved by USEPA for use as an Ecological Screening Benchmark (ESB) for the Site.

- 1,4-dioxane was not detected in any of the surface water locations that were added into the 2018 annual monitoring event which is consistent with the results from the 2017 sampling event at these same locations.

- While not directly applicable to surface water, the concentrations of 1,4-dioxane detected in the nine surface water samples in the PMP Area and immediately downstream are at or slightly above its NJGWQS of 0.4 ug/L.

- As shown in Table 10B, total arsenic was reported above its NJSWQS in one sample (SW-PAB-02). However, no dissolved arsenic concentrations were reported above NJSWQS indicating that the reported total arsenic concentrations are attributable to particulates in this water sample.

- As also shown in Table 10B, total lead was reported above its NJSWQS at two locations. Dissolved lead was not reported above NJSWQS again indicating that the reported total concentrations are attributable to particulates in these water samples.

- As shown in Table 10B, there were no wet chemistry parameters above their respective NJSWQS.

Overall, the collective surface water data are generally consistent with historic results and continue to demonstrate the absence of site-related constituents in locations downstream of Sally's Pond or downstream of the Site, as confirmed by the nine-additional downstream surface water locations that were sampled in 2017 and again during this 2018 Annual Sampling Event.

Quality Control Samples

Field and trip blanks were collected in accordance with the established protocols for quality assurance purposes. Tables 11A – 11D summarize the Groundwater/Surface Water Quality Control Sample Data and Table 12 summarizes the Data Validation Qualifiers. As shown in Tables 11A-11D, methylene chloride was detected in four field blanks and two trip blanks. and is a common laboratory contaminant. 1,4-dioxane was detected in one field blank collected on August 24, 2018 at a concentration of 0.26 ug/L suggesting some cross-contamination may have occurred with the sampling equipment on that date. This is the purpose of field blanks and, as noted in the water quality discussion above, the detection of 0.26 ug/L of 1,4 dioxane in the August 24, 2018 field blank indicates that the 1,4-dioxane results for samples collected as part of the associated SDG may be biased high. There were no other field blanks with any indication of cross contamination which supports the adequate decontamination of sampling equipment between sampling locations.

The data validation prepared by Cadena further supports the quality of the data. None of the data were rejected.

The August 1, 2017 Work Plan, under which the 2018 Annual Sampling Event was completed, recommended elimination of testing for SVOCs (with the exception of 1,4-dioxane), PCBs, and the full list of TAL metals because these data have done little, if anything, to improve the understanding of Site-related COCs. In addition, the Work Plan also recommended eliminating the general chemistry parameters of alkalinity, chloride, and sulfate because these parameters have been used to assess potential biodegradation and attenuation, and sufficient analyses have been performed regarding these mechanisms. At the request of USEPA, these analytes, with the exception of SVOCs and PCBs in surface water, were again tested for during the 2018 Annual Sampling Event and the results of the 2018 Annual Sampling Event continue to support this recommendation.

More specifically:

- Of the SVOCs, only hexachlorobenzene and one instance of benzo(a)anthracene were detected slightly above their respective NJGWQS and these compounds are not identified as Site-related COCs. Furthermore, the three reported hexachlorobenzene concentrations within the PMP area were all flagged with an "*" indicating that the

laboratory control sample recoveries were above acceptable limits such that the results are biased high.

- PCBs were not detected in any of the groundwater or mine water samples.

- Metals reported above their NJGWQS or NJSWQS are largely naturally occurring and, with the exception of arsenic and lead, are not identified as Site-related COCs.

In a letter dated October 22, 2018, the USEPA approved the Final Remedial Design for Operable Unit 2 (OU2). One element of the Final Remedial Design is an Interim Monitoring Plan required under the OU2 Record of Decision to be implemented until the groundwater remedy (OU3) is selected for the Site. The Interim Monitoring Plan approved by the USEPA as a part of the OU2 Final Remedial Design approval includes an analytical program consisting of VOCs, 1,4-dioxane, arsenic and lead, and the results of the 2018 Annual Sampling Event continue to support this analytical program.

With the USEPA's approval of the Final Remedial Design and associated Interim Monitoring Plan, ongoing monitoring at the Site will now be in accordance with the Interim Monitoring Plan, and the Annual Sampling Event will be discontinued. The timing of the first sampling event under the Interim Monitoring Plan will be coordinated with the USEPA.

TABLE 12

CADENA Valid Qualifiers

Valid Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
J-	The result is an estimated quantity, but the result may be biased low.
JB	NON-DETECT AT THE CONCENTRATION REPORTED AND ESTIMATED
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
JUB	NON-DETECT AT THE REPORTING LIMIT AND ESTIMATED
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
TNTC	Too Numerous to Count - Asbestos and Microbiological Results.
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Notes:

Results for 1,4-dioxane, benzene, chloroethane, lead, and arsenic are presented in this table. See Summary tables for full results.

Results are presented in µg/L unless otherwise noted.

[1] NJGWQS, New Jersey Groundwater Quality Standard NJAC7:9C March 2014

[2] Results represent split samples between Test America (without isotope dilution) and Alpha Analytical (with isotope dilution), respectively.

1,4-dioxane analyzed by Method 8270 Sim with Isotope Dilution as of August 2016.

Shaded values exceed NJGWQS.

*First two results via 8270 SIM-ID, second result outside of hold time. Third result is via Method 522 from Pace Analytical as part of isotope study. See Text.

** First result by 8270 SIM-ID, second result via Method 522 from Pace Analytical as part of isotope study.

< = not detected

B (inorganic) = estimated result is between the detection limit and quantification limit

B (organic) = analyte found in associated method blank

ft bgs = feet below ground surface

J = estimated result

NA = not analyzed or not available

R = rejected result

µg/L = micrograms per liter

Notes:

Results for 1,4-dioxane, benzene, lead, and arsenic are presented in this table. See Summary tables for full results.

Results are presented in µg/L unless otherwise noted.

[1] NJGWQS, New Jersey Groundwater Quality Standard NJAC7:9C March 2014

[2] Results represent split samples between Test America (without isotope dilution) and Alpha Analytical (with isotope dilution), respectively.

1,4-dioxane analyzed by Method 8270 Sim with Isotope Dilution as of August 2016.

Shaded values exceed NJGWQS.

* First result by 8270 SIM-ID, second result via Method 522 from Pace Analytical as part of isotope study.

< = not detected

B (inorganic) = estimated result is between the detection limit and quantification limit

B (organic) = analyte found in associated method blank

ft bgs = feet below ground surface

J = estimated result

NA = not analyzed or not available

R = rejected result

µg/L = micrograms per liter

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
*	LCS or LCSD is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F1	MS and/or MSD Recovery is outside acceptance limits.

GC/MS VOA TICs

Qualifier	Qualifier Description
J	Indicates an Estimated Value for TICs
N	This flag indicates the presumptive evidence of a compound.

GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
*	LCS or LCSD is outside acceptance limits.
X	Surrogate is outside control limits
*	RPD of the LCS and LCSD exceeds the control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits

GC/MS Semi VOA TICs

Qualifier	Qualifier Description
J	Indicates an Estimated Value for TICs
N	This flag indicates the presumptive evidence of a compound.

GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

HPLC/IC

Qualifier	Qualifier Description
D	Sample results are obtained from a dilution; the surrogate or matrix spike recoveries reported are calculated from diluted samples.
U	Indicates the analyte was analyzed for but not detected.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD Recovery is outside acceptance limits.

Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F5	Duplicate RPD exceeds limit, and one or both sample results are less than 5 times RL. The data are considered valid because the absolute difference is less than the RL.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.

General Chemistry

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Narrative

CASE NARRATIVE

Client: Cornerstone Environmental Group, LLC

Project: FORD Ringwood Mines E203361

Report Number: 460-163149-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 8/22/2018 4:45 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 7 coolers at receipt time were 0.5º C, 0.7º C, 0.8º C, 0.8º C, 0.9º C, 1.1º C and 2.7º C.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Narrative

CASE NARRATIVE

Client: Cornerstone Environmental Group, LLC

Project: FORD Ringwood Mines E203361

Report Number: 460-163188-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 8/23/2018 11:25 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 5 coolers at receipt time were 0.8º C, 1.1º C, 1.2º C, 1.2º C and 1.5º C.

Receipt Exceptions

The following samples were listed on the Chain of Custody (COC), however, no samples were received: OB-3 and OB-24. These samples were received in the first delivery group, and are logged in and are being analyzed as 460-163149-17 and 460-163149-18.

One of the vials for the following sample was received empty: OB-33-082218 (460-163188-6). There is sufficient remaining volume to run the requested VOC analyses.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

Narrative

CASE NARRATIVE

Client: Cornerstone Environmental Group, LLC

Project: FORD Ringwood Mines E203361

Report Number: 460-163302-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 8/24/2018 5:10 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 10 coolers at receipt time were 0.4º C, 0.5º C, 0.6º C, 0.7º C, 0.7º C, 0.8º C, 0.8º C, 0.9º C, 0.9º C and 1.0º C.

Receipt Exceptions

The 8260 and 8260-SIM analysis was canceled for the following samples on 08/31/2018 by the client, due to significiant headspace in the sample vials: OB-20B-082318 (460-163302-1), RW-6-082318 (460-163302-3), RW-6A-082318 (460-163302-4), CMS-50-082318 (460-163302-5), CMS-50-082318 (460-163302-5[MS]), CMS-50-082318 (460-163302-5[MSD]), CMS-100-082318 (460-163302-7), CMS-160-082318 (460-163302-8), CMS-275-082318 (460-163302-9) and SC-01-082418 (460-163302-22). The samples were recollected on 9/5/2018 and can be found in SDG 460-164119. Since sample #5 was submitted as MS/MSD, there will be no MS/MSD able to be reported for 8260 batch 460-548123 and 8260-SIM batch 460-548540.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

Six surrogates are used for this analysis. The laboratory's SOP allows one acid and one base of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following samples contained an allowable number of surrogate compounds outside limits: PMS-230-082418 (460-163302-21), PMS-230-082418 (460-163302-21[MS]) and PMS-230-082418 (460-163302-21[MSD]). These results have been reported and qualified.

2,4,6-Tribromophenol (Surr) failed the surrogate recovery criteria high for OB-20B-082318 (460-163302-1), CMS-50-082318 (460-163302-5), LCS 460-547574/2-A, LCS 460-547599/2-A, LCS 460-548149/2-A, CMS-50-082318MS (460-163302-5MS), 460-163112-E-9-C MSD, and CMS-50-082318MSD (460-163302-5MSD).

2-Methylphenol and Hexachlorobutadiene failed the recovery criteria low for the MS and MSD of sample CMS-50-082318 (460-163302-5) in batch 460-547615.

Refer to the QC report for details.

No other difficulties were encountered during the semivolatiles analysis.

All other quality control parameters were within the acceptance limits.

A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analytes is considered estimated.

The CCV analyzed in batch 460-547710 was outside the method criteria for the following analytes: Hexachlorobenzene and Dibenz(a,h)anthracene. A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. The laboratory control sample (LCS) for preparation batch 548650 recovery outside control limits for the following analytes: Cyanide. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Cyanide, Total failed the recovery criteria high for the MS and MSD of sample OB-5-082318 (460-163302-11) in batch 460-548949.

Cyanide, Total failed the recovery criteria high for the MS of sample CMS-50-082318 (460-163302-5) in batch 460-548949.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

No other difficulties were encountered during the cyanide analysis.

All other quality control parameters were within the acceptance limits.
