

Alternative Energy Projects at Superfund Sites

Status Update and Highlights from Across the Country

December 2023

EPA's Superfund Redevelopment Program helps communities return formerly contaminated lands to productive use. Many Superfund sites are well suited to support alternative energy production, including solar, wind, landfill-gas-to-energy, geothermal, hydropower and biomass projects. About a quarter of projects are able to offset some or all on-site energy demands for cleanup efforts. In other areas, energy produced on Superfund sites serves to advance cleaner and more cost effective energy technologies. About 64% of alternative energy projects are happening at sites in communities with potential environmental justice concerns.

Alternative Energy at Superfund Sites

Number of Superfund Sites: 96
Number of Projects: 138
Installed Capacity (MW): 587
Energy Production (MWh): 23,365,983

1,966,834 HOMES

Installed capacity of alternative energy facilities at Superfund sites is enough to power more than 1,966,834 homes for one year

The largest alternative energy facility is Greenleaf Power's Plainfield Renewable Energy biomass cogeneration plant at the Gallup's Quarry Superfund site in Plainfield, Connecticut. The 37.5-megawatt facility uses waste wood to generate enough electricity to power the equivalent of about 40,000 homes in Plainfield. The facility provides a market for waste biomass materials that would otherwise be taken to a landfill or left to decay, leading to off-gassing of methane and other greenhouse gases.

In collaboration with <u>EPA's RE-Powering America's Land Initiative</u>, the Superfund Redevelopment Program is <u>supporting reuse planning</u> at Superfund sites with renewable energy assessments at six sites. These assessments characterize alternative energy sources, stakeholder priorities, financial impacts and site suitability. EPA's Superfund Redevelopment Program is collaborating with state and federal agencies and The Nature Conservancy to determine areas most suitable for solar and other renewable energy development on the Carson River Mercury site. Several areas within the site have been identified as potentially suitable for solar. These areas will be further explored by The Nature Conservancy as part of a statewide effort called Mining the Sun. This effort is a collaboration between The Nature Conservancy and the Nevada Mining Association to promote the development of renewable energy plants on historic mining sites in Nevada.

Alternative Energy Spotlight – Global Sanitary Landfill

Old Bridge Township, New Jersey

The Global Sanitary Landfill Superfund site covers 57.5 acres. Much of the site is bordered by wetlands and residential areas are located north and west of the site. Today, people's exposure to the contaminants at the site remain under control. Annual monitoring of groundwater and wetlands is ongoing.

AC Power LLC, a solar developer specializing in previously disturbed properties, identified the site's reuse potential in 2017 and retained outside counsel and experts to evaluate site-related risks and responsibilities. They proposed to place a 2.8 megawatt solar array atop the landfill cap. In 2021, the New Jersey Board of Public Utilities awarded the project capacity under the second year of its Community Solar Pilot Program, enabling the development to move forward. After Old Bridge Township's approval of the Global Landfill project, AC Power collaborated with New Jersey Resources Clean Energy Ventures (NJRCEV), which became the project's long-term owner and operator.

The project became operational in October 2023, providing power to about 400 homes. The design of the solar facility is compatible with the site's cleanup plan, ensuring the long-term protectiveness of human health and the environment.

For more information, please visit www.epa.gov/superfund/globalsanitarylandfill.

Site Timeline

1968 to 1984

Global Landfill Reclaiming Corporation used the area for solid waste disposal.

1968 to 1977

Disposal operations buried drums containing paint, paint thinner and various solvents in the landfill. Pollutants leaking from the landfill contaminated groundwater under the site.

1984

A failure in the landfill's structure exposed hazardous wastes to nearby wetlands. Global Landfill Reclaiming Corporation stopped all disposal operations.

1989

EPA added the site to the Superfund program's National Priorities List.

1991

EPA and the New Jersey Department of Environmental Protection (NJDEP) selected a cleanup plan for stabilizing and capping the landfill.

1997

EPA, with NJDEP concurrence, selected a cleanup plan for groundwater monitoring, excavation and disposal of contaminated sediment, and five years of ecological monitoring.

2009

EPA approved the engineering design for the cleanup.

2012

The site's potentially responsible parties finished implementing the cleanup plans.
