# 1.0 EXECUTIVE SUMMARY

The Environmental Protection Agency's (EPA) Superfund Program implemented the "Strategy for Addressing 464 Lead Smelter Sites" (Strategy) in FY 2012. The Strategy was created to ensure completion of Superfund site assessment work at a set of 464 historic lead smelters submitted to the Agency in the early 2000s. EPA Headquarters distributed lists of the sites to regional offices but did not establish any assessment requirements due to lack of site specific information. EPA Regions conducted assessments at these sites as resources and priorities permitted, completing initial assessments at about one-half of the sites prior to implementation of the Strategy.

The Strategy established milestones for completing, tracking and reporting required assessments, identifying sites posing an imminent and substantial threat to human health based on existing information, and determining whether to revise the Agency's Pre-CERCLIS Screening guidance. All milestones in the Strategy were met.

Final site assessment results show EPA and its state partners completed over 760 assessments at these sites (about one-third of the sites received a more complex assessment following the initial assessment). Assessment results for the 464 sites concluded no further Superfund interest at 361 sites (78 percent), potential short-or long-term cleanup was or is needed at 88 sites (19 percent), and more complex assessment is still needed at 15 sites (3 percent).

Implementation of the Strategy did not identify any candidate sites for placement on the National Priorities List (NPL), but did identify 66 additional sites needing potential Superfund removal work.

The EPA Office of Inspector General (OIG) evaluated EPA's implementation of the Strategy, releasing a report titled "EPA Has Made Progress in Assessing Historical Lead Smelter Sites But Needs to Strengthen Procedures" in June 2014

(www.epa.gov/oig/reports/2014/20140617-14-P-0302.pdf). The OIG report included several recommendations to strengthen guidance and procedures for managing contaminated sites. The Superfund program has implemented responsive actions to all recommendations, including posting this summary report on EPA's website.

Implementation of the Strategy and related OIG recommendations highlights challenges facing EPA when assessing historic lead smelters. The Superfund site assessment process is essentially a screening tool used to identify sites that are eligible for placement on the NPL and directs these sites to an appropriate cleanup program. The process also directs sites needing emergency or urgent cleanup work to EPA's Superfund removal program.

For longer-term cleanups, NPL eligibility is based on application of the Hazard Ranking System (HRS) component of the National Oil and Hazardous Substances Pollution

Contingency Plan (NCP). Historic lead smelters are often associated with lead contamination in soil. However, the HRS requires that the released hazardous substances (e.g., lead) in the soil be attributable to the site. In cases when there are multiple sources of lead in the vicinity of the smelter and the contaminant concentration distribution does not show an obvious link to the smelter, establishing attribution may not be possible

Further, many historic smelter locations have since been paved over or redeveloped, potentially blocking the soil exposure pathway which can be used under the HRS. When contamination is found, the HRS requires the level of contamination to be significantly greater than surrounding areas which can be challenging given historic smelters are often located in areas of ubiquitous anthropogenic lead sources such as industrial sources, lead paint, and leaded gasoline. These factors can result in HRS scores below the level needed for NPL consideration. When NPL listing and removal cleanup approaches are not options, site information is forwarded to state environmental programs for any additional attention.

Given the assessment challenges associated with historic lead smelters, EPA may consider additional steps under the Superfund program to ensure sites with contaminated soil are addressed under the appropriate program. Potential steps include:

- Exploring cost effective methods to associate contamination to sources;
- Improving public access to site information; and
- Evaluating communication of site data with partners.

# 2.0 INTRODUCTION

The purpose of this report is to summarize EPA's actions and strategy to address sites presented in a 2001 academic study of former secondary lead smelters in the United States. Several phases of evaluation and response occurred between 2001 and 2016, culminating in the completion of individual assessments for over 400 potential secondary smelter locations listed in the 2001 study.

The American Journal of Public Health published an academic study titled, *Discovering Unrecognized Lead-Smelting by Historical Methods* in April 2001. The study identified more than 400 potential secondary lead-smelting sites that were reportedly unknown to Federal and state regulators. The lead smelting sites were compiled from historic industry publications. Lead smelting is a process that extracts elemental lead from lead compounds. Secondary lead smelting refers to the production of lead and lead alloys from lead-bearing scrap material, such as from lead acid batteries.

EPA Headquarters (HQ) Superfund program staff reviewed the study shortly after it was published, conducted a search of the sites in EPA databases and distributed search results to regional Superfund staff in spring 2001. Following discussions between HQ and regional staff, HQ recommended regions review the list of sites and set regional priorities for further evaluation of the locations as resources allowed. HQ did not establish any formal strategy or requirements to assess the sites given the limited site-specific information in the study.

HQ obtained an updated list of 464 sites from one of the study's authors, William P. Eckel, in 2003 and distributed it to regional offices. HQ reviewed the CERCLIS database in 2003 and 2005 to evaluate how many of the site locations mentioned in the study had Superfund site assessments completed. In 2005, EPA assessed 31 sites on the list thought to most likely present human health risk as part of an EPA site identification project. The 31 sites were selected based on their location, population and proximity to schools. Results showed all 31 sites either did not require any Superfund involvement or were already being addressed under Superfund or another cleanup program. The results did not suggest a need for different approach for the remaining sites identified in the study.

Beginning in late 2010, EPA began responding to press requests for the status of Superfund involvement at all sites identified in the academic study. In early 2012, EPA was informed by the press of independent sampling results suggesting some of the unaddressed sites posed human health threats from lead contamination. EPA responded by creating the Lead Smelter Strategy to ensure the Superfund program evaluated every site in the study.

The Strategy included interim milestones to review and categorize the status of all 464 potential smelters, and to complete preliminary assessments by the end of October 2013. EPA completed this work on schedule.

EPA's OIG initiated an evaluation of the Strategy and released a report in June 2014 that included recommendations to strengthen the Superfund program's management of sites with potential lead contamination. The Superfund program has implemented responsive actions to all recommendations.

This report summarizes EPA's actions to evaluate 464 potential former secondary smelters, and resulting recommendations for the Superfund program. The report is presented in chronological order of activities between 2001 and 2016, starting with a brief description of the mission and operation of the Superfund program. This report includes a description of:

- Key points regarding the Superfund program's site assessment and removal processes;
- EPA's evaluation of sites in the 2001 academic study prior to the Strategy;
- Development of the 2012 Lead Smelter Strategy;
- The OIG's evaluation of the Strategy;
- Accomplishments resulting from the Strategy;
- Remaining work to be performed;
- Observations to consider when assessing historic lead smelters; and
- Recommendations for consideration.

#### 3.0 SUPERFUND ASSESSMENT PROGRAMS

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), commonly referred to as "Superfund", establishes Federal authority to respond directly to releases or threatened releases of hazardous substances, pollutants or contaminants that may endanger public health or the environment. The NCP is EPA's regulation for implementing the requirements of CERCLA. The NCP sets forth guidelines and procedures for responding to releases or potential releases, including guidelines for conducting Superfund remedial and removal site evaluations (assessments). Remedial assessments are driven by criteria outlined in the HRS regulation which is a component of the NCP.

The HRS is a numerically based screening system that uses information from initial limited investigations to assess the relative potential of a release to pose a threat to human health or the environment. It is the principal mechanism EPA uses to determine eligibility for inclusion on the NPL, EPA's list of national priorities among the known or threatened releases of hazardous substances, pollutants or contaminants throughout the United States. Releases (sites) with HRS scores of 28.50 or greater are eligible for placement on the NPL.

Only sites on the NPL are eligible for Superfund Trust Fund-financed remedial actions. Sites eligible for the NPL may be addressed using the NPL or through a non-NPL approach such as a state managed environmental cleanup program. Regardless of site status with respect to the NPL, any sites posing urgent risks may be addressed by, or in conjunction with, EPA's

Superfund removal program. Contaminated sites determined not to be eligible for the NPL or require removal attention are referred back to state and tribal programs.

#### 3.1 Remedial Assessment

#### Process

The Superfund remedial site assessment process evaluates potential or confirmed releases of hazardous substances that may pose a threat to human health or the environment to determine whether cleanup may be warranted under a Superfund managed or monitored program. EPA learns about new sites primarily through referrals from state, tribal and other Federal regulators of environmental programs. A smaller number of sites are identified through EPA research and petitions for assessment of a potential release.

EPA regional staff work with their state and tribal partners as necessary to prioritize and assess sites. States serve as the lead agency for about 50 percent of Superfund remedial assessments performed each year, although this percentage varies significantly across EPA Regions (from 0 to 100 percent). EPA funds states to conduct this work using cooperative agreements.

The general principle applied during assessment is to assess worst sites first. EPA policy is to identify sites posing the highest (relative) risk or potential risk (to human health and/or the environment) and develop a strategy to assess those sites in a timely manner while balancing their other site assessment needs. Figure 1 shown below illustrates the Superfund site assessment process.

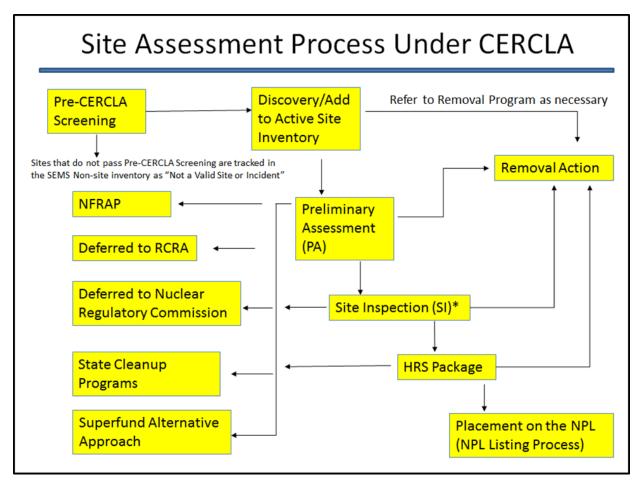

Figure 1: Site Assessment Process Under CERCLA

While most sites identified for assessment are based on referrals from states and other federal programs, CERCLA established a petition option for any party to request assessment of a site. EPA's Petition for Preliminary Assessment fact sheet presents minimum information needed from requestors before taking action, including how the petitioner is affected by the release. The fact sheet discourages requestors from submitting large lists of sites without sufficient information to: 1) ensure only sites presenting serious environmental problems are added to the workload; and 2) avoid diverting time and limited resources from known and potentially more serious sites.

The screening-level assessments used in the Superfund remedial assessment process are limited in scope and are intended to collect the necessary information required to determine NPL eligibility. These assessments are not intended to fully characterize the nature and extent of potential contamination associated with a site. If required following completion of the remedial assessment process, comprehensive site characterization to determine the extent of contamination and human health and ecological risk assessments are generally conducted as part of the remedial cleanup process.

Assessments begin with Pre-CERCLA Screening (PCS) (formerly called "Pre-CERCLIS Screening) to determine whether a potential site needs to be included in the Superfund active site inventory for completion of a remedial Preliminary Assessment (PA). A PA and progressively more complex assessments such as Site Inspections (SI) are performed as needed until a decision can be made regarding NPL eligibility and the appropriate cleanup program. Sites determined to need urgent cleanup attention at any point during the remedial assessment process are routinely referred to EPA's Superfund removal program. Following completion of removal attention, sites may be returned for further remedial assessment.

#### HRS Methodology

Throughout the remedial assessment process, the HRS and related guidance is used to drive data collection and decision-making to screen and prioritize sites for further site-specific investigation. Those sites placed on the NPL based on an HRS score are then further investigated to determine site-specific risk. The HRS score is calculated by assigning numerical factors to potential contamination pathways (ground water migration, surface water migration, soil exposure, and air migration) based on conditions at the site. An HRS score is not a comparison of the severity of contamination at scored sites or reflective of a specific risk level; it is a value based on relative risk amongst candidate sites that determines whether a site is eligible for listing on the NPL.

Sites that obtain HRS evaluation scores of 28.50 or greater are eligible for placement on the NPL. Sites with an HRS score of less than 28.50 are not eligible for NPL proposal or further assessment under the remedial site assessment process and are typically assigned a No Further Remedial Action Planned (NFRAP) decision, although some of these sites may also be referred to EPA's Superfund removal program for potential removal interest. If no other Superfund remedial, removal and enforcement interest exists at a site, the site can be removed from the active inventory and placed in the archive inventory.

For HRS scoring purposes, a release of a hazardous substance by chemical analysis is established as being from a particular facility when the concentration of the hazardous substance in a release sample is significantly greater than in background samples and is attributable to the site. Lacking either a representative background level or attribution of the hazardous substance to a facility being evaluated can significantly lower the HRS score, and therefore, adversely impact a site's eligibility for placement on the NPL. Establishing background concentrations can be problematic for metals in urban areas, particularly lead, because they can originate from multiple anthropogenic (i.e., human-contributing) sources in comparison to suburban or rural settings.

Attribution is a critical factor in determining site eligibility for the NPL using the HRS. Attribution ensures the significant increase of a hazardous substance concentration in the environment is due to the release from the facility being evaluated, and not from other possible contaminant sources in the vicinity.

In some cases, when the release of the lead in the soil cannot be clearly attributed to a smelter, the area of soil contamination itself may be evaluated as a site under the HRS. However, it is the EPA's policy that a minimum investigation effort should be conducted to attribute the contamination to a release from a facility prior to evaluating the contaminated soil as a site for the NPL with no known origin.

Contamination from non-site related sources can seriously complicate attribution of an elevated hazardous substance concentration to a release from a specific site. As noted, metals concentrations in urban soils, especially in the case of lead, have typically been impacted by many natural and anthropogenic sources over time. In the case of evaluating the soil exposure pathway of a site during HRS scoring, attributing the significant increase of a hazardous substance to the site can be essential to document that a site qualifies for the NPL. This evaluation can often be accomplished by sampling to determine the relative contribution of other sources to show the contaminant's concentration gradient identifies the site as the origin of the contamination. Another method that can be used in establishing attribution is to conduct analytical "fingerprinting" of hazardous substances (e.g., showing the ratio of the hazardous substances in the waste material at the facility and in the soil are similar).

Lead is handled differently than other hazardous substances in the HRS. Their toxicity factors, that are used in calculation of the HRS score, are directly assigned the highest value in the HRS regulation itself. For lead (and its compounds), "targets" that are used in calculation of the HRS score are based on the actual or potentially impacted population. For most other hazardous substances, "targets" may be increased by a multiplier of 10 when health-based soil benchmarks are exceeded. For HRS scoring purposes, "targets" accounts for the presence of people, physical resources (e.g., drinking water wells, surface water intakes), and environmental resources (e.g., sensitive environments, fisheries) that might be threatened by release of a hazardous substance from the site.

#### Site Assessment Workload

Since the start of the Superfund program in 1980, EPA and its state, tribal and other Federal partners have completed nearly 95,000 assessments at almost 53,000 unique sites (sites often receive more than one assessment). The 53,000 sites include over 7,000 sites screened from entry into the Superfund active site inventory, resulting in a total of 45,800 added to the inventory for further remedial assessment.

As shown in Figure 2 below, the level of Superfund remedial assessment work has been declining since 2000.

Figure 2: Remedial Site Assessment Trends (rounded to 00's)

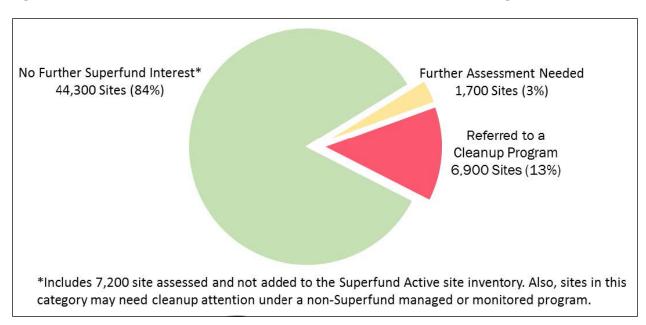

|                            |          | FY2001- | FY2005- | FY2009- | FY2013- |        |

| Completed                  | 75,900   | 6,800   | 4,800   | 4,100   | 3,200   | 94,800 |
| No. Sites Assessed and Not |          |         |         |         |         |        |
| Added to Active Inventory  | 400      | 2,200   | 2,100   | 1,500   | 1,000   | 7,200  |
| No. Sites Assessed and     |          |         |         |         |         |        |
| Added to Active Inventory  | 42,000   | 1,300   | 900     | 900     | 700     | 45,800 |
| No. Sites in Active        |          |         |         |         |         |        |
| Inventory Needing          |          |         |         |         |         |        |
| Assessment (End of Time    |          |         |         |         |         |        |
| Period)                    | 5,000    | 3,100   | 2,500   | 2,300   | 1,700   | 1,700  |

When the academic smelter study was released in 2001, the Superfund program had approximately 3,800 sites needing assessment. Progress has been made towards reducing this workload despite a declining Superfund budget, due in part to the decline in number of new sites added to the inventory.

EPA makes one of three types of decisions at the conclusion of each assessment. These types of decisions include:

- No Further Remedial Action Planned (NFRAP) remedial assessment determines the site is not eligible for the NPL based on currently available information. While these sites do not qualify for an NPL cleanup under Superfund, they may not be free of contamination and may need further cleanup attention under another state, tribal or other Federal cleanup program. A subset of sites assigned a NFRAP decision may require potential cleanup under EPA's Superfund removal program. New information can result in returning a NFRAP site back to the Superfund program for further remedial assessment. NFRAP sites are included in the "No Further Superfund Interest" category on subsequent charts and tables in this report;
- Further Assessment Needed remedial assessment determines more complex assessment is needed to determine if a site is eligible for the NPL; and
- Refer to Cleanup Program remedial assessment determines the site is eligible for the NPL and refers the site to a Superfund managed or monitored cleanup approach. This includes NPL and Non-NPL cleanup approaches. Non-NPL cleanup approaches include Superfund removal, RCRA Corrective Action, Superfund Alternative Approach, cleanup under the Nuclear Regulatory Commission and cleanup under a state, tribal, municipal or other federal governmental environmental cleanup program.

Figure 3 shows the current distribution of these decisions at the 53,000 sites assessed under the Superfund program:

#### Figure 3: Current Results of 53,000 Sites Assessed by the Superfund Program

#### Coordination with Other Programs

The remedial site assessment process generally involves coordination with other cleanup programs both internal and external to EPA. Coordination begins with site notification as the majority of new sites needing assessment are submitted by states and to a lesser extent, EPA's Superfund removal program. Given states carry out approximately one-half of the remedial assessments performed each year, the process offers ongoing opportunities for EPA/state coordination. Sites posing threats sufficient for listing on the NPL require additional coordination based on EPA's policy to seek governor support to propose a site to the NPL.

Information collected during the assessment process originates in several sources. In general, relevant site-specific information originating in state and local government agencies flows up to EPA and will already be shared or known by all regulators. At sites where EPA collects data, such as sampling information, assessment decisions are generally reported to or otherwise made available to states and the general public. Information collected on sites needing attention under an EPA managed or monitored cleanup program is provided to the agency or program that will handle cleanup investigation.

For sites being assessed that have potential lead contamination, the Agency for Toxic Substances and Disease Registry (ATSDR) may work directly with state and local government agencies on a site-by-site basis to gather blood lead level (BLL) data. This data collection occurs infrequently at sites in the Superfund remedial assessment process. When it does, EPA, state and local government staff are generally aware of this activity and are in close coordination on results. EPA uses this data along with other relevant site information collected or provided to EPA when determining next steps at a site.

The overall level of coordination between EPA and external cleanup programs may be stronger when some type of agreement has been established between EPA and the other program. For example, cooperative agreements established with states to perform remedial assessments generally require frequent interactions and discussion on site work. Similarly, a memorandum of understanding covering agency roles and responsibilities can serve as a foundation for ensuring key site information is communicated and transferred in a timely manner.

#### 3.2 Superfund Removal Program

Potential removal sites can be referred to the EPA's Superfund Emergency Response and Removal Program from various entities including local, State, other Federal Agencies and the remedial program. The primary purpose of a removal site evaluation is to collect information about site conditions to determine if a removal action is appropriate.

The first step is to conduct a site reconnaissance. The next step is to determine the scope and approach to collecting samples including what samples to collect and where to collect them. Information collected must be of sufficient quantity and quality to make a decision regarding the need for removal action.

The eight NCP removal factors are then applied:

- 1. actual or potential exposure to humans or animals or food chain;
- 2. actual or potential contamination of drinking water or sensitive ecosystems;
- hazardous substances or pollutants or contaminants in containers with may pose a threat;
- 4. high levels of hazardous substances or pollutants or contaminants in surface soils that may migrate;
- 5. weather conditions may cause hazardous substance or pollutants or contaminants to migrate or be released;
- 6. threat of fire or explosion;
- 7. availability of other federal or state mechanisms; and
- 8. other factors that may pose a threat.

Site access issues are next considered. Enforcement concerns are addressed as well as statutory limitations to the response. Removal site evaluations can have all of these considerations or a subset of such considerations. If it is determined that a site does not meet removal criteria, it is often referred back to the referring entity.

EPA has the authority to conduct removal actions if a site appears to pose a serious immediate threat to human health or the environment. A removal action may be conducted

at any time during the Superfund process. In addition, EPA has the authority to conduct a removal action, whether or not it is a site listed on the NPL, to eliminate, control, or mitigate a threat posed to the public.

Removal actions are responses performed at NPL and non-NPL sites that eliminate or reduce threats to public health or the environment from the release, or potential release, of hazardous substances or pollutants or contaminants that may pose an imminent and substantial danger to public health or welfare.

These risk reduction activities can be conducted as emergency, time-critical, or non-time critical removal actions.

| Emergencies:       | Removals where the release requires that on-site activities be initiated<br>within hours of the lead agency's determination that a removal action<br>is appropriate. If the work is ongoing beyond a year, the removal type<br>should be changed to Time-Critical or Non-Time-Critical.   |
|--------------------|---|
| Time-Critical:     | Removals where, based on the site evaluation, the lead agency<br>determines that a removal action is appropriate and that there is a<br>period of less than six months available before on-site activities must<br>be initiated.  |
| Non-Time Critical: | Removals where, based on the site evaluation, the lead agency<br>determines that a removal action is appropriate and that there is a<br>planning period of more than six months available before on-site<br>activities must begin. The lead agency will undertake an Engineering<br>Evaluation/Cost Analysis (EE/CA) for non-time critical removals and<br>provide the EE/CA for public comment. The remedial program typically<br>leads these removal actions. |

# 4.0 EPA PRE-STRATEGY ACTIVITIES

EPA learned of the potentially unrecognized secondary lead smelters following publication of an academic study titled, *Discovering Unrecognized Lead-Smelting by Historical Methods*, in April 2001. The study used the Standard Metal Directory (various years from 1931-1964) and Year Book of the American Bureau of Metal Statistics (1945-1990) as primary historical sources to identify battery lead, Babbitt metal, and solder smelters (secondary lead smelters) that were in operation at that time. The list of secondary lead smelters was then cross-checked against EPA and state environmental databases to create a master list of 430 sites that appeared unknown to government authorities. The study included investigating 12 of these sites, including soil sampling at eight sites, to determine if any posed potential health threats. The study reported seven of the eight sites sampled presented had lead levels exceeding EPA guidelines for residential areas and three exceeded EPA guidelines for industrial properties.

HQ discussed the study and site list with regional site assessment staff in Spring 2001, noting regions may receive petitions to conduct PAs on some or all of the sites. For the most part, site-specific petitions did not materialize.

HQ conducted a search for the sites in its CERCLIS and Envirofacts databases and distributed an annotated list of the 430 sites to regional offices in September 2001. The database search was challenged by a lack of specific addresses for a portion of the sites on the list with some sites only including a state or city.

As of September 2001, no region reported receiving a petition to conduct a PA. A few regions indicated they were pursuing assessments at some of the sites on the list as resources permitted. HQ concluded regional offices could assess sites on the list on a discretionary basis if necessary and as resources allowed. HQ did not recommend to the regions to add unaddressed sites to the Superfund database due to insufficient site-specific information.

In FY2003, HQ reached out to Dr. Eckel, primary author of the study, and obtained an updated list of 464 potential secondary lead smelters and distributed this information to regional offices. Nearly 25 percent of the sites on the updated list still had missing or questionable addresses. HQ was aware that regions were continuing to assess some of the sites on the list as resources permitted, but maintained its position that information did not warrant addition of <u>all</u> sites on the list to the Superfund database since the information still did not meet the requirements of a Petition for a PA.

Figure 4 shows the geographic distribution of the 464 potential secondary lead smelters. Approximately 78 percent of the sites were concentrated in four EPA regions (Regions 2, 3, 5 and 9).

Figure 4: Geographic Distribution of 464 Potential Secondary Lead Smelters

| EPA Region | 1  | 2   | 3  | 4  | 5   | 6  | 7  | 8 | 9  | 10 | Total |
|------------|----|-----|----|----|-----|----|----|---|----|----|-------|
| No. Sites  | 33 | 120 | 71 | 24 | 128 | 21 | 16 | З | 41 | 7  | 464   |

HQ studied progress at these sites again in FY 2005-2007 as part of internal site identification project to determine if a centralized approach would prove useful in identifying high human health risk sites that were unreported to EPA. The project focused on the smelting industry given its associated risk for lead in soils and surface water and the availability of the list of 464 potential secondary lead smelters. Database research at the beginning of this project determined 122 (26%) of the 464 sites were included in the Superfund database as of September 2005.

HQ selected a sample of 31 sites that were not in the database. The sample included sites in nine of the 10 regions. The sample was created by selecting sites that had the highest number of schools and populations within ¼ mile of the potential secondary lead smelter. HQ requested regional offices assess the sample sites to determine the need for Superfund involvement. Assessment results showed none of the 31 sites appeared to present human health risks that warranted Superfund remedial cleanup. Six of the sites were already being addressed by state clean-up programs or private parties, and the rest of the sites showed no imminent human health risks. Based on these results, HQ did not recommend to the regions to assess all sites, or add them to the Superfund database.

In FY 2011, HQ and regional offices received a series of Freedom of Information Act (FOIA) requests from a reporter representing a major news organization. The FOIAs focused on EPA's handling of the list of 464 sites and progress made addressing the sites under the Superfund program. HQ discussed the status of FOIAs and site progress with regional offices on multiple calls throughout FY 2011.

During follow-up discussions, the reporter indicated independent sampling had been performed for lead in soils using handheld X-Ray Fluorescence (XRF) analyzers and/or laboratory analysis of collected soil samples at around 20 of the sites located in urban areas with many showing high levels of lead contamination.

HQ and regions met in February 2012 and discussed the status of the sites and the need for a coordinated strategy to ensure any unassessed sites on the list of 464 sites get added to the Superfund database and receive an assessment. Figure 5 shows the assessment status of the 464 sites as of February 2012.

At this time, approximately 60 percent of sites still needed an initial or more complex assessment. The remaining 40 percent had completed assessment and were either determined to have no further Superfund interest or were referred to a cleanup program for potential cleanup work.

Figure 5 shows by February 2012, 18 of the 464 sites had completed assessment work and were referred to an EPA managed or monitored cleanup program.

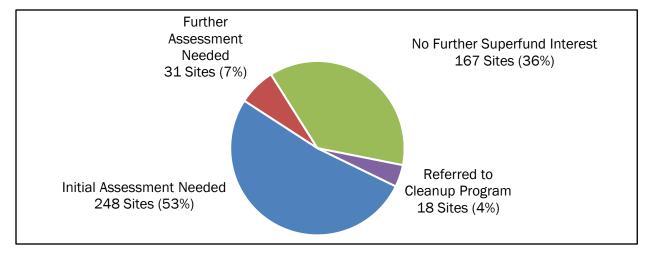

Figure 5: Assessment Status of 464 Potential Secondary Lead Smelters – February 2012

Figure 6 shows the distribution of the 18 sites across various cleanup program options. The 18 includes one site that had finished assessment work and needed cleanup attention but the appropriate cleanup program still needed to be determined.

Figure 6: Selection of Cleanup Program (18 sites) – February 2012

|                |     | Other Cleanup |      |         |                  |
|----------------|-----|---------------|------|---------|------------------|
| Cleanup Option | NPL | Activity      | RCRA | Removal | To Be Determined |
| # Sites        | 7   | 3             | 4    | 3       | 1                |

The seven sites referred to the NPL included two sites proposed to the NPL and five sites on the NPL. EPA addressed six of these seven sites prior to publication of the academic study.

#### 5.0 LEAD SMELTER STRATEGY

EPA formed a workgroup of HQ and regional Superfund assessment staff in February 2012 to help develop a coordinated assessment strategy designed to complete remaining assessment work at all 464 potential secondary lead smelters. The workgroup met monthly and focused on status updates and general issues surrounding the universe of sites. The strategy was titled "Strategy for Addressing 464 Lead Smelter Sites" and was finalized and distributed to regional offices on August 30, 2012. The Strategy is attached as Appendix B of this report.

The Strategy created a framework of steps and milestones to ensure all 464 sites are tracked and assessed under the Federal Superfund program. The Strategy focused on reviewing available information and collecting new information to determine if any of the

464 sites may pose a health threat requiring further assessment and possible cleanup. The Strategy included guidelines for prioritizing assessments; coordinating with state, tribal and other environmental and public health agencies; and communicating progress to key stakeholders such as members of the community and elected representatives. The Strategy served as the first formal requirement to track and assess all 464 potential secondary lead smelters.

In general, assessment milestones required regions to:

- Review files to determine the assessment status of all 464 sites;
- Conduct Pre-CERCLIS or equivalent screenings at 48 of the 464 sites that appeared to be "unrecognized" sites not in the Superfund database and not referred to another program for assessment as of February 2012;
- Review existing information in consultation with EPA's Superfund removal program to determine if any sites could pose an imminent and substantial threat to human health that might require removal assessment and/or cleanup;
- Complete initial assessments at sites that had not been screened;
- Complete Preliminary Assessments at sites needing them; and
- Schedule more complex assessments at sites needing them.

The Strategy required HQ to:

- Develop database tracking reports and progress reports to monitor progress towards meeting the Strategy milestones;
- Consider communication and/or outreach tools the Regions could use to respond to concerns raised by community members and other stakeholders; and
- Explore the need to update EPA's guidance for pre-screening potential Superfund sites.

The Strategy established the following factors to consider when determining priorities for assessment and, as necessary, cleanup of secondary lead smelter sites:

- Sites where sample collection or collection of additional samples was recommended;
- Sites where impacts of prior industrial activities may not have been fully evaluated;
- Sites whose locations were difficult or impossible to determine based on available information;
- Sites previously referred to the state or other programs;
- Sites where sampling results indicated the presence of lead or other heavy metals attributable to past smelter operations and above risk-based screening levels and background;
- Sites where no previous assessment had been conducted;

- Sites located near where children may congregate or be active (e.g., residential areas, day care centers, schools);
- Sites where population density (e.g., population with ¼ mile of the listed address) is high; and
- Sites with potential Environmental Justice issues.

The first set of Strategy milestones required completion of the following activities by July 31, 2012: 1) development of a tracking report; 2) preliminary review of new site information; 3) updating site information in the Superfund database; and 4) pre-screening the 48 sites not accounted for by EPA or its state and tribal partners.

Subsequent deadlines applied primarily to completing assessments and reporting progress to EPA HQ senior managers.

The Strategy recognized limited resources (e.g., state and federal capacity and funding constraints) and new priorities could impact the ability of program staff to meet deadlines for assessing sites. Caveats were added to certain activities, requiring regions to complete work to the "maximum extent practicable" given these constraints.

HQ closely monitored implementation of the Strategy following its release in August 2012. Monitoring activities were built into the Strategy itself and included review of database tracking reports to gauge progress towards meeting Strategy deadlines and preparation of progress reports for senior managers.

# 6.0 OFFICE OF INSPECTOR GENERAL EVALUATION

EPA's OIG initiated an evaluation of the Strategy in July 2013. The OIG gathered source information from HQ and regional Superfund offices and released an independent report, *EPA Has Made Progress in Assessing Historical Lead Smelter Sites But Needs to Strengthen Procedures* (OIG Report No. 14-P-0302) on June 17, 2014. The OIG report included recommendations intended to strengthen the Superfund program's management of contaminated sites.

EPA's Office of Land and Emergency Management (OLEM), formerly the Office of Solid Waste and Emergency Response, concurred with all of the recommendations in the report while noting concerns with the accuracy of several statements. The OIG's final report acknowledged a portion of these concerns. The OIG report recommendations included:

 Establishing criteria for determining upfront whether to expend resources to conduct a Pre-CERCLA Screening and/or add a non-petitioned site that had been referred to the EPA Superfund program to EPA's existing workload. Document and communicate decisions made in EPA records.

- 2. Refine the process for tracking non-petitioned sites referred to the EPA Superfund site assessment program, including:
  - a. Definition of a reasonable timeframe that Pre-CERCLIS Screenings and site assessments should be conducted. If needed, a discovery date should be entered as well as target dates for future assessments.
  - b. Establishment of a tracking mechanism for any backlog of Pre-CERCLIS Screenings.
  - c. Periodic reviews to ensure that sites in the assessment backlog have appropriate qualifiers that indicate priority level for further assessment.
- 3. Assess existing EPA guidance for addressing lead contamination in soil within the Superfund site assessment process and obtain input from the Regions to determine whether any updates are needed and revise as appropriate. Include the following issues in the assessment:
  - a. Amount of resources, level of effort, and methods used to link lead contamination to a source.
  - b. Cleanup or other actions needed at sites when background contamination levels are above screening levels, including those in urban areas.
  - c. Determination of actual and/or potential health impact on communities, including whether a referral to another agency or program for further review or health-based testing is necessary.
- 4. Clearly post the August 2012 Lead Smelter Strategy document on EPA's website.
- 5. Following completion of the 2012 Strategy, create and post a summary of the results of EPA's efforts to address sites included in the strategy and, as applicable, any findings and recommendations on EPA's website.

The Superfund program has implemented responsive actions to all recommendations.

# 7.0 ACCOMPLISHMENTS

EPA closely monitored implementation of the Strategy from start to finish. The workgroup that helped develop the Strategy continued to convene monthly conference calls to discuss progress on the OIG's recommendations. Senior EPA managers were informed of progress via the reporting requirements built into the Strategy itself.

#### 7.1 Site Assessment and Removal Accomplishments

Regions completed all assessment milestones in the Strategy by the prescribed deadlines. The assessment work conducted per the Strategy ensured all 464 potential secondary lead smelters were included in EPA's Superfund database, each underwent a current file review, and those sites without assessments were addressed accordingly. Figure 7 displays the total number of assessments performed under the Superfund program at the 464 potential smelters, prior to and since implementation of the Strategy.

| Assessment Type/<br>Time Period     | <=FY2000 | FY2001-<br>FY2004 | FY2005-<br>FY2008 | FY2009-<br>FY2012 | FY2013-<br>Current | Total |
|-------------------------------------|----------|-------------------|-------------------|-------------------|--------------------|-------|
| Pre-CERCLA Screening                | 0        | 73                | 115               | 82                | 114                | 384   |
| Preliminary Assessment <sup>2</sup> | 41       | 4                 | 61                | 3                 | 43                 | 152   |
| Site Inspection <sup>3</sup>        | 22       | 0                 | 27                | 12                | 23                 | 84    |
| Site Reassessment                   | 0        | 0                 | 2                 | 8                 | 12                 | 22    |
| HRS Package                         | 6        | 2                 | 0                 | 0                 | 0                  | 8     |
| Removal Assessment                  | 11       | 28                | 3                 | 2                 | 69                 | 113   |
| Total Assessments                   | 80       | 107               | 208               | 107               | 261                | 763   |

Figure 7: Superfund Assessments Completed at 464 Potential Secondary Lead Smelters<sup>1</sup>

<sup>1</sup> Includes multiple assessments at some sites.

<sup>2</sup> Includes PAs and Integrated Assessments.

<sup>3</sup> Includes SIs, Expanded SIs, Combined PA/SIs, and Site Inspection Prioritizations (SIPs).

Superfund assessments were completed at about 30 of the 464 sites prior to publication of the study. Several of these sites were tracked in the Superfund database under different site names than what was listed in the report. By the time the Strategy was issued near the end of FY2012, EPA and its partners had already completed nearly 500 assessments at about 340 of the smelters (about 150 sites had multiple assessments). Most (70%) of the 261 assessments completed since FY2013 occurred in FY2013-2014.

Figure 8 shows the breakout of decision outcomes of the 464 sites as of March 2017.

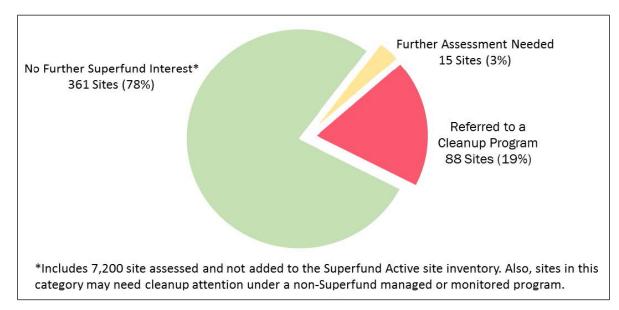

Figure 8: Assessment Results of 464 Potential Secondary Lead Smelters – March 2017

Figure 8 shows the majority (78%) of sites are currently determined to have no further Superfund interest based on current information in the Superfund database. Figure 8 also shows 19 percent of the sites were referred to a cleanup program and three percent are in need of additional assessment. As can occur with any type of site assessed under the Superfund program, EPA may receive new information on a site that was previously determined to have no further Superfund interest and may need to perform further assessment work. As a result, the current figures are expected to fluctuate slightly when decisions are made on the 15 sites currently needing assessment and if/when new information warrants reassessing any of the 464 sites.

Figure 8 shows 88 of the 464 sites have been referred to an EPA managed or monitored cleanup program as of March 2017. Figure 9 shows the distribution of these 88 sites.

| Cleanup Option | NPL | Other Cleanup<br>Activity <sup>1</sup> | RCRA | Removal | To Be Determined |
|----------------|-----|--|------|---------|------------------|
| # Sites        | 9   | 7                                      | 3    | 69      | 0                |

Figure 9: Selection of Cleanup Program (88 sites) – March 2017

<sup>1</sup>Includes two of the 464 potential smelters that are represented by a single site in the Superfund database.

The nine sites referred to the NPL includes two sites currently proposed to the NPL, five sites on the NPL, and two sites determined to part of existing NPL sites. All but one of these NPL sites (Price Battery Lead Smelter in Hamburg, PA), were being addressed by EPA prior to publication of the academic study.

Referrals to EPA's Superfund removal program accounted for the 69 (78%) of the 88 sites referred to a cleanup program. Of these 69 sites, all have been reviewed by the Superfund removal program and have had subsequent removal assessments or removal actions started or completed except for two sites. One of the two sites has enforcement activity planned, the other site is being reviewed again for potential removal involvement. Further, 31 of these 69 sites have been moved to the Archive site inventory as of March 2017. The remaining 38 sites are in the Active site inventory and either have removal assessments or removal actions being considered, planned or ongoing (27 sites), awaiting completion of enforcement activity (1 site), or are candidates for moving to the Archive site inventory (10 sites). The 69 sites referred to the Superfund removal program exclude two sites with removal assessments ongoing and need further remedial assessment after completion of the removal assessments. These two sites are tracked as Further Assessment Needed in Figure 8.

If new information warrants reassessment of sites previously determined to have no further Superfund interest, the number of sites referred to a cleanup program may rise based on the outcome of subsequent assessments. In addition, sites that have been referred to the Superfund removal program, state clean-up, or other programs may be referred back to the site assessment program in cases where a potential longer-term cleanup component still exists.

Appendix A is a list of all 464 potential smelter sites tracked under the Strategy. The list shows the original site name as listed in the academic study (Eckel Site Name), the name of the site as it is tracked in the Superfund database, last assessment decision, and latest activity conducted at the site under the Superfund program.

Beyond assessment work, EPA's Superfund removal program has performed or overseen completion of 48 removal actions across 27 of the 464 smelters (more than one removal was performed at nine sites). Nearly one-half of these removals were completed at sites currently proposed to or on the NPL. Figure 10 shows the number of removal actions completed at these sites since inception of the Superfund program.

| Time Period               | <=FY2000 | FY2001-<br>FY2004 | FY2005-<br>FY2008 |   | FY2013-<br>03/2017 | Total |
|---------------------------|----------|-------------------|-------------------|---|--------------------|-------|
| All Removal Actions       | 11       | 6                 | 6                 | 6 | 19                 | 48    |
| At NPL Sites <sup>1</sup> | 9        | 4                 | 5                 | 5 | 0                  | 23    |
| At Non-NPL Sites          | 2        | 2                 | 1                 | 1 | 19                 | 25    |

<sup>1</sup>Includes removal actions completed at Proposed and Final NPL sites and at sites addressed as part of an NPL site. Also includes multiple removals at some sites.

#### 7.2 Other Accomplishments

The Strategy and the OIG's evaluation resulted in guidance and data tracking changes within the Superfund remedial assessment program. These changes and related accomplishments include:

#### FY 2014

- Revised the Pre-CERCLA Screening (PCS) section in the Superfund Program Implementation Manual (SPIM) to include:
  - Minimum requirements needed before starting a PCS.
  - Establishing a one-year time period to complete a PCS at a site.
  - Adding PCS reports to the list of core Superfund documents that must be tracked electronically in the Superfund records system.
  - Requiring timely transmittal of completed PCS information to states and tribes.
- Created a new database tracking report for sites needing PCS completions.

#### FY2015

 Completed analyzing HQ site assessment guidance documents issued to date for guidance on addressing lead contamination in soil and determined no change to existing guidance is necessary.

#### FY 2016

- EPA offered presentations on assessing sites with potential lead contamination in soil at the June 2016 National Site Assessment Symposium Training Program. Presentations included:
  - "Differentiating Sources of Lead in the Environment" which summarized investigative approaches for source attribution at sites with lead contamination; and
  - "Using Field Sampling Techniques in Site Assessment and HRS Scoring" which clarified the use of field screening approaches in the Superfund site assessment process.
- EPA updated the "Refer to Removal" section in the FY 2017 SPIM to encourage engagement of the Superfund removal program when remedial assessments find consistent exceedances of Superfund removal program screening values.

FY 2017

• EPA completed the "Pre-CERCLA Screening Guidance" document on December 19, 2016. This document replaces EPA's "Improving Site Assessment: Pre-CERCLIS Screening Assessments" guidance issued in October 1999.

# 8.0 REMAINING WORK

EPA's Superfund database shows 15 of the 464 sites still need additional remedial assessment work and 27 additional sites need completion of removal assessment or removal actions, including one site that needs additional review for potential removal work. In addition, five of the seven non-NPL sites being addressed under state or municipal government programs are still in the Superfund Active site inventory and could potentially need further Superfund involvement.

Since new information on site conditions can be discovered and submitted to EPA on any potential hazardous waste site previously assessed under Superfund, it is possible sites previously determined to have no further Superfund interest may be returned to the Superfund Program for additional work. As with other types of sites, EPA does not expect this to occur for the majority of sites assessed. Since the start of the Superfund Program, less

than 10 percent of sites previously determined to have no further Superfund interest have been returned to the program for further work.

Current Superfund database information on sites in the Active and Archive site inventories is posted on the internet at <a href="https://cumulis.epa.gov/supercpad/cursites/srchsites.cfm">https://cumulis.epa.gov/supercpad/cursites/srchsites.cfm</a>. Available information includes key indicators such as the site's NPL status and Non-NPL Status.

# 9.0 OBSERVATIONS

#### Source Information

Finding historic smelting locations proved challenging at many sites. The academic study cited use of historical industry publications to compile the list of potential secondary lead smelters. EPA's review of these documents found incomplete addresses for many sites, some displaying only a state or city.

The documents also lacked detail to determine if the address represented the physical location of smelting activities versus a sales office or some other non-producing facility related to a smelting company. EPA reviewed historic Sanborn maps and other sources to search for some of these sites but was not always successful in finding evidence that historical smelting operations actually took place at the reported location.

Historic industry and other publications may be useful to help identify potential sources of contamination but can yield false positives if not supported by other compelling information.

#### Site Setting

Locating historic smelting operations was also complicated by changes in site setting. In some cases, the street addresses had changed names or the street itself no longer existed. In many cases, smelting towers and other equipment have since been demolished or removed making it more challenging to confirm where historical smelting was performed. Further, historical changes in land use over time have resulted in reducing or eliminating exposure to potential lead in soil at some sites (e.g., area paved for parking lots and roadways, buildings erected, etc.). Many sites are located in urban areas where other sources beyond the smelting operation itself may have contributed to high levels of lead in soils which then can impact the Superfund remedial assessment process as described in the following section.

#### HRS Methodology

Attribution of the hazardous substance in a release to the site is an important factor in determining eligibility for the NPL when using the HRS, which uses screening level data gathered during the PA and SI, and was frequently problematic when attempting to evaluate

the potential smelters using only screening level data. Many of the potential smelters were situated in urban areas where anthropogenic sources may have played a role in elevated lead-in-soil concentrations. For some sites, junkyards and scrap metal and recycling yards were occupying potential areas of contamination that could be associated with historic smelting operations. These additional sources often prevented attribution of the elevated hazardous substance concentrations to the smelters themselves with limited data collected during site assessment.

The difficulty documenting the link between elevated lead-in-soil concentrations and a specific facility or facilities can complicate a site's NPL eligibility. In such cases, attempting to establish attribution of elevated lead-in-soil concentrations to a specific site can require extensive, time-consuming, and expensive sampling. In some cases, it might not even be possible due to the number of possible lead sources in the area, disturbance of the area, and the length of time since the lead release occurred.

If a link between contaminated soils and a facility cannot be established, it is still possible that a site may be evaluated using the HRS if the contamination is significantly greater than background levels. However, lead tends to be ubiquitous in the environment in urban and industrial areas in general due to the historical and current uses of lead by humans. In these areas, the background concentrations of lead-in-soil can be elevated sufficiently due to non-smelter sources such that soil samples collected to establish the release of lead to the soil from a smelter may not meet the HRS requirement of having concentrations significantly greater than the background level.

If a significant release from a smelter cannot be established for the HRS Soil Exposure Pathway, then the release from a smelter cannot be evaluated and scored for human exposure to the contamination in the soil. Additionally, other factors, such the actual or potentially impacted population level, can make it unlikely that a small site will obtain a score that makes it eligible for placement on the NPL. These possibilities can preclude the use of the Superfund remedial program as a viable cleanup approach at a site unless unacceptable threats due to other contaminant migration pathways are documented resulting in an HRS score at or above 28.50.

Two other uncommon mechanisms of placing a site on the NPL also exist. A site may qualify for listing based on an Agency for Toxic Substances and Disease Registry health advisory and a finding that it is not cost effective to address the site using removal authority. States may also designate one site to the NPL regardless of the site's HRS score. A total of 11 states and the District of Columbia have not assigned a site to the NPL as a state top-priority pick as of the date of this report.

# **10.0 RECOMMENDATIONS**

Given the assessment challenges associated with historic lead smelters, EPA may consider additional steps under the Superfund program to ensure sites with contaminated soil are addressed under the appropriate program. Potential steps include:

- 1. Explore cost effective methods to associate contamination to sources. Investigative techniques to differentiate sources of lead in the environment are evolving. Current methods are often based on chemical testing (e.g., isotope ratios, speciation, trace metals analysis), geographic distribution (e.g., source air modeling, hyperspectral imagery, residential history and development patterns), and/or groundwater sampling approaches for private drinking water wells that exhibit elevated lead levels (groundwater purge sequence, filtered groundwater samples). In addition, examine the capacity of available resources to implement these methods. Research and communication of available and cost-effective methods may improve the ability of EPA to attribute contamination to a specific source.
- 2. Improve public access to site information. Review site-specific information collected and maintained by EPA's Superfund program at sites posing lead-based health threats, and determine if additional site information can be made available to the public through EPA's site-based national web services (e.g., Search Superfund Site Information web query).
- 3. Evaluate communication of site data with partners. Review processes in place to distribute Superfund collected site-specific information to appropriate cleanup program regulators (e.g., other federal, state and local agencies) and determine if improvements are needed in terms of content and timeliness of information exchange.

11.0 APPENDIX A

# ASSESSMENT STATUS OF 464 POTENTIAL SECONDARY LEAD SMELTERS ADDRESSED BY THE EPA SUPERFUND PROGRAM

March 2017

## 12.0 APPENDIX B

# STRATEGY FOR ADDRESSING 464 LEAD SMELTER SITES

April 30, 2012

#### Strategy for Addressing 464 Lead Smelter Sites August 30, 2012

#### Purpose

This is a strategy for assessing lead smelter sites that had been the subject of a study conducted by William P. Eckel in 2001. Over the past decade, as a follow-up to the Eckel study, EPA has worked with State partners to identify and assess a number of lead smelters identified by Dr. Eckel, resulting in decisions that further federal involvement under the Comprehensive Environmental Response, Compensation and Liability Act of 1980, as amended (CERCLA) is warranted or, in certain cases, that cleanup is necessary. However, there remain lead smelters where the assessment process is ongoing. It will be necessary to determine the extent to which new information recently made available to EPA could affect planned, ongoing and completed assessments, including any decisions associated with these assessments. It will also be necessary to identify smelters that may pose a health threat requiring further assessment and, as necessary, cleanup. EPA recognizes that there exist lead smelter sites in addition to those identified in the Eckel study. As part of the national site assessment program, EPA will continue efforts to evaluate all sites, including other smelters, brought to the Agency's attention. However, this strategy focuses on the 464 smelters identified by Dr. Eckel.

## Background

Dr. Eckel was the primary author of a report titled *Discovering Unrecognized Lead-Smelting Sites by Historical Methods*, which was published in the American Journal of Public Health in April 2001. Dr. Eckel developed this report from historical literature searches for secondary lead smelters and refined his findings to include 464 battery lead, babbitt metal, and solder smelters that were not in federal or state environmental databases at the time, based on records that documented smelters operating from 1931 through 1964. Smelters are a source of lead and possibly other heavy metals that have contributed to environmental contamination.

#### Lead Smelter Assessment Strategy

EPA has developed a strategy to ensure successful completion of remaining Superfund site assessment work at the 464 smelters, which includes identifying sites requiring no further evaluation beyond pre-CERCLIS screening, identifying sites to be entered into the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) active site inventory, performing remedial assessments, documenting final assessment decisions and identifying those smelters where cleanup may be required. When reviewing information associated with each of the smelters, EPA will consider the following circumstances when determining priorities for assessment and, as necessary, cleanup:

- Sites where sample collection or collection of additional samples was recommended
- Sites where impacts of prior industrial activities may not have been fully evaluated
- Sites whose location was difficult or impossible to determine based on available information
- Sites previously referred to the state or other programs
- Sites where sampling results indicate the presence of lead or other heavy metals, attributable to past smelter operations, above risk-based screening levels and background
- Sites where no previous assessment had been conducted
- Sites located near where children may congregate or be active (e.g., residential areas, day care centers, schools)

- Sites where population density (e.g., population within 1/4 mile of the listed address) is high
- Sites with potential Environmental Justice issues

It is important to note that the objective of pre-CERCLIS screening is to determine, based on a review of available information, whether a potential Superfund site should be entered into or excluded from the active CERCLIS inventory. If a site is placed in the active CERCLIS inventory, information obtained will be used to perform a preliminary assessment, which is a limited-scope, screening-type investigation that involves collection of additional information and performance of a site reconnaissance. The goal of a preliminary assessment is to determine whether further investigation under Superfund, such as a site inspection and/or evaluation under the hazard ranking system for potential placement on the National Priorities List (NPL), is warranted. Samples are typically not collected during a pre-CERCLIS screening or preliminary assessment, although existing sampling data, if available, would be reviewed. In certain instances, EPA regions may elect to collect samples as part of a pre-CERCLIS screening or preliminary assessment.

## Implementation

In order to ensure continued progress, EPA has outlined an approach, as part of this strategy, that involves undertaking the following actions in consultation with state, tribal and other environmental and public health partners:

1. Review and properly categorize the status of 464 smelter sites (e.g., non-NPL status, action start/completion dates), in consultation with site assessment managers from each region, to ensure that data tracked in CERCLIS is up to date and accurate for each of the 464 sites where assessment or cleanup has been conducted under the federal Superfund program (January 27, 2012 – July 31, 2012).

**Output:** EPA possesses timely and accurate information on the 464 smelter sites.

Information tracked by EPA will allow a comprehensive evaluation of all 464 smelter sites in order to determine next steps in the assessment process.

2. Complete review of the 48 "unrecognized" lead smelter sites (without CERCLA IDs) reported by the Office of Superfund Remediation and Technology Innovation (OSRTI) in February 2012 as not having been assessed by EPA or referred to another program for assessment – applies only to Regions 2, 5 and 9 (July 31, 2012).

**Output:** Pre-CERCLIS screening or equivalent will be completed at these 48 lead smelter sites. EPA will assure that documentation obtained as part of the pre-CERCLIS screening process, including equivalent screenings undertaken by states or other programs, is of sufficient quality to support decisions whether or not potential sites are added to the CERCLIS active inventory. Documentation will include clearly stated rationale supporting each decision and, in cases where sites are excluded from the CERCLIS active inventory, indicate whether these sites are being addressed by state, tribal or other programs.

The status of these sites will be correctly reflected in CERCLIS to identify: (1) sites excluded from the CERCLIS active site inventory (no further evaluation necessary beyond pre-CERCLIS screening) and (2) sites entered into the CERCLIS active site inventory (requiring remedial and/or removal assessments).

3. Review existing information in consultation with the removal program to determine if any smelter sites could pose an imminent and substantial threat to human health requiring cleanup (August 31, 2012).

**Output:** All smelters potentially posing an imminent and substantial threat will have been identified and referred to the removal program for evaluation to determine if cleanup is required. It is recognized that all removal assessments will not be completed before August 31<sup>st</sup>. Additionally, it is anticipated that this consultation process will continue in the future as new information is acquired for smelter sites. Smelters will be evaluated based on a review of available sampling results (e.g., data from EPA or other parties) and comparison to existing risk-based screening levels, as well as a consideration of data quality, naturally-occurring levels of heavy metals ("background" concentrations) and the potential presence of other (non-smelter-related) sources of contamination. During this process, regional toxicologists, regional representatives from the Agency for Toxic Substances and Disease Registry (ATSDR) and, as necessary, the lead Technical Review Workgroup (TRW) will be consulted. These technical specialists can assist in evaluating potential threats posed by contamination, deciding whether a site should be referred to the removal program and, as necessary, determining when cleanup is necessary. When evaluating exposures to lead, site managers and/or regional toxicologists are encouraged coordinate with the regional representative from the lead TRW.

CERCLIS will be updated to reflect involvement of the Removal program and to document cleanup decisions.

4. Complete pre-CERCLIS screening at all remaining sites that are not in CERCLIS (without CERCLA IDs) and update CERCLIS accordingly (October 31, 2012).

**Output:** To the maximum extent practicable given available resources and competing priorities, pre-CERCLIS screening or equivalent (if sites are being addressed by state, tribal or other programs) will be completed. EPA will assure that documentation obtained as part of the pre-CERCLIS screening process, including equivalent screenings undertaken by states or other programs, is of sufficient quality to support decisions whether or not potential sites are added to the CERCLIS active inventory. Documentation will include clearly stated rationale supporting each decision and, in cases where sites are excluded from the CERCLIS active inventory, indicate whether these sites are being addressed by state, tribal or other programs.

The status of these sites will be correctly reflected in CERCLIS to identify: (1) sites excluded from the CERCLIS active site inventory (no further evaluation necessary beyond pre-CERCLIS screening) and (2) sites entered into the CERCLIS active site inventory (requiring remedial and/or removal assessments).

5. Continue ongoing smelter evaluation efforts to ensure review of file information for all 464 smelter sites, taking into account the aforementioned circumstances, thereby identifying any sites requiring further assessment or reassessment (January 27, 2012 – October 31, 2013).

**Output:** In addition to the aforementioned sites, the remaining smelter sites, including those presently being evaluated, will have been assessed to determine whether response actions are required. As necessary, EPA will develop a plan of action for undertaking further assessment activities or, for sites where a final site assessment decision had previously been made, reassessments.

CERCLIS will also have been updated to reflect the current status of all 464 smelter sites. The assessment process will include, at a minimum, performance of a pre-CERCLIS screening (or equivalent). To the maximum extent practicable given available resources and competing priorities, EPA will ensure that a preliminary assessment has been performed for all sites entered into the CERCLIS active site inventory.

#### **Outreach and Coordination**

EPA regions will undertake assessment of smelters in close consultation with state, tribal and other environmental and public health partners, as well as key stakeholders such as members of the community and elected representatives. Outreach and coordination activities are intended to focus on sites that have progressed beyond the pre-CERCLIS screening assessment stage and that, based on existing information, may pose the most threat to human health and the environment.

Taking into account the current and future level of interest that may be anticipated at smelter sites, EPA headquarters will explore development of a "boilerplate" communications strategy, fact sheets or other communication/outreach tools for regional use in order to proactively respond to concerns raised by members of the community and other stakeholders.

#### Community Involvement

EPA regions, in close collaboration with EPA headquarters, will develop a communications strategy to address concerns that may arise at the following categories of smelter sites: (1) no further federal involvement under CERCLA warranted; (2) currently being assessed by the Agency under the remedial or removal programs; (3) referred to state, tribal or other programs and (4) CERCLA cleanup planned, ongoing or completed.

- 1. If no further federal involvement under CERCLA is warranted, the Agency will indicate the reason for making this determination (e.g., lack of CERCLA authority, levels of lead or other contaminants at the site do not pose a health threat necessitating further assessment, site being addressed by state, tribal or other programs). EPA will clearly communicate instances where the Agency lacks the CERCLA authority to respond to contamination (e.g., soil contamination resulting solely from lead-based paint) and identify other organizations/programs that may be in a position to address such contamination. EPA will also indicate when further remedial assessment is not warranted either because contaminants cannot be attributed to past smelter operations or because the number of people potentially affected by contamination is too low for the site to qualify for the National Priorities List.
- 2. For sites currently being assessed by the EPA, the Agency will be prepared to discuss the type of assessment activity planned or ongoing (removal assessment or remedial assessment) and provide the anticipated completion date. If sites are undergoing remedial assessment, EPA will indicate the particular assessment phase (pre-CERCLIS screening, preliminary assessment, site inspection, etc.) and whether the Agency or state/tribe (under Cooperative Agreement with EPA or absent Cooperative Agreement) is performing this work.
- 3. For sites referred to state, tribal or other programs, the Agency will identify a point-of-contact (at the state, tribal or local level) who can respond to questions from property owners or community members regarding the status of investigations and cleanups.

4. For sites where CERCLA cleanup is determined to be necessary, EPA will indicate the cleanup status (planned, ongoing or completed) and, if planned/ongoing, the anticipated completion date. If cleanup has been completed, EPA will be prepared to describe the nature of cleanup such as the particular response actions undertaken and hazardous substances addressed. EPA will also indicate whether further evaluation as part of the remedial assessment process is required.

At sites where EPA (or state/tribe under Cooperative Agreement) collected samples, when sharing results with property owners, the Agency will explain the significance of the results and indicate whether or not follow-on evaluation is planned. If no further federal involvement under CERCLA is warranted, the Agency will indicate the reason for making this determination and explain that these sites have been referred to state, tribal or other programs for follow-up. If further federal involvement under CERCLA is warranted, the Agency will discuss the type of assessment activity planned and provide the anticipated assessment completion date. EPA will also indicate whether the site is being evaluated for possible removal actions.

#### Consultation with Public Health Agencies

EPA will consult with public health agencies, such as ATSDR and/or other governmental health departments, which can assist the Agency by: (1) reviewing sample results; (2) providing recommendations for follow-on evaluations; (3) assessing threats/risks posed by contamination; (4) supporting decisions whether a removal action is necessary and (5) identifying a point-of-contact who can respond to questions from property owners or community members regarding potential health effects posed by contamination. Regional ATSDR representatives are available to assist in undertaking the aforementioned tasks and state health departments may also be able to provide support either independently or through existing agreements with ATSDR. The extent to which local health departments could assist will vary from locality to locality.

EPA headquarters will consult with the Centers for Disease Control (CDC) and Prevention's Advisory Committee on Childhood Lead Poisoning Prevention (ACCLPP) regarding new scientific knowledge and technical developments and the practical implications for childhood lead poisoning prevention efforts. EPA headquarters is reviewing the recommendations provided by the ACCLPP to the CDC regarding new strategies for defining elevated blood lead levels among children. If it is determined that changes to the Agency's approaches or policies are needed, impacts of such a change will be carefully evaluated. Findings will be shared with the regions.

#### Remedial/Removal Program Interaction

EPA regions will continue to rely upon existing internal coordination processes between remedial and removal programs when identifying sites where contamination could pose an imminent and substantial threat to human health. Regional removal programs will coordinate with the Headquarters' Office of Emergency Management on all lead cleanups involving nationally significant or precedent-setting issues. Communications will emphasize that, if at any time in the site evaluation process an imminent and substantial threat is identified, EPA is prepared to use its emergency removal authority. It is anticipated that a determination of such threats would also be made in consultation with regional EPA toxicologists or risk assessors, regional ATSDR representatives and, as necessary, the lead TRW.

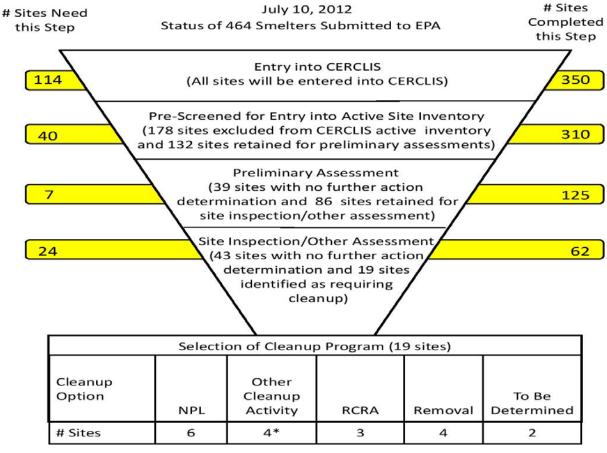

#### Referral to State or Tribal Governments

Whenever EPA refers sites to state or tribal governments for follow-up, the Agency will clearly explain the reason for the referral and will make available all releasable site-related information. This referral process will be documented as part of the final site assessment decision. For sites currently in the active CERCLIS inventory (undergoing pre-screening, preliminary assessments, site inspections, etc.), EPA regions should periodically follow-up with the party leading or managing investigations and cleanups to ensure adequate progress is being made.

#### Monitoring Progress (Status – July 10, 2012)

To the maximum extent practicable, given available resources and taking into account competing priorities, EPA makes every attempt to perform and complete evaluations as part of the remedial site assessment process within the time frames established under CERCLA, the National Contingency Plan and existing policy.

EPA headquarters (OSRTI) has developed the following flowchart that presents the current assessment status and progress made to date with respect to all 464 smelters:

\* 2 of the 4 Other Cleanup Activity sites are represented by a single site in CERCLIS (Florida Smelting Co.)

Notes: (1) preliminary assessment includes remedial and removal assessment; (2) removal actions can occur at any point in the process and (3) no further action designation applies to the Federal Superfund program only [State and Tribal governments may perform further work at these sites under their own programs].

The flowchart depicts all 464 smelter sites and shows, in a sequential fashion, the number of sites falling into the various phases of the assessment process. Key decision points include entry of sites into CERCLIS (350 smelters already entered and 114 requiring entry), performance of pre-CERCLIS screening (310 smelters pre-screened and 40 requiring pre-screening) and the results of pre-screening (178 smelters excluded from the CERCLIS active inventory and 132 reaching the preliminary assessment stage).

Of the 132 smelters requiring preliminary assessments, 125 preliminary assessments have been completed and 7 preliminary assessments remain to be completed. Based on the completed preliminary assessments, a determination that no further federal action is required under CERCLA has been made at 39 smelters and 86 have reached the site inspection stage. Of the 86 smelters requiring site inspections (or other assessments), 62 site inspections (or other assessments) have been completed and 24 site inspections (or other assessments) remain to be completed. Based on the completed site inspections (or other assessments), a determination that no further federal action under CERCLA has been made at 43 smelters and 19 have been identified as requiring cleanup.

It is important to note that, as the remaining sites are continually entered into CERCLIS, the numbers of sites requiring pre-CERCLIS screening will change as will, in succession, the number of sites requiring a preliminary assessment and/or site inspection (or other assessments).

OSRTI will produce a tracking report, which will be updated quarterly, for use by EPA headquarters and the regions to monitor progress towards assessing smelters subject to this strategy. This report will identify sites requiring no further federal involvement under CERCLA, sites requiring further assessment and sites requiring cleanup (with cleanup program identified).

|                    | Timeline for Smelter-related Activities   |
|--------------------|---|
| July 31, 2012      | OSRTI develops CERCLIS tracking report to monitor progress at sites.  |
| July 31, 2012      | Using the spreadsheet prepared by OSRTI, regions undertake a preliminary review of new information, including sampling data, made available to the Agency to determine if any of these sites should be identified as high priorities for assessment or cleanup.   |
| July 31, 2012      | Regions review/update status and action data for each of the 464 smelters included on<br>the CERCLIS active site inventory to reflect current information. CERCLIS pulls will<br>form the basis for HQ reporting. For sites needing further remedial assessment,<br>regions will add planned completion dates for ongoing assessments and planned start<br>and completion dates for sites awaiting start of a new assessment. |
| July 31, 2012      | Regions (where applicable) complete pre-CERCLIS screenings at the 48 sites<br>unrecognized as of February 2012 and identify sites that should be entered into (or<br>excluded from) the CERCLIS active site inventory.  |
| August 31, 2012    | Regions identify all smelters potentially posing an imminent and substantial threat to human health based on existing information. Sites will be evaluated as soon as practicable thereafter to determine if a removal action is necessary. It is recognized that all removal assessments will not be completed before August 31 <sup>st</sup> .  |
| September 30, 2012 | OSRTI explores possibility of revising existing pre-CERCLIS screening guidance (OSWER Directive 9375.2-11FS); including approaches for improving the historical records search process.   |
| October 2012       | OSRTI submits initial quarterly report on status/progress for all 464 sites. Initial report address sites excluded from the CERCLIS active inventory, which require no further evaluation beyond pre-CERCLIS screening, and sites entered into the CERCLIS active inventory, which require remedial and/or removal assessments.   |
| October 31, 2012   | Regions ensure, to the maximum extent practicable given available resources and competing priorities, that pre-CERCLIS screenings or equivalent are completed at the remaining smelters (without CERCLA IDs) to identify sites that should be entered into (or excluded from) the active inventory.   |
| November 30, 2012  | Regions will identify sites where a preliminary assessment has been performed or will be performed.   |
| January 2013       | OSRTI submits quarterly progress report to HQ senior management. This report and subsequent reports focus on sites entered into the CERCLIS active inventory needing remedial and/or removal assessments.   |
| March 31, 2013     | Regions report status of sites where preliminary assessments have been completed or are ongoing.  |
| April 2013         | OSRTI submits quarterly progress report to HQ senior management.  |
| June 30, 2013      | Regions report status of sites where preliminary assessments have been completed or are ongoing.  |
| July 2013          | OSRTI submits quarterly progress report to HQ senior management.  |
| October 2013       | OSRTI submits quarterly progress report to HQ senior management.  |
| October 31, 2013   | Regions complete preliminary assessments, to the maximum extent practicable given<br>available resources and competing priorities, at all smelter sites included on the<br>CERCLIS active inventory and develop a plan of action for addressing those sites that<br>need further assessment or reassessment.  |
| January 2014       | OSRTI submits quarterly progress report to HQ senior management.  |

## Lead Smelters – Additional Considerations

The following factors should be taken into account, as appropriate or necessary (i.e., sample collection may not be required during site assessment), by EPA, state and tribal governments during the evaluation process to determine the next steps with respect to assessment and cleanup of smelters:

#### Approach to Document/Records Review

- > Information sources (historical aerial photographs, Sanborn maps, existing reports, etc.)
- Information gathering techniques (Internet, libraries, interviews, etc.)
- Findings/conclusions presented in existing reports (including recommendations/rationale)

#### Physical Setting/Site Conditions

- ► Land use at/near the site at the time of sampling
- Current land use (if known to have changed since sampling)
- Development activities subsequent to smelter operations
- Presence of buildings constructed before 1978 (lead-based paint contribution to observed soil contamination)
- > Other (non-smelter) sources potentially contributing to observed soil contamination
- Extent of vegetative cover (e.g., bare versus grassy) at locations where soil samples were tested/collected

#### Approach to Sample Collection/Analysis (if sampling is performed)

- Number of samples collected
- Depth of samples collected
- Biased versus non-biased sampling
- Discrete versus composite sampling
- Number of aliquots per composite
- Proximity of samples to building drip lines
- Presence of paint chips in samples
- Background samples

#### XRF Instrumentation

- Precision/accuracy limitations make results from *in situ* analysis more qualitative in nature, while results from *ex situ* analysis results can be quantitative (or at least semi-quantitative).
- Presence of metals other than lead (especially risk-drivers) in soil above screening concentrations might affect site assessment decisions.
- Issues associated with XRF data including, but not necessarily limited to, differentiating among peaks for certain metals/elements or peak overlap (e.g., lead versus arsenic) are sometimes encountered and could affect site assessment decisions, especially if decisions are based solely on XRF data.

#### Laboratory Analysis

Presence of metals other than lead (especially risk-drivers) in soil above screening concentrations might affect site assessment decisions.

- Collection of samples for laboratory analysis at locations where XRF testing was performed could be used for confirmation purposes.
- Comparison (i.e., degree of correlation) between laboratory and XRF results would support XRF findings.

#### Approach to Data Evaluation

- Data limitations/usability (quality assurance/quality control measures employed)
- > Exposure assumptions
- Risk-based screening levels
- > Attribution from past smelter operations versus other anthropogenic sources

**Contacts:** The Headquarters contact for this strategy is Drew Lausch at <u>lausch.robert@epa.gov</u> or 703-603-0721. Specific questions regarding the reporting and tracking of CERCLIS accomplishments should be directed to Randy Hippen at <u>hippen.randy@epa.gov</u> or 703-603-8829.
