INTRODUCTION

Exponent conducted a survey in sections of the Upper Hudson River in the spring of 1998 to characterize macroinvertebrate and fish communities, including variation in abundance, species composition, and trophic structure, among different habitat types and among the sampling areas in Thompson Island Pool and Stillwater Pool. Exponent also conducted a similar survey in the fall of 1997 (Exponent 1998b). Because aquatic habitats and the trophic structure of biological communities change seasonally, the spring survey was conducted to determine seasonal differences in food-web structure. Data from the fall 1997 and spring 1998 surveys will be used by Quantitative Environmental Analysis in their development of a polychlorinated biphenyl (PCB) bioaccumulation model for the General Electric Company (GE).

Objectives of the spring 1998 survey were to compare food-web structures between seasons and between and among sampling areas, to analyze PCB concentrations in fish species used by the New York State Department of Environmental Conservation (NYSDEC) to monitor PCB trends, and to compare PCB concentrations in these fish species between seasons. NYSDEC will present the results of PCB analyses in a separate report. The spring 1998 sampling activities were directed to answer the following study questions:

- How does the biological community structure (composition and abundance of benthic macroinvertebrates [BMI]) differ between habitats that are vegetated and those that are unvegetated?
- How does the biological community structure differ between Thompson Island Pool and Stillwater?
- What is the composition of fish gut contents during the NYSDEC sampling activities?
- How does the diet of the dominant fish species differ between Thompson Island Pool and Stillwater?

This report summarizes the data collected as a result of the 1998 survey and specifically presents the results of the taxonomic identification and enumeration of macroinvertebrate and fish stomach-content samples, biomass determination of aquatic vegetation and select macroinvertebrate groups, and analysis of sediment total organic carbon (TOC) and grain-size distribution. Data are presented for the following samples:

- **Taxonomic identification and enumeration**
 - Stomach contents of largemouth bass (*Micropterus salmoides*), brown bullhead (*Ictalurus nebulosus*), yellow bullhead (*Ictalurus natalis*), yellow perch (*Perca flavescens*) and spottail

shiner (*Notropis hudsonius*) that were collected from vegetated habitats in the Upper Hudson River

- Phytophilous macroinvertebrates (PMI) collected from mixed vegetation habitats
- BMI collected from vegetated and unvegetated sediments

■ **Biomass determination**

- Aquatic vegetation removed from 0.1 m² quadrats (collected in June 1998; see *Methods, Biomass Samples, Vegetation Biomass* below)
- Aquatic vegetation collected with PMI in box samplers
- Macroinvertebrates of selected taxa collected from vegetated and unvegetated habitats

■ **TOC and grain-size**

- Sediments collected in vegetated and unvegetated habitats in conjunction with sampling of BMI.

The following sections outline the methods used for the collection of fish, BMI, PMI, and aquatic vegetation samples; taxonomic analyses; and biomass determination.

STUDY DESIGN

The initial study design for the spring 1998 sampling is similar to that for the fall 1997 sampling, with three exceptions. First, sampling was planned for the Coveville area where NYSDEC collects fish in the spring as part of their PCB trends monitoring program. Second, the northern Thompson Island Pool area, which was sampled during September 1997 to provide data for comparison with the sampling area at Griffin Island, was not included in the May 1998 survey because the NYSDEC fish collection program does not include fish collected from this area. Third, May 1998 sampling of PMI communities was minimized because submerged aquatic vegetation beds are not well developed during the spring.

Exponent's field sample collection in spring 1998 was coordinated with that of NYSDEC and the U.S. Geological Survey (USGS) to increase efficiency in time and sampling costs. The NYSDEC Hudson River spring sampling program included fish collection at two areas in the Upper Hudson River: Griffin Island in the Thompson Island Pool and Coveville in the Stillwater Pool. Coveville is a different sampling location than the Stillwater Pool area previously sampled by Exponent. Because areas sampled by Exponent during spring 1998 were determined by the NYSDEC sampling program, the Stillwater and the northern Thompson Island Pool areas sampled in fall 1997 were not sampled in the spring 1998 survey.

In planning for the spring 1998 sampling, it was assumed that the dominant submerged aquatic vegetation species, *Trapa natans* and *Vallisneria americana*, would not be mature at this time of year. Thus, PMI sampling was not included in the sampling design. However, upon viewing dense mixed vegetation beds at the Griffin Island and Coveville sampling areas, the decision was made to sample these areas for PMI because the mixed vegetation was a likely habitat for important prey of target fish.

METHODS

An overview of the methods used in collection and analysis of fish stomach contents, BMI and PMI, sediments, and biomass samples is provided below. A detailed description of methods is contained in the field sampling plan (FSP) (Exponent 1998a).

SAMPLE COLLECTION

Samples of fish stomach contents, macroinvertebrates, aquatic vegetation, and sediment were collected at the NYSDEC sampling areas at Griffin Island and Coveville (Figures 1 and 2). Originally, Exponent and GE planned to collect all sample types at the Stillwater sampling area, which was previously sampled in fall 1997. However, NYSDEC, while in the field, decided not to collect fish from the Stillwater sampling area. BMI and sediment chemistry samples were collected from the Stillwater sampling area before this decision was made. Thus, the taxonomic laboratories were instructed to archive these samples. However, because of laboratory error, sediment chemistry samples were analyzed. Therefore, these results are presented in this report. Macroinvertebrates for biomass determination were collected and analyzed from all three sampling areas.

FISH STOMACH CONTENTS

Fish Collection and Stomach Content Extraction

Largemouth bass, yellow bullhead, brown bullhead, spottail shiner and yellow perch were collected using a boat electroshocker on May 18–22, 1998, for taxonomic analysis of stomach contents by NYSDEC, USGS and Exponent staff. Largemouth bass, brown bullhead and yellow bullhead were sampled for stomach-content analysis because these piscivorous species are targeted by the NYSDEC sampling program and are the same species previously collected by Exponent in September 1997. Forage fish species were selected in the field based on availability (two species per sampling area). Spottail shiner and yellow perch were selected as forage species because they were the most abundant forage species observed in all habitats. NYSDEC also selected carp for PCB analysis and additional yellow perch in order to conduct a separate stomach-content analysis. Largemouth bass longer than 30.5 cm, bullhead longer than 20 cm, and forage fish between 70–150 mm in length were collected. The sampling goal was to collect 20 bass, 20 bullhead and 15 of each forage species from each sampling area. Sample size was restricted to the NYSDEC sampling quota. If more than 20 bass or bullhead were collected by NYSDEC/USGS staff, their stomach contents were extracted to maximize sample size.

All fish were weighed and measured for total length before removing stomach contents. Contents of the largemouth bass and bullhead stomachs were removed and preserved in 10 percent buffered formalin, as described in the FSP (Exponent 1998a). Then, bass and bullhead were tagged and given to NYSDEC staff for necropsy and fillet preservation. The abdomen of each spottail shiner and yellow perch was slit and about 1 ml of formalin was injected into the digestive tract to preserve stomach contents for later extraction in the laboratory.

Taxonomic Identification

Taxonomic identification of all macroinvertebrates in fish stomachs was performed by Aquatic Resources Center (ARC) in Franklin, Tennessee. ARC used a 250- μm sieve to rinse each sample before sorting organisms. ARC mounted all Cladocera, Oligochaeta, and Chironomidae specimens and used compound microscopes (up to 2000 \times magnification) for their identifications. All other taxonomic groups were identified using stereomicroscopes (up to 100 \times magnification). ARC shipped all stomach content samples containing prey fish to Ichthyological Associates of Lansing, New York for taxonomic analysis. Chain-of-custody procedures were followed during all sample transfers.

Analytical procedures were conducted in accordance with the requirements specified in the quality assurance project plan section of the FSP (Exponent 1998a). Multiple literature sources were used to confirm identifications (see Attachment A-1 in Appendix A). All taxonomic identifications were made to the lowest possible level.

MACROINVERTEBRATE COMMUNITIES

Macroinvertebrate Collection for Taxonomic Identification

Exponent staff collected macroinvertebrate samples from May 18–27, 1998. All macroinvertebrate samples were collected according to the methods described in the FSP (Exponent 1998a). BMI were collected using a 3-in.-diameter gravity-assisted corer in vegetated (i.e., *Trapa natans*, *Vallisneria americana*, and mixed vegetation) and unvegetated habitats from the Griffin Island, Coveville, and Stillwater sampling areas. Three co-located samples collected taken at three stations in each habitat in each area. Each sample was sieved at 500 μm in the field and subsequently preserved in 10 percent buffered formalin for shipment to the analytical laboratory. PMI were collected with Plexiglas® box samplers in mixed vegetation from the Griffin Island and Coveville sampling areas. The mixed vegetation in the Coveville sampling area was consistently dominated by pondweed (*Potamogeton crispus*) but also included water milfoil (*Myriophyllum* sp.), coontail (*Ceratophyllum* sp.), and filamentous algae. The vegetation in the Griffin Island sampling area was patchily distributed, and the dominant species alternated between *Myriophyllum* sp. and *Potamogeton* sp. Thus, three replicates each were taken from each

of two patches—one dominated by *Myriophyllum* sp. and one dominated by *Potomogeton* sp.—to allow comparison of macroinvertebrate communities between these habitats.

Because water flow fluctuated irregularly, water depth measurements recorded during the sampling event were relative, not absolute depth measurements. Measurements of water depth at the macroinvertebrate and vegetation sampling stations were standardized to the annual mean depth using hydrologic data generated and maintained by USGS. A water stage recorder at Fort Edward records the river's stage height every 15 minutes of every day. The data providing stage height at Fort Edward at all time intervals during the 1998 spring survey, from May 18–27, were downloaded from the Internet (<http://water.usgs.gov/public/realtimedata.html>). The annual mean discharge for Fort Edward for the period from 1977 to 1996 was reported by USGS (1996) to be 5,180 ft³/sec. The annual mean stage height of 21.90 ft for Fort Edward was calculated from this value using a model of the relationship between stage height and discharge derived by USGS (1992). For each data point on each transect, the adjusted depth was calculated as:

$$AD = (G_{AM} - G_T) + D_T$$

where:

- AD = adjusted depth (ft)
- G_{AM} = annual mean stage height
- G_T = stage height at time T (ft)
- D_T = depth at time T.

Taxonomic Identification

ARC performed all analyses of macroinvertebrate samples. BMI and PMI samples were rinsed in the laboratory using a 500- μ m sieve to remove formalin and invertebrates from vegetation. All invertebrates in each BMI sample were sorted and identified. Because the first sample of PMI processed contained more than 1,000 individuals, a modified Caton subsampler was used to process the remaining PMI samples. Each quarter of the subsampler was counted until at least 300 organisms were found. Once started, a quarter was completely counted to enable estimation of the total number of individuals in the sample. Organisms from BMI and PMI samples were removed from the sample during sorting and placed into a vial of 70 percent ethyl alcohol.

Cladocerans, chironomids and oligochaetes were mounted using standard medium for identification. All other taxa were identified under a dissecting microscope. Multiple literature sources were used to confirm identifications (Attachment A-1 in Appendix A).

BIO MASS SAMPLES

Vegetation Biomass

Vegetation collected with each PMI sample was processed in the laboratory for dry-weight biomass determination after the associated macroinvertebrates were removed by rinsing. This vegetation biomass measurement allows the density of PMI to be calculated on a per gram vegetation basis.

Vegetation samples were also collected on June 14, 1998, using 0.1 m² quadrats. Sampling vegetation with quadrats requires employment of divers. Because sampling of PMI was not originally planned for the spring sampling event, field staff were not set up to collect vegetation from quadrats. Exponent field crew returned to the site with divers on June 14, 1998, and collected two replicate samples from three stations in each habitat. Samples contained water chestnut (*Trapa natans*), which was beginning its growing season and had rapidly expanded into the mixed vegetation beds. Because *T. natans* was not present in any of the PMI samples previously collected, *T. natans* stems were removed from all vegetation samples collected from quadrats. At the Griffin Island sampling area, the sampling objective was to collect vegetation from patches dominated by *Myriophyllum* sp. and *Potomogeton* sp. as were the PMI samples. Twelve samples were collected from patches that best represented the targeted species mix. Six samples (three of each species) most clearly dominated by a target species (either *Myriophyllum* sp. or *Potomogeton* sp.) were labeled accordingly. The remaining six were considered general mixed vegetation samples. Vegetation was cut at the base of the stem, removed from the quadrat, and processed for dry-weight biomass determination to allow conversion of invertebrate densities from individuals per gram vegetation to individuals per m².

Macroinvertebrate Biomass

Macroinvertebrate Sample Collection

Macroinvertebrates were collected for biomass determination using three sampling methods. Plankton tows were conducted to collect cladocerans and cyclopoid copepods. D-ring nets were used to sweep aquatic vegetation for PMI, and sediment cores were collected to capture BMI. All biomass samples were collected from May 18–20, 1998.

Plankton tows were conducted at the Griffin Island and Coveville sampling areas. The plankton net (80-µm mesh) was towed at a constant speed for 2–5 minutes. The objective was to collect enough plankton for biomass determination (250 individuals each of cladocerans and cyclopoid copepods); therefore, a flow meter was not used for quantification of water volume sampled. A minimum of three replicate tows per sampling area were collected. Plankton were rinsed through 80-µm sieves and concentrated into sample bottles. Ten percent buffered formalin was added to obtain a final concentration of 4 percent formaldehyde in each sample.

D-ring net samples were collected at Griffin Island and Coveville sampling areas. The D-ring net was swept through relatively dense aquatic vegetation beds and the contents of the net were rinsed through an 80- μm sieve and concentrated into 1-L sample bottles. Six replicate sweeps were made in each sampling area. The D-ring net contents were examined after each pass through the vegetation to ensure that adequate numbers of individuals and a high taxonomic diversity of invertebrates were being collected. Ten percent buffered formalin was added to sieved samples to obtain a total concentration of 8–10 percent formalin in each sample.

Sediment cores were collected from the Stillwater and Griffin Island sampling areas to obtain BMI for biomass determination. The method used to collect cores for benthic biomass determination was the same as that used in collecting cores for BMI taxonomy (see *Macroinvertebrate Communities* above). Samples were passed through a 500- μm sieve to reduce the sediment and detritus load and then preserved in one liter bottles with 10 percent buffered formalin.

Taxonomic Identification and Enumeration

All biomass samples were shipped to and analyzed by ARC. Exponent selected 14 taxonomic groups that are important in fish diets based on the September 1997 data for prey abundance. These taxonomic groups were Amphipoda, Aculidae, Anisoptera, *Caecidotea* sp., Chironomidae, Cladocera, Cyclopoida, Ephemeroptera, *Hexagenia* sp., Ostracoda, Trichoptera, and Zygoptera. Sediment core and D-ring net samples were washed through a 500- μm sieve in the laboratory. The plankton tow samples were washed through a 250 μm sieve. ARC sorted the macroinvertebrates in biomass samples into these groups with the goal of obtaining five sets (10 individuals each) for each taxonomic group except for planktonic groups. Cladocerans and cyclopoid copepods were grouped into five sets of 50 individuals each. Macroinvertebrates were sorted from the Griffin Island sampling area first until the maximum number of individuals was obtained (5×50 or 5×10 depending on the taxonomic group). Then, benthic biomass samples from the Stillwater sampling area and D-ring net samples from the Coveville sampling area were subsequently sorted in search of organisms for taxonomic groups for which the targeted total number of individuals were still lacking (*Hexagenia* sp., Trichoptera, Anisoptera and Aculidae).

Biomass Determination

Analytical methods for biomass measurements are described in the FSP (Exponent 1998a).

SEDIMENT CHEMISTRY SAMPLES

Sediment chemistry samples were collected using the same method as the BMI samples (see *Macroinvertebrate Collection for Taxonomic Identification*) in accordance with the FSP (Exponent 1998a). Three replicate sediment chemistry samples were collected in each vegetated habitat and one sample was collected in the unvegetated habitat in each sampling area. All 30 sediment chemistry samples were shipped to Columbia Analytical Services, Inc. of Kelso, Washington, for TOC and grain size analysis. Analytical methods are described in the FSP (Exponent 1998a).

RESULTS

Results of taxonomic identifications, biomass determinations, fish length measurements, and sediment analyses are presented in the following sections. The results of the quality assurance review of the fish stomach-content data, the BMI and PMI data, and sediment data are presented in Appendices A-C, respectively.

FISH STOMACH-CONTENT ANALYSES

Table 1 lists the total number of fish collected and archived and the number of stomachs found empty. The results of the stomach-content analyses are presented in Tables 2 and 3; Appendix D, Table D-1 provides a key to the taxonomic codes used in Tables 2 and 3.

Analyses were completed on stomach contents from 21 brown bullhead, 2 yellow bullhead, 11 largemouth bass, 15 spottail shiner, and 15 yellow perch from the Coveville sampling area and on stomach contents from 17 brown bullhead, 3 yellow bullhead, 16 largemouth bass, 12 spottail shiner, and 15 yellow perch from the Griffin Island sampling area (Table 1). Of these fish stomachs, 13 were found to be empty. Two yellow perch from the Coveville sampling area were archived because they were not needed to obtain sufficient numbers of prey for diet characterization.

BENTHIC AND PHYTOPHILOUS MACROINVERTEBRATE ANALYSES

The water depth at each station sampled for BMI and sediment chemistry samples is presented in Table 4.

Eighty-one BMI samples and 12 PMI samples were processed for taxonomic identification and enumeration. All organisms were identified to the lowest possible taxonomic level. Tables 5 and 6 present the number of BMI identified in each sample by taxonomic group, and Table 7 presents the number of PMI identified in each sample by taxonomic group. Table D-1, Appendix D provides a key to the taxonomic codes used in Tables 5-7.

BIOMASS DETERMINATIONS

Vegetation Biomass

The dry-weight biomass of vegetation collected with PMI is presented in Table 7. The results of dry-weight biomass determination for 18 samples of vegetation from quadrats is presented in Table 8.

Macroinvertebrate Biomass

Sufficient numbers of individuals were collected to complete five replicate sets for all taxonomic groups except Zygoptera, *Hexagenia* sp., Aencylidae and Anisoptera. Two replicate sets each were formed for Zygoptera and *Hexagenia* sp. but fewer than 10 individuals total were found to represent either Aencylidae and Anisoptera. For some taxonomic groups, individuals from multiple samples had to be combined to create full replicate sets. The results of the dry-weight biomass determinations are presented in Table 9.

SEDIMENT CHEMISTRY

The TOC content and grain-size distribution of sediments collected at each station are presented in Table 10.

SUMMARY OF QUALITY ASSURANCE REVIEW

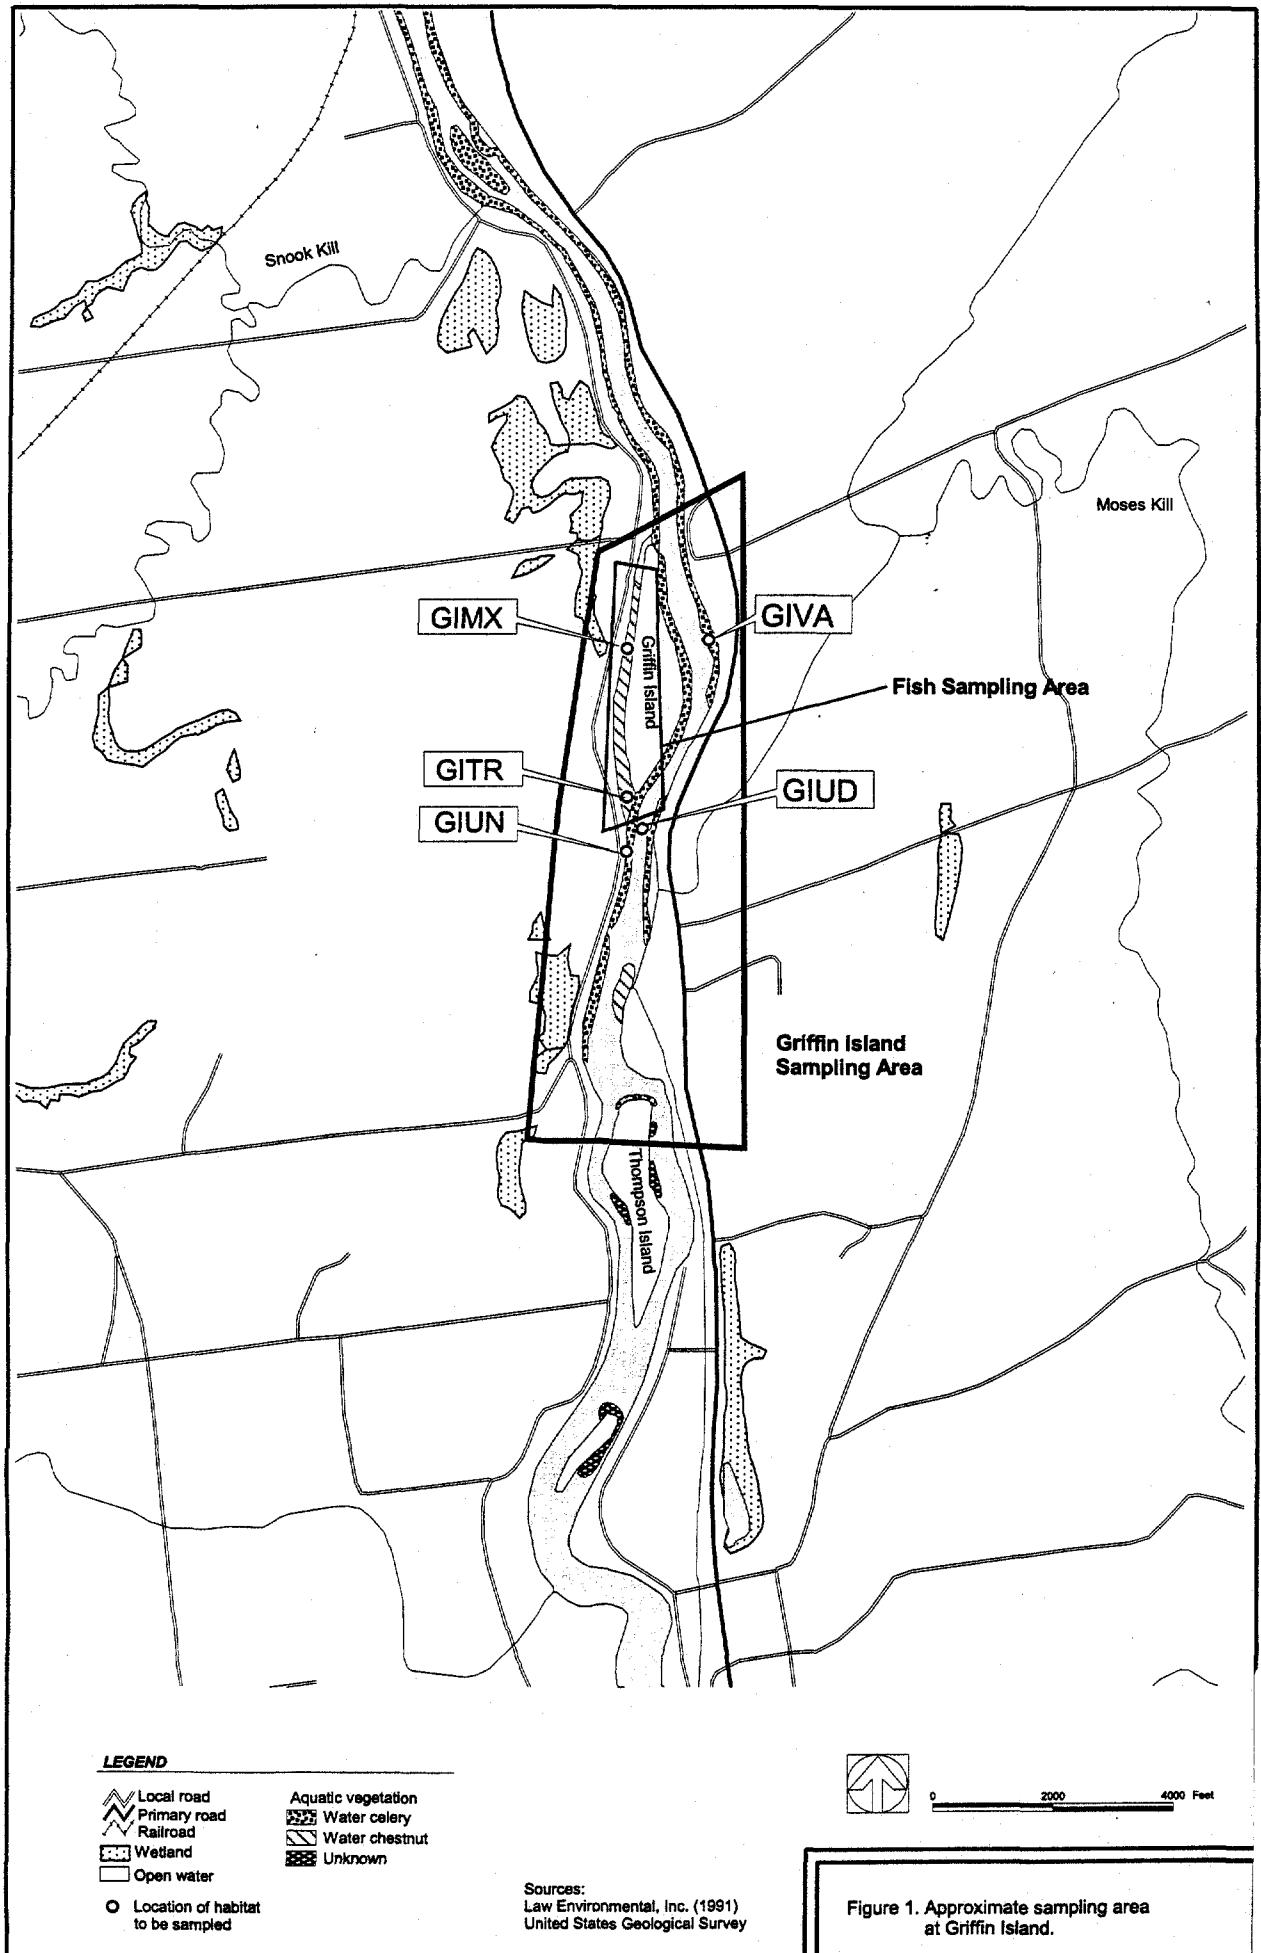

The quality assurance review was conducted to verify that the laboratory quality assurance and quality control procedures were documented and that the quality of the data is sufficient to meet the project's data quality objectives and support the use of the data for its intended purposes. All of the fish stomach content data, the PMI and BMI data, the vegetation biomass determinations, and the sediment analytical data are acceptable relative to the data quality objectives for this study (Appendices A-C).

^a Station IDs are coded as follows:

The first two letters designate the sampling area

CV - Coveville

GI - Griffin Island

The second two letters designate habitat type

TR - *Trapa natans*

MX - Mixed vegetation

VA - *Vallisneria americana*

UD - Unvegetated deep water

UN - Unvegetated

The fifth letter designates the station.

^b Sloped river bottom.

^a Station IDs are coded as follows:

The first two letters designate the area

CV - Coveville

GI - Griffin Island

The second two letters designate habitat type

MX - Mixed vegetation

TR - *Trapa natans*

VA - *Vallisneria americana*

UN - Unvegetated

The fifth letter designates the station

^b Full identification, to the lowest level possible is presented in Appendix D.

^c Pupa stage.

^a Station IDs are coded as follows:

The first two letters designate the area

CV - Coveville

GI - Griffin Island

The second two letters designate habitat type

MX - Mixed vegetation

TR - *Trapa natans*VA - *Vallisneria americana*

UN - Unvegetated

The fifth letter designates the station

^b Full identification, to the lowest level possible, is presented in Appendix D.^c Pupa stage.

Number of Individuals Composited Per Mean Biomass Determined	10	10	10	10	10	10	10	10	10	10	10	10	10

Note: Key to sample prefixes:

- KB - plankton tow
- PB - D-ring net sweep
- BI - benthic core

^a All samples collected from the Griffin Island sampling area except for sample numbers PB0007 (Coveville sampling area) and B10003 (Stillwater sampling area).

^b Values represent an average of triplicate mass measurements required for quality control.

^c Weight is below detection limit of instrument (<0.1 mg).

^d Values with more than one sample number represent a composite of x individuals sampled from all sample numbers listed.

Quality Assurance Review Summary—Fish Stomach- Content Taxonomic Analyses

QUALITY ASSURANCE REVIEW SUMMARY— FISH STOMACH-CONTENT TAXONOMIC ANALYSES

This summary documents the results of the quality assurance review of the fish stomach-content data generated in 1998 for the assessment of ecological value and food-web structure in segments of the Upper Hudson River. The quality assurance review was performed to ensure that sampling, analyses, and data validation were conducted in accordance with specifications of the field sampling plan (FSP) (Exponent 1998) and that data are acceptable for use in future stages of the food-web study.

The quality assurance review consisted of an evaluation of the following major elements of the fish stomach-content investigation:

- **Field Methods**—Were the major specifications of the field sampling procedures followed as described in the FSP (Exponent 1998)?
- **Laboratory Methods**—Were the major specifications of the laboratory testing procedures followed as described in the quality assurance project plan (QAPP) contained within the FSP (Exponent 1998)?
- **Taxonomic Accuracy**—Were the taxonomic identifications verified by taxonomists outside the taxonomic laboratory?
- **Test Results**—Were there any anomalous results that should be rejected or qualified?

SUMMARY OF QUALIFIED DATA

Taxonomic identifications were reported for 58 fish stomach-content samples from the Coveville sampling area and for 56 fish stomach-content samples from the Griffin Island sampling area. Results were not available for 7 fish stomach-content samples from the Coveville sampling area and for 6 fish stomach-content samples from Griffin Island sampling area because no organisms were found in those samples. Seventeen fish stomach-content samples contained prey fish and were identified by Ichthyological Associates, Inc., (IA) of Lansing, New York. Based on the results of this quality assurance review, all of the fish stomach-content data presented in this report are considered acceptable for use during the food-web study.

FIELD METHODS

The quantities of each species collected are described in the *Methods* section of the main text. The major field collection specifications for the fish stomach-content study were identified in the FSP (Exponent 1998) as follows:

- Fish were collected using a boat electroshocker
- At least 20 largemouth bass, 20 bullhead, 15 yellow perch, and 15 spottail shiner were collected from each sampling area
- All fish were weighed and measured for total length before removing stomach contents or preserving the body
- Stomach contents of bullhead and bass were removed and immediately preserved in a buffered solution of 10 percent formalin
- The abdomen of forage species was slit, and a buffered solution of 10 percent formalin was injected into the gut
- Proper chain-of-custody documentation was maintained at all times.

Coordination with the New York State Department of Environmental Conservation limited the effort used in collecting target fish. Thus, in some cases, the target number of fish was not achieved. In both sampling areas, many of the largemouth bass that were collected had empty stomachs; consequently, fewer than 20 largemouth bass with stomach contents were collected. Also, fewer than 15 spottail shiner were collected from the Griffin Island sampling area. All other targeted totals either were met or exceeded. The other specifications of the FSP were followed. Based on the major field procedures used to collect fish stomach-content samples, all of the results of the fish stomach-content evaluations are considered acceptable for use during this food-web study.

LABORATORY METHODS

The analytical methods for fish stomach contents were based on the following specifications presented in the QAPP portion of the FSP (Exponent 1998):

- Samples were re-screened and transferred to a solution of 70 percent ethanol between 1 and 10 days after fixation with formalin in the field
- Samples were sorted into major taxonomic groups with the aid of a 10x dissecting microscope or a magnifying lamp
- Organisms were identified to the lowest taxonomic level possible (target is species) by experienced taxonomists using the appropriate taxonomic literature

- Taxonomic identifications were verified by taxonomists outside the analytical laboratory
- A reference collection was prepared (including the various taxa identified during the project) and archived.

Based on the major laboratory methods used for the stomach-content analyses, all of the results are considered acceptable for use during the food-web study.

Taxonomic Accuracy

The accuracy of taxonomic identifications was ensured by using the appropriate taxonomic literature to make the initial identifications (Attachment A-1 in Appendix A) and by having the identities of representative taxa in the reference collection of Aquatic Resources Center (ARC) verified by outside taxonomists (Table A-1). IA verified the identities of all organisms except chironomids and oligochaetes. Dr. Len Ferrington, a chironomid expert, verified identities of all chironomids in the reference collection, and Mr. Mark Wetzel, an oligochaete expert, of Invertaxon verified the identities of all oligochaetes in the reference collection.

The literature that the laboratory used is considered appropriate for identifying invertebrate taxa found in the vicinity of the Hudson River. A reference collection containing macroinvertebrate taxa identified in all macroinvertebrate samples and a second reference collection containing additional taxa identified in fish stomachs were created and sent to the verifying taxonomists. A comparison of identifications made by ARC, IA, Dr. Ferrington, and Invertaxon is presented in Table A-2. The results of the reference collection verifications indicated that in nearly all cases the identifications made by ARC were accurate. ARC discussed any discrepancies in classification with the verifying taxonomist until a final identification was agreed upon. Comparison of identifications between ARC and the external taxonomists resulted in a total of 4 identifications being changed from the original taxonomic identification. Differences in the level of classification identified are not considered discrepancies. Changes noted in the comment column of Table A-2 were applied to all samples in the fish stomach-content database.

Based on the results of the fish stomach-content evaluations, all results are considered acceptable for use during the food-web study.

DATA MANAGEMENT

Each field in Exponent's Microsoft Access® database was checked against the original laboratory bench sheets to detect data entry or formatting errors. Ambiguous entries in laboratory bench sheets were confirmed over telephone with laboratory taxonomists. All errors were corrected both in the laboratory records and Exponent's database. The data in all data tables presented in this report were verified against the Exponent database to detect any errors resulting from improper database queries or spreadsheet manipulation.

QUALITY ASSURANCE RESULTS

Based on the results of the quality assurance review, all fish stomach-content data are considered acceptable for use during the food-web study.

Appendix B

**Quality Assurance Review
Summary—Benthic and
Phytophilous Macroinvertebrate
Taxonomic Analyses**

QUALITY ASSURANCE REVIEW SUMMARY—BENTHIC AND PHYTOPHILOUS MACROINVERTEBRATE TAXONOMIC ANALYSES

This summary documents the results of the quality assurance review of the benthic macroinvertebrate (BMI) and phytophilous macroinvertebrate (PMI) data generated in 1998 for the assessment of ecological value and food-web structure in segments of the Upper Hudson River. The quality assurance review was performed to ensure that sampling, analyses, and data validation were conducted in accordance with specifications of the field sampling plan (FSP) (Exponent 1998) and that data are acceptable for use in future stages of the food-web study.

The quality assurance review consisted of an evaluation of the following major elements of the BMI and PMI investigation:

- **Field Methods**—Were the major specifications of the field sampling procedures followed as described in the FSP (Exponent 1998)?
- **Laboratory Methods**—Were the major specifications of the laboratory testing procedures followed as described in the quality assurance project plan (QAPP) contained within the FSP (Exponent 1998)?
- **Sorting Efficiency**—Was each sample sorted with an efficiency of greater than or equal to 95 percent?
- **Taxonomic Accuracy**—Were the taxonomic identifications verified by taxonomists outside the taxonomic laboratory?
- **Test Results**—Were there any anomalous results that should be rejected or qualified?

SUMMARY OF QUALIFIED DATA

Taxonomic and biomass results were reported for 45 BMI and 6 PMI samples from the Griffin Island sampling area and for 36 BMI and 6 PMI samples from the Coveville sampling area.

As specified in the QAPP, a section of the FSP (Exponent 1998), Aquatic Resources Center (ARC) re-sorted 20 percent of the BMI and 20 percent of the PMI samples. In addition, the voucher collection assembled by ARC was sent to Ichthyological Associates, Inc., (IA) of Lansing, New York, Dr. Len Ferrington, and Invertaxon for

confirmation of identifications. Based on the results of the quality assurance review, all of the BMI and PMI data are considered acceptable for use during the food-web study.

FIELD METHODS

The field collection procedures for the BMI and PMI studies were identified in the FSP (Exponent 1998) as follows:

- BMI assemblages were sampled using a 3-in. diameter gravity-assisted corer.
- PMI assemblages were sampled using Plexiglas® boxes as described by Downing (1986). The inside dimensions of the boxes were 30 × 20 × 10 cm (6-L volume).
- The sediment surface of all acceptable BMI samples was relatively undisturbed, and a minimum penetration of 8 in. was achieved for all cores.
- Each sample was preserved in 10 percent solution of buffered formalin
- Proper chain-of-custody documentation was maintained at all times.

Based on the major field procedures used to collect BMI and PMI samples, all of the results of the BMI and PMI evaluations are considered acceptable for use during the food-web study.

LABORATORY METHODS

The analytical methods for the BMI and PMI assemblages were based on specifications presented in the QAPP section of the FSP (Exponent 1998) as follows:

- Samples were re-screened and transferred to a solution of 70 percent ethanol between 1 and 10 days after preserving with formalin in the field
- Samples were sorted into major taxonomic groups with the aid of a 10× dissecting microscope or a magnifying lamp
- Sorting efficiency was monitored by a second taxonomist who re-sorted at least 20 percent of BMI samples
- Organisms were identified to the lowest taxonomic level possible (species level) by experienced taxonomists using the appropriate taxonomic literature

- Taxonomic identifications were verified by taxonomists outside the analytical laboratory
- A reference collection was prepared (including the various taxa identified during the project) and archived.

All specifications listed above were followed. Based on the major laboratory methods used for the BMI and PMI evaluations, all results are considered acceptable for use during the food-web study.

Sorting Efficiency

Sorting efficiency was monitored by a second taxonomist who re-sorted at least 20 percent of all BMI samples. Sorting efficiency for each sample was calculated by dividing the total number of individuals overlooked by the total number of individuals in the original analysis. Then, this number was deducted from 1.0 and multiplied by 100 for conversion to percent efficiency.

The specified minimum sorting efficiency was 95 percent of the total number of organisms present in a sample. The results of the re-sorting indicated that samples sorted by two different taxonomists had failed to meet the minimum sorting efficiency. One of the taxonomists had sorted only the three samples that had been re-sorted for quality assurance. Thus, no further action was necessary. However, the other taxonomist had sorted many additional samples and failure of his three samples required that other samples sorted by him be re-sorted. Thus, another 20 percent (4 samples) of the 17 samples sorted by this taxonomist were re-sorted. Of these, 3 samples failed to meet the minimum 95 percent sorting efficiency. However, it was determined that failure was due to the very small total number of individuals in each sample (i.e., less than 40), which thereby limits the number of allowable missed taxa to fewer than two. Given that the sorting efficiencies of the three samples that failed in the second round were greater than 90 percent, it was decided that no more action was required.

Taxonomic Accuracy

The accuracy of taxonomic identifications was ensured by using the appropriate taxonomic literature to make the initial identifications (Attachment A-1 in Appendix A) and by having identities of representative taxa in the reference collection of ARC verified by outside taxonomists (Table A-1 in Appendix A). IA verified the identities of all organisms except chironomids and oligochaetes. Dr. Len Ferrington, a chironomid expert, verified identities of all chironomids in the reference collection, and Mr. Mark Wetzel, an oligochaete expert, of Invertaxon verified identities of all oligochaetes in the collection.

Eight discrepancies were identified during verification that resulted in changed identifications. A comparison of identifications made by ARC, IA, Dr. Ferrington, and Invertaxon is presented in Table B-1. ARC discussed any discrepancies in classification with the

verifying taxonomist until a final identification was agreed upon. Changes noted in the comment column of Table B- were applied to all samples in the BMI and PMI database. Based on taxonomic accuracy, all of the results of the BMI and PMI evaluations are considered acceptable for use during the food-web study.

DATA MANAGEMENT

Each field in Exponent's Microsoft Access® database was checked against the original laboratory bench sheets to detect data entry and formatting errors. Ambiguous entries in laboratory bench sheets were confirmed over the telephone with laboratory taxonomists. All errors were corrected both in the laboratory records and the Exponent database. The data in all data tables presented in this report were verified against the Exponent database to detect errors due to improper database queries or spreadsheet manipulation.

QUALITY ASSURANCE RESULTS

Based on the results of the quality assurance review, all BMI and PMI data are considered acceptable for use during the food-web study.

^b Differences in the level of classification identified are not considered discrepancies.

Appendix C

**Quality Assurance Review
Summary—Sediment
Investigation**

QUALITY ASSURANCE REVIEW SUMMARY— SEDIMENT INVESTIGATION

INTRODUCTION

A total of 30 sediment samples were collected and analyzed for a study of the food-web structure of the Upper Hudson River. The samples were collected in spring 1998, and included 28 natural samples and 2 field duplicate samples. An EPA Level III data validation was completed for grain size and total organic carbon (TOC). Data assessment procedures were based on *U.S. EPA Contract Laboratory Program, National Functional Guidelines for Organic Data Review* (U.S. EPA 1994). The following laboratory deliverables were reviewed during this data validation process:

- The case narrative discussing analytical problems (if any) and procedures
- Chain-of-custody documentation to verify completeness of data
- Results from all laboratory quality control check samples, including initial and continuing calibration check samples, matrix spikes, and laboratory duplicate sample analyses, to assess analytical accuracy and precision
- All reported sample data for analyses performed.

No results were rejected during the data validation process. All analyses were performed by Columbia Analytical Services, Inc., Kelso, Washington.

COMPLETENESS

The completeness of the analytical data set was assessed by comparing the total number of data points generated to the number of data points rejected and calculating a percent completeness. None of the data were rejected; therefore, the analytical data collected were considered 100 percent complete.

ANALYTICAL METHODS

Analyses were completed in accordance with the methods listed in the table below:

ANALYTICAL METHODS

Constituent	Method	Reference
Grain size	ASTM D422 Modified	ASTM (1989)
Total organic carbon	ASTM D4129-82 Modified	ASTM (1991)

QUALITY ASSURANCE REVIEW SUMMARY

For individual quality assurance and quality control measures performed by the laboratory or instigated in the field, the following sections summarize any problems noted during review of the data and specify how affected sample results were qualified.

Holding Times

Holding time constraints were met for all samples.

Instrument Performance

The performance of the analytical instruments, as documented by the laboratory, was acceptable.

Initial and Continuing Calibration

Initial and continuing calibration verification standards were completed for TOC only, and met the criteria for acceptable performance and frequency of analysis.

Initial and Continuing Calibration Blanks

The initial and continuing calibration blank analyses for TOC met the criteria for acceptable performance and frequency of analysis.

Method Blank Analyses

No analytes were detected in the method blanks.

for poor precision because of the limitations in the method and because the material in these samples did not contain a significant number of large particles. No data were qualified based on these exceedances.

- There was one RPD exceedance for grain size in the other field duplicate sample. The exceedance was associated with a large grain size. No data were qualified due to this field quality control sample exceedance.

OVERALL ASSESSMENT

Results of the review of all quality control checks are presented in Table C-1. All data are considered acceptable for use during the food-web study.

DerTrifi	Annelida	Oligochaeta		Tubificida		Naididae		Dero	trifida	Aquatic worms
DicLeuco	Arthropoda	Insecta		Diptera		Chironomidae		Dicrotendipes	leucoscelis	True flies
DicModes	Arthropoda	Insecta		Diptera		Chironomidae		Dicrotendipes	modestus	True flies
DicNeomo	Arthropoda	Insecta		Diptera		Chironomidae		Dicrotendipes	neomodestus	True flies
DidTrans	Arthropoda	Insecta		Odonata		Libellulidae		Didymops	transversa	Skimmers
Diptera	Arthropoda	Insecta		Diptera						True flies
Donacia	Arthropoda	Insecta		Coleoptera		Chrysomelidae		Donacia		Beetles
Dubiraph	Arthropoda	Insecta		Coleoptera		Elmidae		Dubiraphia		Beetles
Dytiscid	Arthropoda	Insecta		Coleoptera		Dytiscidae				Beetles
Eggs										Eggs
Einfeldi	Arthropoda	Insecta		Diptera		Chironomidae		Einfeldia		True flies

TABLE D-1. (cont.)

Taxon	Phylum	Class	Subclass	Order	Suborder	Family	Subfamily	Genus	Species	Common Name
EinNatci	Arthropoda	Insecta		Diptera		Chironomidae		Einfeldia	natchitocheae	True flies
EisTetra	Annelida	Oligochaeta		Haplotauxida		Lumbricidae		Eiseniella	tetraedra	Aquatic worms
EllCompl	Mollusca	Bivalvia		Unionoida		Unionidae		Elliptio	complanata	Clams
Enallagm	Arthropoda	Insecta		Odonata		Coenagrionidae		Enallagma		Damselflies
EncA	Annelida	Oligochaeta		Haplotauxida		Enchytraeidae		A		Aquatic worms
EncB	Annelida	Oligochaeta		Haplotauxida		Enchytraeidae		B		Aquatic worms
EndNigri	Arthropoda	Insecta		Diptera		Chironomidae		Endochironomus	nigricans	True flies
EndSubte	Arthropoda	Insecta		Diptera		Chironomidae		Endochironomus	subtendens	True flies
Entomobr	Arthropoda	Insecta		Collembola		Entomobryidae				Springtails
Ephemere	Arthropoda	Insecta		Ephemeroptera		Ephemerellidae		Ephemerella		Mayflies
Ephemero	Arthropoda	Insecta		Ephemeroptera						Mayflies
Ephydrid	Arthropoda	Insecta		Diptera		Ephydriidae				True flies
Epitheca	Arthropoda	Insecta		Odonata		Libellulidae		Epitheca		Skimmers
Epoicocl	Arthropoda	Insecta		Diptera		Chironomidae		Epoicocladius		True flies
Erpobdel	Annelida	Oligochaeta		Pharyngobdellida		Erpobdellidae				Aquatic worms
Eurycerc	Arthropoda	Crustacea		Cladocera		Chydoridae		Eurycercus		water fleas
Euryloph	Arthropoda	Insecta		Ephemeroptera		Ephemerellidae		Eurylophella		Mayflies
Fabria	Arthropoda	Insecta		Trichoptera		Phryganeidae		Fabria		Caddisflies
Ferrissi	Mollusca	Gastropoda		Basommatophora		Ancylidae		Ferrissia		Limpets
GamFacia	Arthropoda	Crustacea		Amphipoda		Gammaridae		Gammarus	fasciatus	Scuds
Gammarid	Arthropoda	Crustacea		Amphipoda		Gammaridae				Scuds
Gammarus	Arthropoda	Crustacea		Amphipoda		Gammaridae		Gammarus		Scuds
Gastropo	Mollusca	Gastropoda								Snails; limpets
Gerridae	Arthropoda	Insecta		Heteroptera		Gerridae				Water striders
GilAltii	Mollusca	Gastropoda		Mesogastropoda		Hydrobiidae		Gilia	altilis	Snails
Glyptote	Arthropoda	Insecta		Diptera		Chironomidae		Glyptotendipes		True flies
Gomphida	Arthropoda	Insecta		Odonata		Gomphidae				Dragonflies
GraTestu	Arthropoda	Crustacea		Cladocera		Chydoridae		Graptoleberis	testudinaria	water fleas
GutGutti	Arthropoda	Insecta		Diptera		Chironomidae		Guttipelopia	guttipennis	True flies
GyrDefle	Mollusca	Gastropoda		Basommatophora		Planorbidae		Gyraulus	deflectus	Snails
GyrParvu	Mollusca	Gastropoda		Basommatophora		Planorbidae		Gyraulus	parvus	Snails
Harpacti	Arthropoda	Crustacea	Copepoda	Harpacticoida						Copepods
Helobdel	Annelida	Hirudinea		Rhynchobdellida		Glossiphoniidae		Helobdella		Leech
HelStagn	Annelida	Hirudinea		Rhynchobdellida		Glossiphoniidae		Helobdella	stagnalis	Leech
HelTrise	Annelida	Hirudinea		Rhynchobdellida		Glossiphoniidae		Helobdella	triserialis	Leech
Hemipter	Arthropoda	Insecta		Hemiptera						True bugs
Heptagen	Arthropoda	Insecta		Ephemeroptera		Heptageniidae				Mayflies
Hesperoc	Arthropoda	Insecta		Hemiptera		Corixidae		Hesperocorixa		True bugs
Hexageni	Arthropoda	Insecta		Ephemeroptera		Ephemeridae		Hexagenia		Mayflies
HexLimba	Arthropoda	Insecta		Ephemeroptera		Ephemeridae		Hexagenia	limbata	Mayflies
Hirudine	Annelida	Hirudinea								Leeches
HyaAztec	Arthropoda	Crustacea		Amphipoda		Hyalellidae		Hyalella	azteca	Scuds
HydBront	Arthropoda	Insecta		Trichoptera		Hydropsychidae		Hydropsyche	bronta	Caddisflies
HydPhale	Arthropoda	Insecta		Trichoptera		Hydropsychidae		Hydropsyche	phalerata	Caddisflies
Hydra	Cnidaria	Hydrozoa		Hydroida		Hydridae		Hydra		Hydroids

TABLE D-1. (cont.)

Taxon	Phylum	Class	Subclass	Order	Suborder	Family	Subfamily	Genus	Species	Common Name
Hydrachn	Arthropoda	Arachnida		Hydrachnidia						Water mites
Hydrodro	Arthropoda	Arachnida	Acarina	Trombidiformes		Hydrodromidae		Hydrodroma		Water mites
Hydrop	Arthropoda	Insecta		Trichoptera		Hydroptilidae				Caddisflies
Hydropor	Arthropoda	Insecta		Coleoptera		Dytiscidae				Beetles
Hydropsy	Arthropoda	Insecta		Trichoptera		Hydropsychidae				Caddisflies
Hydropti	Arthropoda	Insecta		Trichoptera		Hydroptilidae				Caddisflies
Hygrobac	Arthropoda	Arachnida	Acarina	Trombidiformes		Hygrobatidae		Hydroptila		Water mites
IlyA	Arthropoda	Crustacea		Cladocera		Macrothricidae		Ilyocryptus		Water fleas
IlyB	Arthropoda	Crustacea		Cladocera		Macrothricidae		Ilyocryptus		Water fleas
IlyTempl	Annelida	Oligochaeta		Tubificida		Tubificidae		Ilyodrilus	templetoni	Aquatic worms
Isonychi	Arthropoda	Insecta		Ephemeroptera		Oligoneuriidae		Isonychia		Mayflies
Isopoda	Arthropoda	Crustacea		Isopoda						Aquatic sow bugs
Isotomid	Arthropoda	Insecta		Collembola		Isotomidae				Springtails
Koenikea	Arthropoda	Arachnida	Acarina	Trombidiformes		Unionicolidae		Koenikea		Water mites
LabNeopi	Arthropoda	Insecta		Diptera		Chironomidae		Labrundinia		True flies
LamRadia	Mollusca	Bivalvia		Unionoida		Unionidae		Lampsilis		Clams
Larsia	Arthropoda	Insecta		Diptera		Chironomidae		Larsia		True flies
Lebertia	Arthropoda	Arachnida	Acarina	Trombidiformes		Lebertiidae		Lebertia		Water mites
LepAmeri	Arthropoda	Insecta		Trichoptera		Leptoceridae		Leptocerus	americanus	Caddisflies
Lepidopt	Arthropoda	Insecta		Lepidoptera						Butterflies; Moths
Leptocer	Arthropoda	Insecta		Trichoptera		Leptoceridae				Caddisflies
LimHoffm	Annelida	Oligochaeta		Tubificida		Tubificidae		Limnodrilus	hoffmeisteri	Aquatic worms
Limnephil	Arthropoda	Insecta		Trichoptera		Limnephilidae				Caddisflies
Limnesia	Arthropoda	Arachnida	Acarina	Trombidiformes		Limnesiidae		Limnesia		Water mites
LimUdeke	Annelida	Oligochaeta		Tubificida		Tubificidae		Limnodrilus	udekemianus	Aquatic worms
Lumbrica	Annelida	Oligochaeta		Haplotaxida	Lumbricina					Aquatic worms
Lumbri	Annelida	Oligochaeta		Haplotaxida		Lumbricidae				Aquatic worms
Lymnaeid	Mollusca	Gastropoda		Basommatophora		Lymnaeidae				Snails
Macromia	Arthropoda	Insecta		Odonata		Libellulidae		Macromia		Skimmers
Macronyc	Arthropoda	Insecta		Coleoptera		Elmidae		Macronymchus		Beetles
Mallocho	Arthropoda	Insecta		Diptera		Ceratopogonidae		Mallochohelea		True flies
ManSpeci	Annelida	Polychaeta		Sabellida		Sabellidae		Manayunkia		Marine worms
MicDilat	Mollusca	Gastropoda		Basommatophora		Planorbidae		Micromenetus		Snails
Microten	Arthropoda	Insecta		Diptera		Chironomidae		Microtendipes		True flies
Mideopsi	Arthropoda	Arachnida	Acarina	Trombidiformes		Mideopsidae		Mideopsis		Water mites
Molanna	Arthropoda	Insecta		Trichoptera		Molannidae		Molanna		Caddisflies
Muscidae	Arthropoda	Insecta		Diptera		Muscidae				True flies
MusPartu	Mollusca	Bivalvia		Heterodontia		Sphaeriidae		Musculium		Clams
NaiParda	Annelida	Oligochaeta		Tubificida		Naididae		Nais		Aquatic worms
NaiSimpl	Annelida	Oligochaeta		Tubificida		Naididae		Nais		Aquatic worms
Nanoclad	Arthropoda	Insecta		Diptera		Chironomidae		Nanocladius		True flies
Nematoda	Nematoda									Round worms
Nematomo	Nematomorpha									Horsehair worms
Nemertea	Nemertea									Ribbon worms
Neoplea	Arthropoda	Insecta		Hemiptera		Pleidae		Neoplea		True bugs
Neurecli	Arthropoda	Insecta		Trichoptera		Polycentropodidae		Neureclipsis		Caddisflies

TABLE D-1. (cont.)

Taxon	Phylum	Class	Subclass	Order	Suborder	Family	Subfamily	Genus	Species	Common Name
Nilothau	Arthropoda	Insecta		Diptera		Chironomidae		Nilothauma		True flies
Notonect	Arthropoda	Insecta		Heteroptera		Notonectidae		Notonecta		Semiaquatic true bugs
Oecetis	Arthropoda	Insecta		Trichoptera		Leptoceridae		Oecetis		Caddisflies
OphSerpe	Annelida	Oligochaeta		Tubificida		Naididae		Ophidonaia		Aquatic worms
Orconect	Arthropoda	Malacostraca		Decapoda		Cambaridae		Orconectes	serpentina	Crayfish
OrtC	Arthropoda	Insecta		Diptera		Chironomidae	Orthocladiinae	c		True flies
Orthocla	Arthropoda	Insecta		Diptera		Chironomidae	Orthocladiinae			True flies
Orthotri	Arthropoda	Insecta		Trichoptera		Hydroptilidae		Orthotrichia		Caddisflies
Pagastie	Arthropoda	Insecta		Diptera		Chironomidae		Pagastiella		True flies
ParA	Arthropoda	Insecta		Diptera		Chironomidae		Parakiefferiella	A	True flies
Parachir	Arthropoda	Insecta		Diptera		Chironomidae		Parachironomus		True flies
Paralaut	Arthropoda	Insecta		Diptera		Chironomidae		Paralauterborniella		True flies
Parapony	Arthropoda	Insecta		Lepidoptera		Pyralidae	Nymphulinae	Paraponyx		Moths
Paratany	Arthropoda	Insecta		Diptera		Chironomidae		Paratanytarsus		True flies
Paratend	Arthropoda	Insecta		Diptera		Orthocladiinae		Paratendipes		True flies
Peltodyt	Arthropoda	Insecta		Coleoptera		Haliporidae		Peltodytes		Beetles
Perithem	Arthropoda	Insecta		Odonata		Libellulidae		Perithemis		Skimmers
Phaenops	Arthropoda	Insecta		Diptera		Chironomidae		Phaenopsectra		True flies
Phylocen	Arthropoda	Insecta		Trichoptera		Psychomyiidae		Phylocentropus		Caddisflies
Physa	Mollusca	Gastropoda		Basommatophora		Physidae		Physa		Snails
Physidae	Mollusca	Gastropoda		Basommatophora		Physidae				Snails
Piona	Arthropoda	Arachnida	Acarina	Trombidiformes		Pionidae		Piona		Water mites
Pisidium	Mollusca	Bivalvia		Heterodonta		Sphaeriidae		Pisidium		Clams
Planarii	Platyhelminthe	Turbellaria		Tricladida		Planariidae				Flatworms
Planorbi	Mollusca	Gastropoda		Basommatophora		Planorbidae				Snails
PlaTrivo	Mollusca	Gastropoda		Basommatophora		Planorbidae		Planorabella	scalaris	Snails
Platycen	Arthropoda	Insecta		Trichoptera		Limnephilidae		Platycentropus		Caddisflies
PleDenti	Arthropoda	Crustacea		Cladocera		Chydoridae		Pleuroxus	denticulatus	water fleas
Podocopi	Arthropoda	Crustacea	Ostracoda	Podocopa						Seed shrimp
PolDipse	Arthropoda	Insecta		Trichoptera		Polycentropodidae		Polycentropus/Dipseudopsidae		Caddisflies
PolLaetu	Arthropoda	Insecta		Diptera		Chironomidae		Polydipedium	laetum	True flies
PolPedic	Arthropoda	Crustacea		Cladocera		Polyphemidae		Polyphemus	pediculus	Water fleas
PoiTritu	Arthropoda	Insecta		Diptera		Chironomidae		Polydipedium	tritum	True flies
Polycent	Arthropoda	Insecta		Trichoptera		Polycentropodidae				Caddisflies
Polycent	Arthropoda	Insecta		Trichoptera		Polycentropodidae		Polycentropus		Caddisflies
Polypedi	Arthropoda	Insecta		Diptera		Chironomidae		Polydipedium		True flies
PriLeidy	Annelida	Oligochaeta		Tubificida		Naididae		Pristina	leidyi	Aquatic worms
ProBellu	Arthropoda	Insecta		Diptera		Chironomidae		Procladius	bellus	True flies
Probezzi	Arthropoda	Insecta		Diptera		Ceratopogonidae		Probezzia		True flies
Procladi	Arthropoda	Insecta		Diptera		Chironomidae		Procladius		True flies
ProExacu	Mollusca	Gastropoda		Basommatophora		Planorbidae		Promenetus	exacuous	Snails
PseColum	Mollusca	Gastropoda		Basommatophora		Lymnaeidae		Pseudosuccinea	columella	Snails
Psectroc	Arthropoda	Insecta		Diptera		Chironomidae		Psectrocladius		True flies
Pseudoch	Arthropoda	Insecta		Diptera		Chironomidae		Pseudochironomus		True flies
Pyralida	Arthropoda	Insecta		Lepidoptera		Pyralidae				Moths
QuiMulti	Annelida	Oligochaeta		Tubificida		Tubificidae		Quistadrilus	multisetosus	Aquatic worms

TABLE D-1. (cont.)

Taxon	Phylum	Class	Subclass	Order	Suborder	Family	Subfamily	Genus	Species	Common Name
