Data Quality Evaluations

Analytical Data Summary for Vapor Intrusion Sampling at the PMC Groundwater Superfund Site, Petoskey, Michigan, May through July 2017

PREPARED FOR:	U.S. Environmental Protection Agency (EPA)
PREPARED BY:	CH2M HILL, Inc. (CH2M)
DATE:	June 22, 2018

This memorandum presents the data quality evaluation (DQE) of indoor air (IA), outdoor air (OA), crawl space (CS), sub-slab soil gas (SS), and exterior soil gas (SG) samples collected during the field investigation conducted May through July 2017 at the PMC Groundwater Superfund Site in Petoskey, Michigan. Guidance for the DQE assessment followed the Quality Assurance Project Plan (QAPP) and QAPP Addendum (CH2M 2016, 2017), EPA *Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review* (EPA 2014), and individual method requirements.

CH2M personnel performed the sampling, and ALS in Simi Valley, California, analyzed the samples. The samples were reported in seven sample delivery groups (SDGs) listed as P1702543, P1702685, P1702788, P1703161, P1703248, P1703476, and P1703587. The analytical results were evaluated using the criteria of precision, accuracy, representativeness, comparability, and completeness (PARCC), as described in the QAPP and QAPP Addendum (CH2M 2016, 2017). This technical memorandum summarizes the data issues identified during the general data quality assessment.

Analytical Data

This DQE report provides the results and validation for 1 normal SS sample, 25 normal SG samples, 45 IA samples, 6 OA samples, 6 CS samples, 2 SG field duplicates (FDs), 4 IA FDs, and 1 CS FDs collected and analyzed for site-specific volatile organic compounds by EPA Methods TO-15 and/or TO-15 SIM. Samples were shipped by an overnight carrier to the laboratory for analysis.

Stage 2B validation (Level III) was performed on 100% of the data to assess their analytical accuracy, precision, and completeness. The data assessment included a review of the following:

- Completeness
- Chain-of-custody documentation
- Holding times and sample receipt conditions
- Frequency of quality control (QC) samples
- Initial calibration and continuing calibration precision and accuracy
- Blank contamination and, if any, its impact on the analytical results
- Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) accuracy
- Surrogate spike accuracy
- Internal standard accuracy and frequency
- Instrument tuning accuracy and frequency
- Laboratory and FD precision

The quality assurance (QA)/QC criteria implemented during validation were those listed in the site-specific QAPP and subsequent addendum (CH2M 2016, 2017). Standard data qualifiers were added as a means of classifying the data as to their conformance to QA/QC requirements. Multiple qualifiers are routinely applied to specific sample method/matrix/analyte combinations, but there is only one final qualifier. A final qualifier is applied to the data and is the most conservative of the applied validation qualifiers. The data qualifiers are defined as follows:

[U] Undetected. The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

[J] Estimated. The analyte was positively identified; the concentration is an estimation due to discrepancies in meeting certain analyte-specific QC criteria or was reported between the detection limit and reporting limit.

In instances where samples had multiple laboratory analyses performed, the analytical run with the lowest reporting limits (least dilute) was used if the QC criteria were met for that analysis. If a sample was analyzed more than once due to a target parameter concentration above the calibration range, the results for all parameters were reported from the lowest dilution, except for the parameters exceeding the calibration range, which were reported from the diluted analysis. In instances where multiple analyses were performed with QC outside criteria, the analytical run with the least number of exceptions or best possible QC was chosen for reporting purposes.

The analytical results were within project control limits, except where noted in the following subsections. Qualified data are listed in Table 1.

Holding Time and Preservation

Acceptance criteria were met.

Calibration

Initial and continuing calibration analyses were performed as required by the methods, and acceptance criteria were met.

Canister and Flow Controller Certification

Canisters and flow controllers are analyzed for contamination before the laboratory certifies them. SG, SS, and CS canisters were batch certified, and IA and OA canisters and flow controllers were individually certified. The canisters and flow controllers were free of contamination with the following exceptions:

- Several analytes were detected at concentrations greater than the method detection limit (MDL) in canisters and flow controllers. Associated results that were detected at concentrations (two times for common laboratory contaminants) less than the concentration found in the canister and/or flow controllers were qualified as nondetected results and flagged “U”. The results also were reported at the MDL.

Method Blanks

Method blanks were analyzed at the required frequency and were free of contamination, with the following exceptions:

- Acetone and chloroform were detected at concentrations greater than the MDL in one method blank associated with SDG P1702543. Associated native sample results that were detected at concentrations (two times for Acetone, a common laboratory contaminant) less than the

concentration found in the method blank were qualified as nondetected results and flagged "U". The results also were reported at the MDL.

Laboratory Control Samples

LCS/LCSDs were analyzed as required, and acceptance criteria were met with the following exceptions:

- Bromoform, bromomethane, dichlorodifluoromethane, trichlorofluoromethane, and vinyl chloride were recovered greater than the upper control limit in LCS and/or LCSD in SDGs P1702543, P1702685 and P1703161, indicating a possible high bias. Detected results were qualified as estimated and flagged "J" in the associated samples. Nondetected results were not qualified under these circumstances.

Surrogate Standards

Surrogates were added to the samples, and acceptance criteria were met.

Internal Standards

Internal standards were added as required, and acceptance criteria were met.

Instrument Tunes

Instrument tunes were completed as required, and acceptance criteria were met.

Laboratory Duplicates

Laboratory duplicates were performed as required, and precision criteria were met with the following exceptions:

- The laboratory duplicates for naphthalene in sample 17CC04-05 and benzene and nonane in sample 17CC04-67 were outside the laboratory limits. The native samples were qualified "J" as estimated for those analytes.

Field Duplicates

FDs were collected and analyzed as required, and the relative percent differences (RPDs) were within established QC limits, with the following exceptions:

- Acetone was flagged estimated as "J" in samples 17CC04-85 and 17CC04-86 (FD) due to an FD precision exceedance.
- Ethyl acetate and Propene were flagged estimated as "J" in samples 17CC04-15 and 17CC04-16 (FD) due to an FD precision exceedance.
- N-hexane was flagged estimated as "J" in samples 17CC04-47 and 17CC04-48 (FD) due to an FD precision exceedance.

Dilutions

The following samples required a dilution to bring the detected concentrations within the linear range of the instrument's calibration curve. The sample dilutions were a result of high target compound concentrations:

- Ethanol for samples 17CC04-05, 17CC04-47, 17CC04-48, 17CC04-63, 17CC04-72, 17CC04-78, and 17CC04-81
- D-Limonene for samples 17CC04-72 and 17CC04-81

- Tetrachloroethene and trichloroethylene for sample 17CC04-75

Overall Assessment

The goal of this assessment is to document that a sufficient number of representative samples were collected, and the resulting analytical data can be used to support the decision-making process. The following summary highlights the PARCC findings for the sampling events:

- Precision of the data was verified by reviewing the field and laboratory data quality indicators that include LCS/LCSD, laboratory duplicate, and FD RPDs. Precision was generally acceptable with the noted exception of seven analytes being qualified as estimated detected results in eight samples due to laboratory duplicate and/or FD RPD issues. Data users should consider the impact to final results that are qualified as estimated, because it may indicate a bias that could affect the decision-making process.
- Accuracy of the data was verified by reviewing the calibration data, LCS/LCSD, surrogate, and internal standard recoveries, as well as the evaluation of the method blank, canister, and flow controller data. Accuracy was generally acceptable with the exception of two analytes being qualified as estimated detected results in two samples due to an LCSD issue. Several analytes were detected in the method blanks, canisters, and flow controllers at concentrations less than the MDL. Associated results that were detected at concentrations (two times for common laboratory contaminants) less than the concentration found in the method blank, canister, and/or flow controllers were qualified as nondetected results and flagged “U”. Nondetected results and concentrations (two times for common laboratory contaminants) greater than the concentration found in the method blank, canister, and/or flow controllers were not qualified.
- Representativeness of the data was verified through the sample’s collection, storage, and preservation procedures, and verification of holding time compliance. The laboratory did not note discrepancies with sample collection, storage, or preservation procedures. The data were reported from analyses within the EPA-recommended holding time.
- Comparability of the data was verified using standard EPA analytical procedures and standard units for reporting. Results obtained are comparable to industry standards in that the collection and analytical techniques followed approved, documented procedures.
- Completeness is a measure of the number of valid measurements obtained in relation to the total number of measurements planned. Completeness is expressed as the percentage of valid or usable measurements compared to planned measurements. Valid data are defined as the data that are not rejected for project use. The data were considered valid, and the completeness goal of 90% was met for the analyte/method combinations.

LCSD>UCL The laboratory control duplicate was recovered greater than control limits.
MB>MDL The method blank was detected greater than the MDL.

Analytical Data Summary for Vapor Intrusion Sampling at the PMC Groundwater Superfund Site, Petoskey, Michigan, February 2018

PREPARED FOR:	U.S. Environmental Protection Agency (EPA)
PREPARED BY:	CH2M HILL, Inc. (CH2M)
DATE:	June 22, 2018

This memorandum presents the data quality evaluation (DQE) of indoor air (IA), outdoor air (OA), crawl space (CS), subslab soil gas (SS), and exterior soil gas (SG) samples collected during the field investigation conducted February 5 through February 21, 2018, at the PMC Groundwater Superfund Site in Petoskey, Michigan. The objective of this investigation is detailed in the *Final Uniform Federal Policy Quality Assurance Project Plan (QAPP) Addendum I, PMC Groundwater Superfund Site, Petoskey, Emmet County, Michigan* (CH2M 2017). Guidance for the data quality evaluation assessment followed the *Final Uniform Federal Policy Quality Assurance Project Plan, PMC Groundwater Superfund Site, Petoskey, Emmet County, Michigan* (CH2M 2016); EPA *Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review* (EPA 2017); and individual method requirements.

CH2M personnel performed the sampling, and ALS in Simi Valley, California, analyzed the samples. The samples were reported in four sample delivery groups (SDGs) listed as P1800620, P1800633, P1800637, and P1800810. The analytical results were evaluated using the criteria of precision, accuracy, representativeness, comparability, and completeness (PARCC), as described in the QAPP and QAPP Addendum (CH2M 2016, 2017). This technical memorandum summarizes the data issues identified during the general data quality assessment.

Analytical Data

This DQE report provides the results and validation for 5 normal SS samples, 17 normal SG samples, 23 IA samples, 3 OA samples, 7 CS samples, 1 SS field duplicates (FDs), 2 SG FDs, 3 IA FDs, 0 OA FDs, and 1 CS FDs collected and analyzed for site-specific volatile organic compounds by Methods TO-15 and/or TO-15 SIM. Samples were shipped by an overnight carrier to the laboratory for analysis.

Stage 2B validation (Level III) was performed on 100% of the data to assess their analytical accuracy, precision, and completeness. The assessment of the data included a review of the following:

- Completeness
- Chain-of-custody documentation
- Holding times and sample receipt conditions
- Frequency of quality control (QC) samples
- Initial calibration and continuing calibration precision and accuracy
- Blank contamination and, if any, its impact on the analytical results
- Laboratory control sample (LCS) accuracy
- Surrogate spike accuracy
- Internal standard accuracy and frequency
- Instrument tuning accuracy and frequency

- Laboratory and FD precision

The quality assurance (QA)/QC criteria implemented during validation were those listed in the site-specific QAPP and subsequent addendums. Standard data qualifiers were added as a means of classifying the data as to their conformance to QA/QC requirements. Multiple qualifiers are routinely applied to specific sample method/matrix/analyte combinations, but there is only one final qualifier. A final qualifier is applied to the data and is the most conservative of the applied validation qualifiers. The data qualifiers are defined as follows:

[U] Undetected. The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

[J] Estimated. The analyte was positively identified; the concentration is an estimation due to discrepancies in meeting certain analyte-specific QC criteria or was reported between the detection limit and reporting limit.

In instances where multiple analyses were performed, the analytical run with the lowest reporting limits was used if the QC criteria were met for that analysis. If a sample was analyzed more than once due to a target parameter concentration above the calibration range, the results for all parameters were reported from the lowest dilution, except for the parameters exceeding the calibration range, which were reported from the diluted analysis. In instances where multiple analyses were performed with QC outside criteria, the analytical run with the least number of exceptions or best possible QC was chosen for reporting purposes.

The analytical results were within project control limits, except where noted in the following sections. Qualified data are listed in Table 1.

Holding Time and Preservation

Acceptance criteria were met.

Calibration

Initial and continuing calibration analyses were performed as required by the methods, and acceptance criteria were met.

Method Blanks

Method blanks were analyzed at the required frequency and were free of contamination, with the following exception:

- Acetone was detected in all SDGs and methods except for SDG P1800810, TO-15 Scan. Acetone is a known laboratory contaminant, and all sample concentrations were well above two times the blank contaminations or nondetect; therefore, no qualifiers were applied.

Laboratory Control Samples

LCS/LCSDs were analyzed as required, and acceptance criteria were met.

Surrogate Standards

Surrogates were added to the samples, and acceptance criteria were met.

Internal Standards

Internal standards were added as required, and acceptance criteria were met.

Instrument Tunes

Instrument tunes were completed as required, and acceptance criteria were met.

Laboratory Duplicates

Laboratory duplicates were performed as required, and precision criteria were met with the following exception:

The laboratory duplicate for 1,1,1-trichloroethane in sample 18CP01-02 reported a 46% relative percent difference (RPD), which is outside the laboratory limit of 25%. The native sample was qualified "J" as estimated.

Field Duplicates

FDs were collected and analyzed as required, and the RPDs were within established QC limits.

Overall Assessment

The goal of this assessment is to document that a sufficient number of representative samples were collected, and the resulting analytical data can be used to support the decision-making process. The following summary highlights the PARCC findings for the sampling events:

- Precision of the data was verified by reviewing the field and laboratory data quality indicators that include FD and LCS/LCSD RPDs. Precision was generally acceptable, except for one analyte that was qualified as estimated in one samples due to LD RPD issues. Data users should consider the impact to results that are qualified as estimated, because it may indicate a bias that could affect the decision-making process.
- Accuracy of the data was verified by reviewing the calibration data, LCS/LCSD, surrogate, and internal standard recoveries, as well as the evaluation of the method blank data. Accuracy was generally acceptable.
- Representativeness of the data was verified through the sample's collection, storage, and preservation procedures, and verification of holding time compliance. The laboratory did not note discrepancies with sample collection, storage, or preservation procedures. The data were reported from analyses within the EPA-recommended holding time.
- Comparability of the data was verified using standard EPA analytical procedures and standard units for reporting. Results obtained are comparable to industry standards in that the collection and analytical techniques followed approved, documented procedures.
- Completeness is a measure of the number of valid measurements obtained in relation to the total number of measurements planned. Completeness is expressed as the percentage of valid or usable measurements compared to planned measurements. Valid data are defined as the data that are not rejected for project use. The data were considered valid, and the completeness goal of 90% was met for the analyte/method combinations.

Analytical Data Summary for Sampling at the PMC Groundwater Superfund Site, Petoskey, Michigan, May through June 2018

PREPARED FOR:	U.S. Environmental Protection Agency (EPA)
PREPARED BY:	CH2M HILL, Inc. (CH2M)
DATE:	July 3, 2019

This memorandum presents the data quality evaluation (DQE) of groundwater (GW) and sub-slab soils samples collected during the field investigation conducted May through June 2018 at the PMC Groundwater Superfund Site in Petoskey, Michigan. Guidance for the DQE assessment followed the Quality Assurance Project Plan (QAPP) (CH2M 2018), EPA *Contract Laboratory Program National Functional Guidelines for Organic Superfund Methods Data Review* (EPA 2017), EPA *Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Methods Data Review* (EPA 2017), and individual method requirements.

CH2M personnel performed the sampling, and ALS in Holland, Michigan, analyzed the samples for metals, site-specific volatile organic compounds (VOCs), total organic carbon (TOC), oxidant demand. ALS in Kelso, Washington, analyzed a subset of the water samples for perfluorooctanoic acid (PFOA)/perfluoroalkyl substances (PFAS). ALS in Simi Valley, California, analyzed the air samples for VOCs. The soil and groundwater samples were reported in nine sample delivery groups (SDGs) listed as 1806126, 1806842, 1807016, 18051328, 18051407, 18051560, 18051682, 18051688, and 18051778. The air samples were reported in 3 SDGs listed as P1803492, P1803494, and P1803495.

The analytical results were evaluated using the criteria of precision, accuracy, representativeness, comparability, and completeness (PARCC), as described in the project QAPP (CH2M 2018). This technical memorandum summarizes the data issues identified during the general data quality assessment.

Analytical Data

This DQE report provides the results and validation for the following samples. 26 normal soil samples from 10 soil vapor boring (SVB) locations and 2 monitoring well (MW) installations were collected and analyzed for

- TAL Metals-EPA Methods SW-846 Method 6010C
- VOC (site specific)- SW-846 Method 8260C
- TOC-Walkley-Black Method
- Oxidant Demand-ASTM 4500B
- PFOA & PFAS-Method PFC 537M using a preparation method 3535A

Sample Tabulation

Thirty-eight normal groundwater samples from 2 CH2M Monitoring Well (CMW) locations, 4 COP locations, 3 MW locations, 13 PS locations and 9 SVB locations were collected and analyzed for site-specific VOCs. Seven of the groundwater samples were also analyzed for PFOA/PFAS. 9 sewer gas and 31 soil vapor samples from 15 SVB locations were also collected and analyzed for site specific VOCs by EPA Method TO-15/TO-15 SIM.

Three groundwater and 5 air field duplicates (FDs) were also collected and analyzed for the site-specific VOC target compound list. Additionally, one equipment blank (EB) was collected and analyzed by the laboratory for the PFOA/PFAS fraction. Thirteen travel blanks (TB) were collected and analyzed for VOC fraction. Samples were shipped by an overnight carrier to the laboratory for analysis.

Stage 2B validation (Level III) was performed on 100% of the data to assess their analytical accuracy, precision, and completeness. The data assessment included a review of the following:

- Completeness
- Chain-of-custody documentation
- Holding times and sample receipt conditions
- Frequency of quality control (QC) samples
- Initial calibration and continuing calibration precision and accuracy
- Blank contamination and, if any, its impact on the analytical results
- Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) accuracy
- Surrogate spike accuracy
- Internal standard accuracy and frequency
- Instrument tuning accuracy and frequency
- Laboratory and FD precision

The quality assurance (QA)/QC criteria implemented during validation were those listed in the site -specific QAPP (CH2M 2018). Standard data qualifiers were added as a means of classifying the data as to their conformance to QA/QC requirements. Multiple qualifiers are routinely applied to specific sample method/matrix/analyte combinations, but there is only one final qualifier. A final qualifier is applied to the data and is the most conservative of the applied validation qualifiers. The data qualifiers are defined as follows:

[**U**] Undetected. The analyte was analyzed for but was not detected above the reported sample quantitation limit.

[**UJ**] The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the action limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

[**J**] Estimated. The analyte was positively identified; the concentration is an estimation due to discrepancies in meeting certain analyte-specific QC criteria or was reported between the detection limit and reporting limit.

[**R**] The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

In instances where samples had multiple laboratory analyses performed, the analytical run with the lowest reporting limits (least dilute) was used if the QC criteria were met for that analysis. If a sample was analyzed more than once due to a target parameter concentration above the calibration range, the results for all parameters were reported from the lowest dilution, except for the parameters exceeding the calibration range, which were reported from the diluted analysis. In instances where multiple analyses were performed with QC outside criteria, the analytical run with the least number of exceptions or best possible QC was chosen for reporting purposes.

The analytical results from the associated field collection event were within project specified control limits for the listed analytical methods, except where noted in the following subsections below.

Holding Time and Preservation

All acceptance criteria were met for the described sample set for this sample set.

Calibration

Initial and continuing calibration analyses were performed as required by the methods. All acceptance criteria were met with the following exceptions:

The initial calibration response was below the control limits for methyl acetate in SDGs 18051778 and 18051682. Any nondetected concentrations were qualified "UJ" and detects were qualified "J" as estimated.

The initial calibration response was below the control limits for 1,2-dichloropropane in SDG 18051682. Any nondetected concentrations were qualified "UJ" and detects were qualified "J" as estimated.

The initial calibration response was below the control limits for bromomethane and dichlorodifluoromethane in SDGs 1806126. Any nondetected concentrations were qualified "UJ" and detects were qualified "J" as estimated.

The initial and all continuing calibrations in SDG 18051778 reported a low recovery for potassium below 75%. The two associated samples were both detected and qualified "R" as unusable.

Multiple continuing calibrations in SDG 18051407 reported low recoveries for acetone, chloromethane, bromoform, 2-butanone, 1,1,2-trichloroethane, methyl acetate, 1,1,2,2-tetrachloroethane and 1,2-dibromo-3-chloropropane. Any nondetected concentrations were qualified "UJ" and detects were qualified "J" as estimated.

Multiple continuing calibrations in SDG 1807016 reported low recoveries for 1,2-dibromoethane. All associated samples were nondetect and therefore qualified "UJ".

Zinc reported a high recovery in SDG 18051778, therefore, detected concentrations in associated samples were qualified "J". Nondetects were not qualified.

Blank Sample Findings

Method blanks were analyzed at the required frequency and were free of contamination, with the following exceptions:

- Ethanol was detected at a concentration greater than the MDL in one method blank associated with SDG P1803492. Associated native sample results that were detected at concentrations less than the concentration found in the method blank were qualified as nondetected results and flagged "U". The results also were reported at the RDL.
- Ethanol, acetone and chloroform were detected at concentrations greater than the MDL in one method blank associated with SDG P1803495. Associated native sample results that were detected at concentrations (two times for Acetone, a common laboratory contaminant) less than the concentration found in the method blank were qualified as nondetected results and flagged "U". The results also were reported at the RDL.

Trip blanks were analyzed at the required frequency and were free of contamination, with the following exceptions:

- Acetone and chloroform were detected at concentrations greater than the MDL in one trip blank associated with SDG 1806126. Methylene chloride was detected at a concentration greater than the MDL in one trip blank associated with SDG 18051778. Associated native sample results that were detected at concentrations (two times for Acetone and methylene chloride, common laboratory

contaminants) less than the concentration found in the trip blank were qualified as nondetected results and flagged "U". The results also were reported at the RDL.

The equipment blank for the PFOA/PFAS fraction was analyzed at the required frequency and was free of contamination and no detects of target compounds.

Laboratory Control Samples

LCS/LCSDs were analyzed as required, and acceptance criteria were met for this sample set.

Surrogate Standards

Surrogates were added to the samples, and acceptance criteria were met for this sample set.

Internal Standards

Internal standards were added as required, and acceptance criteria were met for this sample set.

Instrument Tunes

Instrument tunes were completed as required, and acceptance criteria were met for this sample set.

Matrix and Post-Digestion Spikes

MS/MSD samples were analyzed as required and all accuracy and precision criteria were met with the following exceptions:

In SDG 18051407, sample PMC-SVB-12-SO/12.0-13.0-051818, the MS/MSD had several target compounds below the control limits: 1,4-dichlorobenzene, 1,2,4-trichlorobenzene, 1,3-dichlorobenzene, and 1,2-dichlorobenzene.

In SDG 18051407, sample PMC-SVB-12-SO/1.5-2.5-051818; 1,1,2,2-tetrachloroethane, was reported below the control limit. The MS/MSD for TOC was also reported below the control limits.

In SDG 1806842, sample PMC-COP-5-R-061118, acetone and trichloroethylene were reported below the control limit.

In SDG 1807016, sample PMC-PS-CD-062818, acetone was reported below the control limit.

Any nondetected concentrations in the associated parent sample data were qualified "UJ" and detects were qualified "J" as estimated.

Laboratory Duplicates

Laboratory duplicates were performed as required, and precision criteria were met with the following exceptions:

- The laboratory duplicates for oxidant demand in samples PMC-SVB-11-SO/18.0-19.0-051818 and PMC-SVB-12-SO/8.0-9.0-051818 were outside the laboratory limits. The native samples were qualified "J" as estimated for those analytes.

Field Duplicates

FDs were collected and analyzed as required, and the relative percent differences (RPDs) were within established QC limits, with the following exceptions:

- Acetone was flagged estimated as "J" in parent samples PMC-SVB-04-06-062718, PMC-SVB-10-15.6-062618 and PMC-SVB-11-05-062618 due to FD precision exceedances.

- n-Butanol was flagged estimated as "J" in parent samples PMC-SVB-04-06-062718, PMC-SVB-10-15.6-062618 and PMC-ST-05-062918 due to FD precision exceedances.
- Isopropanol was flagged estimated as "J" in parent sample PMC-ST-05-062918 due to a FD precision exceedance.

Sample Analysis

The analysis of sample PMC-ST-06-062918, in SDG P1803495, in SIM mode had positive hits for all target analytes at concentrations above MDL. The laboratory determined that the sample was contaminated with trace levels of the standard during the analysis. Therefore, the results being reported for this sample are biased high by approximately 0.031 micrograms per cubic meter and flagged "J" as estimated.

Overall Assessment

The goal of this assessment is to document that a sufficient number of representative samples were collected, and the resulting analytical data can be used to support the decision-making process. The majority of the sample results that were qualified during the validation process were in the VOC fraction. Additionally, there was limited flagging of Oxidant Demand. No other analytical fractions were qualified upon the review/validation of the laboratory final data.

The following summary highlights the PARCC findings for the sampling events:

- Precision of the data was verified by reviewing the field and laboratory data quality indicators that include LCS/LCSD, laboratory duplicate, and FD RPDs. Precision was generally acceptable with the noted exception of three analytes being qualified as estimated detected results in five samples due to laboratory duplicate and/or FD RPD issues. Data users should consider the impact to final results that are qualified as estimated, because it may indicate a bias that could affect the decision-making process.
- Accuracy of the data was verified by reviewing the calibration data, LCS/LCSD, surrogate, and internal standard recoveries, as well as the evaluation of the method blank, canister, and flow controller data. Accuracy was generally acceptable with the exception of several analytes that were detected in the method blanks at concentrations greater than the MDL. Associated results that were detected at concentrations (two times for common laboratory contaminants) less than the concentration found in the method blank, canister, and/or flow controllers were qualified as nondetected results and flagged "U". Nondetected results and concentrations (two times for common laboratory contaminants) greater than the concentration found in the method blank were not qualified.
- Representativeness of the data was verified through the sample's collection, storage, and preservation procedures, and verification of holding time compliance. The laboratory did not note discrepancies with sample collection, storage, or preservation procedures. The data were reported from analyses within the EPA-recommended holding time.
- Comparability of the data was verified using standard EPA analytical procedures and standard units for reporting. Results obtained are comparable to industry standards in that the collection and analytical techniques followed approved, documented procedures.
- Completeness is a measure of the number of valid measurements obtained in relation to the total number of measurements planned. Completeness is expressed as the percentage of valid or usable measurements compared to planned measurements. Valid data are defined as the data that are not rejected for project use. The data were considered valid with the exception of the two potassium

results flagged "R" as noted above, and the completeness goal of 90% was met for the analyte/method combinations.

Analytical Data Summary for Sampling at the PMC Groundwater Superfund Site, Petoskey, Michigan, October through November 2018

PREPARED FOR:	U.S. Environmental Protection Agency (EPA)
PREPARED BY:	CH2M HILL, Inc. (CH2M)
DATE:	July 3, 2019

This memorandum presents the data quality evaluation (DQE) of air samples collected during the field investigation conducted October through November 2018 at the PMC Groundwater Superfund Site in Petoskey, Michigan. Guidance for the DQE assessment followed the Quality Assurance Project Plan (QAPP) (CH2M 2018), EPA *Contract Laboratory Program National Functional Guidelines for Organic Superfund Methods Data Review* (EPA 2017), and individual method requirements.

CH2M personnel performed the sampling, and ALS in Simi Valley, California, analyzed the air samples for VOCs. The air samples were reported in seven sample delivery groups (SDGs) listed as P1805476, P1805493, P1805497, P1805559, P1806319, P1806321, and P1806362. The analytical results were evaluated using the criteria of precision, accuracy, representativeness, comparability, and completeness (PARCC), as described in the QAPP (CH2M 2018). This technical memorandum summarizes the data issues identified during the general data quality assessment.

Analytical Data

This DQE report provides the results and validation for the following samples. 48 air-media samples from nine locations, and nine soil vapor samples from five soil vapor boring (SVB) locations were collected and analyzed for site specific VOCs by EPA Method TO-15/TO-15 SIM.

One soil vapor and seven air-media field duplicates (FDs), were also collected and analyzed for site-specific VOCs. Samples were shipped by an commercial carrier to the laboratory for analysis.

Stage 2B validation (Level III) was performed on 100% of the data to assess their analytical accuracy, precision, and completeness. The data assessment included a review of the following elements:

- Completeness
- Chain-of-custody documentation
- Holding times and sample receipt conditions
- Frequency of quality control (QC) samples
- Initial calibration and continuing calibration precision and accuracy
- Blank contamination and, if any, its impact on the analytical results
- Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) accuracy
- Surrogate spike accuracy
- Internal standard accuracy and frequency
- Field duplicate precision

The quality assurance (QA)/QC criteria implemented during validation were those listed in the site-specific QAPP (CH2M 2018). Standard data qualifiers were added as a means of classifying the data

as to their conformance to QA/QC requirements. Multiple qualifiers are routinely applied to specific sample method/matrix/analyte combinations, but there is only one final qualifier. A final qualifier is applied to the data and is the most conservative of the applied validation qualifiers. The data qualifiers are defined as follows:

[U] Undetected. The analyte was analyzed for but was not detected above the reported sample quantitation limit.

[UJ] The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the action limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

[J] Estimated. The analyte was positively identified; the concentration is an estimation due to discrepancies in meeting certain analyte-specific QC criteria or was reported between the detection limit and reporting limit.

[R] The data are unusable. The sample results are rejected due to serious deficiencies in meeting Quality Control (QC) criteria. The analyte may or may not be present in the sample.

In instances where samples had multiple laboratory analyses performed, the analytical run with the lowest reporting limits (least dilute) was used if the QC criteria were met for that analysis. If a sample was analyzed more than once due to a target parameter concentration above the calibration range, the results for all parameters were reported from the lowest dilution, except for the parameters exceeding the calibration range, which were reported from the diluted analysis. In instances where multiple analyses were performed with QC outside criteria, the analytical run with the least number of exceptions or best possible QC was chosen for reporting purposes.

The analytical results were within project control limits, except where noted in the following subsections.

Holding Time and Preservation

Acceptance criteria were met.

Calibration

Initial and continuing calibration analyses were performed by the laboratory as required by the analytical methods. All acceptance criteria were met.

Blanks

Method blanks were analyzed by the laboratory at the required frequency and were free of contamination, with the following exceptions:

- Acetone, dichlorodifluoromethane, and toluene were detected at concentrations greater than the MDL in method blanks associated with SDG P1806319. Associated native sample results that were detected at concentrations (two times for acetone, a common laboratory contaminant) less than the concentration found in the method blank were qualified as nondetected results and flagged “U”. The results also were reported at the laboratory’s quantitation reporting limit.
- Acetone and acetonitrile were detected at concentrations greater than the MDL in method blanks associated with SDG P1806321. Associated native sample results that were detected at concentrations (two times for acetone, a common laboratory contaminant) less than the concentration found in the method blank were qualified as nondetected results and flagged “U”. The results also were reported at the laboratory’s quantitation reporting limit.

Laboratory Control Samples

LCS/LCSDs were analyzed as required, and acceptance criteria were met with the following exceptions:

In SDG P1806319, bromomethane and chloroethane did not meet RPD criteria between the LCS and LCSD. Dichlorodifluoromethane exhibited low recoveries in the LCSD. Detected results were qualified "J" as estimated.

In SDG P1806321, dichlorodifluoromethane did not meet RPD criteria between the LCS and LCSD. Detected results were qualified "J" as estimated.

Surrogate Standards

Surrogates were added to the samples, and acceptance criteria were met with the following exceptions:

Samples PMC-IN-07-01-110618 and PMC-IN-40-110818 in SDG P1806319, exhibited high recoveries in the surrogates. Detected results were qualified "J" as estimated.

Samples PMC-03-IN01-110818 and PMC-03-IN02-110818 in SDG P1806321, exhibited high recoveries in the surrogates. Detected results were qualified "J" as estimated.

Field Duplicates

Field duplicates were collected and analyzed as required, and the relative percent differences (RPDs) were within established QC limits, with the following exceptions listed in the table below:

SDG	Sample ID	Target Analyte
P1806319	PMC-02-SS01-110818	Carbon Disulfide
P1806319	PMC-02-SS01-110818-FD	Carbon Disulfide
P1806319	PMC-IN-47-02-110818-FD	n-Butanol
P1806319	PMC-IN-47-02-110818	n-Butanol
P1806321	PMC-01-SS01-110718	Carbon Disulfide
P1806321	PMC-01-SS01-110718-FD	Carbon Disulfide
P1806321	PMC-01-SS01-110718	n-Butanol
P1806321	PMC-01-SS01-110718-FD	n-Butanol
P1806321	PMC-03-SS01-110718	Carbon Disulfide
P1806321	PMC-03-SS01-110718-FD	Carbon Disulfide
P1806321	PMC-03-SS01-110718	n-Butanol
P1806321	PMC-03-SS01-110718-FD	n-Butanol
P1806321	PMC-04-IN01-110918	Toluene
P1806321	PMC-04-IN01-110918-FD	Toluene
P1806321	PMC-05-IN01-110918	Acetone
P1806321	PMC-05-IN01-110918	Dichloromethane
P1806321	PMC-05-IN01-110918	n-Hexane
P1806321	PMC-05-IN01-110918	Toluene

SDG	Sample ID	Target Analyte
P1806321	PMC-05-IN01-110918	Xylenes, m & p
P1806321	PMC-05-IN01-110918-FD	Acetone
P1806321	PMC-05-IN01-110918-FD	Dichloromethane

P1806321	PMC-SVB-01-5.8-110518	n-Butanol
P1806321	PMC-SVB-01-5.8-110518-FD	n-Butanol
P1806362	PMC-SG-50-111518	Carbon Disulfide
P1806362	PMC-SG-50-111518-FD	Carbon Disulfide

Nondetected results were qualified as “UJ” and detected results were qualified as “J” estimated.

Overall Assessment

The goal of this assessment is to document that a sufficient number of representative samples were collected, and the resulting analytical data can be used to support the decision-making process. The following summary highlights the PARCC findings for the sampling events:

- Precision of the data was verified by reviewing the field and laboratory data quality indicators that include LCS/LCSD, and FD RPDs. Precision was generally acceptable with the exceptions of FD RPD issues noted in this document. Data users should consider the impact to final results that are qualified as estimated, because it may indicate some degree of bias that could affect the decision-making process.
- Accuracy of the data was verified by reviewing the calibration data, LCS/LCSD, surrogate, and internal standard recoveries, as well as the evaluation of the method blank, canister, and flow controller data. Accuracy was generally acceptable with the exception of several analytes that were detected in the method blanks at concentrations greater than the MDL. Accuracy of the data was generally acceptable with noted exceptions in the LCS/LCSD, surrogate recoveries, and method blank contamination which does impact final results for those qualified due to blank contamination and flagged “U” as nondetected.
- Representativeness of the data was verified through the sample’s collection, storage, and preservation procedures, and verification of holding time compliance. The laboratory did not note any discrepancies with sample collection, storage, or preservation procedures. The data were reported from analyses within the EPA-recommended holding time.

- Comparability of the data was verified using standard EPA analytical procedures and standard units for reporting. Results obtained are comparable to industry standards in that the collection and analytical techniques followed approved, documented procedures.
- Completeness is a measure of the number of valid measurements obtained in relation to the total number of measurements planned. Completeness is expressed as the percentage of valid or usable measurements compared to planned measurements. Valid data are defined as the data that are not rejected for project use. The data were considered valid and the completeness goal of 90% was met for the analyte/method combinations.

APPENDIX G

Assessment of Mass Storage of Volatile Organic Compounds in Soil and Groundwater

PREPARED FOR: U.S. Environmental Protection Agency (EPA)

PREPARED BY: CH2M HILL, Inc. (CH2M)

DATE: November 2018

Introduction

This technical memorandum evaluates the mass storage volatile organic compounds (VOCs) in soil and groundwater at the Petoskey Manufacturing Company (PMC) Groundwater Superfund Site in Petoskey, Michigan (site) and presents the analytical results of this investigation. This investigation was conducted to evaluate the potential for vapor intrusion (VI) of VOCs, primarily trichloroethylene (TCE), at properties at or near the site.

Assessment of Mass Storage of Volatile Organic Compounds in Soil and Groundwater

Previous results strongly suggest that both the saturated and unsaturated zones at this site contain sufficient mass of TCE to each independently produce subslab soil gas concentrations that are elevated above VI screening levels. Using the conceptual site model developed for this site, an analysis was performed to identify the media (groundwater, soil gas, or bulk soil) and locations within those media contributing to relatively higher masses of TCE in soil gas. This analysis included graphical display of the site characterization data to evaluate vertical profiles of TCE in soil vapor at different locations, and equilibrium partitioning calculations using Henry's law equilibrium partitioning from VOCs in groundwater. Additionally, 3-phase equilibrium partitioning modeling was used to estimate potential soil vapor concentrations in onsite soils and identify potential vapor intrusion (VI) impacts. The results from this assessment will be used in the feasibility study to determine if remedial alternatives need to consider technologies for remediating both groundwater and soil to protect receptors from VI exposure pathways, and if cleanup of both media are needed to discontinue operation of VI mitigation systems.

1.1 Problem Formulation

A problem formulation consists of a conceptual model, a series of study questions and brief description of the data analysis methods used to answer those questions.

1.1.1 Conceptual Model

The conceptual site model is presented in detail in the Remedial Investigation Report. Brief excerpts are presented in this section to depict source, pathway and receptor relationships related to TCE vapor transport.

Sources: Residual VOC contaminants in soil and groundwater from prior cleanups. Residential structures overly soil and groundwater contamination. TCE concentrations in groundwater are low (<36 micrograms per liter [µg/L], from June 2018 groundwater sampling data). Groundwater plume has been stable to declining for several decades. Similarly, TCE concentrations in soil vapor are low (generally <10,000 micrograms per cubic meter [$\mu g/m^3$]). There are a few isolated locations with bulk soil sampling results >1 milligram per kilogram (mg/kg) TCE. These results seem to diverge from the groundwater and soil gas lines of evidence.

Fate and transport: Unconsolidated material in the vadose zone consists of fill (for example, topsoil) overlying heterogeneous fill consisting of sub-rounded limestone boulders and cobbles in a matrix of sand,

gravel, silt, and clay. The thickness of the unconsolidated material generally ranges from 5 to 15 feet, though the unconsolidated material thins towards the northwest of the historical source area (Water Street Condominiums). Higher total organic compound (TOC) concentrations (>1 percent) are found in shallow (<5 feet) unconsolidated material. TOC measurements at depth from the sandy material suggest there are lower concentrations of organic carbon in the coarser material, <0.3 percent. In the unconsolidated material, areas with higher TOC concentrations or finer-grained materials, such as the fill material, could be sinks for VOCs. Groundwater occurs at 12 to 16 feet.

Receptors: Inhalation exposures of individuals in overlying buildings from VI pathways from TCE in soil gas.

1.1.2 Study Questions

Determine whether TCE vapor mass is found primarily in the vadose or saturated zones. Low (<50 µg/L) concentrations TCE concentrations in shallow groundwater (at the water table) partition into overlying soil gas following Henry's law. With a Henry's law constant of approximately 0.4 (EPA 2018), the relationship with TCE is 400 µg/m^3 in soil gas per 1 µg/L in water. TCE concentrations in groundwater higher than 50 µg/L then can potentially produce soil gas concentrations at the water table that are well above its VISL in soil gas (i.e., >20,000 µg/m^3). If VOCs in groundwater are producing a vadose zone vapor source for VI, one might observe at that location a soil gas concentration vertical profile with higher concentrations at depth and the highest concentrations from samples at the water table. Comparing measured soil gas concentrations with concentrations modeled from groundwater using Henry's law identifies locations where attenuation of TCE may be greater than indicated by default attenuation factors (AFs); at these locations, the VISL may be overly stringent for identifying VI from TCE in groundwater.

Conversely a soil gas concentration profile with high concentrations in shallow soil, low concentrations at depth, indicates a potential surface release as the VOC source in soil gas. Which media (soil gas, groundwater or both) need to be treated to achieve cleanup that protects from VI pathways? In other words, are both remediation of soil and groundwater needed to discontinue operating VI mitigation systems? VOC mass storage in soil and groundwater is assessed in this analysis by converting both to soil gas concentrations at equilibrium. Measured soil gas concentration data are used directly. VOC concentrations in groundwater are transformed to equivalent soil gas concentrations at the water table using Henry's law. VOC concentrations in bulk soil samples are transformed to equivalent soil gas concentrations using a 3-phase equilibrium partitioning model. Measured and modeled soil gas concentrations are compared to determine which media – groundwater or soil – represents the largest soil gas source strength.
The distribution of TCE in groundwater and soil gas varies across the site. In assessing which media need to be treated, the site was divided into the three study areas. Soil gas and shallow groundwater samples from the June 2018 sampling event were placed in one of the three following groups:

- Water Street Condominiums (historical source area) and groundwater plume to the northwest
- Commercial property, downgradient to the west (soil vapor samples SVB-05/SVB-02)
- Along Lake Street, further west (SVB-01/SVB-03)

Bulk soil sample data are discussed separately, as these represent an uncertainty in the mass storage analysis. As is described below, with equilibrium partitioning modeling using parameters for a sand, a concentration of 1 mg/kg TCE in a bulk soil sample corresponds to 950,000 µg/m^3 in soil gas; locations with bulk soil results >1 mg/kg might indicate a strong though localized soil gas source in the vadose zone (i.e., the unconsolidated material). The bulk sampling results are discussed further in this section as related to soil characteristics and nearby soil gas sampling results.

1.2 Data Analysis

1.2.1 Water Street Condominiums

The vertical distribution of TCE in soil shows higher concentrations in the shallow intervals in some sample locations (SVB-11, SVB-12, and SVB-15). The VOC profiles at these locations suggest these are the result of releases to the ground surface stored in the shallow soils.

TCE concentrations measured in groundwater at SVB-11 and PS-4, converted to soil gas concentrations with Henry's law, provide an indication of potential vapor source strength at the water table. The vapor source strengths in the elevated locations in shallow soil and in groundwater are of comparable magnitude, as shown in Figure 1. The high TCE vapor source strength from groundwater is not apparent from the available deep soil gas sampling data. Site-specific attenuation from groundwater in this area may be greater than the default attenuation factor used for groundwater VISLs (meaning VISLs are overly conservative for assessing VI from TCE in groundwater).

It is uncertain how much attenuation of TCE from groundwater is occurring in this area. Most of the soil gas samples were collected from shallower depths and may not represent well the soil gas concentrations at the water table. In studies with toluene, Provoost et al., 2011 suggested that equilibrium soil vapor concentrations from groundwater were around one order of magnitude lower than would be expected from estimation using a laboratory-derived Henry's law constant. Results from one soil gas sampling location at the water table (SVB-10) are consistent with this literature finding. While there may be uncertainty about the magnitude of vapor transport, TCE in shallow groundwater represents a potential vapor source for VI pathways at this portion of the site.

Therefore, in this area, mass storage in both vadose zone soils and groundwater probably plays an important role since each can generate concentrations well in excess of the TCE soil gas VISL (16 µg/m^3). The shallow concentrations in these external soil gas borings also likely underestimate the concentrations directly beneath the Water Street Condominiums, before mitigation began, due to capping effects. TCE concentrations in subslab samples from the condos pre-SSD installation (in January and April 2017) ranged from 178 to 15,400 µg/m^3, with a median value of 2,900 µg/m^3. All of these concentrations are well above (>10-fold) the soil gas VISL.

1.2.2 Commercial Property west of the site

The vertical profiles of TCE in soil gas in this area suggest a groundwater source (see Figure 2). In sample locations SVB-04 and SVB-05, the highest concentrations are found in the deepest samples. Some of the soil vapor vertical profiles in this area suggest there's greater attenuation then is implied in default assumptions (i.e. VISLs in groundwater would be more conservative than a site-specific screening level would be). Though, as described in Section 1.2.1, it is uncertain how much attenuation is occurring. While there may be uncertainty about the magnitude of vapor transport, TCE in shallow groundwater represents the larger potential vapor source for VI pathways at this portion of the site, not vadose zone soil.

1.2.3 Lake Street

Assessment of where TCE vapor mass is located in this area is inconclusive. The soil gas concentrations from the available samples show very low TCE soil gas concentrations, and groundwater data are not available in this area. However, at the maximum contaminant level for TCE (5 µg/L), groundwater would provide greater vapor source strength than soil, as shown in Figure 3.

1.3 Conclusions

TCE vapor source strength is found both in the vadose zone and in groundwater at the historical source area (Water Street Condominiums), though TCE source strength appears to be greater from groundwater.

TCE vapor source strength in groundwater predominates in downgradient areas (i.e., Eagles Lodge and area to northwest of Water Street Condominiums). Identification of media (soil or groundwater) as a primary source strength is too uncertain along Lake Street.

Site-specific TCE vapor transport from groundwater appears to be more attenuated than indicated by agency default attenuation factors, though this conclusion is uncertain because of limitations with the data. It is supported by data reported in the literature. This potentially affects the development of groundwater cleanup levels protective of VI; cleanup levels derived from VISLs and their attenuation factors are likely to be overly protective for this site for a conventional vapor intrusion pathway. Correspondingly, if VISLs and the default AF of 0.001 are considered representative, TCE in groundwater is potentially an ongoing source for VI at locations with concentrations higher than 5 µg/L.

Uncertainties with this assessment include:

- The greater degree of site-specific attenuation cannot be quantified with the currently available data. Soil gas samples would ideally be collected in closer proximity to groundwater (i.e., ~2-foot vertical separation); however, this poses a risk that water level variations could submerge the points in the future. A few locations in the Water Street Condominiums area had TCE in bulk soil samples at concentrations >1 mg/kg. These do not appear to be associated with fine-grained materials or elevated total organic carbon in soil, these likely reflect “hot spots” left over from prior removal actions, and likely locally influence soil gas concentrations. While 3-phase equilibrium partitioning modeling using parameters for sand shows that 1 mg/kg = 950,000 µg/m^3 in soil gas, the existing soil gas data shows much lower vapor source strengths.

SECTION 1

Introduction

1.1 Overview

This human health risk assessment (HHRA) was prepared for indoor air, soil vapor (subslab and exterior), and subsurface soil at Operable Unit 2 (OU2) of the Petoskey Manufacturing Company (PMC) Groundwater Superfund Site (site) located in Petoskey, Emmet County, Michigan (see Figure 1-1 of the RI report). Site groundwater is being addressed separately as OU1.

The HHRA approach and assumptions presented below are consistent with the Work Plan for the PMC Groundwater Superfund Site Remedial Investigation (RI)/Feasibility Study (FS) (CH2M 2018a), unless noted otherwise.

In accordance with the U.S. Environmental Protection Agency (EPA) guidance documents, this HHRA consists of a four-step evaluation process composed of the following:

- Data collection and evaluation, including identification of chemicals of potential concern (COPCs)
- Exposure assessment
- Toxicity assessment
- Risk characterization

1.2 Scope of the Risk Assessment

The HHRA provides an evaluation of the potential current and reasonably foreseeable future risks to human health posed by detected chemicals at the site in accordance with EPA guidance for conducting HHRAs. The detailed scope and overall approach for the HHRA follows EPA's *Risk Assessment Guidance for Superfund* (RAGS), Parts A, D, E, and F (EPA 1989; EPA 2001; EPA 2004; EPA 2009a), *Human Health Evaluation Manual*, *Update of Standard Default Exposure Factors* (EPA 2014), and *OSWER Technical Guide for Assessing and Mitigating the Vapor Intrusion Pathway from Subsurface Vapor Sources to Indoor Air* (EPA 2015). In addition, other EPA guidance documents were used and are cited in the text and tables.

Condominium units and buildings with existing operational subslab depressurization (SSD) systems or other vapor intrusion mitigation systems (VIMS) were not evaluated in the HHRA. SSD systems are installed at the 200 West Lake Street (Water Street Condominiums), [redacted] and a VIMS is installed at [redacted]. Except for [redacted], these properties are currently residential. Operational SSD systems and other VIMS render the vapor intrusion (VI) pathway incomplete (and therefore no associated risk) or within EPA-acceptable risk levels. It is assumed that each SSD system and other VIMS will remain operational until the vapor source below the building has been reduced to acceptable levels. However, if the SSD system or other VIMS is shut off prior to the vapor source being reduced to acceptable levels, indoor air risks may be unacceptable.

1.3 Site Description, Site History, and Potential Receptors

The site is located at 200 West Lake Street, Petoskey, Emmet County, Michigan. The site has been redeveloped as a condominium complex (the 200 West Lake Street Condominiums), which consists of four buildings, each housing two to six condominiums, none of which have basements and most of which are three-story. The condominium complex is located approximately 500 feet south of Little Traverse Bay of Lake Michigan and is bordered to the north by another condominium complex [redacted], which consists of two buildings, including three stories with multiple condominiums, none of which have basements. Northeast and northwest of the former PMC facility,

surrounding the [redacted], are park spaces connected by a bike path. These park spaces front the Little Traverse Bay of Lake Michigan. To the east and south of the former PMC facility is a neighborhood consisting of multiple single-family residences or duplexes, most of which have stone foundations, and a crawlspace-turned-basement ("Michigan-style" basement) with or without concrete poured flooring. Three of the residences entered during this phase of investigation were found to have basement areas that appeared to be fit for occupancy. Northwest of the former PMC facility is a split-level commercial building with a finished basement and poured concrete foundation. This facility is occupied primarily during standard daytime business hours. Bear Creek, which drains into Little Traverse Bay, is located approximately 500 feet east of the PMC property. Immediately south of Lake Street (behind a row of homes) is a steep bluff running approximately parallel to the shoreline. The study area is shown in Figure 1-2 of the RI Report.

The former PMC facility was a small fabricating operation that was active from 1946 to 2000. Activities included die casting, plating, and painting small automotive trim parts. The facility used trichloroethylene (TCE) and xylene as solvents; TCE was stored in a 1,000-gallon aboveground storage tank (Environmental Consultants & Services Inc. 2001). Spills of hydraulic fluid and "standing oils" in several rooms were also reported at the former PMC facility (Malcolm Pirnie 1998). A subsequent RI showed that at the location with the highest benzene concentration, chemicals were detected that suggest a release of solvents, including petroleum-based solvents (CH2M 2018b). Tetrachloroethene (PCE) was also released to shallow soils in parts of the site (CH2M 2018b). There were likely other solvent release points at the facility. Site contamination discovery and site investigation activities are discussed in Section 1.3 of the RI Report; a brief overview is provided below.

Contamination at the site was first discovered in September 1981, when analytical data from water samples collected from a municipal water supply well (Ingalls Street Well) showed detections of TCE, cis-1,2-dichloroethene, and trihalomethanes. Soil and groundwater sampling by the Michigan Department of Environmental Quality (MDEQ)[1] indicated elevated concentrations of several volatile organic compounds (VOCs), including xylene, toluene, TCE, and ethylbenzene near the site, which were attributed to PMC. MDEQ subsequently asked PMC to determine the extent of the contaminated soil, and to remove and dispose of the impacted material. In 1982, under the direction of MDEQ, PMC completed a partial soil removal from the west side of the PMC building to a depth ranging from 2 to 5 feet. Subsequently, the site was proposed for the National Priorities List and listed in 1983. Detailed site background information and remediation efforts prior to the RI can be found in the *Quality Assurance Project Plan (QAPP), PMC Groundwater Superfund Site, Operable Unit 2* (CH2M 2016).

The former PMC facility was sold in April 2003 to a developer, and the PMC building was demolished in July 2004. Additional rounds of soil samples were collected as the slab was removed, and additional soil excavation was completed in 2004 in conjunction with construction activities. The construction of the residential condominium complex started in September 2004; by 2008, 10 of the planned residential units were completed. In fall 2009, the property was in foreclosure because the developer went bankrupt. Construction for the remaining units was completed by 2014 by a subsequent developer.

It is reported that a barrier consisting of a polyvinyl chloride membrane was placed beneath a portion of the complex in 5 of the units, which left 12 units either partially or completely without an engineered barrier; however, a final report was not issued on this work because of lack of payment. The incomplete installation likely limits the barrier's effectiveness; this barrier was not taken into consideration in the HHRA. Additional information regarding this barrier is provided in Section 1.3.3 of the RI.

Pre-RI activities began in 2016 when CH2M prepared a QAPP (CH2M 2016) for a soil, groundwater, and VI screening sampling program. In October 2016, groundwater samples were collected for analysis of

[1] Effective April 22, 2019, the Michigan Department of Environmental Quality (MDEQ) reorganized into the Michigan Department of Environment, Great Lakes, and Energy (EGLE). Historical references to MDEQ occur throughout this document.

VOCs, general chemistry, dissolved gases, total and dissolved metals, and 1,4-dioxane from 21 monitoring wells. The general chemistry and dissolved gas analyses were used to support an evaluation of monitored natural attenuation. Metals analysis was used to evaluate whether well construction materials are contributing to elevated concentrations of metals in groundwater. 1,4-Dioxane analysis was added because of its status as an emerging contaminant and potential chemical of concern. Details of this sampling event are presented in *Long-Term Groundwater Monitoring Activities, PMC Groundwater Superfund Site* (CH2M 2017a).

In 2016, CH2M installed subslab soil vapor sample points in garages at the Water Street Condominiums (most of the living space of the condominiums directly overlies the garages) and attempted to complete the installation of multi-depth subsurface soil vapor probes. However, the subsurface lithology prevented the use of the planned drilling method (direct-push) as a result of refusal from what is interpreted as large boulders or blocks of weathered bedrock. In January 2017, samples were collected from the subslab soil vapor probes at the Water Street Condominiums for VOC analysis. Analytical results demonstrated that TCE concentrations exceeded the EPA vapor intrusion screening level (VISL). Based on these results, EPA's Removal Program initiated rapid-response activities, including additional subslab soil vapor probe installation, subslab soil vapor and indoor air sampling, and installation of SSD systems to mitigate the VI pathway in 11 of the 17 units of the Water Street Condominiums [redacted]). Results of these response activities are presented as an appendix to the *Vapor Intrusion Investigation – PMC Groundwater Site, Emmet County, Michigan* (CH2M 2018c).

While response activities were being conducted, CH2M implemented a VI assessment at residences surrounding the Water Street Condominiums. These activities were completed in May, June, and July 2017, and February and November 2018 and included subslab and exterior soil vapor probe installation and sampling and indoor air sampling. The data collected by CH2M are presented in *Vapor Intrusion Investigation—PMC Groundwater Site, Emmet County, Michigan* (CH2M 2018c). The data are also included in the RI report and are incorporated into the data analysis presented herein.

As indicated previously, EPA established a new VI operable unit (OU2) in 2017. The scope of investigation for OU2 is defined in *Uniform Federal Policy–Quality Assurance Project Plan, PMC Groundwater Site, Emmet County, MI* (CH2M 2018d). In May and June 2018, soil and groundwater samples were collected, and soil vapor probes and monitoring wells were installed and sampled. In October and November 2018, the soil vapor probes were sampled, and additional residential indoor air and soil vapor sampling was completed.

Based on current and reasonably foreseeable future site conditions, the following potential current and future human receptors were identified in the study area:

Current Exposure Scenarios

- **Residents**—Adults and children currently living on residential properties (apartment units, condominium units, houses) who may contact COPCs in indoor air and crawlspace air (that may be impacted by VOCs migrating from the subsurface).

  Soil exposures to residents outside the former PMC footprint were not evaluated since soil contamination investigations at the site and immediate vicinity were conducted in 1990s; a ROD was issued in 1995.

  Soil contamination was found beneath the former PMC facility after it was demolished in 2004. Exposures to soil beneath the facility were not evaluated in previous investigations; however, soil exposures by residents at the 200 West Lake Street Water Street Condominiums on the former PMC facility property are expected to be insignificant because residents will not have significant contact with soil due to the lack (or small size) of gardens in a condominium setting. Disturbance of soils at the former PMC facility property is also governed by an existing restrictive covenant agreement.

- **Industrial/Commercial Workers**—Two commercial units are present in the study area and both have SSD systems. Therefore, industrial/commercial workers were not further evaluated in the HHRA.

Reasonably Foreseeable Future Exposure Scenarios

- **Residents**—Adults and children currently living on residential properties (apartment units, condominium units, houses) who may contact COPCs in soil (via direct contact and emissions from soil) and indoor air (that may be impacted by VOCs migrating from the subsurface). Soil exposures by residents at the condominium units are expected to be insignificant because residents will not have significant contact with soil due to the lack (or small size) of gardens in a condominium setting. Disturbance of soils at the former PMC facility property is also governed by an existing restrictive covenant agreement.
- **Construction Workers**—Construction workers who may contact COPCs in soil (via direct contact and air emissions from soil) while conducting intrusive soil activities such as building construction or utility maintenance. Soil contamination was found beneath the former PMC facility after it was demolished. Exposures to soil beneath the facility were not evaluated in previous reports; therefore, soil within the footprint of the PMC facility was addressed in this HHRA.

Indoor air and crawlspace air data are used to evaluate current indoor air exposures, while subslab soil vapor or exterior soil vapor data are used to assess whether indoor air concentrations are from a subslab source (rather than an indoor source) and to evaluate potential future indoor air exposures. In cases where indoor air/crawlspace air data is not available for a dwelling, soil vapor data are used to evaluated current indoor air exposures.

A human health conceptual exposure model presents potential exposure media, exposure points, receptors (current and future), and exposure routes. The conceptual exposure model is graphically presented in Figure 1 of Appendix H-1 and included in Table 1 of Appendix H-2.

SECTION 2

Data Evaluation

2.1 Data Used in the HHRA

Indoor air, crawlspace air, subslab soil vapor, exterior soil vapor, and soil samples collected by CH2M in 2017 and 2018 were used in the HHRA. In addition, data collected in 2017 and 2018 by The Mannik & Smith Group, Inc. at the 200 West Lake Street condominiums [redacted] and [redacted] were used in the HHRA. Information regarding the Mannik & Smith data is presented in the VI investigation technical memorandum (Appendix B of the RI report). Descriptions of the data collection activities for samples used in the HHRA is provided in Section 2 of the RI report. Groundwater data was not used in the quantitative risk assessment of the VI pathway since an extensive network of soil vapor sampling locations is available for the site and is more extensive than the groundwater monitoring network. Groundwater as a source of mass storage and transport for VI is considered in the conceptual site model and in the nature and extent sections of the RI, and also in the upcoming feasibility study. For properties with no subslab data, risks were estimated using the nearest exterior soil vapor point to the property.

Appendix H-3, Table 1 summarizes the data groupings used in the HHRA. Appendix H-3, Table 2 describes samples associated with each data grouping. The following subsections discuss data groupings for each exposure medium. Sample locations are depicted in Figure 4-3 (soil) of the RI report, and in Appendix B, Figure 3 (subslab, near-slab, exterior soil vapor) and Figure 5 (subslab soil vapor and indoor air) of the RI Report.

All media samples were analyzed for VOCs. Appendix H-4 contains the analytical data for the samples used in the HHRA.

Note that indoor air/crawlspace air data was used to evaluate current indoor air exposures at a property, while subslab soil vapor data (or if not available, the nearest exterior soil vapor data within 100 feet) was used to evaluate potential future indoor air exposures at a property. For properties where indoor air/crawlspace air data were not collected, subslab soil vapor data (or exterior soil vapor data, if subslab soil vapor data are not available) were used to evaluate both current and potential future indoor air exposures.

The data from the RI were evaluated using the following procedures:

- A value reported as estimated ("J" qualified) was included in the HHRA if it was the only value provided for a sample or if it is the highest reported result from a set of reported values from dilutions and/or reanalysis.
- For sample locations where a duplicate sample was also collected, the higher of the original or duplicate sample result was used when results are detects. If one result was a detect and one was a nondetect, the detected value was used.
- "U" or "UJ" qualified results were treated as nondetected values.

A description of the data quality assurance and quality control process is provided in Section 2.13 of the RI report. Data validation of site samples collected by CH2M was conducted to assess the accuracy and precision of the data following guidelines outlined in the *QAPP, PMC Groundwater Superfund Site, Operable Unit 2* (CH2M 2016) and the *UFP–QAPP, PMC Groundwater Site, Emmet County, Michigan* (CH2M 2018d). Appendix E of the VI TM contains data quality evaluation (DQE) memorandums for the January 2017, May through July 2017, and February 2018 sampling events (CH2M 2018c). A DQE

memorandum for the remaining 2018 CH2M sampling activities is included in Appendix E of the RI report.

2.1.1 Indoor Air and Crawl Space Air Samples

Indoor air samples collected in March through July, September, and November 2017, and January, February, and November 2018 were used in the HHRA. Crawlspace air samples collected in June 2017 and February and November 2018 were used in the HHRA. Indoor air samples were collected from 27 condominium units and 22 residential properties; crawlspace air samples were collected from 7 condominium units and 2 residential properties (Appendix H-3, Table 1); indoor air and crawlspace air data sets were evaluated separately for each property.

Under current conditions, residents could be exposed to COPCs in indoor air and crawlspace air.

2.1.2 Subslab Soil Vapor

Subslab soil vapor samples collected in January, April, July, September, and November 2017, and January, February, and November 2018 were used in the HHRA. The subslab soil vapor data were collected from 6 condominium units and 8 detached residential properties (Appendix H-3, Table 1); subslab soil vapor data sets were evaluated separately for each property.

Under future exposure scenarios, residents could be exposed to COPCs in subslab soil vapor if COPCs migrate to indoor air.

2.1.3 Exterior Soil Vapor

Exterior soil vapor samples collected in May, June, and July 2017, and February and June 2018 were used in the HHRA. The closest exterior soil vapor samples collected from condominium units and residential properties where no subslab soil vapor samples were collected were used to evaluate the VI pathway. The exterior soil vapor data were used for the [redacted] and 16 residential properties (Appendix H-3, Table 1); exterior soil vapor data sets were evaluated separately for each property.

Under future exposure scenarios, residents could be exposed to COPCs in exterior soil vapor if COPCs migrate to indoor air. Exterior soil vapor data from one residential property was used to evaluate current conditions because indoor air and subslab soil vapor data were not collected at this property.

2.1.4 Soil

Soil samples collected from 1 to 10 feet below ground surface (bgs) in May 2018 were used in the HHRA to evaluate direct contact exposures to soil. The soil data were collected during the installation of 10 of 15 soil vapor probes adjacent to the 200 West Lake Street Water Street Condominium units and were grouped into one exposure unit (Appendix H-3, Table 1). Samples were not collected from all borings because excessive heating of the soil occurred while advancing some borings as a result of the rotosonic drilling method. The data limitations of the samples that were collected are discussed in Section 7.2.1 of the RI report.

Under future exposure scenarios, construction workers could be exposed to COPCs in soil (1 to 10 feet bgs) via direct contact and emissions from soil in excavations. Soil exposures by residents at the condominium units are expected to be insignificant because residents will not extensively work in gardens or have significant soil exposure in a condominium setting. Disturbance of soils at the former PMC facility property is also governed by an existing restrictive covenant agreement.

2.2 Selection of Chemicals of Potential Concern

The COPCs are those chemicals that have the greatest potential to cause adverse human health effects if receptors come in contact with site media. The maximum detected concentration of each chemical in a data grouping was compared to its respective screening level (SL). If the maximum detected concentration exceeded its SL, it was retained as a COPC for the HHRA. Chemicals that were undetected in all samples within a medium/data grouping were not selected as COPCs for that medium and data grouping. A detected chemical that has no SL was compared with an SL for a surrogate chemical based on structural or functional similarities, if such information and values were available. The SLs used for each medium are provided in the following subsections.

2.2.1 COPC Screening Levels

2.2.1.1 Indoor Air and Crawl Space Air

The SLs used for indoor air and crawlspace air are the residential air *Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites* (EPA 2019a). The RSLs were based on a target excess lifetime cancer risk (ELCR) of 1×10^{-6} and a noncarcinogenic target hazard quotient (HQ) of 0.1 to account for the potential presence of multiple chemicals affecting the same target organ. For chemicals with more than one RSL (for example, carcinogenic-based RSL and noncarcinogenic-based RSL), the lowest value was selected as the final SL for that chemical.

If the maximum detected concentration of a site-related chemical in indoor air exceeded its SL, the multiple lines of evidence (MLE) evaluation (performed to determine if the chemical is related to VI or potentially present because of background sources) was used to determine whether that chemical was a COPC on a building by building basis. The MLE evaluation is in Attachment H-6, Table 1. If a chemical detected in indoor air or crawlspace air exceeded its SL and is related to VI, it was selected as a VI COPC for that building.

Chemicals present in indoor air or crawlspace air because of background sources or unrelated to site contamination were eliminated as VI COPCs and not addressed further in the HHRA. Chemicals exceeding VISLs but unrelated to VI from the source medium include 1,2-dichloroethane, 1,3-butadiene, 1,4-dichlorobenzene, acrolein, acrylonitrile, chloroform, ethyl acetate, ethylbenzene, 1,2,4-trimethylbenzene, bromodichloromethane, carbon tetrachloride, dichlorodifluoromethane, ethyl acetate, ethylbenzene, isopropyl alcohol (isopropanol), and xylenes. Additional information on a number of these chemicals can be found in the TM "*Discussion of Non-Site Related Compound Exceedances, Petoskey Manufacturing Company Groundwater Superfund Site*" (CH2M 2017b). For chemicals not included in this TM (i.e., 1,2,4-trimethylbenzene, bromodichloromethane, carbon tetrachloride, dichlorodifluoromethane, ethyl acetate, ethylbenzene, isopropyl alcohol (isopropanol), and xylenes), an abbreviated MLE evaluation is provided in Attachment H-6, Table 1 Supplement A.

2.2.1.2 Subslab Soil Vapor and Exterior Soil Vapor

Subslab soil vapor and exterior soil vapor SLs were calculated using the EPA *Vapor Intrusion Screening Level (VISL) Calculator* (EPA 2019b); the VISL calculator output is provided in Appendix H-5, Table 1. EPA's default soil vapor-to-indoor air attenuation factor (AF) of 0.03 and the residential air RSLs were used in the VISL calculations. The soil vapor SLs were based on a target ELCR of 1×10^{-6} and a target HQ of 1.[2]

If the maximum detected concentration of a chemical in soil vapor exceeded its SL, the MLE evaluation was used to determine whether that chemical was a COPC as discussed above for indoor air on a

[2] A target HQ of 1 is used for soil vapor SLs due to the conservatism in the attenuation factor used for cross-media transfer from soil vapor to indoor air, and the lack of direct exposure to soil vapor.

building by building basis. The MLE evaluation is in Attachment H-6, Table 1. If a chemical is related to VI, it was selected as a VI COPC.

2.2.1.3 Total Soil

The SLs used for soil exposure via direct contact (ingestion and dermal absorption) and particulate and volatile emissions from soil (to ambient air) are EPA's industrial soil RSLs (EPA 2019a). The soil RSLs are based on a target ELCR of 1×10^{-6} and noncarcinogenic target HQ of 0.1 to account for the potential presence of multiple chemicals affecting the same target organ. For chemicals with more than one RSL (for example, carcinogenic-based RSL and noncarcinogenic-based RSL), the lowest value was selected as the final SL for that chemical. In cases where a chemical's saturation limit value is less than the RSL value(s), the saturation limit is used as the SL.

2.2.1.4 Screening Levels for Receptor Groups

In summary, the SLs used for each receptor group to identify COPCs are as follows:

- **Residents (Adult and Child)**—Concentrations detected in indoor air, crawlspace air, subslab soil vapor, and exterior soil vapor, where applicable, were compared to residential SLs, then identified as a COPC based on results of the MLE evaluation.
- **Construction Workers**—Concentrations detected in total soil (1 to 10 feet bgs) were compared to industrial soil RSLs (ingestion, dermal contact, and inhalation of particulate and vapor emissions exposure pathways).

2.2.2 COPC Screening Results

The analytes with maximum detected concentrations exceeding SLs were identified as COPCs. For indoor air, crawlspace air, and soil vapor COPCs, analytes must also have been determined to be related to VI based on the MLE evaluation (Attachment H-6, Table 1). The results of the COPC screening process for the receptor/media groups are presented in Tables 2.1 through 2. 8 in Appendix H-2 and are summarized as follows:

Current Exposure

- **Indoor Air ([redacted])**—TCE was identified as a COPC in indoor air at five condominium units ([redacted] (Table 2.1 of Attachment H-2).
- **Crawlspace Air [redacted])**— No COPCs were identified in crawlspace air at any of the condominium units (Table 2.2 of Attachment H-2).
- **Indoor Air (Residential Properties)**—TCE was identified as a COPC in indoor air at five residential properties ([redacted] Table 2.3 of Attachment H-2).
- **Crawlspace Air (Residential Properties)**—No COPCs were identified in crawlspace air at any of the condominium units (Table 2.4 of Attachment H-2).

Current/Future Exposure

- **Exterior Soil Vapor (Residential Properties)**—Benzene was identified as a COPC in exterior soil vapor at one residential property [redacted] where subslab soil vapor samples were not available (Table 2.5 of Attachment H-2).

Future Exposure

- **Soil Vapor (Condominiums at 200 West Lake Street)**—TCE was identified as a COPC in subslab soil vapor at all six condominium units. Naphthalene was identified as a COPC at two units [redacted]

[redacted], and 1,3-dichlorobenzene was identified as a COPC in one unit ([redacted] (Table 2.6 of Attachment H-2).

- **Exterior Soil Vapor ([redacted] [sampled common areas])**—No COPCs were identified in exterior soil vapor at the [redacted] (Table 2.6 of Attachment H-2).
- **Soil Vapor (Residential Properties)**
  - Subslab Soil Vapor—TCE was identified as a COPC in subslab soil vapor at three residential properties ([redacted]) (Table 2.7 of Attachment H-2).
  - Exterior Soil Vapor—TCE and benzene were identified as COPCs in exterior soil vapor at one residential property ([redacted] (Table 2.7 of Attachment H-2).
- **Total Soil (Construction Workers)**—No COPCs were identified in total soil at the study area for a construction worker exposure scenario (Table 2.8 of Attachment H-2). Therefore, soil exposures are not addressed further in the HHRA.

SECTION 3

Exposure Assessment

3.1 Exposure Pathways Quantified

The potential exposure pathways quantified in the HHRA for each receptor group are presented in the following subsections. Only the exposure pathways with COPCs (see Section 2.2) were quantified.

3.1.1 Current Exposure Scenarios

- **Indoor Air [redacted])**—Inhalation of COPCs in indoor air; indoor air concentrations are presented in Table 3.1.RME of Attachment H-2.
- **Indoor Air (Residential Properties)**—Inhalation of COPCs in indoor air; indoor air concentrations are presented in Table 3.2.RME of Attachment H-2.

3.1.2 Current/Future Exposure Scenarios

- Soil Vapor (Exterior)—Inhalation of COPCs in exterior soil vapor (nearest to a residence) that potentially migrates to indoor air; soil vapor concentrations are presented in Table 3.3.RME of Attachment H-2. The indoor air EPCs, modeled using EPA's VISL calculator (EPA 2018b), are presented in Table 3.3.RME Supplement of Attachment H-2.

3.1.3 Future Exposure Scenarios

- **Soil Vapor (Subslab or Exterior - [redacted])**—Inhalation of COPCs in subslab soil or exterior soil vapor (nearest to a residence) that potentially migrates to indoor air; soil vapor concentrations are presented in Table 3.4.RME of Attachment H-2. The indoor air EPCs, modeled using EPA's VISL calculator (EPA 2019b), are presented in Table 3.4.RME Supplement of Attachment H-2.
- **Soil Vapor (Subslab or Exterior—Residential Properties)**—Inhalation of COPCs in subslab or exterior soil vapor (nearest to a residence) that potentially migrates to indoor air; soil vapor concentrations are presented in Table 3.5.RME of Attachment H-2. The indoor air EPCs, modeled using EPA's VISL calculator (EPA 2019b), are presented in Table 3.5.RME Supplement of Attachment H-2.

3.2 Exposure Pathways Not Quantified in the HHRA

Ingestion, dermal contact, and inhalation exposures to potable use of groundwater were not quantified in the HHRA. Groundwater exposures have already been addressed as part of OU1 and are documented in the 1998 Record of Decision (EPA 1998).

3.3 Quantification of Exposure

To evaluate the potentially complete exposure pathways further, the magnitude, frequency, and duration of exposure were estimated and quantified. EPCs were identified and pathway-specific intakes were estimated. EPA guidance (1989) recommends selecting intake variable values for a given pathway so that the combination of all intake variable values results in an estimate of the reasonable maximum exposure (RME) for that pathway. EPA recommends using upper-bound parameter values (as opposed to average values) for exposure frequency and exposure duration. EPA guidance also recommends that the contact rate be a value representing the 95th percentile.

3.3.1 Exposure Point Concentrations

EPCs were based on measured or modeled COPC concentrations. Because no COPCs were identified in soil, soil EPCs were not identified in the HHRA. The estimated EPCs are summarized in Tables 3.1 through 3.5 in Appendix H-2.

Measured EPCs. The following is an overview of the EPCs used for each exposure medium based on measured concentrations:

- **Current Indoor Air/Crawlspace Air EPCs**—The maximum detected indoor air/crawlspace air concentrations (where available) were used as the EPCs for current exposure scenarios.
- **Modeled EPCs.** The following is an overview of the modeled indoor air EPCs used. EPA's default soil-gas-to-indoor-air AF of 0.03 was used with the VISL calculator (EPA 2019b) to model indoor air EPCs. To model indoor air EPCs, a soil-gas-to-indoor-air AF was applied to soil vapor concentrations as follows:

  EPC in indoor air (micrograms per cubic meter [µg/m^3]) = EPC in soil vapor (µg/m^3) x AF

- **Current Indoor Air EPCs**—Exterior soil vapor data were used to model indoor air EPCs for current exposure scenarios where indoor air/crawlspace air and/or subslab soil vapor data were not available. The maximum detected concentrations of COPCs in each exterior soil vapor data grouping were used in the model.
- **Future Indoor Air EPCs**—Subslab soil vapor data (where available) were used to model indoor air EPCs for future exposure scenarios; where subslab soil vapor data were not available, exterior soil vapor data were used. The maximum detected concentrations of COPCs in each subslab soil vapor or exterior soil vapor data grouping were used in the model.

3.3.2 Exposure Factors

An RME scenario was quantified for potential receptors under current and future exposure scenarios (EPA 1989). The exposure factors used in the intake calculations are presented in Tables 4.1 and 4.2 of Appendix H-2. The primary references for exposure factor values are the standard default exposure factors presented in the *Human Health Evaluation Manual, Update of Standard Default Exposure Factors* (EPA 2014a).

The exposure factor values used for EPA-specified age groups for COPCs that act through a mutagenic mode of action (MMOA) for carcinogenicity are presented in Tables 4.1 Supplement A and 4.2 Supplement A of Appendix H-2.

SECTION 4

Toxicity Assessment

The inhalation toxicity values (inhalation unit risks [IUR] and reference concentrations [RfC]) used in the HHRA were obtained from the EPA standard hierarchy of toxicity value sources (EPA 2003) as follows:

- Tier 1 Source—Integrated Risk Information System (EPA 2019b)
- Tier 2 Source—EPA Provisional Peer-Reviewed Toxicity Values
- Tier 3 Sources—Other peer-reviewed federal and state toxicity values
  - California EPA (Cal/EPA) toxicity database (Cal/EPA 2019)

Table 5.1 of Attachment H-2 presents noncancer toxicity values used in the HHRA. Table 6.1 of Attachment H-2 provides cancer toxicity values.

4.1 Noncarcinogenic Toxicity Values

Noncarcinogenic toxicity values (inhalation RfCs) were used in estimating potential adverse health effects associated with exposure to COPCs. Chronic toxicity data for potential noncarcinogenic effects of COPCs are presented in Table 5.1 of Appendix H-2.

4.2 Carcinogenic Toxicity Values

Carcinogenic toxicity values (IURs) were used in evaluating potential carcinogenic effects associated with exposure to known, probable, or possible carcinogens having an EPA weight-of-evidence classification of A, B, or C, respectively. IURs were used to estimate upper-bound lifetime statistical probabilities of a hypothetical individual developing cancer as a result of exposure to a potential carcinogen. Toxicity data for potential carcinogenic effects of COPCs are presented in Table 6.1 of Appendix H-2.

4.3 Toxicity Values for Mutagenic Chemicals

Consistent with the EPA cancer guidelines and supplemental guidance (EPA 2005a and 2005b, respectively), COPCs that act through an MMOA for carcinogenicity were evaluated using age-dependent adjustment factors (ADAFs) for receptor groups, including children and adolescents aged 16 and under. TCE (identified as a COPC in indoor air, subslab soil vapor, and exterior soil vapor) is considered to act through an MMOA. TCE does not have age-specific carcinogenic toxicity values; as such, EPA's default ADAFs were applied to the IUR of TCE when carcinogenic risk was estimated for child residents. TCE is carcinogenic by an MMOA for induction of kidney tumors (EPA 2011). Therefore, ADAFs were used to estimate carcinogenic risks only for the kidney cancer component of TCE. Modes of action have not been established for TCE-induced non-Hodgkin lymphoma and liver cancer; therefore, ADAFs were not used to estimate risks for these types of cancers.

SECTION 5

Risk Characterization

Indoor air risk estimates were calculated on a building-specific basis where COPCs were identified. Soil risk estimates were not calculated since COPCs were not identified in soil.

Potential human health risks are discussed separately for carcinogenic and noncarcinogenic effects of COPCs due to the different toxicological endpoints, relevant exposure durations, and methods used to estimate risk. EPA Superfund guidance considers an acceptable site ELCR range to be 1 to 100 in a million (1×10^{-6} to 1×10^{-4}). Generally, remedial actions are not warranted for site media with an ELCR of 1×10^{-4} or below, or a hazard index (HI) of 1 or less, although it may be warranted if a standard (e.g., MCL) is exceeded, or if other EPA policies or site-specific information suggests to EPA risk managers that action is appropriate.

5.1 Approach for Potential Noncarcinogenic Effects

The HHRA evaluated the potential for noncarcinogenic effects by comparing the ECs of each COPC with its RfC. In EPA methodology, this ratio of exposure to toxicity is referred to as an HQ. The HQ assumes that there is a level of exposure below which it is unlikely for even sensitive populations to experience adverse health effects. If the exposure level exceeds this threshold, there is the potential for noncancer health effects to occur. The HQ is calculated as follows:

$$HQ = \frac{EC}{RfC}$$

Where:

HQ = Hazard quotient
EC = Exposure concentration (milligram per cubic meter [mg/m^3])
RfC = Reference concentration (mg/m^3)

ECs and RfCs are expressed in the same units (mg/m^3). A HQ that exceeds 1 (i.e., EC exceeds the RfC) indicates that there is a potential for adverse health effects associated with exposure to that COPC.

To assess the potential for noncarcinogenic health effects posed by exposure to multiple COPCs and exposure routes, an HI approach was used (EPA 1989). This approach assumes that noncarcinogenic hazards associated with exposure to more than one COPC are additive. Synergistic or antagonistic interactions between COPCs are not quantified. The HI may exceed 1 even if all of the individual HQs are less than 1. The HI is equal to the sum of the HQs and is calculated as follows:

$$HI = \frac{EC_1}{RfC_1} + \frac{EC_2}{RfC_2} + \cdots \frac{EC_j}{RfC_j}$$

Where:

HI = Hazard index
EC = Exposure concentration (mg/m^3)
RfC = Reference concentration (mg/m^3)
EC_j = Exposure concentration for the "*j*"th constituent
$RfCj_i$ = Reference concentration for the "*j*"th constituent

5.2 Approach for Potential Carcinogenic Effects

The potential for carcinogenic effects due to exposure to site media was evaluated by estimating the ELCR. The ELCR is the incremental increase in the probability of developing cancer during one's lifetime (as a result of exposure to site media) above the probability of developing cancer from non-site exposures.

Potential ELCRs associated with exposure to individual carcinogens were calculated using IURs and ECs for inhalation exposures. The linear low-dose equation was used to estimate the incremental probability of an individual developing cancer over a lifetime as a result of exposure to potential carcinogens. Estimated ELCRs are calculated as follows:

$$ELCR = EC \times IUR$$

Where:

ELCR = Excess lifetime cancer risk
EC = Exposure concentration [microgram per cubic meter ($\mu g/m^3$)]
IUR = Inhalation unit risk $(\mu g/m^3)^{-1}$

The theoretical probability of developing cancer as a consequence of exposure to two or more COPCs was calculated by summing the risk estimates for each COPC using the following equation:

$$Total\ ELCR = (EC_1 \times IUR_1) + (EC_2 \times IUR_2) + \ldots (EC_i \times IUR_i)$$

Where:

ELCR = Excess lifetime cancer risk
EC = Exposure concentration ($\mu g/m^3$)
IUR = Inhalation unit risk $(\mu g/m^3)^{-1}$
EC_j = Exposure concentration for the 'j'th constituent
IUR_j = Inhalation unit risk for the '*j*'th constituent

5.3 Approach for Potential Mutagenic Effects

Consistent with the *Cancer Guidelines and Supplemental Guidance* (EPA 2005a and 2005b), for COPCs that act via an MMOA, ELCRs were estimated using ADAFs. One VOC, TCE, is a COPC at the site that is categorized as having a MMOA. The calculations of ELCR using ADAFs are presented in Appendix H-2, Table 7.3.RME Supplement A, Table 7.6.RME Supplement A, Table 7.12.RME Supplement A, and Table 7.15.RME Supplement A. The ELCR was calculated using ADAFs (EPA 2005a and 2005b) based on the equation provided below:

$$ELCR = \left(10 \times EC_{0-2\,yrs} + 3 \times EC_{2-6\,yrs} + 3 \times EC_{6-16\,yrs} + EC_{16-26\,yrs}\right) \times IUR$$

Where:

ELCR = Excess lifetime cancer risk

EC (i-jyrs) = Inhalation exposure concentration (mg/m^3) from i to j years
IUR = Inhalation unit risk $(mg/m^3)^{-1}$

5.4 Summary of Risk Estimates

Table H-1 provides an overview of the buildings within the study area and how they were addressed in this HHRA.

Table H-1. Summary of Building-Specific Evaluations

Location	# in Study Area Inclusion Zone	# with SSD System or Other VIMS (not addressed in the HHRA)	# Without SSD System or VIMS, but no data (not addressed in the HHRA)	# in RAGS Table 2	# in RAGS Table 7 [1]
Separate Buildings	28	1	0	27	8
[redacted]	21	0	0	21	0
[redacted]	17	11	0	6	6

Notes:

[1] If the # of buildings addressed in RAGS Table 7 is lower than the # of buildings addressed in RAGS Table 2, it is due to no VI COPCs identified in some buildings (as indicated on RAGS Table 2).

Condominium units and buildings with existing operational SSD systems or other VIMS were not evaluated in the HHRA. SSD systems are installed at the [redacted], and a VIMS is installed at [redacted]. Except for [redacted] and [redacted], these properties are currently residential. Operational SSD systems and other VIMS render the VI pathway incomplete (and therefore no associated risk) or within EPA-acceptable risk levels. It is assumed that each SSD system and other VIMS will remain operational until the vapor source below the building has been reduced to acceptable levels. However, if the SSD system or other VIMS is shut off prior to the vapor source being reduced to acceptable levels, indoor air risks may be unacceptable.

Potential risks associated with indoor air exposures to COPCs in site media were quantified for current and reasonably foreseeable future exposure scenarios.

The calculated ELCRs and HIs are as follows:

- **Current Resident (Condominiums)**—Indoor air exposures; risk estimates are presented in Tables 7.1.RME (adult), 7.2.RME (child), and 7.3.RME (adult/child aggregate), and summarized in Tables 9.1.RME, 9.2.RME, and 9.3.RME, respectively:

Table H-2. Summary of Resident Current Risk Estimates for Indoor Air Exposures at the [redacted]

Location	Adult/Child Aggregate ELCR	Adult Target-Organ-Specific HIs	Child Target-Organ-Specific HIs
[redacted]	$9x10^{-7}$	<1	<1
[redacted]	$1x10^{-6}$	<1	<1
[redacted]	$7x10^{-7}$	<1	<1
[redacted]	$7x10^{-7}$	<1	<1
[redacted]	$3x10^{-6}$	<1	<1

As indicated in Table H-2, the resident ELCRs and HIs at the condominium indoor air exposure points evaluated in the HHRA were less than or within EPA-acceptable levels.

- **Current Resident (Residential Properties)**—Indoor air exposures; risk estimates are presented in Appendix H-2, Tables 7.4.RME (adult), 7.5.RME (child), and 7.6.RME (adult/child aggregate), and summarized in Tables 9.4.RME, 9.5.RME, and 9.6.RME, respectively:

Table H-3. Summary of Resident Current Risk Estimates for Indoor Air Exposures at Residential Properties

Location	Adult/Child Aggregate ELCR	Adult Target-Organ-Specific HIs	Child Target-Organ-Specific HIs
[redacted]	$2x10^{-6}$	<1	<1
[redacted]	$2x10^{-6}$	<1	<1
[redacted]	$8x10^{-7}$	<1	<1
[redacted]	$1x10^{-6}$	<1	<1

As indicated in Table H-3, the resident ELCRs and HIs at the residential property indoor air exposure points evaluated in the HHRA were less than or within EPA-acceptable levels.

- **Current/Future Resident (Residential Properties)**— Exterior soil vapor (migration into indoor air) exposures; risk estimates are presented in Appendix H-2, Tables 7.7.RME (adult), 7.8.RME (child), and 7.9.RME (adult/child aggregate), and summarized in Tables 9.7.RME, 9.8.RME, and 9.9.RME, respectively:

Table H-4. Summary of Resident Current/Future Risk Estimates for Indoor Air Exposures at Residential Properties (From Exterior Soil Vapor)

Location	Adult/Child Aggregate ELCR	Adult Target-Organ-Specific His	Child Target-Organ-Specific His
[redacted]	$4x10^{-6}$	<1	<1

As indicated in Table H-4, the resident ELCRs and His at the residential property exterior soil vapor (migration into indoor air) exposure points evaluated in the HHRA were less than or within EPA-acceptable levels.

- **Future Resident (Condominiums)**—Subslab soil vapor (migration into indoor air) exposures; risk estimates are presented in Appendix H-2, Tables 7.10.RME (adult), 7.11.RME (child), and 7.12.RME (adult/child aggregate), and summarized in Tables 9.10.RME, 9.11.RME, and 9.12.RME, respectively**:**

Table H-5. Summary of Resident Future Risk Estimates for Indoor Air Exposures (From Subslab Soil Vapor) [redacted]

Location	Adult/Child Aggregate ELCR	Adult Target Organ-specific HIs	Child Target Organ-specific HIs
[redacted]	$2x10^{-6}$	<1	<1
[redacted]	$4x10^{-6}$	<1	<1
[redacted]	$3x10^{-5}$	developmental HI = 6, cardiovascular system HI=6, and immune system HI = 6, due to TCE	developmental HI = 6, cardiovascular system HI=6, and immune system HI = 6, due to TCE
[redacted]	$1x10^{-5}$	developmental HI = 4, cardiovascular system HI=4, and immune system HI = 4, due to TCE	developmental HI = 4, cardiovascular system HI=4, and immune system HI = 4, due to TCE
[redacted]	$5x10^{-6}$	<1	<1
[redacted]	$1x10^{-6}$	developmental HI = 2, cardiovascular system HI=2, and immune system HI = 2, due to TCE	developmental HI = 2, cardiovascular system HI=42, and immune system HI = 2, due to TCE

As indicated in Table H-5, the resident ELCRs at the condominium indoor air exposure points modeled from subslab soil vapor evaluated in the HHRA were within EPA-acceptable levels. However, target organ-specific HIs exceeded EPA's threshold HI due to TCE at three condominium units.

- **Future Resident (Residential Properties)**—Subslab soil vapor (migration into indoor air) exposures; risk estimates are presented in Appendix H-2, Tables 7.13.RME (adult), 7.14.RME (child), and 7.15.RME (adult/child aggregate), and summarized in Tables 9.13.RME, 9.14.RME, and 9.15.RME, respectively**:**

Table H-6. Summary of Resident Future Risk Estimates for Indoor Air Exposures (From Subslab Soil Vapor)

Location	Adult/Child Aggregate ELCR	Adult Target Organ-specific HIs	Child Target Organ-specific HIs
[redacted]	$1x10^{-6}$	<1	<1
[redacted]	$6x10^{-6}$	1	1
[redacted]	$2x10^{-5}$	developmental HI = 4, cardiovascular system HI=4, and immune system HI = 4, due to TCE	developmental HI = 4, cardiovascular system HI=4, and immune system HI = 4, due to TCE
[redacted]	$6x10^{-6}$	<1	<1

As indicated in Table H-6, the resident ELCRs at the residential property indoor air exposure points modeled from subslab soil vapor evaluated in the HHRA were within EPA-acceptable levels. However, target organ-specific HIs exceeded EPA's threshold HI due to TCE at one residential property.

5.5 Chemicals of Concern

Generally, remedial actions are not warranted for site media with an ELCR of 1×10^{-4} or below, or a hazard index (HI) of 1 or less, although it may be warranted if other EPA policies or site-specific information suggests to EPA risk managers that action is appropriate.

In general, chemicals of concern (COCs) are identified when the potential ELCR or HI for a receptor group exceeds EPA threshold values (a total ELCR of 1×10^{-4} or a target-organ-specific HI of 1) and concentrations are site-related. When a potential ELCR of 1×10^{-4} is exceeded for an exposure medium for a receptor group, the COPCs posing an individual ELCR greater than 1×10^{-6} in the environmental medium responsible for the unacceptable risks are identified as COCs. When a potential target-organ-specific HI exceeds 1 for an exposure medium for a receptor group, the COPCs posing an HQ greater than 0.1 for that target organ in the environmental medium responsible for the unacceptable HI are identified as COCs. Factors such as nature of contamination source, laboratory contamination, background levels, and common pesticide use (unrelated to spills, improper storage disposal or use) are typically considered when identifying COCs. COCs are summarized in Table H-7.

Indoor air risk estimates were less than or within EPA's target risk range and HI threshold for current exposures at the condominiums and residential properties that have not yet been mitigated. That is, the potential ELCRs for these exposure points were less than or within the target ELCR range of 1×10^{-6} to 1×10^{-4}, and the estimated target-organ-specific HIs did not exceed the threshold of 1.

Exterior soil vapor (migrating to indoor air) risk estimates for current/future exposures were less than or within EPA's target risk range and HI threshold at residential properties.

Subslab soil vapor (migrating to indoor air) risk estimates for potential future exposures were less than or within EPA's target risk range and HI threshold for the 200 West Lake Street condominium [redacted] and [redacted] Although risk estimates for potential future exposures

at the [redacted] and residential property 4 were within EPA's acceptable ELCR range, the noncancer HI estimates exceed the HI threshold of 1, with TCE being the risk driver for the properties. Therefore, TCE was identified as a COC for inhalation of indoor air (based on subslab soil vapor migrating to indoor air). The estimated ELCRs and HIs for this COC (i.e., TCE) for the applicable properties are presented in Tables 10.1 through 10.4 of Appendix H-2.

Table H-7. Summary of Media/Receptor COCs

Location	ELCR COCs	Adult Target-Organ-Specific HI COCs	Child Target-Organ-Specific HI COCs
Future Resident—Indoor Air Exposures (from Subslab Soil Vapor)			
[redacted]	None	TCE (HIs = 6)	TCE (HIs = 6)
[redacted]	None	TCE (HIs = 4)	TCE (HIs = 4)
[redacted]	None	TCE (HIs = 2)	TCE (HIs = 2)
[redacted]	None	TCE (HIs = 4)	TCE (HIs = 4)

5.6 Uncertainty Analysis

The assumptions used in the HHRA have inherent uncertainty. While it is theoretically possible that this leads to underestimates of potential risk, the use of numerous upper-bound assumptions most likely results in conservative estimates of potential risk. A receptor group's potential exposure and subsequent potential risk are influenced by the exposure scenario and dose/response and vary on a case-by-case basis. The key assumptions in the HHRA and their influence on the numerical risk estimates and specific uncertainties associated with the HHRA are discussed in the following subsections.

5.6.1 Data Evaluation

The purpose of data evaluation is to determine which constituents, if any, are present at the site at concentrations requiring evaluation in the HHRA. Uncertainty with respect to data evaluation can arise from many sources, such as the quality of data used to characterize the site and the process used to select data and COPCs in the HHRA.

The sampling that was conducted at the site generally focused on areas of known or suspected impact from historical site use and previous sampling information. Therefore, the uncertainty in sampling and the possibility of missing a location impacted by site constituents is expected to be minimal except for the 5 residences where access for sampling was not granted. The uncertainty associated with the data analysis is minimal, as the data were fully validated before use in the HHRA.

A limited amount of soil data is available for the site and is discussed in Section 7.2.1 of the RI report. Fifteen borings were advanced in May 2018 where permanent soil vapor probes were to be installed (Figure 2-1 of the RI report); soil samples were collected from ten of the 15 borings. Soil cores were continuously logged and screened by a CH2M geologist in accordance with the QAPP (CH2M 2018d) to provide lithologic information to support the RI CSM and to guide soil vapor probe installation depth. Historical soil data [shown in Figure 5 of the QAPP (CH2M 2018d)] suggest that TCE, and in some cases PCE, was released to shallow soils in eastern and southern parts of the site. Not all of the areas with these soil releases were excavated and most soils were reworked during condominium construction and historic soil removals; some were assumed to be capped by the foundations, and others met the standards that prevailed at the time.

Chemical surrogates were used for three chemicals in the COPC screening step because SLs were not available for these detected constituents (m&p-xylenes, trans-1,3-dichloropropene, and 1,3-

dichlorobenzene). Chemical surrogates were selected based on structural similarity, chemical activity, and mechanisms of toxicity. The RSL for 1,4-dichlorobenzene is used for 1,3-dichlorobenzene; 1,3-dichlorobenzene was identified as a COPC despite not having its own chemical-specific RSL. The other two chemicals were not identified as COPCs since maximum detected concentrations were below their surrogate RSLs. Although chemical surrogates were selected using best professional judgment and are based on structural similarities between compounds, using chemical surrogates could underestimate or overestimate the toxicity of chemicals that lack published SLs.

5.6.2 Exposure Assessment

In accordance with EPA guidance, exposure estimates were calculated for an RME scenario. An RME scenario results in upper-bound exposure estimates and likely overestimates actual site exposures. For example, residents are assumed to inhale indoor air for 24 hours per day for 350 days per year for 26 years at their property. Actual risks are likely to be less than the potential risks presented in this HHRA.

The HHRA assumed that the EPCs for site media remain constant throughout the assumed exposure period within the exposure area. This assumption results in an overestimation of risk since, because of the lack of a continuous release source, concentrations of COPCs will decrease over the exposure durations used in the HHRA. The maximum detected concentration of COPCs for the indoor air, subslab soil vapor, and exterior soil vapor data groupings were used as the EPCs. Use of the maximum detected concentration may overestimate risk.

The EPA default AF (based on the 95th percentile of a sample of residential buildings) was also used to model future indoor air concentrations from subslab soil vapor data collected in buildings existing at the site. Therefore, the indoor air EPCs estimated from the subslab soil vapor concentrations may be overestimated.

Concentrations in soil vapor and indoor air can be affected by temporal variability. For instance, changes in source strength, barometric pressure, and soil moisture are just a few factors that can affect soil vapor concentrations. Indoor air concentrations can be affected by changes in soil vapor concentrations, soil vapor entry rates, air exchange rates, indoor air sources, and other factors. Temporal variability is addressed by collecting soil vapor and indoor air samples over multiple dates. VI-related data were collected in the non-heating season and in the heating season; a detailed description of sampling events is provided in the Vapor Intrusion Investigation Technical Memorandum (see Appendix B of the RI Report).

For structures where crawlspace/indoor air and/or subslab soil vapor data were not available, EPCs were calculated from exterior soil vapor concentrations using the EPA VISL calculator. However, the VISL calculator is not intended for use in cases with exposed soil in basements or exposed bedrock in basements (which was observed at some houses that were accessed and sampled). If the structures where crawlspace or indoor air data were not available have exposed soil or bedrock in basements, the indoor air EPCs may be underestimated.

5.6.3 Toxicity Assessment

Significant uncertainties exist in estimated noncarcinogenic toxicity values. Noncarcinogenic toxicity effects are effects with a threshold. For many noncarcinogenic effects, protective mechanisms, which must be overcome before an adverse effect is manifest, are believed to exist in the human body. As a result, humans can tolerate chemical exposures ranging from zero to a certain point (threshold) without expressing adverse effects.

The chemical concentrations to which people potentially are exposed in an environmental setting are usually much lower than the levels used in the studies from which dose-response relationships are developed. Therefore, estimating potential health effects from environmental exposure requires the use of models that allow the extrapolation of health effects.

One COPC (1,3-dichlorobenzene) has no inhalation RfC and IUR, so potential exposures to this COPC were not quantified and are therefore underestimated.

The uncertainty factor for the chronic RfC for TCE ranges from 10 to 10,000 and the uncertainty factors for the chronic RfCs for benzene and naphthalene are 300 and 3,000, respectively (Attachment H-2, Tables 5.1). Due to the uncertainties associated with toxicity values for the COPCs, it is possible that the potential hazards could be underestimated or overestimated in the HHRA.

Uncertainty is also associated with the application of ADAFs for TCE (identified as a COPC in indoor air and soil vapor) which acts with an MMOA and lacks age-specific toxicity factors. Chemical-specific ADAFs are not available for TCE; therefore, using the default ADAFs in the HHRA may overestimate or underestimate the actual carcinogenic risks for TCE.

5.6.4 Risk Characterization

The potential risk of adverse health effects is characterized based on potential exposures and potential dose-response relationships. An important additional source of uncertainty is introduced in this phase of the HHRA–the combination of upper-bound intake estimates with upper-bound toxicity estimates.

Generally, the goal of a baseline risk assessment is to estimate an upper-bound, but reasonable, potential risk. Such an upper-bound estimate can be derived in several ways, depending on how conservative one wants the final estimate to be. HHRAs combine several upper-bound assumptions to estimate potential risk.

Most of the assumptions about exposure and toxicity used in this HHRA are representative of statistical upper-bounds for each parameter. The result of combining several such upper-bound assumptions is that the final estimate of potential exposure or potential risk is conservative.

SECTION 6

Technical Exceptions for Vapor Intrusion Investigations

This HHRA provides results regarding the potential occurrence and significance of VI based on reasonably obtainable sampling data and observations.

This report does not address indoor air quality problems, including mold or mildew, radon, and building air quality unrelated to subsurface contaminants or general indoor ventilation issues. In addition, it does not address landfill gas or explosive atmospheres.

The HHRA provides comparison of indoor air concentrations with EPA VISLs. These comparisons are not intended to imply the presence or absence of healthful or safe indoor air quality, and do not represent any medical opinion.

The VI results and conclusions presented in this HHRA are developed for land uses and site conditions as characterized by the available data. Any changes in land use or site conditions based on additional information may warrant reevaluation of the results and conclusions of the VI investigation.

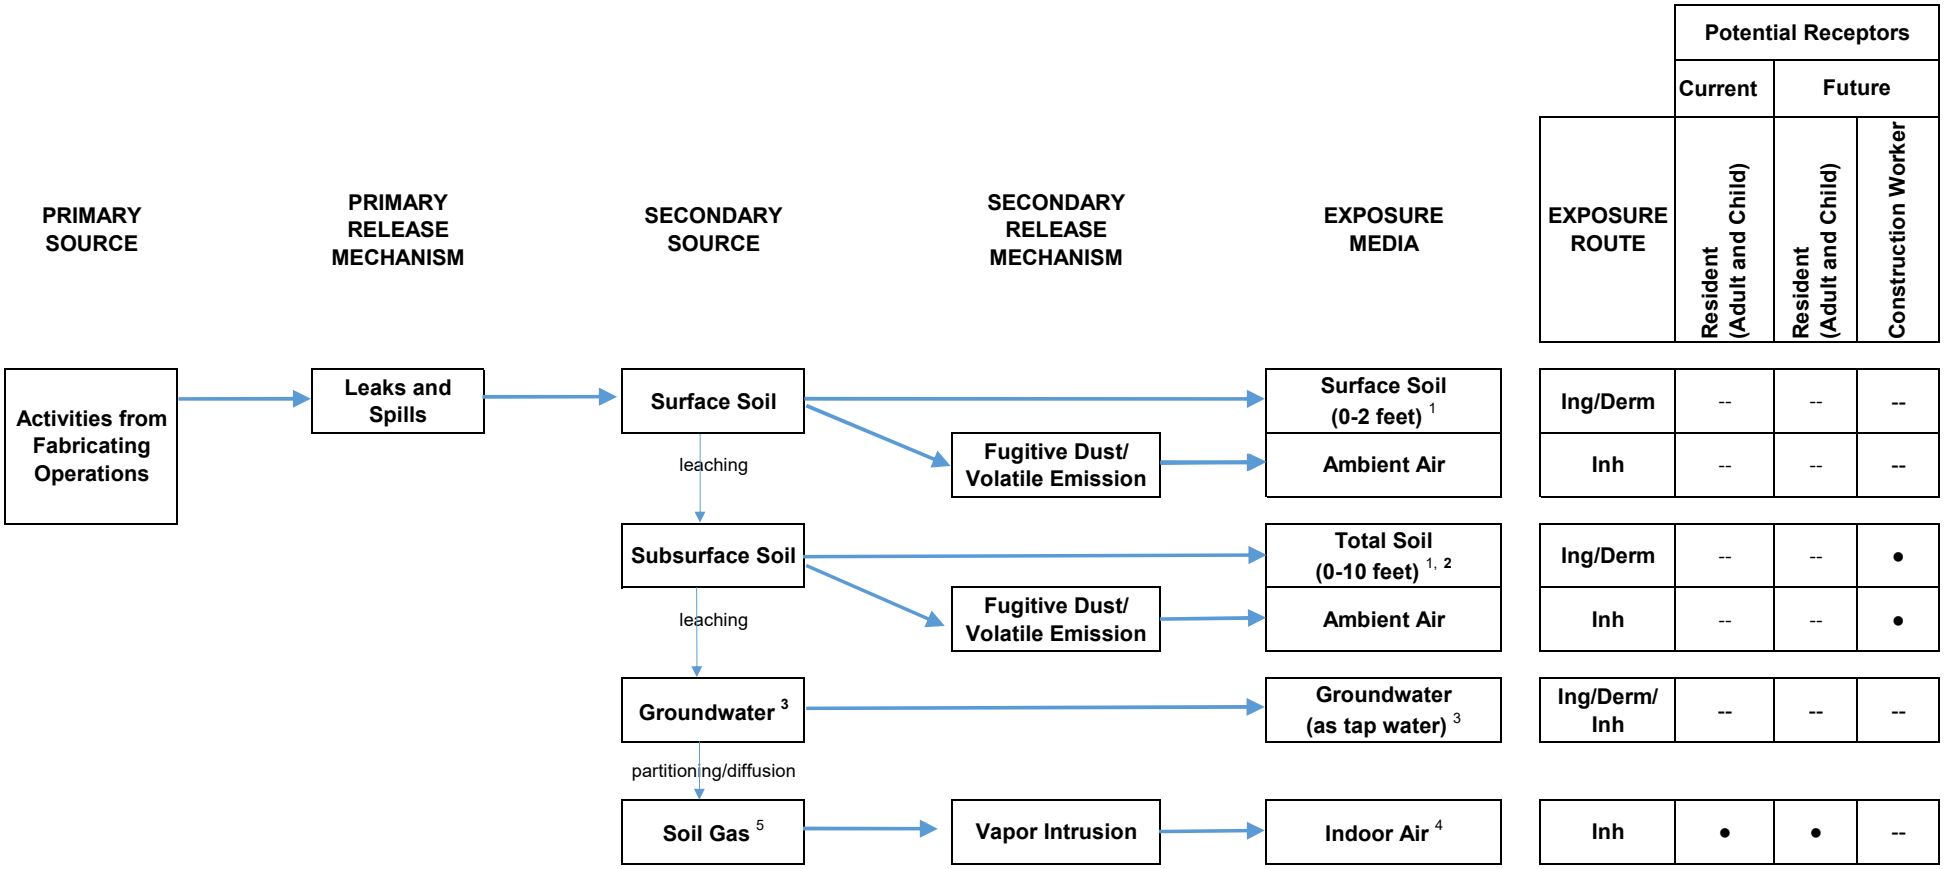
Figure



Notes:
-- Negligible or Incomplete Pathway
● Potentially Complete Pathway to be Evaluated
Ing - Ingestion, Der - Dermal, Inh - Inhalation
1) Soil exposures by residents at the condominium complex are insignificant and will not be quantified.
2) Future soil exposures are evaluated for total soil, assuming surface and subsurface soil become mixed during future development activities. Construction worker exposures to total soil will be evaluated as one exposure unit.
3) Groundwater was evaluated in a previous remedial investigation.
4) Indoor air/crawl space air data will be used to evaluate current exposure scenarios at a property. Subslab soil vapor data (or if not available, exterior soil vapor data) will be used to evaluate future exposure scenarios at a property. For properties where indoor air/crawl space air data were not collected, subslab soil vapor data (or exterior soil vapor data) will be used to evaluate both current and future indoor air exposure scenarios.
5) Buildings with subslab depressurization systems will not be evaluated in the HHRA.

TABLE 1

SELECTION OF EXPOSURE PATHWAYS

PMC Superfund Site

Petoskey, Emmet County, Michigan

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	Onsite/ Offsite	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Current	Indoor Air[1]	Indoor Air and Crawl Space Air	Indoor air in residences without a SSDS	Resident	Adult/Child	Inhalation	Onsite	Quant	Residents may inhale volatiles in indoor air (via migration from soil vapor and groundwater) inside buildings where a SSDS is not present.
Current/Future	Indoor Air and Soil Vapor	Indoor Air	Indoor air in commercial units/buildings without a SSDS	Commercial Worker	Adult	Inhalation	Onsite	None	Both commercial buildings [redacted] of Water Street Condominiums and [redacted] in the study area have SSDS.
	Soil vapor (Subslab and Exterior[2,3])	Indoor Air	Indoor air in residences without a SSDS	Resident	Adult/Child	Inhalation	Onsite	Quant	Adult and child residents could inhale volatile constituents in soil vapor that migrate to the indoor air in buildings where a SSDS is not present.
	Indoor Air and Soil Vapor	Indoor Air	Indoor air in residences with a SSDS	Resident	Adult/Child	Inhalation	Onsite	None	At buildings where a SSDS is present, the indoor air exposure pathway is incomplete and will not be evaluated.
	Soil	Surface Soil	Surface soil (0-2 feet bgs) around the condominium complex	Resident	Adult/Child	Ingestion, Dermal, Inhalation	Onsite	Qual	Residents in the condominium complex will likely have little, if any, direct soil exposures. Some residents may have gardens (e.g., for flowers) in a condominium setting but exposures would be minimal. Will discuss concentrations in the 0-2 foot interval in the uncertainty analysis section of the HHRA.
Future	Soil vapor (Subslab and Exterior[3])	Indoor Air	Indoor air in residences without a SSDS	Resident	Adult/Child	Inhalation	Onsite	Quant	Adult and child residents could inhale volatile constituents in soil vapor that migrate to the indoor air in buildings where a SSDS is not present.
	Soil	Total Soil	Total soil (0-10 feet bgs) around the condominium complex	Construction Worker	Adult	Ingestion, Dermal	Onsite	Quant	During potential site redevelopment, construction workers could contact soil (0 to 10 feet bgs).
				Resident	Adult/Child	Ingestion, Dermal, Inhalation	Onsite	Qual	Residents in the condominium complex will likely have little, if any, direct soil exposures. Some residents may have gardens (e.g., for flowers) in a condominium setting but exposures would be minimal. Will discuss concentrations in the 0-2 foot interval in the uncertainty analysis section of the HHRA.
		Ambient Air	Ambient air around the condominium complex	Construction Worker	Adult	Inhalation	Onsite	Quant	During potential site redevelopment, construction workers could inhale volatile emissions or fugitive dust from soil (0 to 10 feet bgs).
	Groundwater	Indoor Air	Indoor air in residences	Resident	Adult/Child	Inhalation	Onsite	None	Groundwater is being evaluated in a separate investigation.
		Bathroom Air	Bathroom air in residences	Resident	Adult/Child	Ingestion, Dermal, Inhalation	Onsite	None	Groundwater is being evaluated in a separate investigation.
		Groundwater	Groundwater in excavation trenches	Construction Worker	Adult	Dermal, Inhalation	Onsite	None	Site groundwater is being addressed separately as OU1.

Notes:

(1) All residential properties (apartment units, condominium units, houses) will be evaluated separately.

(2) At residential properties where indoor air samples were not collected, subslab soil vapor or exterior soil vapor data will be used to evaluate both current and future indoor air (i.e., vapor intrusion pathway).
exposures. Subslab and exterior soil vapor data will be evaluated separately.

(3) Subslab soil gas data will be used to assess whether indoor air concentrations are from a subslab source (rather than an indoor source). Also, subslab or exterior soil vapor samples will be used to evaluate future indoor air exposures (i.e., vapor intrusion pathway). If subslab vapor soil samples are not available, the nearest exterior soil vapor sample located within 100 feet of a property will be used to evaluate indoor air for the property in the HHRA.

bgs: below ground surface

Qual: Qualitative

Quan: Quantitative

SSDS: Subslab depressurization system

Notes:

(1) Maximum concentration is used for screening.

(2) Regional Screening Levels for Residential Air (November 2018). Concentrations based on non-carcinogenic health effects are based on HQ=0.1.
The RSL for m-Xylene is used for m,p-Xylene.

(3) Rationale Codes:
Above Screening Levels (ASL)
Below Screening Level (BSL)
No Toxicity Value Available (NTX)

(4) Although this chemical exceeded the screening value, it is not identified as a COPC. Chemicals presumed to be present because of background sources and chemicals not related to site contamination were eliminated as VI COPCs. These chemicals are not included in the MLE evaluation.

(5) Although this chemical exceeded the screening value, it is not identified as a COPC. Based on the MLE evaluation (Attachment F, Table 1), this chemical is not a site-related contributor to the VI pathway or the VI pathway is not likely complete.

Data Qualifiers:
J = compound was detected below the reporting limit in the sample
+ = biased high
D = dilution

Abbreviations:
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/ To Be Considered
COPC = Chemical of Potential Concern
HQ = hazard quotient
MLE = multiple lines of evidence
NA = not available

RSL keys:
c = carcinogenic
n = noncarcinogenic
VI = vapor intrusion

Unit:
ug/m^3 = microgram per cubic meter

Notes:

(1) Maximum concentration is used for screening.

(2) Regional Screening Levels for Residential Air (November 2018). Concentrations based on non-carcinogenic health effects are based on HQ=0.1.
The RSL for m-Xylene is used for m,p-Xylene.

(3) Rationale Codes:
Above Screening Levels (ASL)
Below Screening Level (BSL)
No Toxicity Value Available (NTX)

(4) Although this chemical exceeded the screening value, it is not identified as a COPC. Chemicals presumed to be present because of background sources and chemicals not related to site contamination were eliminated as VI COPCs. These chemicals are not included in the MLE evaluation.

(5) Although this chemical exceeded the screening value, it is not identified as a COPC. Based on the MLE evaluation (Attachment F, Table 1), this chemical is not a site-related contributor to the VI pathway or the VI pathway is not likely complete.

Data Qualifiers:
J = compound was detected below the reporting limit in the sample
Abbreviations:
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/ To Be Considered
COPC = Chemical of Potential Concern
HQ = hazard quotient
MLE = multiple lines of evidence
NA = not available
RSL keys:
c = carcinogenic
n = noncarcinogenic
VI = vapor intrusion
Unit:
ug/m^3 = microgram per cubic meter

Notes:

(1) Maximum concentration is used for screening.

(2) Regional Screening Levels for Residential Air (November 2018). Concentrations based on non-carcinogenic health effects are based on HQ=0.1.
The RSL for Dichloropropene is used for trans-1,3-Dichloropropene.
The RSL for m-Xylene is used for m,p-Xylene.

(3) Rationale Codes:
Above Screening Levels (ASL)
Below Screening Level (BSL)
No Toxicity Value Available (NTX)

(4) Although this chemical exceeded the screening value, it is not identified as a COPC. Chemicals presumed to be present because of background sources and chemicals not related to site contamination were eliminated as VI COPCs. These chemicals are not included in the MLE evaluation.

(5) Although this chemical exceeded the screening value, it is not identified as a COPC. Based on the MLE evaluation (Attachment F, Table 1), this chemical is not a site-related contributor to the VI pathway or the VI pathway is not likely complete.

Data Qualifiers:
J = compound was detected below the reporting limit in the sample
Abbreviations:
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/ To Be Considered
COPC = Chemical of Potential Concern
HQ = hazard quotient
MLE = multiple lines of evidence
NA = not available
RSL keys:
c = carcinogenic
n = noncarcinogenic
VI = vapor intrusion
Unit:
ug/m^3 = microgram per cubic meter

Notes:

(1) Maximum concentration is used for screening.

(2) Vapor Intrusion Screening Levels for Residential Target Subslab and Exterior Soil Vapor (November 2018).
Concentrations for non-carcinogenic health effects are based on HQ=1.
The SL for m-xylene was used for m,p-xylene.

(3) Rationale Codes:
Above Screening Levels (ASL)
Below Screening Level (BSL)
No Toxicity Value Available (NTX)

(4) Although this chemical exceeded the screening value, it is not identified as a COPC. Chemicals presumed to be present because of background sources and chemicals not related to site contamination were eliminated as VI COPCs. These chemicals are not included in the MLE evaluation.

(5) Although this chemical exceeded the screening value, it is not identified as a COPC. Based on the MLE evaluation (Attachment F, Table 1), this chemical is not a site-related contributor to the VI pathway or the VI pathway is not likely complete.

(6) Access to the property was not granted. The nearest exterior soil vapor sampling location(s) will be used to evaluate the vapor intrusion pathway at this property for both current and future exposures.

Data Qualifiers:
J = compound was detected below the reporting limit in the sample

Abbreviations:
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/ To Be Considered
COPC = Chemical of Potential Concern
HQ = hazard quotient
MLE = multiple lines of evidence
NA = not available

RSL keys:
c = carcinogenic
n = noncarcinogenic
VI = vapor intrusion

Unit:
ug/m^3 = microgram per cubic meter

Notes:

(1) Maximum concentration is used for screening.

(2) Vapor Intrusion Screening Levels for Residential Target Subslab and Exterior Soil Vapor (November 2018).
Concentrations for non-carcinogenic health effects are based on HQ=1.
The RSL for 1,4-Dichlorobenzene is used for 1,3-Dichlorobenzene.
The SL for m-xylene was used for m,p-xylene.

(3) Rationale Codes:
Above Screening Levels (ASL)
Below Screening Level (BSL)
No Toxicity Value Available (NTX)

(4) Although this chemical exceeded the screening value, it is not identified as a COPC. Chemicals presumed to be present because of background sources and chemicals not related to site contamination were eliminated as VI COPCs. These chemicals are not included in the MLE evaluation.

Data Qualifiers:
J = compound was detected below the reporting limit in the sample

Abbreviations:
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/ To Be Considered
COPC = Chemical of Potential Concern
HQ = hazard quotient
MLE = multiple lines of evidence
NA = not available

RSL keys:
c = carcinogenic
n = noncarcinogenic
VI = vapor intrusion

Unit:
ug/m^3 = microgram per cubic meter

Notes:

(1) Maximum concentration is used for screening.

(2) Vapor Intrusion Screening Levels for Residential Target Subslab and Exterior Soil Vapor (November 2018).
Concentrations for non-carcinogenic health effects are based on HQ=1.
The RSL for 1,4-Dichlorobenzene is used for 1,3-Dichlorobenzene.
The SL for m-xylene was used for m,p-xylene.

(3) Rationale Codes:
Above Screening Levels (ASL)
Below Screening Level (BSL)
No Toxicity Value Available (NTX)

(4) Although this chemical exceeded the screening value, it is not identified as a COPC. Chemicals presumed to be present because of background sources and chemicals not related to site contamination were eliminated as VI COPCs. These chemicals are not included in the MLE evaluation.

(5) Subslab soil vapor samples were not collected for this property. The nearest exterior soil vapor sampling location(s) will be used to evaluate the vapor intrusion pathway at this property for future exposures.

Data Qualifiers:
J = compound was detected below the reporting limit in the sample

Abbreviations:
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/ To Be Considered
COPC = Chemical of Potential Concern
HQ = hazard quotient
MLE = multiple lines of evidence
NA = not available

RSL keys:
c = carcinogenic
n = noncarcinogenic
VI = vapor intrusion

Unit:
ug/m^3 = microgram per cubic meter

Notes:

(1) Maximum concentration is used for screening.

(2) Regional Screening Levels for Industrial Soil (November 2018). Concentrations based on non-carcinogenic health effects are based on HQ=0.1.
The RSL for m-Xylene is used for m,p-Xylene

Rationale Codes:
(3) Above Screening Levels (ASL)
Below Screening Level (BSL)

Data Qualifiers:
J = compound was detected below the reporting limit in the sample

Abbreviations:
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/ To Be Considered
COPC = Chemical of Potential Concern
HQ = hazard quotient
NA = not available
RSL keys:
c = carcinogenic
n = noncarcinogenic
sat = soil saturation concentration
Unit:
mg/kg = milligram per kilogram

TABLE 6.1
CANCER TOXICITY DATA -- INHALATION
PMC Groundwater Superfund Site - Operable Unit 2
Petoskey, Emmet County, Michigan

Chemical of Potential Concern	Unit Risk		Weight of Evidence/ Cancer Guideline Description	Unit Risk	
	Value	Units		Source(s)	Date(s) (MM/DD/YYYY)
1,3-Dichlorobenzene	NA	NA	NA	NA	NA
Benzene	7.8E-06	$(\mu g/m^3)^{-1}$	Known/likely human carcinogen	IRIS	03/07/2019
Naphthalene	3.4E-05	$(\mu g/m^3)^{-1}$	Carcinogenic potential cannot be determined	Cal EPA	03/07/2019
Trichloroethylene	4.1E-06	$(ug/m^3)^{-1}$	Carcinogenic to humans	IRIS	03/07/2019
Trichloroethylene (kidney) (1)	1.0E-06	$(ug/m^3)^{-1}$	Carcinogenic to humans	IRIS	03/07/2019
Trichloroethylene (NHL + Liver)	3.1E-06	$(ug/m^3)^{-1}$	Carcinogenic to humans	IRIS	03/07/2019

Definitions: IRIS = Integrated Risk Information System
NA = Not Available
$\mu g/m^3$ = microgram per cubic meter
Cal EPA = California Environmental Protection Agency

(1) This chemical operates with a mutagenic mode of action (EPA 2005) and would exhibit a greater effect in early-life versus later-life exposure. With the exception of vinyl chloride, chemical-specific toxicity data are not available for childhood and early-life exposures; thus, EPA (2005) default age-dependent adjustment factors (ADAF) will be applied to the inhalation unit risk as follows:

AGE (years)	AGE ADAF
0-<2	10
2-<16	3
16-<26	1

Notes:

(1) Matrix: AI - Indoor Air; AC - crawl space air; AS - subslab soil vapor; GS - exterior soil vapor; SO - soil

(2) Sample Type: N - normal sample. FD - field duplicate. Data from field duplicate samples were used when the concentrations were higher than those in associated normal sample.

NA - not applicable

Table 1: Summary of Vapor Intrusion Multiple Lines of Evidence Evaluation

PMC Groundwater Superfund Site

Petoskey, Michigan

Property Information and Summary of VI Sampling Performed	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]
Property Address	[redacted]						[redacted]	[redacted]	[redacted]	[redacted]	[redacted]
Description of Property	Four separate buildings on the property. Easternmost structure houses [redacted] The condos have a ground level garage and den space with two stories of living space above.						Three-story condominium complex located north of the former PMC building and adjacent to Little Traverse Bay. The complex consists of two buildings (Building 1 and Building 2). Building 1 houses 12 condominium units, and Building 2 houses 9 units. Each building features a common enclosed area where the main access entrance is located. Buildings are equipped with man-way cuts to allow for passage under the entire building. The common crawl space is partitioned similar to the corresponding floor plan. All the individual condominium unit entrances are located within the enclosed common area. For each building, the second and third floor units are accessed by a set of staircases, or an elevator.	Single family, two-story residential, approximately 100 years old, with unfinished basement and no crawl space	Single family, two-story residential, approximately 120 years old, with crawl space and unfinished basement	Two family, two-story residential property, divided into first floor and second floor apartments. Approximately 120 years old, with partial crawl space and unfinished basement
Sampling Performed by CH2M Hill (now Jacobs)	**Oct 2016 (Round 1)** - Install SS01 and SS02 in garage. **Jan 2017 (Round 1)** - SS sampling, and sewer gas sampling. **Jun 2018 (Round 4)** - Exterior SV and sewer gas sampling. **Nov 2018 (Round 5)** - SS and IA sampling. Exterior SV and sewer gas sampling.	**Oct 2016 (Round 1)** - Install SS01 and SS02 in garage. **Jan 2017 (Round 1)** - SS sampling, and sewer gas sampling. **Jun 2018 (Round 4)** - Exterior SV and sewer gas sampling. **Nov 2018 (Round 5)** - SS and IA sampling. Exterior SV and sewer gas sampling.	**Oct 2016 (Round 1)** - Install SS01 and SS02 in garage. **Jan 2017 (Round 1)** - SS sampling, and sewer gas sampling. **Jun 2018 (Round 4)** - Exterior SV and sewer gas sampling. **Nov 2018 (Round 5)** - SS and IA sampling. Exterior SV and sewer gas sampling.	**Oct 2016 - Jan 2017 (Round 1)** - Access not granted. Sewer gas sampling. **Jun 2018 (Round 4)** - Exterior SV and sewer gas sampling **Nov 2018 (Round 5)** - SS and IA sampling. Exterior SV and sewer gas sampling.	**Oct 2016 - Jan 2017 (Round 1)** - Access not granted. Sewer gas sampling. **Jun 2018 (Round 4)** - Exterior SV and sewer gas sampling **Nov 2018 (Round 5)** - SS and IA sampling. Exterior SV and sewer gas sampling.	**Oct 2016 (Round 1)** - Install SS01 and SS02 in garage. **Jan 2017 (Round 1)** - SS sampling, and sewer gas sampling. **Jun 2018 (Round 4)** - Exterior SV and sewer gas sampling. **Nov 2018 (Round 5)** - SS and IA sampling. Exterior SV and sewer gas sampling.	**Jun 2017** - Concurrent IA (one in each unit) and CS [redacted] sampling, and near-slab SV (3 around building) **Feb 2018** - Concurrent IA [redacted] and CS sampling [redacted], and near-slab SV (1 location)	**Jun 2017** - Concurrent IA (one in each unit) and CS [redacted] sampling, and near-slab SV (3 around building) **Feb 2018** - Concurrent IA [redacted] and CS sampling [redacted] and near-slab SV (2 locations)	**May-July 2017 (Round 2)** - near-slab SV sampling (access for IA sampling not granted) **Feb 2018 (Round 3)** - IA sampling	**May/July 2017 (Round 2)** - IA, near-slab SV sampling **Feb 2018 (Round 3)** - IA, near-slab SV sampling	**May/July 2017 (Round 2)** - IA and near-slab SV sampling **Feb 2018 (Round 3)** - IA and SS sampling **Jun 2018 (Round 4)** - sewer gas sampling **Oct/Nov 2018 (Round 5)** - sewer gas sampling
Sampling Performed by Mannik-Smith	**Apr 2017** - SS and IA sampling **Jun 2017** - IA sampling **Sep 2017** - SS and IA sampling **Jan 2018** - SS and IA sampling	**Mar/Apr 2017** - SS and IA sampling (Owners denied access afterwards)	**Apr 2017** - SS and IA sampling **Jun 2017** - IA sampling **Sep 2017** - SS and IA sampling **Jan 2018** - SS and IA sampling	**Apr 2017** - SS and IA sampling **Jun 2017** - IA sampling **Sep 2017** - SS and IA sampling **Jan 2018** - SS and IA sampling	**Mar 2017** - IA sampling **Jun 2017** - IA sampling **Nov 2017** - SS and IA sampling **Jan 2018** - SS and IA sampling	**Apr 2017** - SS and IA sampling **Jun 2017** - IA sampling **Sep 2017** - SS and IA sampling **Jan 2018** - SS and IA sampling	Not applicable	Not applicable	Not applicable	Not applicable	Not applicable

Property Address	[redacted]						[redacted]		[redacted]	[redacted]	[redacted]
Lines of Evidence Used to Evaluate IA Data											
OA (site-wide) similar or greater than IA concentrations, indicating background VOCs?	No	No	No	No	No	No	No	No	No	No	No
Potential indoor VOC sources identified during building survey?	Yes. Potential indoor VOC sources removed by Condo Property Management company prior to Oct/Nov 2018 building survey	Yes. Potential indoor VOC sources removed by Condo Property Management company prior to Oct/Nov 2018 building survey	Yes. Potential indoor VOC sources removed by Condo Property Management company prior to Oct/Nov 2018 building survey. Although scented plugins were not giving elevated ppbRae readings, they were removed during sampling of indoor air In Nov 2018.	Yes. Potential indoor VOC sources removed by Condo Property Management company prior to Oct/Nov 2018 building survey	Yes. Potential indoor VOC sources removed by Condo Property Management company prior to Oct/Nov 2018 building survey	Yes. Potential indoor VOC sources removed by Condo Property Management company prior to Oct/Nov 2018 building survey	May and June 2017 - various items removed from [redacted] including drain cleaner, WD-40, spray paint, spot cleaners, air fresheners, aerosol cleaners, wood polish and oil, degreaser, pesticides and bug sprays, hobby glue, glue remover, wood polish, aerosol deodorant, oven cleaner, wallpaper remover, nail polish remover, lighter fluid, sfabric protector, leather protector, hair color foam/dye, adhesive remover, PB blaster silicon spray	May and June 2017 - various items removed from [redacted] including spot cleaners, furniture cleaner/polish, cook top cleaner, aerosol lubricants, nail polish remover, aerosol cleaners, pesticides and bug sprays, drain cleaner, aerosol air freshener, WD-40, adhesive, lubricants, metal polish/cleaner, adhesive remover, metal polish, automotive wax	Feb 2018 - Observed general household/potential indoor VOC sources observed. Based on building survey, no items removed prior to sampling	May/July 2017 and Feb 2018 - General household/potential indoor VOC sources observed. None removed prior to sampling. New carpeting installed prior to May/July 2017 sampling event	No chemicals observed during May/July 2017 and Feb 2018 sampling events. None removed prior to sampling. Remodeling compeleted prior to May/July 2017 sampling event.
Building construction/conditions that could increase or decrease liklihood of VI?	Condominium unit, slab on grade with the majority of the first level as a garage, one shared wall with [redacted] n good condition, new construction (<10 years old).	Condominium unit, slab on grade with the majority of the first level as a garage, two shared walls with [redacted] in good condition, new construction (<10 years old).	Condominium unit, slab on grade with the majority of the first level as a garage, two shared walls with [redacted] in good condition, new construction (<10 years old).	Condominium unit, slab on grade with the majority of the first level as a garage, two shared walls with [redacted] 5, in good condition, new construction (<10 years old).	Condominium unit, slab on grade with the majority of the first level as a garage, two shared walls with [redacted] in good condition, new construction (<10 years old).	Condominium unit, slab on grade with the majority of the first level as a garage, one shared wall with [redacted] in good condition, new construction (<10 years old).	Building construction is wood frame with a concrete and block foundation. The ground-level units in each building have accessible partitioned, common crawlspace areas with fine sand, cobbles, and a fair amount of crushed concrete.	Building construction is wood frame with a concrete and block foundation. The ground-level units in each building have accessible partitioned, common crawlspace areas with fine sand, cobbles, and a fair amount of crushed concrete.	Poured concrete basement with stone walls	"Michigan Basement" with partially exposed dirt floor	"Michigan Basement" with partially exposed dirt floor
IA ≥ CS, near-slab SV, or SS concentration?	Yes, benzene in IA similar to SS	Yes, benzene in IA similar to SS	Yes, benzene in IA similar to SS	Yes, benzene in IA similar to SS	Yes, benzene in IA similar to SS	Yes, benzene in IA similar to SS	Yes - Benzene and TCE (IA ≥ CS, near-slab SV)	Yes - Benzene and TCE (IA ≥ CS, near-slab SV)	**Yes - Benzene (ND in SS04 and near-slab SV)**	**Yes - Benzene (ND in near-slab SV)**	**Yes - Benzene (ND in SS and near-slab SV)**
Mismatched ratios between SS, near-slab SV, CS and IA concentrations for different VOCs?	Yes, comparing TCE and PCE to benzene and naphthalene indicates indoor sources of benzene and naphthalene.	Yes, comparing TCE and benzene indicates indoor source of benzene	Yes, comparing TCE and benzene indicates indoor source of benzene	Yes, comparing TCE and benzene indicates indoor source of benzene	Yes, comparing TCE and benzene indicates indoor source of benzene	Yes, comparing TCE and benzene indicates indoor source of benzene	Yes - indicating indoor sources of benzene and TCE	Yes - indicating indoor sources of benzene and TCE	No, but apparent indoor air source of benzene	No, but apparent indoor air source of benzene	Yes, comparing TCE and benzene ratios indicates indoor source of benzene
Is VI Currently Occuring and Significant (causing IA > VISLs)?	**Possibly - TCE > VISL in Mannik-Smith Sep 2017 IA3. However, Manik-Smith Jan 2018 IA and Nov 2018 IA TCE < VISL.**	No	**Possibly - TCE > VISL in Mannik-Smith Jun 2017 IA1 and Sep 2017 IA2 and IA3. However, Manik-Smith Jan 2018 IA and Nov 2018 IA TCE < VISL.**	**Possibly - TCE > VISL in Mannik-Smith Apr 2017 IA1. However, Manik-Smith Sep 2017 and Jan 2018 IA and Nov 2018 IA TCE < VISL.**	**Possibly - TCE > VISL in Mannik-Smith Mar 2017 IA1 and IA2. However, Manik-Smith Jun and Nov 2017 and Jan 2018 IA and Nov 2018 IA TCE < VISL.**	**Yes - TCE > VISL in Mannik-Smith IA samples in Apr, Jun, and Sep 2017, and Jan 2018, and Nov 2018 IA.**	No	No	No	No	No
Potential for Future Significant VI?	**Possibly - exterior SV probes and GW wells have VOCs > VISLs. Mannik-Smith data indicates TCE in SS exceeded the VISL in Sep 2017; however, more recent (Jan and Nov 2018) SS sampling indicates TCE < VISL.**	**Yes - TCE > VISL in Jan 2017 and Nov 2018 SS. Exterior SV probes and GW wells have VOCs > VISLs.**	**Yes - TCE > VISL in SS in multiple events including most recent in Nov 2018. Naphthalene > VISL in SS in Sep 2017. Exterior SV probes and GW wells have VOCs > VISLs**	**Yes - TCE > VISL in SS in multiple events including most recent in Nov 2018. Exterior SV probes and GW wells have VOCs > VISLs**	**Yes - TCE > VISL in SS in multiple events including most recent in Nov 2018. 1,3-Dichlorobenzene > VISL in SS in Nov 2017. Exterior SV probes and GW wells have VOCs > VISLs**	**Possibly - exterior SV probes and GW wells have VOCs > VISLs. TCE > VISL in SS in Jan, Apr, and Sep 2017; however, more recent (Jan and Nov 2018) SS sampling indicates TCE < VISL. Naphthalene > VISL in Sep 2017 but ND in Jan 2018.**	**Unlikely - near-slab SV VOCs < VISLs for 2 rounds, and VOCs not detected in nearby GW wells.**	**Unlikely - near-slab SV VOCs < VISLs for 2 rounds, and VOCs not detected in nearby GW wells.**	**Yes - SS04 TCE > VISL (adjacent property)**	**Unlikely - near-slab SV VOCs < VISLs**	**Yes - SS TCE > VISL**

Petoskey, Michigan

Property Information and Summary of VI Sampling Performed	RP-042	RP-044	RP-047	RP-048	RP-049	RP-050	RP-051	RP-052	RP-058	RP-059	RP-060	RP-064
Property Address	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]
Lines of Evidence Used to Evaluate IA Data												
OA (site-wide) similar or greater than IA concentrations, indicating background VOCs?	No	No	No	No	No	No	No	No	No	Not applicable	Not applicable	Not applicable
Potential indoor VOC sources identified during building survey?	General households/potential indoor VOC sources observed during Oct/Nov 2018 building survey. None removed prior to sampling.	General households/potential indoor VOC sources observed during May/July 2017 and Feb 2018 building surveys. None removed prior to sampling. Remodeling/painting had been performed in basement within two months prior to May/July 2017 sampling event	May/July 2017 and Feb 2018 events were conducted around the time recent maintenance activities had taken place. Mothballs removed during Oct/Nov 2018 event	General households/potential indoor VOC sources observed during May/July 2017 and Feb 2018 building surveys. None removed prior to sampling.	May/July 2017 and Feb 2018 - Spray paint, nail polish remover, WD-40 removed prior to sampling. Carpet cleaning had been performed within 3 months prior to May/July 2017 sampling event	May/July 2017 and Feb 2018 - Aerosol cleaners, spot cleaners (laundry/carpet), spray paint, adhesive remover, nail polish remover were removed prior to sampling. Baseboards had been painted within 6 months prior to May/July 2017 sampling event	May/July 2017 - Spray paint, WD-40 removed. Feb 2018 - no elevated ppbRae readings recorded	May/July 2017, Feb 2018, and Oct/Nov 2018 - General households/potential indoor VOC sources observed. None removed prior to sampling.	May/July 2017 and Feb 2018 - General households/potential indoor VOC sources observed. None removed prior to sampling.	Not applicable	Not applicable	Not applicable
Building construction/conditions that could increase or decrease liklihood of VI?	"Michigan Basement" with partially exposed dirt floor	None	"Michigan Basement" with partially exposed dirt floor	Exposed dirt crawl space	"Michigan Basement" with partially exposed dirt floor	"Michigan Basement" with partially exposed dirt floor	None	"Michigan Basement" with partially exposed dirt floor	Exposed dirt crawl space	Not applicable, property has not granted access	Not applicable, property has not granted access	Not applicable, property has not granted access
IA ≥ CS, near-slab SV, or SS concentration?	No	**Yes - Benzene in Feb 2018 (ND in near-slab SV) For Jun 2017, benzene detected in near-slab SV similar to IA**	**Yes - Benzene (ND in near-slab SV) No - TCE in near-slab SV > IA**	**Yes - Benzene (ND in near-slab SV)**	**Yes - Benzene (ND in near-slab SV)**	**Yes, but only for near-slab SV where benzene and TCE are ND (Feb and Nov 2018) For Nov 2018, benzene and TCE detected in IA and sub-slab (Nov 2018) with IA < SS**	**Yes - Benzene (ND in near-slab SV)**	**Yes - Benzene (ND in near-slab SV)**	**Yes - Benzene (ND in near-slab SV)**	Not applicable	Not applicable	Not applicable
Mismatched ratios between SS, near-slab SV, CS and IA concentrations for different VOCs?	No	No, but possible indoor air source of benzene	Yes, comparing PCE, TCE, and benzene ratios indicates possible indoor source of benzene and TCE	No, but apparent indoor air source of benzene	No, but apparent indoor air source of benzene	Yes, comparing PCE, TCE, and benzene ratios (IA/SS in Nov 2018) indicates indoor source of benzene and TCE	No, but apparent indoor air source of benzene	No, but apparent indoor air source of benzene	Yes, comparing PCE and benzene ratios indicates indoor source of benzene	Not applicable	Not applicable	Not applicable
Is VI Currently Occuring and Significant (causing IA > VISLs)?	No	No	**Unlikely, MLE indicates indoor source(s) of TCE and benzene**	No	No	**Unlikely, MLE indicates indoor source(s) of TCE and benzene**	No	No	No	**Although no indoor air samples have been collected for comparison, it is unlikely that VI is currently occurring at this property, with consideration given to nearby exterior SV results and the current assessment at [redacted]**	**Although no indoor air samples have been collected for comparison, it is unlikely that VI is currently occurring at this property, with consideration given to nearby exterior SV results and the current assessment at nearby [redacted]**	**Although no indoor air samples have been collected for comparison, it is unlikely that VI is currently occurring at this property, with consideration given to nearby exterior SV results and the current assessment at nearby [redacted]**
Potential for Future Significant VI?	**Possibly - as benzene and TCE exceeded VISL in nearby SVBs. In addition, nearby SS results at RP-040 have TCE exceedance of VISL.**	**Possibly - as benzene and TCE exceeded VISL in nearby SVBs.**	**Possibly - as benzene and TCE exceeded VISL in nearby SVBs.**	**Unlikely - near-slab SV < VISLs**	**Possibly - as benzene and TCE exceeded VISL in nearby SVB.**	**Possibly - as benzene and TCE exceeded VISL in nearby SVB.**	**Unlikely - near-slab SV < VISLs**	**Unlikely - near-slab SV < VISLs**	**Unlikely - near-slab SV < VISLs**	**Possibly - nearby SVB exceed benzene and TCE VISLs**	**Possibly - nearby SVB exceed benzene and TCE VISLs**	**Possibly - nearby SVB exceed benzene and TCE VISLs**
Reccomended Further Action												
VI CSM Category												
Property likely currently has complete VI pathway that is causing IA and/or CS > VISLs, and has potential for this in the future												
Property possibly currently has complete VI pathway that is causing IA and/or CS > VISLs, and has potential for this in the future												
Property unlikely currently has complete VI pathway that is causing IA and/or CS > VISLs, but has potential for this in the future	x	x	x		x	x				x	x	x
Property unlikely currently has complete VI pathway causing IA and/or CS > VISLs, and unlikely has potential for this in the future				x			x	x	x			
Current Scenario: Site-related COPCs	**None**	**None**	**None**	**None**	**None**	**None**	**None**	**None**	**None**	**None**	**None**	**None**
Future Scenario: Site-related COPCs	**Benzene, TCE**	**Benzene, TCE**	**Benzene, TCE**	**None**	**Benzene, TCE**	**Benzene, TCE**	**None**	**None**	**None**	**Benzene, TCE**	**Benzene, TCE**	**Benzene, TCE**

Notes:

Data was not included from times that a mitigation system supplied by EPA such as subslab depressurization or air purifiers were being operated in a particular building. However data is included when mitigation systems were only operating in the general area, not in the specific building

VISL - Vapor Intrusion Screening Level, based on a cancer risk of $1x10^{-6}$ for carcinogens

Grey shading indicates a summary of an exceedance in sample media

Groundwater	Not detected in 1992, 1993, 1995, or 2018 groundwater samples.	Detected in 1992 and 1993. Not detected in 2018 groundwater samples.	Not detected in 1992, 1993, 1995, or 2018 groundwater samples.	Not detected in 1992, 1993, 1995, or 2018 groundwater samples.	Not detected in 1992, 1993, 1995, or 2018 groundwater samples.	Not detected in 1992, 1993, 1995, or 2018 groundwater samples.	Not detected in 1992, 1993, 1995, or 2018 groundwater samples.	Not detected in 1992, 1993, 1995, or 2018 groundwater samples.
Soil	NA	Not detected in 2018 soil samples.	Not detected in 2018 soil samples.	Not detected in 2018 soil samples.	NA	- FOD: 5/14	NA	- FOD: 11/28
Conclusion								
VI Chemical of Potential Concern	No - There is no strong subsurface source. Presence indicates indoor source.	No - There is no strong subsurface source. Presence indicates indoor source.	No - There is no strong subsurface source. Presence indicates indoor source.	No - There is no strong subsurface source. Presence indicates indoor source.	No - There is no strong subsurface source. Presence indicates indoor source.	No - Concentrations in subslab SV were below VISLs and below the peak concentrations detected in indoor air, suggesting an indoor source.	No - There is no strong subsurface source. Presence indicates indoor source.	No - Concentrations in subslab SV were below VISLs and below the peak concentrations detected in indoor air, suggesting an indoor source.

Notes:

[1] Includes o-xylenes, and m&p-xylenes.

Frequency of detections (FODs) includes only those samples evaluated as part of the risk assessment.

SV - soil vapor

NA - not analyzed

Eder Associates Consulting Engineers (Eder). 1993. Phase I Remedial Investigation, Petoskey Manufacturing Company, Petoskey, Michigan. December.
