1.0 INTRODUCTIONS

Tetra Tech, Inc. (Tetra Tech) was tasked by the Pennsylvania Department of Environmental Protection (DEP), under Contract Number [REDACTED], to perform operation and maintenance (O&M) services under Operable Unit 2 (OU-2) and OU-3 for the groundwater treatment facility at the Havertown PCP Superfund Site located in Haverford Township, Pennsylvania.

Activities performed for OU-2 O&M are to operate and maintain the groundwater treatment facility, optimize the facility's performance, perform all required monitoring (groundwater and surface water discharge) associated with this facility, and maintain the cap in accordance with the selected remedy and Remedial Action Objectives (RAOs). Activities conducted for OU-3 O&M are to contain the contaminated deep groundwater plume that is migrating from the site in conjunction with the OU-2 remedy, operate and maintain the OU-3 extraction and monitoring wells in the Recreation and Open Space (ROS) Area, maintain the ROS pumping system through the Railroad Right-of-Way (RR ROW), and operate the in-situ flushing system in conjunction with the OU-2 groundwater treatment system.

This report covers the groundwater monitoring period from July 2017 to June 2018, which includes long-term performance monitoring for the OU-2 and OU-3 remedies. Analytical data collected during monitoring period were used to evaluate efficacy and capacity of the groundwater collection system; update the site-wide historical database; and present conclusions and recommendations regarding future groundwater sampling. The treatment system's operational performance (including plant discharge monitoring results) is presented in a separate report.

1.1 SITE BACKGROUND

The Havertown PCP Superfund Site (the Site) is located in southeastern Pennsylvania approximately 10 miles west of Philadelphia (**Figure 1**). Commercial establishments, industries, parks, schools, and residential homes surround the Site.

The Site covers approximately 12 to 15 acres and is defined by the extent of contamination attributable to the site. It is roughly delineated by Lawrence Road and Rittenhouse Circle to the south, the former Penn Central Railroad (PCRR) tracks to the north, and the fence on the Continental Motors property to the west, and Naylors Run to the east.

The Havertown PCP site is located in the Piedmont Uplands section of the Piedmont Physiographic Province. Consolidated rock in the vicinity of the site consists of metamorphic schist and gneiss of the Wissahickon Formation. Regionally the unconsolidated deposits that overlay the bedrock consist of saprolite (in-situ weathered bedrock), and occasional sand and gravel terrace deposits, and artificial fill. In the vicinity of the bed of Naylors Run, thicker unconsolidated gravel deposits have been identified above Wissahickon Schist. Groundwater at the Havertown site flows in a southeasterly direction and occurs in two major zones. The upper zone consists of surficial soils and saprolite (heavily weathered rock). The movement of water in the saprolite zone is influenced by the degree of saprolite weathering, relict bedrock structures, compositional variations, and the thickness of the weathered zone. The lower zone consists of fractured schist bedrock, with water movement occurring along interconnected fractures. Vertical hydraulic gradients are small, suggesting that the aquifer at the site is well connected by porous/fracture flow.

Upward flow occurs within the saturated saprolite and presumably provides observed seepage/base flow to Naylors Run southeast of Rittenhouse Circle. The depth to groundwater below the site ranges from approximately 23 feet below ground surface in the vicinity of former Young's Produce Store to seepage as springs at ground surface in the ROS Area southeast of Rittenhouse Circle. These permeable zones are closely interconnected, and typically represent one aquifer. Semi-confining layers may locally reduce aquifer interconnection — but are not widespread.

Historically, the Site consisted of a number of distinct properties, including a former wood treatment facility owned by National Wood Preservers (NWP), a bubble gum manufacturing plant owned by the Philadelphia Chewing Gum Company (PCG), and neighboring residential and commercial areas. Former structures on the NWP property (lying north of the intersection of Eagle Road and Lawrence Road) consisted of a sheet metal building with multiple aboveground chemical storage tanks. The two-acre NWP property has since been capped and enclosed within a chain-link fence. The PCG facility consisted of a single, large former gum production building located due east of NWP (northeast of the intersection of Eagle Road and Lawrence Road). Residential areas bordering Rittenhouse Circle and Naylors Run comprise the remainder of the study area (**Figure 2**).

From approximately 1947 to 1963, the NWP property was used to treat wood products using pentachlorophenol (PCP) dissolved in diesel fuel. NWP allegedly disposed of waste materials into a well reportedly located in the vicinity of the former Young's Produce Market, at the corner of Lawrence and Eagle Road. However, the exact location of the well was not identified. In 1977, the NWP facility discontinued the use of PCP and oil to treat wood products and began treating wood using metal salts.

The metal salts consisted of chromium copper arsenate (CCA) in a 0.4% or 0.6% water solution. Other metals used included chromated zinc chloride (a fire retardant) and tributyl tin oxide (an anti-fouling compound). All three water-soluble chemicals were used in pressure treatment of wood products.

The Site was placed on the National Priorities List (NPL) in 1982. The Site was divided into three OUs. OU-1 addressed the discharge to Naylors Run and the on-site wastes at the NWP facility. OU-2 addressed shallow groundwater, and OU-3 addressed deep groundwater in the source area and the groundwater and soil contamination in the ROS Area.

Major contaminants attributable to the Site include volatile organic compounds (VOCs), PCP, polynuclear aromatic hydrocarbons (PAHs), and dioxins/furans.

EPA issued the first Record of Decision (ROD) for the Site in September 1989. The 1989 ROD for OU-1 included provisions for an interim remedial action. It called for the installation of an oil-water separator to address the continued release of contaminants from the Site into the surface water of Naylors Run. In addition, this ROD called for the removal and disposal of the on-site waste.

During a soil investigation, EPA learned that the contamination on the NWP facility was more extensive than originally anticipated. The soil contamination was addressed in a 1996-1997 Superfund Removal Action, during which a synthetic geo-membrane cap was installed over three acres of the Site. The installation of the cap removed the potential for exposure to soils contaminated with arsenic and dioxins/furans by providing an impermeable synthetic barrier and 18 inches of soil cover over the areas of contamination. In the fall of 1997, EPA covered the capped area with an additional 4 feet of fill and planted the fill with a mixture of seed mulch and fertilizer.

EPA issued the ROD for OU-2 on September 30, 1991, which defined the interim remedy. The RAOs of the OU-2 remedy were as follows:

- Design and implement an interim remedial action to protect human health and the environment by removing free product and contaminated groundwater from the shallow groundwater aquifer.
- Collect data on the aquifer and contaminant response to remedial measures.

The primary purpose of the OU-2 ROD is to contain the entire contaminated shallow groundwater plume migrating from the Site under Eagle Road and to treat and discharge it into Naylor's Run. The extraction/recovery wells are intended to reduce the size of the oil plume floating on the water table.

Tetra Tech completed the conceptual design for OU-2 (shallow groundwater) in 1994. The Remedial Design (RD) for OU-2 was completed during the period 1997-2000 by several contractors under direction from the U.S. Army Corps of Engineers (USACE). Treatment plant construction was completed in 2001, and the plant became fully operational in August 2001, with treated water being discharged to Naylor's Run in accordance with National Pollutant Discharge Elimination System (NPDES) permit limits. Groundwater & Environmental Services, Inc. (GES) operated the plant on behalf of USACE until August 15, 2002. Between 2002 and 2013, Tetra Tech performed O&M activities at the plant on behalf of EPA.

EPA issued the ROD for OU-3 in April 2008. OU-3 was further divided into OU-3A and OU-3B. OU-3A addressed contamination related to deep groundwater in the source area, whereas OU-3B addressed contamination in Haverford Township's ROS Area, located below Rittenhouse Circle and adjacent to Washington Avenue in Havertown. The RAOs for the OU-3 remedy were as follows:

Groundwater

- Mitigate contamination to Applicable, Relevant or Appropriate Requirements (ARARs) and/or risk-based cleanup levels to protect human health and the environment.
- Discharge treated groundwater to surface water (Naylor's Run) in concentrations that meet NPDES regulations.
- Prevent exposure to contaminated groundwater in the future.
- Prevent discharge of groundwater to surface water at concentrations of contaminants that would result in exceedances of water quality criteria.
- Contain the contamination plume in the source area and the ROS Area to prevent further off-site migration and to ensure that downgradient groundwater is not impacted.
- Restore groundwater quality at the Site.

Soils of ROS Area

- Eliminate current exposure of human and ecological receptors to contaminated soils.
- Prevent further migration of contaminants in soil to groundwater.
- Prevent transport of contaminants in surface soils via surface water runoff.
- Prevent potential future exposure to contaminants through ingestion and dermal contact by human and ecological receptors.

The purposes of the OU-3 remedy are to contain the contaminated deep groundwater plume migrating from the site in conjunction with the OU-2 remedy, operate and maintain the OU-3 shallow extraction and

monitoring wells in the ROS, maintain the ROS pumping system through the RR ROW, and operate the in-situ flushing system in conjunction with the OU-2 groundwater treatment system. The OU-2 remedy was incorporated into the OU-3 as a final groundwater remedy. The OU-3 remedy consisted of the following elements:

- Installation of an additional groundwater recovery well and associated piping in the Source area of the site.
- Operate and maintain the existing groundwater treatment facility. Upgrade or retrofit the existing groundwater treatment facility to increase the capacity of the facility to process 60 to 70 gallons per minute (gpm) of contaminated water.
- Treat collected groundwater as necessary to meet discharge requirements.
- In-situ flushing in the Source area of the Site, with treated water from the groundwater treatment facility.
- Excavation of an area approximately 50 ft. by 50 ft. around wells SW-8 and SW-9 in the ROS Area, and a narrow zone along the abandoned sewer line about 200 ft. long and 20 ft. wide. The portion of the abandoned sewer line that has not been sealed will be removed. All excavated material will be properly disposed of off-site.
- Backfilling of the excavated area with clean fill, restoration of sidewalks, curbs, utilities, etc. and planting of appropriate vegetation.
- Installation of three groundwater recovery wells and associated piping in the ROS Area to extract groundwater and transport it to the site's groundwater treatment facility for remediation.
- Demonstrate recovery of benthic macroinvertebrate and fish communities, to examine the efficacy of the ROS Area excavation and groundwater treatment to reduce or eliminate the contaminant releases that are the major source of risk to aquatic organisms in Naylor's Run.
- Perform groundwater monitoring.
- Implement institutional controls to protect the integrity of the remedy and to prevent the installation of groundwater wells, through groundwater use restrictions and notices for the site and surrounding area, as appropriate.

In November 2008, EPA began work to increase the capacity and optimize the existing groundwater treatment facility and to meet the 2008 OU-3 ROD requirements. EPA redesigned the pretreatment portion of the facility to increase the amount of water being treated. This portion of the Remedial Action (RA) was completed in February 2009 as part of the OU-2 long-term response action (LTRA). The facility currently treats 70 gpm of contaminated groundwater. From March through August 2010, the OU-3 remedy was implemented. Construction involved converting an existing monitoring well (CW-31D) to a deep recovery well (RW-7), adding three new shallow recovery wells (RW-8, RW-9, and RW-10) and three new monitoring wells (CW-32, CW-33, and CW-34) in the ROS Area, and converting three existing shallow recovery wells (RW-1, RW-2, and RW-4) into injection wells (IW-1, IW-2, and IW-3) with an associated pumping system as part of the in-situ flushing system. The treatment plant remained operational during construction.

The groundwater extraction and treatment system consists of six recovery wells, one collection trench (CTR), and an on-site treatment system. The CTR has been online since 2001; RW-5 and RW-6 have been online since February 2006; RW-7 was fully online in October 2010; and RW-8, RW-9, and RW-10 were online in August 2010. Four original recovery wells (RW-1, RW-2, RW-3, and RW-4) have been

offline since February 2006. In 2010, the former RW-1, RW-2, and RW-4 were converted into injection wells (IW-1, IW-2, and IW-3) and placed into service in August 2010. Since IW-1, IW-2, and IW-3 started plugging, two additional wells, IW-4 (formerly CW-29D) and IW-5 (formerly CW-30D), were placed online in July and October 2011, respectively.

To restore contaminated groundwater to beneficial use, remediation implemented under the remedies will operate until remediation goals (RGs) or groundwater clean-up goals are achieved. The RGs for groundwater OU-2 and OU-3 are presented in Table 1.

1.2 GROUNDWATER WELL NETWORK DESCRIPTION

The groundwater well network consists of recovery wells, injection wells, monitoring wells, and the CTR. Well construction data is provided in **Table 2**. These wells are also located on **Figure 2**.

There are six active recovery wells currently including RW-5, RW-6, RW-7, RW-8, RW-9, and RW-10. Four original recovery wells RW-1, RW-2, RW-3, and RW-4 have been offline since February 2006.

There are five injection wells (IW-1 through IW-5) in or near the source area. The injection wells IW-1, IW-2, and IW-3 were placed into service in August 2010. The former monitoring well CW-29D was converted into injection well IW-4 and placed online in July 2011, and the former monitoring well CW-30D was converted into injection well IW-5 and placed online in October 2011.

After IW well redevelopment in June 2013, three IW wells (IW-1, IW-2, and IW-3) were shut down. The injection system remains active with IW-4 and IW-5.

Four piezometers (PZ-1 through PZ-4) are used to monitor water levels in the CTR.

1.3 MONITORING PROGRAM

Presently, there are 60 wells included in the O&M groundwater monitoring program. These wells can be classified as shallow wells above bedrock [about 5 ft. to 30 ft. below ground surface (bgs)] and deep wells in the bedrock (up to 120 ft. deep). In 2010 and 2011, six wells were deleted from the program but remain available. In mid-2012, due to construction of the Young Men's Christian Association (YMCA) building, four monitoring wells (HAV-02, CW-6S, CW-6I, and CW-6D) were abandoned.

The purpose of this sampling is to monitor treatment system performance and migration of the PCP plume. Sampling is performed per the revised Sampling and Analysis Plan (SAP) (Tetra Tech, 2016b). Groundwater samples are collected on periodic as follows:

- Quarterly sampling to determine recovery system water quality and extraction system's effectiveness.
- Semi-annual sampling to determine recovery well water quality and effectiveness.
- Bi-annual sampling to monitor the edge of the shallow contaminant capture zone.
- Annual sampling to update the historical database.

Groundwater samples are analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), herbicides (low-level pentachlorophenol), metals, pesticides (dieldrin) and dioxin/furans. During well sampling, other parameters are also collected [e.g., pH, temperature, dissolved oxygen (DO), specific conductivity and oxidation-reduction potential (ORP)].

During the July 2017 to March 2018 period, all samples were sent to the DEP-designated laboratory for analysis. Samples collected during the June 2018 sampling event were sent to the laboratory procured by Tetra Tech (ALS Middletown).

2.0 GROUNDWATER MONITORING ACTIVITIES

2.1 SAMPLING METHODS

Groundwater samples were collected from the monitoring wells and injection wells through polyethylene (PE) tubing that was attached to a peristaltic pump with medical-grade flexible silicon tubing. The PE tubing was inserted down the well and set at the approximate midpoint of the screen. Geochemical parameters (DO, specific conductivity, pH, temperature, and ORP) were measured during purging using an YSI 556 water quality meter equipped with an in-line flow through cell. Turbidity was measured using a LaMotte 2020e turbidimeter during purging. The purging rate was set at between 0.1 to 0.4 liter/minute, and water levels were monitored to assure that the static water level was not drawn down into the well screen.

Purged water was monitored for pH, specific conductivity, temperature, turbidity, ORP, and dissolved oxygen (DO) every five minutes. When levels of these parameters stabilized, and a minimum of two saturated screen volumes had been removed from the well, the purging was considered complete and the groundwater samples were obtained. Parameter stabilization was defined as three successive readings (taken at least 5 minutes apart) within 0.1 unit for pH, 3% for specific conductivity, 10% for turbidity and DO, and 10 mV for ORP. All monitored parameter measurements (including time, water level, purge rate, temperature, pH, specific conductance, turbidity, DO, and ORP) were recorded on low-flow purge data sheets. Groundwater samples were collected in laboratory-supplied containers after three consistent readings of pH, specific conductivity, temperature, and turbidity ($\pm 10\%$), immediately placed on ice, and delivered under proper chain-of-custody protocol to the DEP-designated laboratory and ALS Environmental (June 2018 sampling event).

Groundwater samples of the recovery wells were collected from sampling ports located in the well vaults. After purging 5 gallons of the groundwater from sampling port, the groundwater sample was obtained. Temperature, pH, specific conductance, turbidity, DO and ORP, were measured and recorded on sampling logs.

2.2 GROUNDWATER SAMPLING EVENTS

2.2.1 September 2017 Sampling Event

A quarterly groundwater sampling event was performed on September 11-13, 2017. A total of 18 locations were sampled and analyzed as follows. The analytical results are provided in **Appendix A-1**. **Table 4A** summarizes the contaminants of concern (COCs) detected in well samples during the September 2017 sampling event and compares them to groundwater remediation goals (RGs) (**Table 1**).

- Seven groundwater extraction wells (RW-5 thru 10 and collection trench (CTR)), eight downgradient monitoring wells (HAV-04, HAV-05, CW-12D, CW-13D, CW-22S & 22D, MW-1, and MW-2) and three Recreation and Open Space (ROS) area monitoring wells (CW-32, CW-33,

and CW-34) were analyzed for volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs).

- Six ROS area wells (CW-32, CW-33, CW-34, RW-8, RW-9, and RW-10) were additionally analyzed for low pentachlorophenol (PCP) detection limit and dieldrin.

2.2.2 December 2017 Sampling Event

A quarterly groundwater sampling event was conducted on December 12 and 13, 2017. A total of 11 locations were sampled and analyzed as follows. The analytical results are provided in **Appendix A-2**.

Table 4B summarizes the contaminants of concern (COCs) detected in well samples during the December 2017 sampling event and compares them to groundwater remediation goals (RGs) (**Table 1**).

- Three ROS area extraction wells (RW-8, RW-9, and RW-10) were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), low pentachlorophenol (PCP) detection limit and dieldrin.
- Eight downgradient monitoring wells (HAV-04, HAV-05, CW-12D, CW-13D, CW-22S & 22D, MW-1, and MW-2) were analyzed for VOCs and SVOCs.

2.2.3 March 2018 Sampling Event

The annual groundwater sampling event was performed from March 19 through March 28, 2018. A total of 50 wells were sampled and analyzed for TCL VOCs and SVOCs. A total of 16 wells were sampled and analyzed for TAL metals. A total of 5 wells were sampled and analyzed for dioxins/furans. Six ROS area were also analyzed for low pentachlorophenol (PCP) detection limit and three ROS recovery wells (RW-8, RW-9, and RW-10) were analyzed for dieldrin. Injection well IW-3 was dry and was not sampled.

Figure 2 presents sample locations. The analytical results are provided in **Appendix A-3**. **Table 4C** summarizes the contaminants of concern (COCs) detected in well samples during the March 2018 sampling event and compares them to groundwater remediation goals (RGs) (**Table 1**).

2.2.4 June 2018 Sampling Event

A quarterly groundwater sampling event was conducted on June 12 and 13, 2018. A total of 7 locations were sampled and analyzed as follows. The analytical results are provided in **Appendix A-4**. **Table 4D** summarizes the contaminants of concern (COCs) detected in well samples during the June 2018 sampling event and compares them to groundwater remediation goals (RGs) (**Table 1**).

- Six downgradient monitoring wells (CW-12D, CW-13D, CW-22S & 22D, MW-1 and MW-2) were analyzed for VOCs and SVOCs.
- Source area well R-2 was analyzed for VOCs, SVOCs and Dioxin.
- Quarterly sampling of ROS area wells was discontinued as per DEP.

2.3 WATER-LEVEL MEASUREMENTS

Water-level measurements were collected from 69 wells and a collection trench sump on June 12, 2018. Elevation measurements were obtained during a day of no precipitation, and at least 48 hours after the conclusion of any precipitation event. Static water levels were measured in all available wells using an electronic water-level indicator and were recorded to the nearest 0.01 foot. Groundwater level data are provided in **Table 3**.

Figure 3 shows groundwater contours for the shallow zone/overburden while the system was operational. **Figure 4** displays groundwater contours for the deep zone/bedrock while the system was operational.

3.0 DATA EVALUATION

3.1 GROUNDWATER LEVELS

Table 3 presents water-level data. **Figures 3** and **4** indicate a measurable drawdown near the RW wells and CTR. Pumping at recovery well RW-5 screened at 36 to 46 ft bgs continued to draw down water levels in surrounding deep wells CW-24, CW-26 and CW-16 S/I/D, and to impact the water level in downgradient wells CW 27D, and CW-4S/I/D. Pumping at RW-7 (screened from 90 to 120 ft bgs) draws down the water tables in surrounding wells CW-28, NW-1, CW-4S/I/D, and CW-17D, and impacts water levels in downgradient wells CW-3S/I/D, CW-5S/I/D, CW-18D, and CW-19D.

The pumping systems at the CTR (8 to 18 ft bgs) and RW-6 (screened from 25 to 35 ft bgs) continued to draw down water levels in nearby monitoring wells MW-1, MW-2, CW-9S/D, and downgradient wells HAV-07 and CW-21S/D. These two pumping systems also influenced water levels in upgradient wells HAV-04, HAV-05, and MW-3.

3.2 GROUNDWATER CONTAMINANT CONCENTRATIONS AND TRENDS

The shallow aquifer source area encompasses groundwater contamination associated with wells CW-2S, R-2, CW-4S, CW-5S, HAV-02 (now B-1), and HAV-04 (Tetra Tech, 1991). The OU-3 ROD (EPA, 2008) further defined the deep aquifer source area as encompassing wells CW-17D, CW-25D (now RW-5) CW-2I, CW-2D, and CW-31D (now RW-7) by establishing the plume of deep free-product oil containing PCP. This area is considered to represent principal threat waste since it is a continuous source of groundwater contamination. The OU-3 ROD also considered well CW-16S to be representative of the shallow aquifer source area.

The complete sets of analytical data generated during the reporting period are included in **Appendix A**. **Tables 4A** through **4D** summarize the contaminants of concern (COCs) detected in well sampled during the 2017-2018 reporting period and compares them to groundwater remediation goals (RGs) (**Table 1**). **Figures 5** and **6** present the PCP concentrations detected during 2018 annual sampling event as iso-concentration contour maps for shallow overburden and deep bedrock wells, respectively.

Historical trends were evaluated by comparing current PCP concentrations with those detected during previous sampling events. The historical PCP and dioxin concentrations are presented in **Table 5** from March 2011 to June 2018. **Appendix B** graphically represent the historical trends of PCP concentrations during the period February 2008 through June 2018 in the source area wells (recovery wells, injection wells and surrounding wells); recovery trench area wells; plume perimeter wells; and ROS Area recovery wells and surrounding wells.

3.2.1 Recovery Well and Collection Trench PCP Concentrations and Trends

Generally, PCP concentrations in the recovery wells (RW) fluctuated as follows:

Well	April 2014	April 2015	March 2016	March 2017	March 2018
RW-5	2,860 µg/L	3,820 µg/L	3,500 µg/L	650 µg/L	800 µg/L
RW-6	306 µg/L	498 µg/L	418 µg/L	110 µg/L	200 µg/L
RW-7	2,580 µg/L	2,110 µg/L	3,050 µg/L	320 µg/L	960 µg/L

µg/L = Micrograms per liter

Based on the 2017-2018 data, PCP concentrations of RW-8, RW-9 and RW-10 have continued to be non-detect (ND) or below the groundwater RG of 1 µg/L since December 2012.

For CTR samples, PCP concentrations varied from 500 µg/L (March 2013) to 415 µg/L (April 2014) to 255 µg/L (April 2015) to 430 µg/L (March 2016) to 43 µg/L (March 2017) to 130 µg/L (March 2018). More detailed information may be found in **Table 5**.

3.2.2 Monitoring Well PCP Concentrations and Trends

Operation of deep recovery well RW-5 continued to decrease PCP concentrations in the source area deep groundwater (see **Figures 7 and 8**). During the period of 2013 to 2018, PCP concentrations in two deep wells have been ND while it reduced significantly in an additional deep well as below:

Well	April 2014	April 2015	March 2016	March 2017	March 2018
CW-16D	29.55 µg/L	3.7 µg/L	7.3 µg/L	ND	ND
CW-26D	3,560 µg/L	4.1 µg/L	3.6 µg/L	ND	ND
CW-27D	1,810 µg/L	1,950 µg/L	1,310 µg/L	490 µg/L	5 J µg/L

PCP concentrations in other adjacent wells near RW-5 fluctuated as follows:

Well	April 2014	April 2015	March 2016	March 2017	March 2018
CW-24D	2,230 µg/L	1,920 µg/L	1,180 µg/L	620 µg/L	890 µg/L
CW-28D	6,830 µg/L	3,230 µg/L	219 µg/L	490 µg/L	390 µg/L

Operation of deep extraction well RW-7 continued to affect PCP concentrations in deep wells near RW-7 (**Figures 7, 8, 9, and 10**). During the period of 2013 to 2018, PCP concentrations in adjacent wells near RW-7 fluctuated as follows:

Well	April 2014	April 2015	March 2016	March 2017	March 2018
CW-3D	552 µg/L	209 µg/L	215 µg/L	59 µg/L	170 µg/L
CW-4D	1,180 µg/L	1,260 µg/L	2,030 µg/L	320 µg/L	54 µg/L

Well	April 2014	April 2015	March 2016	March 2017	March 2018
CW-5D	ND	6 µg/L	ND	ND	ND
CW-17D	3,780 µg/L	1,300 µg/L	2,800 µg/L	410 µg/L	1,300 µg/L
CW-18D	52.6 µg/L	59.8 µg/L	ND	ND	ND
CW-19D	1,030 µg/L	554 µg/L	1,040 µg/L	390 µg/L	450 µg/L

After the YMCA building addition, wells HAV-02, CW-6D, CW-6I, and CW-6S were abandoned in mid-2012 and are no longer part of the groundwater monitoring program.

Operation of deep extraction well RW-6 and CTR continued to decrease in PCP concentrations in groundwater around the CTR area and downgradient wells (see **Figure 9**). Specifically:

Well	April 2014	April 2015	March 2016	March 2017	March 2018
CW-21S	833 µg/L	892 µg/L	523 µg/L	450 µg/L	260 µg/L
CW-21D	830 µg/L	1,030 µg/L	827 µg/L	530 µg/L	430 µg/L
MW-1	ND	ND	ND	ND	ND
MW-2	4.3 µg/L	2.8 µg/L	3 µg/L	ND	ND

PCP concentrations for wells HAV-04, HAV-05, and MW-3 were as follows:

Well	April 2014	April 2015	March 2016	March 2017	June 2017	March 2018
HAV-04	3,290 µg/L	4,180 µg/L	5,910 µg/L	1,300 µg/L	1,700 µg/L	990 µg/L
HAV-05	2,020 µg/L	3,490 µg/L	502 µg/L	190 µg/L	94 µg/L	200 µg/L
MW-3	1,040 µg/L	599 µg/L	773 µg/L	49 µg/L	-	510 µg/L

HAV-4 and HAV-5 were also sampled in September 2017, and PCP concentration were 1,200 µg/L and 270 µg/L respectively. HAV-5 was also sampled in December 2017, PCP concentration was 190 µg/L. From downgradient of HAV-4 and HAV-5 wells and upgradient of ROS Area, PCP in four deep wells (CW-9D, CW-11D, CW-12D and CW-13D) located southeast of the main groundwater contaminant plume has been non-detect since April 2015 sampling. PCP in another deep well CW-10D, just north of CW-13D, was non-detect in 2014 and 2015 sampling, 6.2 µg/L in March 2016, and non-detect in March 2017 and March 2018 sampling. The PCP concentrations reported for these wells since 2012 are as follows:

Well	Sept 2012	April 2014	April 2015	March 2016	March 2017	March 2018
CW-9D	0.31 µg/L	ND	ND	ND	ND	-
CW-10D	6.7 µg/L	ND	ND	6.2 µg/L	ND	ND
CW-11D	1.2 µg/L	ND	ND	ND	ND	-
CW-12D	0.86 µg/L	4 µg/L	ND	ND	ND	ND
CW-13D	63 µg/L	115 µg/L	ND	ND	ND	ND

Figure 10 presents the historical trends of PCP concentrations detected in the downgradient plume perimeter wells.

3.2.3 In-Situ Flushing System PCP Concentrations and Trends

Operation of the in-situ flushing system continued to influence PCP concentrations in injection wells and deep wells near the injection system. IW-4 and IW-5 were both operational during the monitoring period from March 2013 to June 2018. IW-1, IW-2, and IW-3 were non-operational since June 2013. Figure 11 presents historical trends of PCP concentrations in the injection wells.

For injection wells IW-4 and IW-5, PCP concentrations were as follows:

Well	April 2014	April 2015	March 2016	March 2017	March 2018
IW-4	11 µg/L	97.1 µg/L	47.8 µg/L	50 µg/L	ND
IW-5	33.2 µg/L	37.5 µg/L	172 µg/L	3 J µg/L	ND

PCP concentrations for non-operational wells IW-1, IW-2, and IW-3 fluctuated as follows:

Well	April 2014	April 2015	March 2016	March 2017	March 2018
IW-1	358 µg/L	981 µg/L	1,060 µg/L	360 µg/L	ND
IW-2	4,750 µg/L	4,750 µg/L	11 µg/L	2,600 µg/L	2,500 µg/L

Well	March 2012	June 2012	April 2014
IW-3	1,700 µg/L	3,100 µg/L	980 µg/L

Between 2011 and 2018, PCP concentrations for three deep wells were reported as follows:

Well	April 2014	April 2015	March 2016	March 2017	March 2018
CW-26D	3,560 µg/L	4.1 µg/L	3.7 µg/L	ND	ND
CW-27D	4,600 µg/L	1,950 µg/L	1,450 µg/L	490 µg/L	5 J µg/L
CW-28D	6,830 µg/L	3,230 µg/L	219 µg/L	490 µg/L	390 µg/L

These wells received the majority of injection flow throughout the year. To compensate for this, the injection pumping system was turned off prior to groundwater sampling events.

3.2.4 Other Groundwater Contaminants

Tables 4A through D provide a summary of the groundwater concentrations detected during the 2017-2018 reporting period. Trends for several other contaminants are discussed below.

Trichloroethene (TCE) and Vinyl Chloride: During the March 2018 annual sampling event, TCE was detected above the groundwater RG of 5 µg/L in wells CW-1S, CW-1D, and RW-5 at concentrations of 200 µg/L, 8 µg/L, and 6.6 µg/L, respectively. Additionally, TCE concentration exceeded its RG of 5 µg/L in wells CW-13D (5.1 µg/L) and RW-5 (10 µg/L) during the September 2017 sampling event.

TCE concentrations contained in well cluster CW-1 (upgradient of the site) were as follows:

Well	2014	2015	March 2016	March 2017	March 2018
CW-1S	160 µg/L	ND	401 µg/L	230 µg/L	200 µg/L
CW-1D	1.7 µg/L	3.6 µg/L	4.4 µg/L	14 µg/L	8 µg/L

TCE was also contained in downgradient wells CW-10D, and HAV-04 and source area recovery wells RW-5 and RW-7 as reported below:

Well	2014	2015	March 2016	March 2017	March 2018
CW-10D	5.8 µg/L	2.9 µg/L	2 µg/L	1.5 µg/L	0.6 µg/L
HAV-04	3.9 µg/L	7.2 µg/L	2.9 µg/L	Dry	0.9 µg/L
RW-5	10.5 µg/L	7.6 µg/L	9.5 µg/L	8.7 µg/L	6.6 µg/L
RW-7	4.5 µg/L	3.8 µg/L	2.2 µg/L	2.2 µg/L	1.4 µg/L

Vinyl chloride was also detected above the groundwater RG of 5 µg/L in wells CW-1D and CW-1S at concentrations of 24 µg/L and 22 µg/L, respectively.

Benzene was detected in wells CW-4I, CW-24D, HAV-05, and RW-5 at concentrations exceeding its RG of 5 µg/L. Benzene concentrations ranged from 6.4 µg/L contained in well HAV-05 (September 2018) to 21 µg/L in well CW-24D.

2-Methylnaphthalene was detected above the groundwater RG of 2 µg/L in wells HAV-04, CW-24D, RW-3, RW-5, and R-2 at concentrations of 78 µg/L (September 2017); 41 µg/L (March 2018); 4 µg/L (March 2018); 2 µg/L and 4 µg/L (September 2017 and March 2018); and 213 µg/L (June 2018), respectively.

Benzo(a)pyrene was detected above the groundwater RG of 0.2 µg/L in wells CW-16D and CW-16S at concentrations of 0.2 J µg/L and 1 µg/L, respectively.

Dibenzofuran was detected above the groundwater RG of 4 µg/L in wells RW-5, CW-24D, and R-2 at concentrations of 4 µg/L and 4 µg/L (September 2017 and March 2018); 6 µg/L (March 2018); and 4.6 µg/L (June 2018), respectively.

Naphthalene was detected above the groundwater RG of 3 µg/L in 10 wells during the reporting period. Concentrations were ranging from 3 µg/L in wells HAV-05 (March 2018) and MW-1 (September 2017) to 1,200 µg/L in well HAV-04 (September 2017).

In general, naphthalene concentrations continued to decline in most wells as follows:

Well	2014	2015	March 2016	March 2017	March 2018
HAV-04	ND	12.4 µg/L	216 µg/L	310 µg/L	1 µg/L
RW-5	175 µg/L	60.7 µg/L	62 µg/L	27 µg/L	21 µg/L
CW-2D	53 µg/L	ND	76.9 µg/L	48 µg/L	ND
CW-4I	2.7 µg/L	1.5 µg/L	9.7 µg/L	ND	ND
CW-4D	31.1 µg/L	3.4 µg/L	6.9 µg/L	ND	ND
CW-4S	ND	4.2 µg/L	ND	ND	ND
CW-17D	99.9 µg/L	ND	0.39 µg/L	0.2 J µg/L	ND
CW-26D	5.9 µg/L	ND	0.6 µg/L	23 µg/L	ND
CW-27D	4.2 µg/L	ND	2.5 µg/L	1 µg/L	ND
CW-28D	698 µg/L	127 µg/L	5.3 µg/L	21 µg/L	ND

However, naphthalene concentrations in 2018 increased in the following wells but still below 2016 level. Specifically:

Well	2014	2015	March 2016	March 2017	March 2018
RW-3	627 µg/L	1.7 µg/L	168 µg/L	1 µg/L	49 µg/L

Well	2014	2015	March 2016	March 2017	March 2018
RW-7	147 µg/L	78.6 µg/L	89.4 µg/L	4 µg/L	11 µg/L
CW-16S	9.9 µg/L	ND	ND	ND	1 µg/L
CW-24D	415 µg/L	193 µg/L	546 µg/L	180 µg/L	240 µg/L
HAV-05	123 µg/L	310 µg/L	3.4 µg/L	0.3 J µg/L	3 µg/L

4,6-Dinitro-2-methylphenol was detected above the groundwater RG of 1.7 µg/L in well HAV-04 at concentrations of 22 µg/L (September 2017).

Dioxins/Furans: Total 2,3,7,8-TCDD, reported as Dioxin Toxicity Equivalent Quotient (TEQ), was detected in wells HAV-05 and NW-1 at concentrations exceeding its RG of 30 pg/L. Specifically:

Well	2014	2015	March 2016	March 2017	March 2017
NW-1	25 pg/L	35 pg/L	101 pg/L	64.7 pg/L	44.9 pg/L
HAV-05				154 pg/L	35.6 pg/L

3.2.5 ROS Area Wells

Table 6 provides a comparison of groundwater remediation goals to sampling results of ROS wells during the 2012 to 2018 sampling events. Trends for COCs (PCP, TAL metals, and dieldrin) in regards to the ROS Area Shutdown Memo and subsequent EPA comments are as follows:

In March 2018, all six ROS area wells were tested for low PCP reporting detection limits (as herbicide). Based on these results, PCP concentration was non-detect (or below RDL) in four of the six ROS area wells. Trace concentrations of PCP were detected at RW-9 and CW-34, reported as 0.065 µg/L and 0.084 µg/L, respectively.

All six ROS area wells were tested for dieldrin (as pesticide) beginning with December 2016 sampling event. Based on the results obtained during the 2016 and 2017 calendar year that showed little fluctuation and upon further discussion with PADEP, it was decided to reduce sampling frequency of ROS area wells to once a year. Based on these results, dieldrin was detected in all six ROS area wells at concentrations exceeding its remediation goal of 0.038 µg/L during the reporting period.

Well	Dec 2016	March 2017	June 2017	Sept 2017	Dec 2017	March 2018
RW-8	0.24 µg/L	0.42 µg/L	0.29 µg/L	0.18 µg/L	0.24 µg/L	0.23 µg/L
RW-9	0.14 µg/L	0.27 µg/L	0.24 µg/L	0.15 µg/L	0.30 µg/L	0.087 µg/L
RW-10	0.18 µg/L	0.30 µg/L	0.29 µg/L	0.28 µg/L	0.26 µg/L	0.11 µg/L
CW-32	0.54 µg/L	0.74 µg/L	0.66 µg/L	0.39 µg/L	-	-

Well	Dec 2016	March 2017	June 2017	Sept 2017	Dec 2017	March 2018
CW-33	0.45 µg/L	0.66 µg/L	0.47 µg/L	0.41 µg/L	-	-
CW-34	0.30 µg/L	0.32 µg/L	0.25 µg/L	0.24 µg/L	-	-

Furthermore, all six ROS are wells were sampled for TAL metals. **Aluminum** was detected above the groundwater RG of 200 µg/L in wells CW-32 and CW-34 at concentrations of 1,100 µg/L and 2,130 µg/L, respectively.

Iron was detected above the groundwater RG of 300 µg/L in wells except CW-33 with concentrations ranging from 1,050 µg/L in RW-9 to 2,520 µg/L in CW-34.

Manganese was detected above the groundwater RG of 50 µg/L in wells RW-9, RW-10, CW-32, and CW-34 at concentrations of 626 µg/L, 1,240 µg/L, 84.6 µg/L, and 885 µg/L, respectively.

3.2.6 Conceptual Site Model (CSM)

Per the EPAs request, the Conceptual Site Model (CSM) for the site was updated to include the data from the 2018 sampling events. The purpose of this updated CSM is to depict current site conditions and compare them with historical conditions. The current CSM is based on the original CSM generated in 2006 and modified in 2014, and updated in 2017.

This updated CSM was generated using ArcGIS technology along with the most recent available aerial photograph as a background. It should be noted that site conditions have changed since this aerial was taken in 2010, and the former Gum Factory has been replaced with a new YMCA. Aerial photographs depicting the new YMCA were not available at the time this CSM update was performed.

New data was added to the map using the ESRI shapefile format for the groundwater levels, PCP concentration levels, and contours. The overhead view of the CSM is shown on **Figure 12**.

The three cross-section alignments generated during the 2014 update were updated with the March and June 2018 data as well. The alignment locations are shown on **Figure 12**. These cross-sections were generated in AutoCAD to depict the subsurface conditions at key locations and include the following:

- Parallel to the flow direction (cross-section A-A', **Figure 13**);
- Parallel to Eagle Road and perpendicular to the primary flow direction (cross-section B-B', **Figure 14**);
- Perpendicular to primary flow direction in the vicinity of historic groundwater discharge to the stream (cross-section C-C', **Figure 15**).

The electronic files of the surface map and the subsurface cross-sections constitutes the site CSM. Using this electronic resource, a variety of figures depicting different aspects of the CSM can be generated based on the requirements of the user.

Review of the data indicates that the primary contaminant demonstrating the extent of contamination is PCP. While other contaminants, such as naphthalene, are present at levels of concern, they do not have the overall lateral extent nor the consistently high concentrations of PCP. Therefore for mapping and

visual interpretation purposes, PCP is the most appropriate/conservative site chemical to depict the extent of contamination.

Historical CSM interpretation of the site is that there are two distinct zones of contamination, a shallow zone and a deep zone. While it is possible to separate out the contamination into these zones, comparison of the two indicates that with the exception of the occasional hot spots, plume morphology between depths is very similar. This is a result of the local geology which includes overburden, weathered rock which transition to bedrock in a heterogeneous manner across the site. However, with this in mind for the purposes of the CSM, the deep plume (which is the larger of the two plumes) was utilized to depict the overall extent of the contamination. This is considered the most conservative approach to depicting the current conditions of the CSM.

Review of pump test and boring log data at RW-5, RW-6, and RW-7 indicated a zone of vertical fracturing near the area shown on **Figure 12**. At this time, the fracture zone has not been fully delineated, and the approximate alignment shown on the map is the area estimated to have an impact on the wells currently included in the O&M monitoring. Based on the alignment of Naylor's Run, the rocks observed in the creek, and the approximate alignment of the fractures on the historic Naylor's Run stream channel, it is probable that the fracture zone extends further north and south away from the approximate alignment shown on the map.

A review of the updated CSM indicates that the vast majority of the plume is currently being captured by the existing remediation system. While 100% capture may not always occur due to abnormal conditions (such as an excessively rainy season, or technical issues) the remediation system has reduced the overall size of the plume from the 2005 extent and appears to contain it. However, since the 2017 CSM update, there does not appear to have a significant change in plume volume, though there has been a change in morphology, as seen by the extent of the 2018 plume when compared to the 2017 plume. Thus the plume appears to be within the capture zone.

Vertically, the extent of the plume is based on the groundwater model and analytical data, and the capture zone analysis indicates that groundwater capture extends below the bottom of the recovery wells. Cross-sections showing the estimated extent of vertical contamination are shown in **Figures 13, 14, and 15**. Overall, there has been little changed in the vertical profile of the plume when comparing the 2017 plumes.

Review of the cross-sections B-B' and C-C' indicate that while the contamination is migrating primarily in a northwest to southeast orientation, there is some migration away from the inferred source areas perpendicular to the primary regional flow direction. The CZA indicates that most of this migration is captured by the treatment system. It should also be noted that similar to the previous year's plumes, there appears to be influence on the plume morphology being caused by the pumping and re-injection of treated water into the aquifer. In particular, the plume is "pinched" near Eagle Road, with the plume wider to the northwest under the Source Area, and then again southeast underneath the YMCA. Continuation of this trend could indicate the start of hydraulic isolation between the source area and the downgradient plume.

3.3 DISCUSSION

Based upon a review of the groundwater data generated through June 2018, there has been contaminant reduction in both shallow and deep zones in general. Contaminant concentrations in some wells

fluctuated over the past three years and did not indicate a decreasing trend over time. **Appendix B** presents historical PCP concentrations in wells from February 2008 to June 2018.

Based on the 2017-2018 data, PCP concentrations in monitoring wells CW-13D, CW-22S and CW-22D continued to be non-detect. In March 2018, PCP concentrations in monitoring wells CW-1D, CW-4S, CW-5S, CW-5D, CW-10D, CW-16S, CW-16D, CW-18D, CW-20D, NW-1, IW-4 and IW-5 were also non-detect. Free product was observed at well R-2; however, the floating product depth continued to be non-existent at those wells formerly containing product.

Based on the 2012-2018 data, PCP concentrations for RW-8, RW-9, and RW-10 and monitoring wells (CW-32, CW-33, and CW-34) continued to be non-detect or remained well below the remediation goal. In March 2018, these three wells along with ROS area monitoring wells (CW-32, CW-33, and CW-34) were analyzed for SVOC using a reporting limit of 1 µg/L or lower based on EPA and DEP's mutual agreement.

Three ROS area wells (RW-8 thru RW-10) were tested for dieldrin (as pesticide) in September 2017, December 2017 and March 2018. Other three ROS area wells (CW-32, CW-33, and CW-34) were also tested for dieldrin in September 2017. Based on the results, dieldrin was detected in all six ROS area wells at concentrations exceeding its remediation goal of 0.038 µg/L.

PCP concentrations in HAV-04 reduced while there was no change in HAV-05. PCP concentration in downgradient wells (CW-10D and CW-13D) located southeast of the main groundwater contaminant plume has been non-detect since March 2017.

During the latest round of sampling in June 2018, PCP was detected at concentrations exceeding the remediation goal of 1 µg/L in downgradient monitoring wells MW-1, MW-2 and CW-12D (2.6 µg/L, 44 µg/L, and 17.4 µg/L, respectively). Historically, PCP concentrations in wells MW-2 and CW-12 have been non-detect. This unexpected spike in concentration could potentially be attributed to extended treatment plant shutdown in May 2018 because of plant repair activities.

4.0 CONCLUSIONS AND RECOMMENDATIONS

4.1 CONCLUSIONS

The following conclusions have been made based on the analytical and hydrogeologic data collected over the monitoring period:

- Overall, there has been contaminant reduction in both shallow and deep groundwater zones since operation of the treatment plant began.
- The overall areal extent of the PCP plume based on 2018 data is smaller compared to 2017 based on PCP groundwater concentrations. Also, the magnitude of the plume is slightly lower.
- In general, historical trends of PCP concentrations in groundwater indicate a very gradual and uneven decrease in PCP concentrations.
- PCP concentrations for ROS Area recovery wells RW-8, RW-9, and RW-10 and ROS area monitoring wells CW-32, CW-33, and CW-34 continued to be non-detect.

- PCP concentrations in HAV-04 and HAV-05 have reduced significantly in last 4 years although it is still >1 mg/L in HAV-04. And it appears that downgradient wells CW-9S and CW-10S do not have any interconnection with these wells.

4.2 RECOMMENDATIONS

The following recommendations are made with respect to the groundwater monitoring results:

- Continue evaluating analytical and hydrogeologic data to determine the long-term effects of the extraction system on reducing the extent of the contaminant plume and the removal of contaminants.
- Continue monitoring the ROS Area recovery wells and nearby monitoring wells on an annual basis, as these wells have met the cleanup goal for VOCs and SVOCs.
- Sample HAV-04 and HAV-05 annually, because no significant change in concentration is expected on a quarterly basis.
- Monitor for anomalous fluctuations in PCP concentration in downgradient wells and conduct additional investigation.

TABLE 1
REMEDIATION GOALS FOR GROUNDWATER
HAVERTOWN PCP SUPERFUND SITE
HAVERTOWN, PENNSYLVANIA

CHEMICAL	GOAL	UNIT	OU ^{(1) (2)}
Benzene	5 (MCL)	µg/L	2
Benzo(a)pyrene	0.2 (MCL)	µg/L	Both
Dieldrin	0.038 (Risk-Based)	µg/L	3
Bis(2-ethylhexyl)phthalate	6 (MCL)	µg/L	Both
Dibenzofuran	4 (Risk-Based)	µg/L	3
Ethylbenzene	700 (MCL)	µg/L	2
2-Methylnaphthalene	2 (Risk-Based)	µg/L	3
Naphthalene	3 (Risk-Based)	µg/L	3
Pentachlorophenol (PCP)	1 (MCL)	µg/L	Both
Phenanthrene	41 (Risk-Based)	µg/L	Both
Toluene	1,000 (MCL)	µg/L	2
Total 2,3,7,8-TCDD	0.00003 (MCL)	µg/L	Both
TCE	5 (MCL)	µg/L	2
1,2-Trichloroethylene	100 (MCLG)	µg/L	2
1,2,4-Trimethylbenzene	16 (Risk-Based)	µg/L	3
1,3,5-Trimethylbenzene	16 (Risk-Based)	µg/L	3
4,6-Dinitro-2-methylphenol	1.7 (Risk-Based)	µg/L	3
Vinyl chloride	5 (MCL)	µg/L	2
Xylene	10,000 (MCL)	µg/L	2
Aluminum	50-200 (SMCL)	µg/L	3
Arsenic	50 (MCL) (OU-2); 10 (MCL) (OU-3)	µg/L	Both
Chromium	100 (MCL)	µg/L	3
Barium	2,000 (MCL)	µg/L	3
Manganese	50 (SMCL)	µg/L	Both
Iron	300 (SMCL)	µg/L	3
Vanadium	3.1 (Risk-Based)	µg/L	3
