## SECTION 1 - INTRODUCTION

### 1.01 Background

O'Brien & Gere Engineers, Inc. (O'Brien & Gere) conducted field studies in a 40 mile reach of the upper Hudson River extending from Hudson Falls to Troy, New York. This work was prompted by the PCB Reassessment Remedial Investigation and Feasibility Study (RRI/FS) being performed on the upper Hudson River by the U.S. Environmental Protection Agency (USEPA). The work being performed by USEPA in conjunction with the Hudson River RRI/FS is described in their Phase 1 Report (USEPA, 1991) and the Final Phase 2 Work Plan and Sampling Plan (USEPA, 1992). These efforts paralleled the USEPA RRI/FS. This report presents results of the Temporal Water Column Monitoring Program (TWCMP). Water column sampling and analysis activities conducted in association with the TWCMP were performed in accordance with the Quality Assurance Project Plan (QAPP; O'Brien & Gere, 1993a) prepared for this project. The remainder of this report presents program objectives, sampling and analysis methods, and analytical data in tabular form. Appended to this report are the raw data reports, as received from the laboratories.

### 1.02 Program Objectives

The objectives of the TWCMP were to provide water column polychlorinated biphenyl (PCB) and conventional parameter data to evaluate the spatial and short

term temporal concentration variability in a 40 mile reach of the upper Hudson River extending from Bakers Falls in Hudson Falls, New York to Troy, New York.

## **SECTION 2 - METHODS AND MATERIALS**

### **2.01 Sampling Locations**

Samples were obtained from eight locations for the TWCMP, including six upper Hudson River locations, and two tributaries. The sample locations include the Fenimore (Bakers Falls) Bridge in Hudson Falls, the Rt. 197 Bridge in Ft. Edward (main channel), the western wing wall of the Thompson Island Dam, the Batten Kill (tributary), the Rt. 29 Bridge in Schuylerville, the Stillwater Bridge (County Rt. 125) in Stillwater, the Hoosic River (tributary), and the Rt. 4 Bridge in Waterford. These sample locations are illustrated in Figure 1. The field sampling for the six upper Hudson River sampling locations was initiated on April 1, 1991. The tributary sampling began on June 26, 1991. The final TWCMP sampling event was conducted on June 18, 1992. A sample collection schedule is presented in Table 1.

### **2.02 Sample Collection Procedures**

Composite water column samples were collected with a Wildco model 1200 Kemmerer Bottle at the upper Hudson River locations. This Kemmerer Bottle sampler consisted of a stainless steel 1.2 liter cylinder equipped with closeable stoppers at each end. The sampler was lowered to the desired depth in the water column in the open position. A mechanical messenger was sent down the suspending cable to close the sampler and a discrete aliquot was collected. Upon retrieval, the sampler was discharged into a stainless steel compositing container.

Samples consisted of vertically stratified composites made up of discrete aliquots collected at three foot intervals throughout the water column. The samples

were collected from near the center of the channel off bridges at all stations, with the exception of Thompson Island Dam, which was sampled off the west wing wall of the dam, and the tributaries (Batten Kill and Hoosic River) which were grab samples collected next to shore. The center of the channel at these locations is not accessible by land.

The Kemmerer Bottle sampler was decontaminated between stations by rinsing with acetone, followed by hexane, and finally distilled water. These decontamination procedures are specified in the QAPP (O'Brien & Gere, 1993a).

### **2.03 Quality Assurance/Quality Control Sample Collection**

Quality assurance/quality control (QA/QC) samples were collected on a routine basis during the TWCMP in accordance with the QAPP (O'Brien & Gere, 1993a). These samples included the collection and analysis of matrix spike, blind duplicate, trip blank, and equipment blank samples. The locations of the matrix spike, blind duplicate, and equipment blank samples were selected on a rotational basis from the six upper Hudson River sampling locations. Matrix spike samples were duplicate samples which were submitted to the laboratory. The laboratory spiked the samples with a known quantity of analyte, then analyzed the sample and recorded the percent recovery. Blind duplicate samples were submitted to the laboratory without indication to the laboratory of where the samples were collected. Trip blanks were used for quality control of PCB analyses only. Trip blanks were prepared by filling sample containers with organic free water. The trip blanks accompanied the sampling personnel from the laboratory, throughout the sampling event, and were submitted to the laboratory for PCB analysis. Equipment blank

samples were prepared in the field by decontaminating the sampling equipment, followed by rinsing the Kemmerer Bottle sampler and compositing container with organic free water obtained from OBG Laboratories, Inc. The rinse water was collected and submitted to the laboratory for the appropriate analyses. The results of QA/QC analyses are included in Appendices A - E, as described in Section 4. Data validation reports are currently being prepared.

#### **2.04 Laboratory Analyses**

Water samples collected during the TWCMP were analyzed for the following parameters in accordance with the methodologies described in the QAPP (O'Brien & Gere, 1993a):

- Total PCB,
- Dissolved PCB,
- Total Organic Carbon,
- Dissolved Organic Carbon,
- Total Suspended Solids,
- Total Dissolved Solids,
- Conductivity, and
- Alkalinity.

##### **2.04.01 PCB Analytical Methodology**

Total and dissolved PCB analyses were performed on water column samples by Northeast Analytical, Inc. (NEA) located in Schenectady, New York. A limited number of total PCB analyses were performed by OBG

Laboratories, located in Syracuse, New York, for inter-laboratory comparison. Initially, samples which were submitted to NEA for PCB quantification were analyzed according to USGS protocols (USGS, 1972), which is similar to USEPA method 608 (USEPA, 1982) packed column analysis. These analyses were supplemented by a subset of congener specific PCB (NEA, 1990) capillary column analysis. The analysis scheme was altered as the program progressed to include PCB analysis by congener specific protocols only. Samples submitted to OBG Laboratories for PCB analysis were initially analyzed according to USEPA method 8080 (USEPA, 1986) protocols (Appendix C). Later in the program, OBG Laboratories performed congener specific PCB analysis by methods which were consistent with NEA-608CAP, Rev. 3.0, June 1990 (Appendix D). Table 1 contains the sample collection and analysis schedule.

#### 2.04.02 Dissolved PCB Analysis

Dissolved PCB analysis was performed on samples collected from the Rt. 197 Bridge, Thompson Island Dam, and the Rt. 4 Bridge only. Filtrations for dissolved PCB analysis were conducted in the laboratory by NEA. NEA performed the filtrations by passing the raw sample through a one liter glass millipore vacuum filtration apparatus. The filtration apparatus was equipped with a 0.45 micron teflon filter. The filtrate was collected in a glass sidearm flask, and transferred to a separatory funnel and prepared for extraction in accordance with the analytical protocols.

#### **2.04.03 Method Detection Limit Study**

NEA conducted a Method Detection Limit (MDL) study to determine the lowest detectable concentration, and to establish the Practical Quantitation Limit (PQL) for PCBs that could be reliably achieved in 1 liter water samples collected from the Hudson River. The MDL is defined as the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. This is determined from analysis of a sample in a given matrix containing the analyte. The PQL is the lowest concentration that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operations. For the TWCMP, the PQL was established as four times the MDL.

Testing for the MDL study was performed on organic-free water samples spiked with PCBs. The MDL was conducted in accordance with 40 CFR Part 136. (EPA, 1985). The MDLs for three methodologies were evaluated: Webb and McCall, USGS, and NEA-608CAP. The detailed results of this study are presented in Appendix F to this report.

The results of the MDL study indicated an average MDL value of 7.7 nanograms per liter (ng/L) for the three methodologies. The laboratory elevated the MDL for reporting purposes to 11 ng/L to account for potential matrix interferences within Hudson River water. The PQL, based on this MDL, was set to 44 ng/L. PCB concentrations observed in samples collected during the TWCMP which are between the MDL and PQL (from 11 to 44 ng/L) are reported with a qualifier in this report.

#### 2.04.04 Method Evaluation

The purpose of the USGS method analysis was to provide a baseline reference which could be compared to historical data. Congener specific PCB analysis allowed the quantification of congeners by peak areas and a peak specific response factor. Total PCB are calculated from the sum of congeners containing the same chlorine configuration. After an evaluation of the data produced by both the USGS and congener specific methods, the congener specific method was selected for exclusive use beginning with the September 5, 1991 sampling event.

#### 2.04.05 Field Related PCB Analytical Deviations

Due to the identification of laboratory contamination, samples collected on June 28, 1991 were not quantified for PCB, and therefore PCB data are not included for that date. Samples collected and submitted for PCB analysis on August 7, 1991 were scheduled to be quantified by USGS and congener specific methodologies. Due to laboratory scheduling difficulty, these samples were quantified by congener specific procedures only. The Hoosic River was not sampled on July 17, 1991 due to scheduling difficulty by sampling personnel.

#### 2.04.06 Conventional Parameter Analytical Methodology

Conventional analyses were performed by OBG Laboratories. Analytical methodologies were consistent throughout the TWCMP. Specific analytical methods included:

- Total Organic Carbon (EPA Method 415.1),
- Dissolved Organic Carbon (EPA Method 415.1),
- Total Suspended Solids (EPA Method 160.1),
- Total Dissolved Solids (EPA Method 160.2),
- Conductivity (EPA Method 205), and
- Alkalinity (EPA Method 310.1).

#### **2.04.07 Dissolved Organic Carbon Analysis**

Filtrations for DOC were conducted in the field prior to preservation and submittal to OBG Laboratories. Initially, various filtration techniques were tested to identify the procedure which provided the best results. The use of a Swinex syringe equipped with a teflon 0.45 micron disposable filter was found to be most reliable, and was used for most of the study. Upon collection, an appropriate sample volume (30 - 50 milliliters) was placed in the syringe. A filter was attached to the discharge end of the syringe, and the sample was forced through the filter and collected in an appropriate sample container.

#### **2.04.08 Field-Related Conventional Parameter Analytical Deviations**

Inconsistencies were experienced with DOC analyses during the TWCMP. These inconsistencies included DOC concentrations exceeding total organic carbon (TOC) concentrations, and elevated TOC concentrations in equipment blanks. Samples which indicated higher DOC concentrations than TOC concentrations were re-filtered and re-analyzed by the laboratory.

Laboratory filtrations were performed on unpreserved samples (typically within 24 hours of collection) followed by DOC analysis. The laboratory filtered DOC concentrations were routinely less than the corresponding TOC and field filtered DOC concentrations. The residual contamination of TOC/DOC samples is likely explained by the use of organic solvents (acetone and hexane) in the decontamination procedure specified for sampling equipment used for PCB sample collection. Although the solvents were not used to decontaminate the field filtering apparatus, it is considered likely that the sampling and filtration apparatus was contaminated in the field by residuals of acetone and/or hexane.

Conventional data was not generated for the Hoosic River on July 17, 1991 as a sample was not collected on that date due to an error by sampling personnel.

### **SECTION 3 - DATA PRODUCTION AND REPORTING**

#### **3.01 Northeast Analytical, Inc.**

Northeast Analytical, Inc. (NEA) was responsible for the analysis of approximately 1,020 water column samples for the TWCMP. From April 1 - August 28, 1991, PCB was quantified using USGS procedures (USGS, 1972). In conjunction with the USGS quantification, PCB was also quantified by congener specific methodology (NEA, 1990) on a rotational basis. An analytical schedule is included on Table 1. Beginning with the September 5, 1991 sampling event, and continuing through the June 18, 1992 sampling event, PCB was quantified by congener specific procedures only. Specific procedures employed for each sample are presented on Table 2. NEA performed approximately 374 total PCB quantifications, and 173 dissolved PCB quantifications by USGS methodology. Approximately 581 total PCB quantifications and 148 dissolved PCB quantifications were performed by congener specific procedures.

Since a specific New York State Department of Environmental Conservation - Analytical Services Protocol (NYSDEC ASP)(NYSDEC, 1989) reporting protocol does not exist for congener specific PCB analyses, a reporting package and quality control program was developed which adheres to the guidelines set forth in the NYSDEC ASP Superfund PCB/pesticide requirements. Therefore, a data reporting package and quality control program was developed for congener specific PCB analyses which contains the following components:

- title page,
- sign-off sheet,

- table of contents,
- case narrative,
- sample result form,
- chain of custody forms,
- sample log-in sheet,
- internal sample control record (internal sample tracking sheet),
- matrix spike summary table,
- duplicate summary table,
- method blank summary table,
- sample raw data,
- analyst sample injection log,
- standards summary tables; and
- standards/QC sample (blanks, matrix spikes, duplicates) raw data.

The data summary reports are presented in Appendices A and B to this report. The organization of these appendices is presented in the Table of Contents of this report.

### **3.02 OBG Laboratories, Inc.**

OBG Laboratories, Inc. (OBG Laboratories) was responsible for the analysis of approximately 779 water samples. These samples were analyzed for total suspended solids (EPA method 160.1), specific conductance (EPA method 205), total dissolved solids (EPA method 160.2), total and dissolved organic carbon (EPA method 415.1), alkalinity (EPA method 310.1), PCB (EPA method 8080) and congener specific PCB (NEA CAP608). The above referenced EPA methods are

presented in USEPA documentation (USEPA, 1986; USEPA, 1983). Congener specific PCB methodology was consistent with the congener specific methodology described in Section 2.04.1.

Upon completion of the analyses, OBG Laboratories generated a series of data reports entitled Laboratory Report, General Electric Company, Temporal Water Column Monitoring Program, Hudson River, N.Y. These data reports were prepared consistent with NYSDEC ASP Category B reporting requirements. These data reports are presented as Appendices C, D, and E to this report. The organization of these appendices is presented in the Table of Contents of this report. The PCB data packages contain the following components:

- title page,
- sign-off sheet,
- table of contents,
- case narrative,
- sample result form,
- chain of custody forms,
- sample log-in sheet,
- internal sample control record (internal sample tracking sheet),
- matrix spike summary table,
- duplicate summary table,
- method blank summary table,
- sample raw data,

- analyst sample injection log,
- standards summary tables, and
- standards/QC sample (blanks, matrix spikes, duplicates) raw data.

## **SECTION 4 - SAMPLING AND ANALYSIS RESULTS**

### **4.01 Data Validation Results**

Data validation has been performed on TWCMP data. A computerized method of validation was utilized for evaluation of these data. The computerized method was supplemented by a manual validation of 10% of the data to verify the accuracy of the computer validation. A summary of the data validation results are presented here. Separate data validation reports are currently being prepared. These reports will cover data generated from April 1, 1991 through April 1, 1992. Data generated for the TWCMP after April 1, 1992 are currently being validated.

The results of the data validation indicated that over 99% of the USGS data and over 95% of the congener specific data met the data quality objectives identified for the TWCMP. PCB concentrations in trip and equipment blanks were routinely less than the MDL of 11 ng/L. Original laboratory data, including supporting documentation, have been assembled into Appendices to this report according to the organization presented in the table of contents of this report. Data that did not meet the data quality objectives are not included in this report. Data validation qualifiers are included on the data summary tables described in Section 4.02. The level of completeness in this data set exceeds the normal level of completeness for work of this nature.

#### 4.01.01 USGS Protocols

Validation of data generated under USGS protocols (USGS, 1972) resulted in the evaluation of the quality of the data produced for 351 water samples. Over 99% of these data were concluded to be useable. A total of 210 samples did not meet data quality criteria. The majority of these data were the result of analysis holding time exceedences. However, based on the result of a matrix specific holding time study conducted by O'Brien & Gere, the data for samples exceeding analysis holding times are concluded to be useable for both qualitative and quantitative purposes. The results of this holding time study are included as Appendix G to this report. Spike blank recovery was low for filtered samples. As a result, 63 samples from sample delivery groups associated with low spike blank recovery were assigned the "estimated" (J) designation. Other samples were assigned the "estimated" (J) designation due to irregularities detected in duplicate analyses, matrix spike analysis, and calibration samples. One sample was not accepted because it exceeded the extraction holding time by 28 days.

#### 4.01.02 Congener Specific Protocols

Data provided by the analysis of 457 water samples by congener specific PCB protocols were validated for the TWCMP. Over 95% of these data were concluded to be useable. A total of 235 samples did not meet data quality criteria. The majority of these data were the result of analysis holding time exceedences and low filtered sample recovery. However, based on the result of a matrix specific holding time study conducted by O'Brien & Gere,

the data for samples exceeding analysis holding times are concluded to be useable for both qualitative and quantitative purposes.

Low filtered sample recovery resulted in the designation of 78 samples with a qualifier of "estimated" (J/UJ). Duplicate sample relative percent differences which were out of control limits resulted in the designation of 23 samples as "estimated" (J). Matrix spike recovery resulted in the designation of 22 samples as "estimated" and four samples as "rejected" (R). Deficiencies in internal standard area performance analyses resulted in 18 samples designated as "estimated" (J). Compound identification excursions resulted in the designation of 31 samples as "estimated" (J), and 13 samples as "rejected" (R).

#### **4.02 TWCMP Sampling and Analysis Results**

The TWCMP involved the collection and analysis of water column samples from locations selected along the 40 mile reach of the upper Hudson River extending from Ft. Edward to Troy, New York. The analysis of these samples provided data for several parameters including total and dissolved PCB (quantified by USGS and Congener Specific methodologies), and conventional parameters, including total and dissolved organic carbon, total suspended solids, total dissolved solids, total alkalinity, and specific conductance. These data are presented in summary tables as follows:

Table 2 - NEA PCB Data Summary,

Table 3 - NEA PCB Homolog Distribution Summary: April through December, 1991,

**Table 4 - NEA PCB Homolog Distribution Summary: January through June, 1992,**

**Table 5 - OBG Laboratories PCB Data Summary,**

**Table 6 - OBG Laboratories Conventional Data Summary: April through December, 1991, and**

**Table 7 - OBG Laboratories Conventional Data Summary: January through June, 1992.**

Data for samples collected on March 12, 1992, April 23, 24 and 28, 1992, and May 1, 5, and 8, 1992, as part of the High Flow Monitoring Program were not included in the TWCMP data packages but are presented in Tables 2, 4, and 7 of this report for the purpose of data comparison. These data are presented in the High Flow Monitoring Program Report (O'Brien & Gere, 1993b).

\* - High flow data

\*\* - no data, samples not collected due to river ice conditions.

\*\*\* - data validated as part of the Post-Construction Remnant Deposit Monitoring Program.

Data Validation Qualifiers: U = elevated detection limit or concentration reduced to less than detection limit due to validation, J = estimated concentration, R = rejected, RP = rejected prior to validation due to laboratory contamination.

P = Practical Quantitation Limit (PQL) Qualifier for values between &lt;11 and 44 ppt.

Dissolved PCBs filtered using 0.45 micron teflon filter

\* - High flow data

\*\* - no data, samples not collected due to river ice conditions.

\*\*\* - data validated as part of the Post-Construction Remnant Deposit Monitoring Program.

Data Validation Qualifiers: U = elevated detection limit or concentration reduced to less than detection limit due to validation, J = estimated concentration, R = rejected, RP = rejected prior to validation due to laboratory contamination.

P = Practical Quantitation Limit (PQL) Qualifier for values between &lt;11 and 44 ppt.

Dissolved PCBs filtered using 0.45 micron teflon filter

\* - High flow data

\*\* - no data, samples not collected due to river ice conditions.

\*\*\* - data validated as part of the Post-Construction Remnant Deposit Monitoring Program.

Data Validation Qualifiers: U = elevated detection limit or concentration reduced to less than detection limit due to validation, J = estimated concentration, R = rejected, RP = rejected prior to validation due to laboratory contamination.

P = Practical Quantitation Limit (PQL) Qualifier for values between &lt;11 and 44 ppt.

Dissolved PCBs filtered using 0.45 micron teflon filter

\* - High flow data

\*\* - no data, samples not collected due to river ice conditions.

\*\*\* - data validated as part of the Post-Construction Remnant Deposit Monitoring Program.

Data Validation Qualifiers: U = elevated detection limit or concentration reduced to less than detection limit due to validation, J = estimated concentration, R = rejected, RP = rejected prior to validation due to laboratory contamination.

P = Practical Quantitation Limit (PQL) Qualifier for values between &lt;11 and 44 ppt.

Dissolved PCBs filtered using 0.45 micron teflon filter

\* - High flow data

\*\* - no data, samples not collected due to river ice conditions.

\*\*\* - data validated as part of the Post-Construction Remnant Deposit Monitoring Program.

Data Validation Qualifiers: U = elevated detection limit or concentration reduced to less than detection limit due to validation, J = estimated concentration, R = rejected, RP = rejected prior to validation due to laboratory contamination.

P = Practical Quantitation Limit (PQL) Qualifier for values between &lt;11 and 44 ppt.

Dissolved PCBs filtered using 0.45 micron teflon filter

\* - Calculated from results of congener specific PCB analysis. Table does not include data rejected prior to validation.

Data Validation Qualifiers: L = elevated detection limit or concentration reduced to less than detection limit due to results of validation,  
J = estimated concentration, R = rejected.

P = Practical Quantitation Limit (PQL) qualifier for values between <11 and 44 ng/l.

Dissolved PCBs filtered using 0.45 micron teflon filter

\* - Calculated from results of congener specific PCB analysis. Table does not include data rejected prior to validation.

Data Validation Qualifiers: U = elevated detection limit or concentration reduced to less than detection limit due to results of validation,

J = estimated concentration, R = rejected.

P = Practical Quantitation Limit (PQL) qualifier for values between <11 and 44 ng/l.

Dissolved PCBs filtered using 0.45 micron teflon filter

\* - calculated from results of congener specific PCB analysis

\*\* - samples not collected due to river ice conditions.

# - High flow data

Data Validation Qualifiers: U = elevated detection limit or concentration reduced to less than detection limit due to results of validation,  
 J = estimated concentration, R = rejected.

P = Practical Quantitation Limit (PQL) qualifier for values between &lt;11 and 44 ppt.

Dissolved PCBs filtered using 0.45 micron teflon filter

320794
