- The overall conclusion of this 2017 HHRA update is that the conclusions of the 2013 HHRA remain valid and ingestion of shellfish tissue obtained from the Site 09 shoreline by a current/future recreational user poses a potential cancer risk or noncancer hazard above RIDEM target levels due to arsenic, PCBs, and pesticides (specifically aldrin). Based on this conclusion, the current institutional control prohibiting ingestion of shellfish continues to be necessary to protect public health. However, the shellfish tissue EPCs for arsenic and aldrin are within the range of concentrations detected in reference tissue samples collected from the shoreline of Prudence Island and from Fishing Cove in Wickford, Rhode Island between 2007 and 2011. These results indicate that concentrations of arsenic and aldrin in site shellfish tissue samples evaluated in the 2017 HHRA update may be due to background conditions, rather than Site 09. In addition, the shellfish tissue EPC for PCBs is less than the range of PCB concentrations detected in samples collected in 2011 (the most currently available dataset) through the NOAA Mussel Watch Program (https://products.coastalscience.noaa.gov/nsandt_data/data.aspx). This suggests that some of the PCB contamination noted in the Site 09 samples may reflect regional conditions.
- The overall conclusion of the 2017 ERA update is that the conclusions of the 2015 ERA remain valid and exposure to shallow sediment, pore water, surface water, and shellfish along the Site 09 shoreline does not pose a site-related risk to ecological receptors. Concentrations of several metals were elevated in piezometer water, but it does not appear that these concentrations are related to groundwater at Site 09.

8.2 Recommendations

Based on the evaluation of the data presented in this report and the conclusions summarized above, the following recommendations are made:

- Over the course of the LTM program at Site 09, the components and frequency of the sampling have been continually re-evaluated and optimized in order to streamline the LTM while still meeting the requirements of the remedial action objectives (RAOs) in the ROD. The following recommendations to further streamline the LTM program are presented for consideration in the Fourth Five Year Review Report:
  - Reduce the sediment sampling to just the current five year event sampling and sampling for PAHs only at locations SED09-06B, SED09-08B, SED09-09, and SED09-10 during the annual and biennial events as shown in Table 1 (i.e., SED09-10 only during the annual events; SED09-06B, SED09-08B, SED09-09, and SED09-10 during the biennial events). The data from 45 MEs has shown that groundwater beneath the landfill is not impacting the shoreline sediment overall. However, it is noted that benzo(a)pyrene was detected above the PAL in monitoring wells MW09-09S and MW09-20I during ME45 for the first time since the inception of the LTM program. Therefore continued sampling for PAHs at locations SED09-06B, SED09-08B, SED09-09, and SED09-10 during the annual and biennial events as shown in Table 1 is warranted. Sampling once every five years to support Five Year Review and risk assessment updates is adequate for the remaining locations and analyses.
  - Sample the monitoring wells for pesticides and PCBs only during the five year event sampling. The current dataset developed from 45 MEs indicates that pesticides and PCBs are not an issue in groundwater, and sampling once every five years in support of the Five Year Review Report is adequate.
  - Eliminate the surface water sample collected from Allen Harbor from the LTM program. This sample was originally added for VOCs only at a location adjacent to P09-04A, but over time has evolved into a sample collected for VOCs, metals, and PAHs from a location at the entrance of Allen Harbor. The data collected during ME 45 was largely nondetect and is of little value for the LTM program.
  - Consider some specialized analyses for arsenic (and possibly other metals) for the piezometer samples. As discussed in this report, the arsenic concentrations observed in the piezometer samples do not appear related to the landfill beneath the groundwater. The piezometer water is a mix of groundwater and seawater, and review of the salinity data indicates that it is largely seawater. It is possible that the arsenic concentrations

observed are the result isobaric interferences in the inductively coupled plasma mass spectrometry (ICP-MS) analysis. High chloride concentrations from seawater are known to produce this isobaric interference when chloride (atomic mass of 35) combines with argon (atomic mass of 40) in the plasma cloud to create false positives for arsenic (atomic mass of arsenic is 75). Review of the ME 45 arsenic results indicates that the locations with the lowest salinity (e.g., P09-06B, P09-08B, P09-12B) also have the lowest arsenic concentrations, supporting the theory that elevated results in the other locations are related to isobaric interference. Analysis by hydride generation furnace atomic absorption (SW846-7062) may eliminate this interference and help explain the arsenic concentrations in the piezometer samples. There may be other options such as analysis by ICP-MS coupled with a collision cell.

– Reduce the soil gas screening outside the capped portion of the landfill to once every five years. The data collected over 45 MEs has shown that the landfill cap is stable and functioning as designed. Screening once every five years is adequate.

9.0 SCHEDULE OF FUTURE FIELD ACTIVITIES

The Site 09 ME 46 is scheduled to occur in Fall 2017. This event will consist of the annual sampling list (see Table 1).

Notes:
1. --- = No sampling for this parameter at this location.
2. X = Environmental sampling will be conducted for this parameter at this location.

3. * = MW09-14I was added to the LTMP during ME 24. MW09-08DA, MW09-09DA, and MW09-14IA were added to the LTMP during ME29. Wells MW09-08DA, MW09-09DA, and MW09-14IA replace wells MW09-08D, MW09-09D, and MW09-14I, respectively.

4. ** = MW09-26DA was installed in September 2015 and replaces well MW09-26.
5. CY = Calendar Year - January to December
6. The Five Year Review Event List is consistent with locations and parameters where extensive sampling has been historically performed (e.g. "large events" when quarterly sampling occurred).
7. Field Methane will be determined based on field probes for gas vents and gas probe locations. No fixed-base laboratory samples will be collected.
8. Based on Section 5.1.4 of the Long Term Monitoring Data Summary and Optimizations Recommendations Report (Tetra Tech, 2015), metals do not appear to be migrating. Generally, concentrations in wells are lower than piezometers (and sediment) concentrations.
Additional metals occur in piezometers compared to wells. Therefore, metals are assumed to be a consequeunce of the geochemistry of the site and from emplacement of materials in the constructed wetland.
9. VOC = volatile organic compounds; SVOC = semivolatile organic compounds; PAH = polycyclic aromatic hydrocarbons; PCBs = polychlorinated biphenyls; TPH = total petroleum hydrocarbons

Notes:
µg/kg - micrograms per kilogram
mg/kg - milligrams per kilogram
NA - not applicable

(1) - Lipid normalized results = concentration/percent lipids
(2) - Non-lipid normalized data obtained from Appendix A1 of the 1996 Ecological Risk Assessment for samples AHW1RMND, AHW2RMND, AHW3RMND, and AHW6RMND for ribbed mussel samples
(3) - 2013 through 2016 samples reflect results from ribbed mussels and quahogs

Notes
1 - When summing the results for each compound, the reporting limit for the nondetect results was used in the summation.
2 - For the field duplicate pair, the highest of the detected result or reporting limit was was chosen for the summation.
3 - See Attachment I for details on the calculation of the allowable emission rate.
4 - Methane is not an air toxic and not regulated under RIDEM Air Pollution Control Regulation 22. Therefore, the RIDEM maximum allowable methane emission from landfill gas vents of 100 pounds per day was converted to 5.25E-10 grams per second as the calculated allowable emission rate.
NA - Compound not found in RIDEM Air Pollution Control Regulation 22 Table 1
Units
m3/sec - Cubic meter per second flow rate
Deg C - Degrees Celsius temperature
atm - Atmospheres pressure
Conc. - Concentration
ppbv - Parts per billion by volume
mg/m3 - Milligrams per cubic meter
g/s - Grams per second

Notes:
1) Horizontal distance measured to left well of pairs; center well of clusters.
2) The subsurface sections shown represent our evaluation of the most probably conditions based upon interpretation of presently available data. Some variations from these conditions exist.
3) Rollerbit drilled and cored intervals backfilled with bentonite prior to monitoring well construction.
4) * indicates the monitoring well was abandoned during landfill cap construction.
5) Elevation and subsurface of Allen Harbor beyond breakwater structure estimated based on as-built drawings, available bathymetry data and observations of the site (February 15, 2012).

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0812
Analyses/Method:	EPA SW-846 Method 8260C for VOCs (GC/MS) / 8260C
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Elissa McDonagh/Resolution Consultants Completed on: 12/02/2016
Reviewed by:	Kristin Rutherford/Resolution Consultants File Name: R0812_VOC

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 6, 7, 8, and 9, 2016.

Sample ID	Matrix/Sample Type
MW09-07S-ME45-1	Ground water
MW09-08DA-ME45-1	Ground water
MW09-09DA-ME45-1	Ground water
MW09-11S-ME45-1	Ground water
MW09-17I-ME45-1	Ground water
MW09-21S-ME45-1	Ground water
MW09-24D-ME45-1	Ground water
MW09-25S-ME45-1	Ground water
MW09-26DA-ME45-1	Ground water
MW09-26S-ME45-1	Ground water
MW09-27D-ME45-1	Ground water
MW09-ME45-FD01	Field Duplicate of MW09-27D-ME45-1
MW09-27S-ME45-1	Ground water
MW09-ME45-TB05	Trip Blank

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8260C, Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry* (USEPA, 2006);
- *EPA New England Environmental Data Review Program Guidance (April 2013)*;

- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✗	Holding times and sample preservation
✓	GC/MS performance checks
✗	Initial calibration/continuing calibration verification
✓	Laboratory blanks/trip blanks/equipment blanks
✓	Surrogate spike recoveries
✗	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✗	Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
✓	Field duplicates
✓	Internal standards
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. Selected data points were qualified as estimated and/or rejected due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.

- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-1.

Criteria	Detect	Non-detect
Sample temperature > 6°C but ≤ 10°C upon receipt at the laboratory	Use professional judgment	Use professional judgment
Sample temperature > 10°C upon receipt at the laboratory	Use professional judgment J-	Use professional judgment R
Aqueous sample properly preserved but analyzed outside the 14-day technical holding time	J*	R
Holding times grossly exceeded	J-	R

* The true direction of any bias may be unknown in this case. Use professional judgment based on knowledge of the chemistry of the analytes in the sample, or do not assign a direction to the bias.

Qualified sample results are shown in Table 1.

GC/MS Performance Checks

The data were reviewed to ensure that the 4-bromofluorobenzene (BFB) tuning was performed at the correct frequency and that the method acceptance criteria were met. All samples were analyzed within 12 hours of the BFB tunes.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and/or response factor (RF) method acceptance criteria were met;
- the initial calibration verification standard (ICV) percent recovery acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and (RF) acceptance criteria were met; and
- the retention time method acceptance criteria were met.

Nonconformances are summarized in Attachment A in Tables A-2, A-3, A-4 and A-5. Data qualification to the analytes associated with the specific ICAL and/or CCV was as follows:

ICAL and CCV Response Factor Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results[2]
RF<minimum RF (Table 4 method 8260C)	J	R[1]
[1]Resolution Consultants professional judgment may be used to either raise reporting level or to estimate reporting limit if low standard response is adequate.		
[2]Sample results qualified as not detected (U) due to blank contamination are not rejected, but estimated (UJ).		

ICAL Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected
%RSD > 15% and quantitation based on mean RF	J	UJ
r or r^2 < 0.99 and quantitation based on linear regression	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

ICV Recovery Nonconformances

Criteria	Actions*	
	Detected Results	Nondetected Results
Recovery > 120%	J+	No qualifications
Recovery < 80%	J-	UJ
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

CCV Linearity Nonconformances

Criteria		Actions	
		Detected Results	Nondetected Results
Opening CCV	Closing CCV		
%D > 20%	%D > 50%	J	UJ
%Drift >20%	%Drift >50%	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used			

Qualified sample results are shown in Table 1.

The RFs for acetone and 2-butanone did not meet the method 8260C requirements for initial and/or continuing calibrations as required by the QSM. The nonconformances are summarized in Tables A-2 and A-5. The RFs for acetone and 2-butanone met the National Functional Guidelines requirements. Professional judgement was used to qualify the results for acetone and 2-butanone as estimated (J/UJ).

Laboratory Blanks/Trip Blanks

Laboratory method blanks and trip blanks were evaluated as to whether there were contaminants detected above the detection limit (DL). Equipment blanks were not collected since dedicated sampling equipment was used for ground water samples.

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required. There were no detected target analytes reported in trip blank sample MW09-ME45-TB05.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

MS/MSD Results

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-6. Data qualification to the analytes associated with the specific MS/MSD nonconformances was as follows:

Criteria	Action	
	Detected Compounds	Nondetected Compounds
%R>UL	J+	No qualification
20% ≤ %R < LL	J-	UJ
%R <20% (see note 1)	J-	R*
RPD >UL	J	No qualification
Note: Actions are applied to the native unspiked sample only (see note 2) *When the native sample concentration is >4X the concentration of the spike added (based on Region I criteria), evaluate the MS, MSD, and native sample with regards to %RSD rather than %R (Resolution Consultants professional judgment).		

1. Based on NFG 2016 VOC guidance, Resolution Consultants professional judgment is used to reject (R) non-detects in associated samples for any analyte with < 20% recovery. Also, Resolution Consultants professional judgment is used to estimate (UJ) rather the reject (R) sample results previously negated (U) on the basis of blank contamination.
2. If a field duplicate sample was also collected for the native sample chosen for MS/MSD analysis, professional judgment is used to apply MS/MSD actions to the corresponding field duplicate sample as well as the native sample.

Qualified sample results are shown in Table 1.

LCS/LCSD Results

The LCS/LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-7. Data qualification to the analytes associated with the specific LCS/LCSD %Rs or RPDs was as follows:

Criteria[1]	Action	
	Detected Compounds	Nondetected Compounds
%R or RPD > UL	J+	No qualification
%R < LL	J-	UJ
%R < 20% (see note 1)	J-	R
(LL = lower limit, UL = upper limit)		

Notes:

1. Based on NFG 2016 VOC guidance, Resolution Consultants professional judgment is used to reject (R) non-detects in all associated samples for any analyte with < 20% recovery. Also, Resolution Consultants professional judgment is used to estimate (UJ) rather reject sample results previously negated (U) on the basis of blank contamination.

Qualified sample results are shown in Table 1.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than two times the limit of quantitation (LOQ). All QC acceptance criteria were met.

Internal Standard Results

The internal standard (IS) recoveries were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

Sample Results/Reporting Issues

All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

Any sample that was analyzed at a dilution because of high concentrations of target or non-targets was checked to confirm that the results and/or sample-specific LOQs and limits of detection (LODs) were adjusted accordingly by the laboratory.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
JN	The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Attachment C

Reason Codes and Explanations

Reason Code	Explanation
be	Equipment blank contamination
bf	Field blank contamination
bl	Laboratory blank contamination
bt	Trip blank contamination
c	Calibration issue
d	Reporting limit raised due to chromatographic interference
fd	Field duplicate RPDs
h	Holding times
i	Internal standard areas
k	Estimated Maximum Possible Concentration (EMPC)
l	LCS or OPR recoveries
lc	Labeled compound recovery
ld	Laboratory duplicate RPDs
lp	Laboratory control sample/laboratory control sample duplicate RPDs
m	Matrix spike recovery
md	Matrix spike/matrix spike duplicate RPDs
nb	Negative laboratory blank contamination
p	Chemical preservation issue
r	Dual column RPD
q	Quantitation issue
s	Surrogate recovery
su	Ion suppression
t	Temperature preservation issue
x	Percent solids
y	Serial dilution results
z	ICS results

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0813
Analyses/Method:	EPA SW-846 Method 8260C for VOCs (GC/MS) / 8260C
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Elissa McDonagh/Resolution Consultants Completed on: 11/22/2016
Reviewed by:	Kristin Rutherford/Resolution Consultants File Name: R0813_VOC

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 6, 7 and 8, 2016.

Sample ID	Matrix/Sample Type
MW09-02S-ME45-1	Ground water
MW09-03D-ME45-1	Ground water
MW09-08S-ME45-1	Ground water
MW09-ME45-FD02	Field Duplicate of MW09-08S-ME45-1
MW09-10D-ME45-1	Ground water
MW09-10S-ME45-1	Ground water
MW09-21D-ME45-1	Ground water
MW09-23D-ME45-1	Ground water
MW09-23S-ME45-1	Ground water
MW09-24S-ME45-1	Ground water
MW09-ME45-TB01	Trip Blank
MW09-ME45-TB02	Trip Blank
MW09-ME45-TB03	Trip Blank
MW09-ME45-TB04	Trip Blank

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8260C, Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry* (USEPA, 2006);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);

- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
✓	GC/MS performance checks
✗	Initial calibration/continuing calibration verification
✓	Laboratory blanks/trip blanks/equipment blanks
✓	Surrogate spike recoveries
NA	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✗	Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
✓	Field duplicates
✓	Internal standards
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. Selected data points were qualified as estimated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria. The QC acceptance criteria were met and/or qualification of the data was not required.

GC/MS Performance Checks

The data were reviewed to ensure that the 4-bromofluorobenzene (BFB) tuning was performed at the correct frequency and that the method acceptance criteria were met. All samples were analyzed within 12 hours of the BFB tunes.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and/or response factor (RF) method acceptance criteria were met;
- the initial calibration verification standard (ICV) percent recovery acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met; and
- the retention time method acceptance criteria were met.

Nonconformances are summarized in Attachment A in Tables A-1, A-2, A-3, A-4 and A-5. Data qualification to the analytes associated with the specific ICAL and/or CCV was as follows:

ICAL and CCV Response Factor Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results[2]
RF<minimum RF (Table 4 method 8260C)	J	R[1]
[1]Resolution Consultants professional judgment may be used to either raise reporting level or to estimate reporting limit if low standard response is adequate.		
[2]Sample results qualified as not detected (U) due to blank contamination are not rejected, but estimated (UJ).		

ICAL Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected
%RSD > 15% and quantitation based on mean RF	J	UJ
r or r^2 < 0.99 and quantitation based on linear regression	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

ICV Recovery Nonconformances

Criteria	Actions*	
	Detected Results	Nondetected Results
Recovery > 120%	J+	UJ
Recovery < 80%	J-	UJ
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

CCV Linearity Nonconformances

Criteria		Actions	
		Detected Results	Nondetected Results
Opening CCV	Closing CCV		
%D > 20%	%D > 50%	J	UJ
%Drift >20%	%Drift >50%	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used			

Qualified sample results are shown in Table 1.

The response factors (RFs) for acetone and 2-butanone did not meet the method 8260C requirements for initial and/or continuing calibrations as required by the QSM. The nonconformances are summarized in Tables A-1 and A-5. The RFs for acetone and 2-butanone met the National Functional Guidelines requirements; therefore, professional judgement was used to qualify (J/UJ) as estimated and not reject the results.

Laboratory Blanks/Trip Blanks

Laboratory method blanks and trip blanks were evaluated as to whether there were contaminants detected above the detection limit (DL). Equipment blanks were not collected since dedicated sampling equipment was used for ground water samples.

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required. There were no detected target analytes reported in trip blank samples MW09-ME45-TB01, MW09-ME45-TB02, MW09-ME45-TB03 and MW09-ME45-TB04.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

MS and/or MSD Results

MS/MSD analyses were not performed on samples reported in this SDG. There were no validation actions taken on this basis.

LCS/LCSD Results

The LCS/LCSD %Rs and/or relative percent recoveries (RPDs) were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-6. Data qualification to the analytes associated with the specific LCS %Rs or RPDs was as follows:

Criteria[1]	Action	
	Detected Compounds	Nondetected Compounds
%R > UL	J+	No qualification
%R < LL	J-	UJ
%R < 20% (see note 1)	J-	R
%RPD > UL	J	No qualification
(LL = lower limit, UL = upper limit)		
[1]Professional judgment was applied to use MS/MSD RPD actions in the absence of NFG or Region 1 actions.		

Qualified sample results are shown in Table 1.

Field Duplicates

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than two times the limit of quantitation (LOQ). All QC acceptance criteria were met.

Internal Standards

The internal standard (IS) recoveries were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

Sample Results/Reporting Issues

All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

Any sample that was analyzed at a dilution because of high concentrations of target or non-targets was checked to confirm that the results and/or sample-specific LOQs and limits of detection (LODs) were adjusted accordingly by the laboratory. The sample requiring a dilution has not met all Project Action Limits (PALs) due to the high concentration of target or non-target results.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Attachment B

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
JN	The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Attachment C

Reason Codes and Explanations

Reason Code	Explanation
be	Equipment blank contamination
bf	Field blank contamination
bl	Laboratory blank contamination
bt	Trip blank contamination
c	Calibration issue
d	Reporting limit raised due to chromatographic interference
fd	Field duplicate RPDs
h	Holding times
i	Internal standard areas
k	Estimated Maximum Possible Concentration (EMPC)
l	LCS or OPR recoveries
lc	Labeled compound recovery
ld	Laboratory duplicate RPDs
lp	Laboratory control sample/laboratory control sample duplicate RPDs
m	Matrix spike recovery
md	Matrix spike/matrix spike duplicate RPDs
nb	Negative laboratory blank contamination
p	Chemical preservation issue
r	Dual column RPD
q	Quantitation issue
s	Surrogate recovery
su	Ion suppression
t	Temperature preservation issue
x	Percent solids
y	Serial dilution results
z	ICS results

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0814
Analyses/Method:	EPA SW-846 Method 8260C for VOCs (GC/MS) / 8260C
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Elissa McDonagh/Resolution Consultants Completed on: 11/23/2016
Reviewed by:	Lori Herberich/Resolution Consultants File Name: R0814_VOC

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 7 and 8, 2016.

Sample ID	Matrix/Sample Type
MW09-09S-ME45-1	Ground water
MW09-14D-ME45-1	Ground water
MW09-20D-ME45-1	Ground water
MW09-ME45-FD03	Field Duplicate of MW09-20D-ME45-1
MW09-20I-ME45-1	Ground water

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8260C, Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry* (USEPA, 2006);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✗	Holding times and sample preservation
✓	GC/MS performance checks
✗	Initial calibration/continuing calibration verification
✓	Laboratory blanks/trip blanks/equipment blanks
✓	Surrogate spike recoveries
✓	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✓	Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
✗	Field duplicates
✓	Internal standards
✗	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. Selected data points were qualified as estimated and/or rejected, due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-1.

Criteria	Detect	Non-detect
Sample temperature > 6°C but ≤ 10°C upon receipt at the laboratory	Use professional judgment	Use professional judgment
Sample temperature > 10°C upon receipt at the laboratory	Use professional judgment J-	Use professional judgment R
Aqueous sample properly preserved but analyzed outside the 14-day technical holding time	J*	R
Holding times grossly exceeded	J-	R

* The true direction of any bias may be unknown in this case. Use professional judgment based on knowledge of the chemistry of the analytes in the sample, or do not assign a direction to the bias.

Qualified sample results are shown in Table 1.

GC/MS Performance Checks

The data were reviewed to ensure that the 4-bromofluorobenzene (BFB) tuning was performed at the correct frequency and that the method acceptance criteria were met. All samples were analyzed within 12 hours of the BFB tunes.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and/or response factor (RF) method acceptance criteria were met;
- the initial calibration verification standard (ICV) percent recovery acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met; and
- the retention time method acceptance criteria were met.

Nonconformances are summarized in Attachment A in Table A-2, A-3, A-4, A-5 and A-6. Data qualification to the analytes associated with the specific ICAL and/or CCV was as follows:

ICAL and CCV Response Factor Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results[2]
RF<minimum RF (Table 4 method 8260C)	J	R[1]
[1]Resolution Consultants professional judgment may be used to either raise reporting level or to estimate reporting limit if low standard response is adequate.		
[2]Sample results qualified as not detected (U) due to blank contamination are not rejected, but estimated (UJ).		

ICAL Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected
%RSD > 15% and quantitation based on mean RF	J	UJ
r or r^2 < 0.99 and quantitation based on linear regression	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

ICV Recovery Nonconformances

Criteria	Actions*	
	Detected Results	Nondetected Results
Recovery > 120%	J+	No qualification
Recovery < 80%	J-	UJ
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

CCV Linearity Nonconformances

Criteria		Actions	
		Detected Results	Nondetected Results
Opening CCV	Closing CCV		
%D > 20%	%D > 50%	J	UJ
%Drift >20%	%Drift >50%	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used			

Qualified sample results are shown in Table 1.

The RFs for acetone and 2-butanone did not meet the method 8260C requirements for initial and/or continuing calibrations as required by the QSM. The nonconformances are summarized in Table A-2 and A-6. The RFs for acetone and 2-butanone met the National Functional Guidelines requirements. Professional judgement was used to qualify the results for acetone and 2-butanone as estimated (J/UJ).

The closing CCV was not analyzed by the laboratory for sample MW09-20I-ME45-1DL. Professional judgment was used to estimate the reported results from the diluted analysis. The results for cis-1,2-dichloroethene, trans-1,2-dichloroethene, trichloroethene and 1,1,2,2-tetrachloroethane were qualified as estimated (J).

Laboratory Blanks/Trip Blanks/Equipment Blanks

Laboratory method blanks, trip blanks, and equipment rinsate blanks were evaluated as to whether there were contaminants detected above detection limit (DL). Equipment blanks were not collected since dedicated sampling equipment was used for ground water samples.

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required. There were no trip blank samples submitted with the data package.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

MS and/or MSD Results

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met

LCS/LCSD Results

The LCS/LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-7. Data qualification to the analytes associated with the specific LCS %Rs or RPDs was as follows:

Criteria[1]	Action	
	Detected Compounds	Nondetected Compounds
%R > UL	J+	No qualification
%R < LL	J-	UJ
%R < 20% (see note 1)	J-	R
%RPD > UL	J	No qualification
(LL = lower limit, UL = upper limit)		
[1]Professional judgment was applied to use MS/MSD RPD actions in the absence of NFG or Region 1 actions.		

Qualified sample results are shown in Table 1.

Field Duplicates

The field duplicate samples were analyzed outside of holding time and the nondetect results were rejected.

Internal Standards

The internal standard (IS) recoveries were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

Sample Results/Reporting Issues

All compounds detected at concentrations less than the limit of quantitation (LOQ) but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

The results for vinyl chloride, 1,1-dichloroethene and 1,1,2-trichloroethane in sample MW09-20I-ME45-1 were reported above the calibration range and are qualified as estimated results (J).

Any sample that was analyzed at a dilution because of elevated concentrations of target or non-targets was checked to confirm that the results and/or sample-specific LOQs and limits of detection (LODs) were adjusted accordingly by the laboratory. Sample MW09-09S-ME45-1 required a 10X dilution and did not meet the Project Action Limit (PAL) for tetrachloroethene due to the elevated concentration of target or non-target results.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
JN	The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0898
Analyses/Method:	EPA SW-846 Method 8260C for VOCs (GC/MS) / 8260C
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Elissa McDonagh/Resolution Consultants Completed on: 11/30/2016
Reviewed by:	Kristin Rutherford/Resolution Consultants File Name: R0898_VOC

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 27, 2016.

Sample ID	Matrix/Sample Type
ALLENHARBOR-ME45-1	Ground water
MW09-ME45-FD06	Field Duplicate of Allenharbor-ME45-1
MW07-ME45-TB07	Trip Blank

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8260C, Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry* (USEPA, 2006);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
✓	GC/MS performance checks
✗	Initial calibration/continuing calibration verification
✓	Laboratory blanks/trip blanks/equipment blanks
✓	Surrogate spike recoveries
NA	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✓	Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
✓	Field duplicates
✓	Internal standards
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. Selected data points were qualified as estimated, due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria. The QC acceptance criteria were met.

GC/MS Performance Checks

The data were reviewed to ensure that the 4-bromofluorobenzene (BFB) tuning was performed at the correct frequency and that the method acceptance criteria were met. All samples were analyzed within 12 hours of the BFB tunes.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and/or response factor (RF) method acceptance criteria were met;
- the initial calibration verification standard (ICV) percent recovery acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met; and
- the retention time method acceptance criteria were met.

Nonconformances are summarized in Attachment A in Table A-1 and A-2. Data qualification to the analytes associated with the specific ICAL and/or CCV was as follows:

ICAL and CCV Response Factor Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results[2]
RF<minimum RF (Table 4 method 8260C)	J	R[1]
[1]Resolution Consultants professional judgment may be used to either raise reporting level or to estimate reporting limit if low standard response is adequate.		
[2]Sample results qualified as not detected (U) due to blank contamination are not rejected, but estimated (UJ).		

ICAL Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected
%RSD > 15% and quantitation based on mean RF	J	UJ
r or r^2 < 0.99 and quantitation based on linear regression	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

ICV Recovery Nonconformances

Criteria	Actions*	
	Detected Results	Nondetected Results
Recovery > 120%	J+	No qualification
Recovery < 80%	J-	UJ
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

CCV Linearity Nonconformances

Criteria		Actions	
		Detected Results	Nondetected Results
Opening CCV	Closing CCV		
%D > 20%	%D > 50%	J	UJ
%Drift >20%	%Drift >50%	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used			

Qualified sample results are shown in Table 1.

Laboratory Blanks/Trip Blanks/Equipment Blanks

Laboratory method blanks, trip blanks, and equipment rinsate blanks were evaluated as to whether there were contaminants detected above the detection limit (DL).

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required. There were no detected target analytes reported in trip blank sample MW07-ME45-TB07.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

MS and/or MSD Results

MS/MSD analyses were not performed on samples reported in this SDG. There were no validation actions taken on this basis.

LCS/LCSD Results

The LCS/LCSD %Rs and/or relative percent recoveries (RPDs) were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

Field Duplicates

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than two times the limit of quantitation (LOQ). All QC acceptance criteria were met.

Internal Standards

The internal standard (IS) recoveries were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

Sample Results/Reporting Issues

All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

Any sample that was analyzed at a dilution because of high concentrations of target or non-targets was checked to confirm that the results and/or sample-specific LOQs and limits of detection (LODs) were adjusted accordingly by the laboratory.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 9, 12, 13, 14 and 16, 2016.

Sample ID	Matrix/Sample Type
MW07-ME20-TB01	Trip Blank
MW09-14IA-ME45-1	Ground water
MW09-ME45-FD05	Field Duplicate of MW09-14IA-ME45-1
MW09-ME45-TB05	Trip Blank
MW09-ME45-TB06	Trip Blank
P09-01-ME45-1	Ground water
P09-02A-ME45-1	Ground water
P09-03A-ME45-1	Ground water
P09-04A-ME45-1	Ground water
P09-06B-ME45-1	Ground water
P09-07B-ME45-1	Ground water
P09-08B-ME45-1	Ground water
P09-09-ME45-1	Ground water
P09-10-ME45-1	Ground water
P09-11B-ME45-1	Ground water
P09-12B-ME45-1	Ground water
SP09-01-ME45-1	Ground water
SP09-02-ME45-1	Ground water
SP09-03-ME45-1	Ground water

Data validation activities were conducted with reference to:

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW-846, specifically SW-846 Method 8260C, Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry* (USEPA, 2006);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
✓	GC/MS performance checks
✗	Initial calibration/continuing calibration verification
✓	Laboratory blanks/trip blanks/equipment blanks
✓	Surrogate spike recoveries
✗	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✗	Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
✗	Field duplicates
✓	Internal standards
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. Selected data points were qualified as estimated and/or rejected due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Sample R0838-29 (MW09-141A-ME45-1) was incorrectly listed on the COC and subsequently the laboratory report. The sample corresponds to location MW09-14IA-ME45-1 and is referenced in the database and report as MW09-14IA-ME45-1.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria. The QC acceptance criteria were met.

GC/MS Performance Checks

The data were reviewed to ensure that the 4-bromofluorobenzene (BFB) tuning was performed at the correct frequency and that the method acceptance criteria were met. All samples were analyzed within 12 hours of the BFB tunes.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and/or response factor (RF) method acceptance criteria were met;
- the initial calibration verification standard (ICV) percent recovery acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met; and
- the retention time method acceptance criteria were met.

Nonconformances are summarized in Attachment A in Table A-1, A-2, A-3, A-4 and A-5. Data qualification to the analytes associated with the specific ICAL and/or CCV was as follows:

ICAL and CCV Response Factor Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results[2]
RF<minimum RF (Table 4 method 8260C)	J	R[1]
[1]Resolution Consultants professional judgment may be used to either raise reporting level or to estimate reporting limit if low standard response is adequate.		
[2]Sample results qualified as not detected (U) due to blank contamination are not rejected, but estimated (UJ).		

ICAL Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected
%RSD > 15% and quantitation based on mean RF	J	UJ
r or r^2 < 0.99 and quantitation based on linear regression	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

ICV Recovery Nonconformances

Criteria	Actions*	
	Detected Results	Nondetected Results
Recovery > 120%	J+	No qualification
Recovery < 80%	J-	UJ
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

CCV Linearity Nonconformances

Criteria		Actions	
		Detected Results	Nondetected Results
Opening CCV	Closing CCV		
%D > 20% opening CCV	%D > 50%	J	UJ
%Drift >20% opening CCV	%Drift >50%	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used			

Qualified sample results are shown in Table 1.

The RFs for acetone and 2-butanone did not meet the method 8260C requirements for initial and/or continuing calibrations as required by the QSM. The nonconformances are summarized in Table A-1 and A-5. The RFs for acetone and 2-butanone met the National Functional Guidelines requirements. Professional judgement was used to qualify the results for acetone and 2-butanone as estimated (J/UJ).

Laboratory Blanks/Trip Blanks/Equipment Blanks

Laboratory method blanks and trip blanks were evaluated as to whether there were contaminants detected above the detection limit (DL). Equipment blanks were not collected with ground water samples.

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results

The QC acceptance criteria were met and/or qualification of the sample results was not required. There were no detected target analytes reported in trip blank sample MW07-ME20-TB01, MW09-ME45-TB05 and MW09-ME45-TB06.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

MS and/or MSD Results

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-6. Data qualification to the analytes associated with the specific MS/MSD nonconformances was as follows:

Criteria	Action	
	Detected Compounds	Nondetected Compounds
%R>UL	J+	No qualification
20% ≤ %R < LL	J-	UJ
%R <20% (see note 1)	J-	R*
RPD >UL	J	No qualification
Note: Actions are applied to the native unspiked sample only (see note 2) *When the native sample concentration is >4X the concentration of the spike added (based on Region I criteria), evaluate the MS, MSD, and native sample with regards to %RSD rather than %R (Resolution Consultants professional judgment).		

1. Based on NFG 2016 VOC guidance, Resolution Consultants professional judgment is used to reject (R) non-detects in associated samples for any analyte with < 20% recovery. Also, Resolution Consultants professional judgment is used to estimate (UJ) rather the reject (R) sample results previously negated (U) on the basis of blank contamination.
2. If a field duplicate sample was also collected for the native sample chosen for MS/MSD analysis, professional judgment is used to apply MS/MSD actions to the corresponding field duplicate sample as well as the native sample.

On February 2, 2017 the laboratory submitted a corrective action (attached) indicating that the analyst was incorrectly spiking the MS/MSD solution in sample MW09-14IA-ME45-1 leading to depressed recoveries. The corrective action indicated only the MS/MSD solution was being incorrectly spiked, and based on acceptable surrogate and internal standard no recoveries, professional judgment was used to not qualify data based on MS/MSD recoveries.

LCS/LCSD Results

The LCS/LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-3. Data qualification to the analytes associated with the specific LCS %Rs or RPDs was as follows:

Criteria[1]	Action	
	Detected Compounds	Nondetected Compounds
%R > UL	J+	No qualification
%R < LL	J-	UJ
%R < 20% (see note 1)	J-	R
%RPD > UL	J	No qualification
(LL = lower limit, UL = upper limit)		
[1]Professional judgment was applied to use MS/MSD RPD actions in the absence of NFG or Region 1 actions.		

Qualified sample results are shown in Table 1.

Field Duplicates

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than two times the limit of quantitation (LOQ).

Nonconformances are summarized in Attachment A in Table A-8. Data qualification to the analytes associated with the specific field duplicate RPDs was as follows:

Criteria	RPD	Action	
		Detected	Nondetected
Sample and duplicate are nondetect results	Not calculable (NC)	No qualification	No qualification
Sample and duplicate results ≥2xLOQ	>30 (aqueous) >50 (solids)	J	Not Applicable
Sample and duplicate results <2xLOQ	>60 (aqueous) >100 (solids)	J	Not Applicable
If sample or duplicate result is >2xLOQ and the other is not detected	NC	J	UJ
If sample or duplicate result is <2xLOQ and the other is not detected	NC	No qualification	No qualification

Qualified sample results are shown in Table 1.

Internal Standards

The internal standard (IS) recoveries were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

Sample Results/Reporting Issues

All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

Any sample that was analyzed at a dilution because of high concentrations of target or non-targets was checked to confirm that the results and/or sample-specific LOQs and limits of detection (LODs) were adjusted accordingly by the laboratory.

The LOQ for vinyl chloride is greater than the Project Action Limit (PAL). The LOD and the DL are less than the PAL results and are usable for project objectives.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Attachment B

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
JN	The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Attachment C

Reason Codes and Explanations

Reason Code	Explanation
be	Equipment blank contamination
bf	Field blank contamination
bl	Laboratory blank contamination
bt	Trip blank contamination
c	Calibration issue
d	Reporting limit raised due to chromatographic interference

Laboratory Corrective Action

Eurofins Spectrum Analytical, Inc. -- ESAI-RI

Corrective Action Report

Date Initiated: 29-Dec-16 **Corrective Action Report ID:** 000 681

Initiated By: Edward A Lawler **Department:** MSVOA

Corrective Action Description

CAR Summary: Client has formally requested a corrective action to determine the cause of low reported MS/MSD recoveries for VOCs in SDG R0838. It is either a spiking error or a calculation error, and needs to be reviewed by the laboratory.

Description of Nonconformance: Client Summary: The MS/MSD form now appears to show the sample results in the latest resubmittal. However, MS/MSD recoveries are still listed as consistently failing (attached) but there is no indication that is caused by sample matrix interference based on results of the native sample, surrogate recoveries, and internal standards. Based on the lab's difficulty in reporting the MS/MSD data (and the need for multiple resubmittals) I believe an error exists in the MS/MSD data,

Ed's Summary: In our original report, the Form 3 had no compounds listed at all. Then in our _R1 revision, the MS and MSD were not associated with the correct native sample. Then in our _R2 revision we have the associations correct--so that insures all the calculations are correct. However, in both the R1 and R2 reports it looks like the MS has across-the-board low recoveries. The low recoveries do not appear to be matrix interference (the surrogate recoveries are OK for the MS and MSD, as well as for all samples in this SDG. The IS areas are OK for the MS and MSD, as well as for all samples in this SDG, and there is no apparent bias in percent recoveries based on compound type {volatility, aromatics, chlorinated, etc.})
Note--the _R3 revision of this report address a separate (SVOA) issue.

Description of Corrective Action: Investigate data trail of sample/MS/MSD for reasons of confused and erroneous Form 3 reports. The initial/ original DP that was sent out on 10/24/16 had a shell of a form 3 for the MS/MSD and all LCS form 3s were present. When noted, the form 3 was generated however this data review missed the omission of native sample linking in OMEGA. This means that in the V6_160925B analysis, the sample SEQ# 2404720 was not properly loaded under the SPKref columns for either of the MS/MSD. The RPDref seems to have been loaded fine for the MS/MSD. Because of this, the native sample values for target compounds was not included on the form 3 or in the calculations for recovery. The last attempt to correct the issue did result in a correct form 3. The initial review of the run by the analyst and then the supervisor determined the low recoveries to be due to matrix interferences as that day's LCS met QC criteria. The Run log notes the addition of 20ul for the spiked standards which includes LCS and MS. If a mistake was made the logbook would not show it unless the analyst realized an error had been made and noted that.

Performed By: Sharyn B Lawler **Completion Date:** 05-Jan-17

Client Notification

Client Notification Required: No **Notified By:**

Comment: new information has come to light on spiking technique

Eurofins Spectrum Analytical, Inc. -- ESAI-RI

Corrective Action Report

Date Initiated: 29-Dec-16 **Corrective Action Report ID:** 000 681

Initiated By: Edward A Lawler **Department:** MSVOA

Quality Assurance Review

Nonconformance Type: Routine

Further Action required by QA: The overall low recoveries should have prompted further investigation by the peer reviewer and supervisor rather than assuming matrix effect. Typically poor MS recoveries with an acceptable LCS do confirm matrix but it is unusual to see it across the board on all compounds, especially with good IS/SS. Since this report was sent out another work order had similar issues that were again not investigated until client intervention. At this time a different analyst was requested to run the samples and it came to light that the spiking had been done improperly in workorder S0037. This is the same analyst who performed the spiking in R0838. She has been pulled from analytical duties. Although not intentional she was not following correct procedures which led to insufficient mixing of the spike solution into the sample and resulted in depressed recoveries. The LCS was spiked correctly. The spiking procedure will be revised to include additional detail in our SW8260C SOP and training procedures to prevent this error from reoccuring.

Approval and Closure

Prepared by:	Cathy Larson/Resolution Consultants Completed on: 11/21/16
Reviewed by:	Kristin Rutherford/Resolution Consultants File Name: R0812_SVOC_PAH

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 6, 7, 8, and 9, 2016.

Sample ID	Matrix/Sample Type
MW09-07S-ME45-1	Ground water
MW09-08DA-ME45-1	Ground water
MW09-09DA-ME45-1	Ground water
MW09-17I-ME45-1	Ground water
MW09-21S-ME45-1	Ground water
MW09-25S-ME45-1	Ground water
MW09-26DA-ME45-1	Ground water
MW09-26S-ME45-1	Ground water
MW09-27D-ME45-1	Ground water
MW09-27S-ME45-1	Ground water
MW09-ME45-FD01	Field duplicate of MW09-27D-ME45-1

Data validation activities were conducted with reference to:

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8270D, Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry* (USEPA, 2014) and *SW-846 Method 8270D-SIM, Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry/Selected Ion Monitoring* (USEPA, 2014);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);

- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following parameters (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
✓	Instrument tuning
✗	Initial calibration/continuing calibration verification
✓	Laboratory blanks/equipment blanks
✓	Surrogate spike recoveries
✗	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✗	Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
✓	Field duplicate results
✓	Internal standard results
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. Selected data points were qualified as estimated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Exceptions noted during the review were:

1. Sample misidentification: Sample MW09-27-ME45-1 was listed on the COC. This sample identifier was corrected to MW09-27D-ME45-1 as described in email correspondence dated September 8, 2016.

2. The SAP SVOC list of analytes included N-Nitrosodimethylamine. This analyte was not reported by the laboratory. Also, the compound 2,2'-oxybis (1-chloropropane) was reported by the laboratory, but this compound was not listed in the SAP. No actions were taken except to note these discrepancies.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met and/or data qualification was not required.

Instrument Tuning

The data were reviewed to ensure that the decafluorotriphenylphosphine (DFTPP) tuning was performed at the correct frequency and that the method acceptance criteria were met. All samples were analyzed within 12 hours of the DFTPP tunes.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and/or response factor method acceptance criteria were met;
- the initial calibration verification standard (ICV) percent recovery acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met; and
- the retention time method acceptance criteria were met.

Nonconformances are summarized in Attachment A in Tables A-1a, A-1b, and A-1c. Data qualification to the analytes associated with the specific ICAL and/or CCV was in accordance with QSM and professional judgement as follows:

ICAL Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected
%RSD > 15% and quantitation based on mean RF	J	UJ
r or r^2 < 0.99 and quantitation based on linear regression	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

ICV Recovery Nonconformances

Criteria	Actions*	
	Detected Results	Nondetected Results
Recovery > 120%	J+	No qualifications
Recovery < 80%	J-	UJ
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

CCV Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results
Beginning CCV +/- 20% true value	J	UJ
Ending CCV +/- 50% true value	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

Qualified sample results are shown in Table 1.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks were evaluated as to whether there were contaminants detected above the detection limit (DL). Equipment blanks were not collected since dedicated sampling equipment was used for ground water samples.

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria.

All QC acceptance criteria were met and/or qualification of the sample results was not required.

MS/MSD Results

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-2. Data qualification to the analytes associated with the MS/MSD nonconformances was as follows:

Actions: (Based on NFG 2016, Region 1, and Resolution Consultants professional judgment)

Criteria	Action	
	Detected Compounds	Nondetected Compounds
%R> UL	J+	No qualification
10% ≤ %R < LL	J-	UJ
%R <10%	J-	R
%RPD > UL	J	No qualification

Qualified sample results are shown in Table 1.

LCS/LCSD Results

The LCS %Rs were reviewed for conformance with the QC acceptance criteria. For SVOCs, control limits in the QSM were used and for the 8270D SIM method, the laboratory presented laboratory control limits. Results analyzed by 8270D SIM were also compared to the QSM criteria.

Nonconformances are summarized in Attachment A in Table A-3. Data qualification to the analytes associated with the specific LCS %Rs or RPDs was as follows:

Criteria[1]	Action	
	Detected Compounds	Nondetected Compounds
%R or RPD > UL	J+	No qualification
10%≥%R < LL	J-	UJ
%R < 10%	J-	R
[1] In the absence of NFG 2014 guidance for LCS results, NFG 2014 MS/MSD guidance was applied with Resolution Consultants professional judgment.		

Qualified sample results are shown in Table 1.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤30% for aqueous matrices. This criterion applies if both results were greater than five times the limit of quantitation (LOQ).

All QC acceptance criteria were met and/or qualification of the data was not required.

Internal Standard Results

The internal standard (IS) recoveries were reviewed for conformance with the QC acceptance criteria.

All QC acceptance criteria were met.

Sample Results/Reporting Issues

All compounds detected at concentrations less than the LOQ but greater than the limit of detection (LOD) were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

Any sample that was analyzed at a dilution due to high concentrations of target or non-targets was checked to ensure that the results and/or sample specific limits of detection (LODs) and LOQs were adjusted accordingly by the laboratory.

All analytes reported using method 8270D-SIM were also reported using 8270D. The reporting limit is lower for the SIM method and duplicate results for 8270D were noted as "not reported" in the database.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Attachment B

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
JN	The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Attachment C

Reason Codes and Explanations

Reason Code	Explanation
be	Equipment blank contamination
bf	Field blank contamination
bl	Laboratory blank contamination
c	Calibration issue
d	Reporting limit raised due to chromatographic interference
fd	Field duplicate RPDs
h	Holding times
i	Internal standard areas
k	Estimated Maximum Possible Concentration (EMPC)
l	LCS or OPR recoveries
lc	Labeled compound recovery
ld	Laboratory duplicate RPDs
lp	Laboratory control sample/laboratory control sample duplicate RPDs
m	Matrix spike recovery
md	Matrix spike/matrix spike duplicate RPDs
nb	Negative laboratory blank contamination
p	Chemical preservation issue
r	Dual column RPD
q	Quantitation issue
s	Surrogate recovery
su	Ion suppression
t	Temperature preservation issue
x	Percent solids
y	Serial dilution results
z	ICS results

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0814
Analyses/Method:	EPA SW-846 Method 8270D-SIM for SVOCs (GC/MS) and EPA SW-846 Method 8270D for SVOCs (GC/MS) / 8270D and 8270D-SIM
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Kristin Rutherford/Resolution Consultants Completed on: 12/01/2016
Reviewed by:	Linda Adams/Resolution Consultants File Name: R0814_SVOC_PAH

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 7 and 8, 2016.

Sample ID	Matrix/Sample Type
MW09-09S-ME45-1	Ground water
MW09-14D-ME45-1	Ground water
MW09-20D-ME45-1	Ground water
MW09-ME45-FD03	Field Duplicate of MW09-20D-ME45-1
MW09-20I-ME45-1	Ground water

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8270D, Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry and Mass Spectrometry/Selected Ion Monitoring* (USEPA, 2014);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
✓	Gas Chromatography/Mass Spectrometry (GC/MS) Performance Checks
✗	Initial calibration/continuing calibration verification
✓	Laboratory blanks/equipment blanks
✓	Surrogate spike recoveries
NA	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✗	Laboratory control sample (LCS) results
✓	Field duplicate results
✓	Internal standard recoveries
✓	Sample results/reporting issues

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

It was noted during review that the SAP SVOC list of analytes included N-Nitrosodimethylamine. This analyte was not reported by the laboratory. Also, the compound 2,2'-oxybis (1-chloropropane) was reported by the laboratory, but this compound was not listed in the SAP. No actions were taken except to note these discrepancies.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

GC/MS Performance Checks

The data were reviewed to ensure that the decafluorotriphenylphosphine (DFTPP) tuning was performed at the correct frequency and that the method acceptance criteria were met. All samples were analyzed within 12 hours of the DFTPP tunes.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and/or response factor (RF) method acceptance criteria were met;
- the initial calibration verification standard (ICV) percent recovery acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met; and
- the retention time method acceptance criteria were met.

Nonconformances are summarized in Attachment A in Table A-1a and A-1b. Data qualification to the analytes associated with the specific ICAL and/or CCV was as follows:

ICAL and CCV Response Factor Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results[2]
RF<minimum RF (Table 4 method 8270D)	J	R[1]
[1]Resolution Consultants professional judgment may be used to either raise reporting level or to estimate reporting limit if low standard response is adequate.		
[2]Sample results qualified as not detected (U) due to blank contamination are not rejected, but estimated (UJ).		

ICAL Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected
%RSD > 15% and quantitation based on mean RF	J	UJ
r or r^2 < 0.99 and quantitation based on linear regression	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

ICV Recovery Nonconformances

Criteria	Actions*	
	Detected Results	Nondetected Results
Recovery > 120%	J+	No qualification
Recovery < 80%	J-	UJ
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

CCV Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results
%D > 20%	J	UJ
%Drift >20%	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

Qualified sample results are shown in Table 1.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks were evaluated as to whether there were contaminants detected above the detection limit (DL). Equipment blanks were not collected since dedicated sampling equipment was used for ground water samples.

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met and/or qualification of the sample results was not required.

MS/MSD Results

No client-requested MS/MSD analyses were included in this SDG.

LCS Results

The LCS %Rs were reviewed for conformance with the QC acceptance criteria. For SVOCs, control limits in the QSM were used and for the 8270D SIM method, the laboratory presented laboratory control limits. Results analyzed by 8270D SIM were also compared to the QSM criteria.

Nonconformances are summarized in Attachment A in Table A-2. Data qualification to the analytes associated with the specific LCS %Rs was as follows:

Criteria[1]	Action	
	Detected Compounds	Nondetected Compounds
%R or RPD > UL	J+	No qualification
10%≥%R < LL	J-	UJ
%R < 10%	J-	R

[1] In the absence of NFG 2016 guidance for LCS results, NFG 2016 MS/MSD guidance was applied with Resolution Consultants professional judgment.

Qualified sample results are shown in Table 1.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than five times the limit of quantitation (LOQ).

Since all sample results were nondetect, field duplicate precision was deemed acceptable.

Internal Standard Recoveries

The internal standard (IS) recoveries were reviewed for conformance with the QC acceptance criteria.

All QC acceptance criteria were met.

Sample Results/Reporting Issues

All compounds detected at concentrations less than the LOQ but greater than the limit of detection (LOD) were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

All analytes reported using method 8270D SIM were also reported using 8270D. The reporting limit is lower for the SIM method; therefore duplicate results for 8270D were noted as “not reported” in the database.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
JN	The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Reason Codes and Explanations

Reason Code	Explanation
be	Equipment blank contamination
bf	Field blank contamination
bl	Laboratory blank contamination
c	Calibration issue
d	Reporting limit raised due to chromatographic interference
fd	Field duplicate RPDs
h	Holding times
i	Internal standard areas
k	Estimated Maximum Possible Concentration (EMPC)
l	LCS or OPR recoveries
lc	Labeled compound recovery
ld	Laboratory duplicate RPDs
lp	Laboratory control sample/laboratory control sample duplicate RPDs
m	Matrix spike recovery
md	Matrix spike/matrix spike duplicate RPDs
nb	Negative laboratory blank contamination
p	Chemical preservation issue
r	Dual column RPD
q	Quantitation issue
s	Surrogate recovery
su	Ion suppression
t	Temperature preservation issue
x	Percent solids
y	Serial dilution results
z	ICS results

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0838
Analyses/Method:	EPA SW-846 Method 8270D-SIM for SVOCs (GC/MS-SIM) and EPA SW-846 Method 8270D for SVOCs (GC/MS)
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Kristin Rutherford/Resolution Consultants Completed on: 12/05/2016
Reviewed by:	Linda Adams/Resolution Consultants File Name: R0838_SVOC_PAH

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 12, 13, 15, and 16, 2016.

Sample ID	Matrix/Sample Type
MW09-14IA-ME45-1	Ground water
MW09-ME45-FD05	Field Duplicate of MW09-14IA-ME45-1
P09-04A-ME45-1A	Ground water
P09-06B-ME45-1	Ground water
P09-08B-ME45-1A	Ground water
P09-09-ME45-1	Ground water
P09-10-ME45-1	Ground water
P09-11B-ME45-1	Ground water
P09-12B-ME45-1	Ground water

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8270D, Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry and Mass Spectrometry/Selected Ion Monitoring* (USEPA, 2014);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

- ✓ Data completeness (chain-of-custody [COC])/sample integrity
- ✓ Holding times and sample preservation
- ✓ Gas Chromatography/Mass Spectrometry (GC/MS) Performance Checks
- ✗ Initial calibration/continuing calibration verification
- ✓ Laboratory blanks/equipment blanks
- ✓ Surrogate spike recoveries
- ✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results
- ✗ Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
- ✓ Field duplicate results
- ✓ Internal standard recoveries
- ✓ Sample results/reporting issues

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

The sample ID listed in the laboratory data package and electronic data deliverable (MW09-14**1**A-ME45-1) for laboratory sample R0838-29 should be MW09-14**I**A-ME45-1. The sample ID was corrected in the project database. No actions were taken except to note this discrepancy.

It was noted during review that the SAP SVOC list of analytes included N-Nitrosodimethylamine. This analyte was not reported by the laboratory. Also, the compound 2,2'-oxybis (1-chloropropane) was reported by the laboratory, but this compound was not listed in the SAP. No actions were taken except to note these discrepancies.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

GC/MS Performance Checks

The data were reviewed to ensure that the decafluorotriphenylphosphine (DFTPP) tuning was performed at the correct frequency and that the method acceptance criteria were met. All samples were analyzed within 12 hours of the DFTPP tunes.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and/or response factor (RF) method acceptance criteria were met;
- the initial calibration verification standard (ICV) percent recovery acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met; and
- the retention time method acceptance criteria were met.

Nonconformances are summarized in Attachment A in Table A-1a and A-1b. Data qualification to the analytes associated with the specific ICAL and/or CCV was as follows:

ICAL and CCV Response Factor Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results[2]
RF<minimum RF (Table 4 method 8270D)	J	R[1]
[1]Resolution Consultants professional judgment may be used to either raise reporting level or to estimate reporting limit if low standard response is adequate.		
[2]Sample results qualified as not detected (U) due to blank contamination are not rejected, but estimated (UJ).		

ICAL Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected
%RSD > 15% and quantitation based on mean RF	J	UJ
r or r^2 < 0.99 and quantitation based on linear regression	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

ICV Recovery Nonconformances

Criteria	Actions*	
	Detected Results	Nondetected Results
Recovery > 120%	J+	UJ
Recovery < 80%	J-	UJ
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

CCV Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results
%D > 20%	J	UJ
%Drift >20%	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

Qualified sample results are shown in Table 1.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks and equipment rinsate blanks were evaluated as to whether there were contaminants detected above the limit of detection (LOD).

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria.

All QC acceptance criteria were met and/or qualification of the sample results was not required.

MS/MSD Results

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-2. Data qualification to the analytes associated with the specific MS/MSD nonconformances was as follows:

Actions: (Based on NFG 2016, Region 1, and Resolution Consultants professional judgment)

Criteria	Action	
	Detected Compounds	Nondetected Compounds
%R> UL	J+	No qualification
10% ≤ %R < LL	J-	UJ
%R <10%	J-	R
%RPD > UL	J	No qualification

Notes:

1. Resolution Consultants professional judgment is used to estimate (UJ) rather the reject (R) sample results previously negated (U) on the basis of blank contamination.

2. If a field duplicate sample was also collected for the native sample chosen for MS/MSD analysis,

professional judgment is used to apply MS/MSD actions to the corresponding field duplicate sample as well as the native sample.

Qualified sample results are shown in Table 1.

LCS/LCSD Results

The LCS and/or LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria. For SVOCs, control limits in the QSM were used and for the 8270D SIM method, the laboratory presented laboratory control limits. Results analyzed by 8270D SIM were also compared to the QSM criteria.

Nonconformances are summarized in Attachment A in Table A-3. Data qualification to the analytes associated with the specific LCS %Rs or RPDs was as follows:

Criteria[1]	Action	
	Detected Compounds	Nondetected Compounds
%R or RPD > UL	J+	No qualification
10%≥%R < LL	J-	UJ
%R < 10%	J-	R

[1] In the absence of NFG 2014 guidance for LCS results, NFG 2014 MS/MSD guidance was applied with Resolution Consultants professional judgment.

Qualified sample results are shown in Table 1.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than five times the limit of quantitation (LOQ).

All QC acceptance criteria were met and/or qualification of the data was not required and/or qualification of the sample results was not required.

Internal Standard Recoveries

The internal standard (IS) recoveries were reviewed for conformance with the QC acceptance criteria.

All QC acceptance criteria were met.

Sample Results/Reporting Issues

All compounds detected at concentrations less than the LOQ but greater than the LOD were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

Any sample that was analyzed at a dilution due to high concentrations of target or non-targets was checked to ensure that the results and/or sample specific LODs and LOQs were adjusted accordingly by the laboratory.

All analytes reported using method 8270D SIM were also reported using 8270D. The reporting limit is lower for the SIM method; therefore duplicate results for 8270D were noted as “not reported” in the database.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
JN	The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0898
Analyses/Method:	EPA SW-846 Method 8270-SIM for SVOCs (GC/MS-SIM) / 8270_SIM
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Kristin Rutherford/Resolution Consultants Completed on: 12/02/2016
Reviewed by:	Linda Adams/Resolution Consultants File Name: R0898_PAH

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 27, 2016.

Sample ID	Matrix/Sample Type
ALLENHARBOR-ME45-1	Ground water
MW09-ME45-FD06	Field Duplicate of Allenharbor-ME45-1

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8270D, Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry/Selective Ion Monitoring (SIM)* (USEPA, 2007);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

✓	Data completeness (chain-of-custody (COC)/sample integrity
✓	Holding times and sample preservation
✓	Gas Chromatography/Mass Spectrometry (GCMS) Performance Checks
✗	Initial calibration/continuing calibration verification
✓	Laboratory blanks/equipment blanks
✓	Surrogate spike recoveries
✗	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✓	Laboratory control sample (LCS) results
✓	Field duplicate results
✓	Internal standard results
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. No data were rejected. Selected data points were qualified as estimated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

GC/MS Performance Checks

The data were reviewed to ensure that the decafluorotriphenylphosphine (DFTPP) tuning was performed at the correct frequency and that the method acceptance criteria were met. All samples were analyzed within 12 hours of the DFTPP tunes.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and/or response factor method acceptance criteria were met;
- the initial calibration verification standard (ICV) percent recovery acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met; and
- the retention time method acceptance criteria were met.

Nonconformances are summarized in Attachment A in Table A-1. Data qualification to the analytes associated with the specific ICAL and/or CCV was as follows:

ICAL and CCV Response Factor Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results[2]
RF<minimum RF (Table 4 method 8270D)	J	R[1]
[1]Resolution Consultants professional judgment may be used to either raise reporting level or to estimate reporting limit if low standard response is adequate.		
[2]Sample results qualified as not detected (U) due to blank contamination are not rejected, but estimated (UJ).		

ICAL Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected
%RSD > 15% and quantitation based on mean RF	J	UJ
r or r^2 < 0.99 and quantitation based on linear regression	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

ICV Recovery Nonconformances

Criteria	Actions*	
	Detected Results	Nondetected Results
Recovery > 120	J	No qualification
Recovery < 80	J	UJ
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

CCV Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results
%D > 20%	J	UJ
%Drift >20%	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

Qualified sample results are shown in Table 1.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks and equipment rinsate blanks were evaluated as to whether there were contaminants detected above the detection limit (DL). Equipment blanks were not collected with ground water samples.

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria.

All QC acceptance criteria were met.

MS/MSD Results

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-2. Data qualification to the analytes associated with the specific MS/MSD nonconformances was as follows:

Actions: (Based on NFG 2016, Region 1, and Resolution Consultants professional judgment)

Criteria	Action	
	Detected Compounds	Nondetected Compounds
%R> UL	J+	No qualification
10% ≤ %R < LL*	J-	UJ
%R <10%*	J-	R
%RPD > UL	J	No qualification
* NFG 2016 does not list a minimum limit. Based on Region 1 and Resolution Consultants professional judgment, a minimum limit of 10% was used.		

Notes:

1. Based on NFG 2016 SVOC guidance, Resolution Consultants professional judgment is used to reject (R) non-detects in all associated samples for any analyte with < 10% recovery. Also, Resolution Consultants professional judgment is used to estimate (UJ) rather the reject (R) sample results previously negated (U) on the basis of blank contamination.

2. If a field duplicate sample was also collected for the native sample chosen for MS/MSD analysis, professional judgment is used to apply MS/MSD actions to the corresponding field duplicate sample as well as the native sample.

Qualified sample results are shown in Table 1.

LCS Results

The LCS %Rs were reviewed for conformance with the QC acceptance criteria.

All QC acceptance criteria were met.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than five times the limit of quantitation (LOQ).

Since all sample results were nondetect, field duplicate precision was deemed acceptable.

Internal Standard Results

The internal standard (IS) recoveries were reviewed for conformance with the QC acceptance criteria.

All QC acceptance criteria were met.

Sample Results/Reporting Issues

All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

Any sample that was analyzed at a dilution due to high concentrations of target or non-targets was checked to ensure that the results and/or sample specific limits of detection (LODs) and LOQs were adjusted accordingly by the laboratory.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 6, 7, 8, and 9, 2016.

Sample ID	Matrix/Sample Type
MW09-07S-ME45-1	Ground water
MW09-08DA-ME45-1	Ground water
MW09-09DA-ME45-1	Ground water
MW09-11S-ME45-1	Ground water
MW09-17I-ME45-1	Ground water
MW09-21S-ME45-1	Ground water
MW09-24D-ME45-1	Ground water
MW09-25S-ME45-1	Ground water
MW09-26DA-ME45-1	Ground water
MW09-26S-ME45-1	Ground water
MW09-27D-ME45-1	Ground water
MW09-ME45-FD01	Field Duplicate of MW09-27D-ME45-1
MW09-27S-ME45-1	Ground water

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8081B, Organochlorine Pesticides by Gas Chromatography* (USEPA, 2007);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8082A, Polychlorinated Biphenyls (PCBs) by Gas Chromatography* (USEPA, 2007);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);

- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
✓	GC/ECD Instrument Performance Check
✓	Initial calibration/continuing calibration verification
✓	Laboratory blanks/equipment blanks
✓	Surrogate spike recoveries
✓	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✓	Laboratory control sample (LCS) results
✓	Field duplicates results
NA	Sulfur Clean-up
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. There were no results qualified on the basis of this data review.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

GC/ECD Instrument Performance Check

Instrument performance check standards were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met and/or qualification of the sample results was not required.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and method acceptance criteria were met;
- the second-source calibration verification (ICV) method acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) acceptance criteria were met.

All criteria were met and/or qualification of the sample results was not required.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks were evaluated as to whether there were contaminants detected above the detection limit (DL). Equipment blanks were not collected since dedicated sampling equipment was used for ground water samples.

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance.

The surrogate recoveries were within the QC acceptance criteria and/or qualification of the sample results was not required.

MS/MSD Results

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria.

All QC acceptance criteria were met and/or qualification of the sample results was not required.

LCS Results

The LCS %Rs were reviewed for conformance with the QC acceptance criteria.

The LCS %Rs were within the QC acceptance criteria.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than two times the sample limit of quantitation (LOQ).

Since all sample results were nondetect, field duplicate precision was deemed acceptable.

Sulfur Clean-up

Sulfur clean-up was not applicable for aqueous samples.

Sample Results/Reporting Issues

For detected results for both pesticides and PCBs, the laboratory reported the lower of the two values between the two columns. Based on DoD QSM v5.0, positive results should be reported from the primary column. No actions were taken except to note this discrepancy.

All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation

Dual Column Precision

Sample results were reviewed to ensure that the dual column precision RPD criteria were met.

Since all sample results were nondetect, dual column precision was deemed acceptable.

QUALIFICATION ACTIONS

No sample results were qualified as a result of this data review.

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0838
Analyses/Method:	EPA SW-846 Method 8081B for Organochlorine Pesticides (GC/ECD) and EPA SW-846 Method 8082A for PCBs (GC/ECD)
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Kristin Rutherford/Resolution Consultants Completed on: 11/21/2016
Reviewed by:	Linda Adams/Resolution Consultants File Name: R0838_PEST_PCB

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 12 and 16, 2016.

Sample ID	Matrix/Sample Type
MW09-14IA-ME45-1	Ground water
MW09-ME45-FD05	Field Duplicate of MW09-14IA-ME45-1
P09-09-ME45-1	Ground water
P09-10-ME45-1	Ground water
P09-11B-ME45-1	Ground water

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8081B, Organochlorine Pesticides by Gas Chromatography* (USEPA, 2007);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8082A, Polychlorinated Biphenyls (PCBs) by Gas Chromatography* (USEPA, 2007);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM v5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
✓	GC/ECD Instrument Performance Check
✓	Initial calibration/continuing calibration verification
✓	Laboratory blanks/equipment blanks
✗	Surrogate spike recoveries
✗	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✓	Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
✓	Field duplicates results
NA	Sulfur Clean-up
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. Selected data points were qualified as estimated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

The sample ID for laboratory sample R0838-29 should be MW09-14IA-ME45-1 (with a capital letter "I") not MW09-141A-ME45-1 (with the number one). Revised data were not requested. No other actions were required except to note this discrepancy.

Sample P09-01-ME45-1 was listed on the COC for Pesticide and PCB analyses but due to laboratory error, the sample was recollected on September 27, 2016 and reported in SDG R0898.

Sample P09-11B-ME45-1 was not listed on the COC for analysis, but results for pesticides and PCBs were reported in this data set. This sample was analyzed and reported in error by the laboratory, and the results have not been retained. No further actions were taken except to note this discrepancy.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

GC/ECD Instrument Performance Check

Instrument performance check standards were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met and/or qualification of the sample results was not required.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and method acceptance criteria were met;
- the second-source calibration verification (ICV) method acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) acceptance criteria were met.

All criteria were met.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks were evaluated as to whether there were contaminants detected above the detection limit (DL). Equipment rinsate blank samples were not collected for ground water samples.

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance.

Nonconformances are summarized in Attachment A in Table A-1. Data qualification on the basis of surrogate recoveries was as follows:

Actions: (Based on NFG 2016)

Criteria	Action	
	Detected	Nondetected
%R <10% (undiluted)	J-	R
%R <10% (diluted)	Use professional judgment*	Use professional judgment*
%R ≥10% but is < LL	J-	UJ
%R > UL but ≤200%	J+	No qualification
%R >200	J+	Use professional judgment*
* Use professional judgment in qualifying data, as surrogate recovery problems may not directly apply to target compounds.		

Qualified sample results are shown in Table 1.

MS/MSD Results

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-2. Data qualification to the analytes associated with the specific MS/MSD nonconformances was as follows:

Actions: (Based on NFG 2016)

Criteria	Action	
	Detected	Nondetected
%R <20%	J-	R
%R ≥20% but is < LL	J-	UJ
%R > UL	J+	No qualification
%RPD > QC limit	J	No qualification

Notes: *(applies to PCBs)*

1. If the native sample Aroclor does not qualitatively match the spiked Aroclor then consider the effect of overlapping in evaluating the spike recovery results. Apparently high recoveries may be due to Aroclor mismatch alone.
2. Based on Resolution Consultants professional judgment, apply actions to Aroclors with similar retention time ranges. Apply actions to Aroclors 1016, 1221, 1232, 1242 and 1248 if Aroclor 1016 exceeds MS/MSD %R or RPD criteria and apply actions to Aroclors 1248, 1254 and 1260 if Aroclor 1260 exceeds MS/MSD %R or RPD criteria.

Qualified sample results are shown in Table 1.

LCS/LCSD Results

The LCS and/or LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria.

The LCS and/or LCSD %Rs and/or RPDs were within the QC acceptance criteria.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than two times the sample limit of quantitation (LOQ).

Since all sample results were nondetect, field duplicate precision was deemed acceptable.

Sulfur Clean-up

Sulfur clean-up was not applicable for aqueous samples.

Sample Results/Reporting Issues

For detected results for both pesticides and PCBs, the laboratory reported the lower of the two values between the two columns. Based on DoD QSM v5.0, positive results should be reported from the primary column. No actions were taken except to note this discrepancy.

All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation

Dual Column Precision

Sample results were reviewed to ensure that the dual column precision RPD criteria were met.

Since all sample results were nondetect, dual column precision was deemed acceptable.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Attachment B

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
JN	The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Attachment C

Reason Codes and Explanations

Reason Code	Explanation
be	Equipment blank contamination
bf	Field blank contamination
bl	Laboratory blank contamination
c	Calibration issue
d	Reporting limit raised due to chromatographic interference
fd	Field duplicate RPDs
h	Holding times
i	Internal standard areas
k	Estimated Maximum Possible Concentration (EMPC)
l	LCS recoveries
lc	Labeled compound recovery
ld	Laboratory duplicate RPDs
lp	Laboratory control sample/laboratory control sample duplicate RPDs
m	Matrix spike recovery
md	Matrix spike/matrix spike duplicate RPDs
nb	Negative laboratory blank contamination
p	Chemical preservation issue
r	Dual column RPD
q	Quantitation issue
s	Surrogate recovery
su	Ion suppression
t	Temperature preservation issue
x	Percent solids
y	Serial dilution results
z	ICS results

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0898
Analyses/Method:	EPA SW-846 Method 8081B for Organochlorine Pesticides (GC/ECD) and EPA SW-846 Method 8082A for PCBs (GC/ECD)
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Kristin Rutherford/Resolution Consultants Completed on: 12/02/2016
Reviewed by:	Linda Adams/Resolution Consultants File Name: R0898_PEST_PCB

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 27, 2016.

Sample ID	Matrix/Sample Type
P09-01-ME45R-1	Ground water

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8081B, Organochlorine Pesticides by Gas Chromatography* (USEPA, 2007);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8082A, Polychlorinated Biphenyls (PCBs) by Gas Chromatography* (USEPA, 2007);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
✓	GC/ECD Instrument Performance Check
✗	Initial calibration/continuing calibration verification
✓	Laboratory blanks/equipment blanks
✓	Surrogate spike recoveries
NA	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✓	Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
NA	Field duplicates results
NA	Sulfur Clean-up
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. Selected data points were qualified as estimated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Sample P09-01-ME45-1 was originally sampled on September 13, 2016 but needed to be recollected on September 27, 2016 for Pesticide/PCB analysis only. Because the database only allows one sample date per unique sample ID, the original sample ID for the resampling as listed on the COC has been revised to P09-01-ME45R-1 to allow the correct re-sampling date to be reported.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

GC/ECD Instrument Performance Check

Instrument performance check standards were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met and/or qualification of the sample results was not required.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and method acceptance criteria were met;
- the second-source calibration verification (ICV) method acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) acceptance criteria were met.

Pesticide nonconformances are summarized in Attachment A in Tables A-1a and A-1b. Data qualification on the basis of the initial calibration was as follows:

Pesticides Initial Calibration

Criteria	Actions	
	Detected Results	Nondetected Results
%RSD > 20%	J	UJ[1]
r < 0.995 or r^2 < 0.99 for each peak[2,3]	J[4]	UJ[4]

[1] NFG recommends professional judgment, thus Resolution Consultants professional judgment was used
[2] 6 points required for second order; 7 points required for third order
[3] For toxaphene and technical chlordane each peak, not the average must meet the criteria
[4] No guidance in NFG, thus Resolution Consultants professional judgment was used

PCBs Initial Calibration

Criteria	Actions[3]	
	Detected Results	Nondetected Results
%RSD > 20% for each peak	J	UJ
r < 0.995 or r^2 < 0.99 for each peak[1]	J[2]	UJ[2]

[1] 6 points required for second order; 7 points required for third order
[2] No guidance in NFG, thus Resolution Consultants professional judgment was used.
[3] In the absence of an ICAL for a particular Aroclor, Resolution Consultants professional judgment was used as follows: If the traditional model of a linear calibration was employed by the laboratory, validation actions were applied to Aroclors with similar retention time ranges. Actions were applied to Aroclors 1016, 1221, 1232, 1242, and 1248 when Aroclor 1016 exceeded ICAL criteria and actions were applied to Aroclors 1248, 1254, and 1260 when Aroclor 1260 exceeded ICAL criteria. If multipoint calibration was performed for the individual Aroclors, the calibration factors for those calibrations were used to evaluate linearity.

Data qualification on the basis of the ICVs was as follows:

Pesticides Second-Source Calibration Verification

Criteria	Actions[1]	
	Detected	Nondetected
%D or %Drift >20%	J	UJ

[1] Actions are applied to positive results reported from the nonconforming column. Do not qualify nondetect results unless both columns are noncompliant.

PCBs Second-Source Calibration Verification

Criteria	Actions[1,2]	
	Detected	Nondetected
%D or %Drift[3] >20% for each peak	J	UJ

[1] Actions are applied to positive results reported from the nonconforming column. Do not qualify nondetect results unless both columns are noncompliant.
[2] In the absence of an ICV for a particular Aroclor, Resolution Consultants professional judgment was used to apply validation actions to Aroclors with similar retention time ranges. Actions were applied to Aroclors 1016, 1221, 1232, 1242, and 1248 when Aroclor 1016 exceeded ICV criteria and actions were applied to Aroclors 1248, 1254, and 1260 when Aroclor 1260 exceeded ICV criteria.
[3] No guidance for % drift in NFG, thus Resolution Consultants professional judgment was used.

Data qualification on the basis of the CCVs was as follows:

Pesticides Continuing Calibration

Criteria	Actions[1]	
	Detected	Nondetected
%D or %Drift >20%	J	UJ

[1] Actions are applied to positive results reported from the nonconforming column. Do not qualify nondetect results unless both columns are noncompliant.

PCBs Continuing Calibration

Criteria	Actions[1,2]	
	Detected	Nondetected
%D or %Drift[3] >20% for each peak (>50% for each peak in an ending CCV)	J	UJ

[1] Actions are applied to positive results reported from the nonconforming column. Do not qualify nondetect results unless both columns are noncompliant.
[2] In the absence of a CCV for a particular Aroclor, Resolution Consultants professional judgment was used to apply validation actions to Aroclors with similar retention time ranges. Actions were applied to Aroclors 1016, 1221, 1232, 1242, and 1248 when Aroclor 1016 exceeded CCV criteria and actions were applied to Aroclors 1248, 1254, and 1260 when Aroclor 1260 exceeded CCV criteria.
[3] No guidance for % drift in NFG, thus Resolution Consultants professional judgment was used.

Qualified results are shown in Table 1.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks were evaluated as to whether there were contaminants detected above the detection limit (DL). Equipment rinsate blank samples were not collected for ground water samples.

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance.

The surrogate recoveries were within the QC acceptance criteria.

MS/MSD Results

MS/MSD analyses were not performed on samples reported in this SDG. There were no validation actions taken on this basis.

LCS/LCSD Results

The LCS and/or LCSD %Rs and/or relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria.

The LCS and/or LCSD %Rs and/or RPDs were within the QC acceptance criteria.

Field Duplicate Results

There were no field duplicate samples submitted with this data set. No validation actions were taken on this basis.

Sulfur Clean-up

Sulfur clean-up was not applicable for aqueous samples.

Sample Results/Reporting Issues

For detected results for both pesticides and PCBs, the laboratory reported the lower of the two values between the two columns. Based on DoD QSM v5.0, positive results should be reported from the primary column. No actions were taken except to note this discrepancy.

All compounds detected at concentrations less than the LOQ but greater than the limit of detection (LOD) were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation

Dual Column Precision

Sample results were reviewed to ensure that the dual column precision RPD criteria were met.

Since all sample results were nondetect, dual column precision was deemed acceptable.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0812
Analyses/Method:	EPA SW-846 Method 6020A for Metals (ICP-MS) and EPA SW-846 Method 7470A for Mercury in Liquid Waste (Manual Cold-Vapor Technique)
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Cathy Larson/Resolution Consultants — Completed on: 12/14/2016
Reviewed by:	Linda Adams/Resolution Consultants — File Name: R0812_Metals

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 6, 7, 8, and 9, 2016.

Sample ID	Matrix/Sample Type
MW09-07S-ME45-1	Ground water
MW09-07S-ME45-1-F	Ground water
MW09-08DA-ME45-1	Ground water
MW09-08DA-ME45-1-F	Ground water
MW09-09DA-ME45-1	Ground water
MW09-09DA-ME45-1-F	Ground water
MW09-11S-ME45-1	Ground water
MW09-11S-ME45-1-F	Ground water
MW09-17I-ME45-1	Ground water
MW09-17I-ME45-1-F	Ground water
MW09-21S-ME45-1	Ground water
MW09-21S-ME45-1-F	Ground water
MW09-24D-ME45-1	Ground water
MW09-24D-ME45-1-F	Ground water
MW09-25S-ME45-1	Ground water
MW09-25S-ME45-1-F	Ground water
MW09-26DA-ME45-1	Ground water
MW09-26DA-ME45-1-F	Ground water
MW09-26S-ME45-1	Ground water
MW09-26S-ME45-1-F	Ground water

Sample ID	Matrix/Sample Type
MW09-27D-ME45-1	Ground water
MW09-ME45-FD01	Field Duplicate of MW09-27D-ME45-1
MW09-ME45-FD01-F	Field Duplicate of MW09-27D-ME45-1-F
MW09-27D-ME45-1-F	Ground water
MW09-27S-ME45-1	Ground water
MW09-27S-ME45-1-F	Ground water

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 6020A, Inductively Coupled Plasma-Mass Spectrometry* (USEPA, 1996);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 7470A, Mercury in Liquid Waste* (USEPA, 1996);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following parameters (where applicable to the method):

✓ Data completeness (chain-of-custody [COC])/sample integrity
✓ Holding times and sample preservation
✓ ICP/MS Instrument tuning
✓ Initial calibration/continuing calibration verification
✗ Laboratory blanks/equipment blanks
✓ ICP interference check standards
✓ Matrix spike (MS) results
✓ Laboratory duplicate results
✓ Laboratory control sample (LCS)
✓ Field duplicate results
✓ ICP/MS serial dilution results
✓ ICP/MS internal standard performance
✓ Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. The symbol (✗) indicates that a quality control (QC) nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In

addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. No data were rejected. Selected data points were estimated and/or negated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Exceptions noted during the review were:

1. Sample misidentification: Sample MW09-27-ME45-1 was listed on the COC. This sample identifier was corrected to MW09-27D-ME45-1 as described in email correspondence dated September 8, 2016.

2. A note in the lab report indicated samples were split between SDGs R0812, R0813, and R0814. These SDGs were reviewed and all samples were accounted for.

The exceptions noted did not affect completeness.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

ICP/MS Instrument Tuning

ICP/MS tuning results were reviewed for conformance with the QC acceptance criteria to ensure that:

- the proper tuning solution was used with elements representing all of the mass regions of interest;
- the tunings were performed at the beginning of each analysis and prior to calibration;
- the tuning solution was analyzed at least 4 times as required by the method;
- the mass calibration was within 0.1 amu of the true value for all masses within the region of interest;
- the resolution was verified to be <0.9 amu full width at 10% peak height; and
- the %RSD was ≤ 5% for the analytes contained in the tuning solution.

The QC acceptance criteria were met.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- all criteria were met for the calibration curves
- the initial calibration verification (ICV) percent recovery (%R) criteria were met;
- the continuing calibration verification standard (CCV) method percent difference (%Ds) were met; and
- the low level check standards (CRI or CRA) %R criteria were met.

The QC acceptance criteria were met.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks were evaluated as to whether there were contaminants detected above the detection limit (DL). Equipment blanks were not collected since dedicated sampling equipment was used for ground water samples. Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Method and equipment rinsate results were reviewed for conformance with the QC acceptance criteria. Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

Nonconformances are summarized in Attachment A in Table A-1. Sample results were qualified as follows:

Blank Type	Blank Result	Sample Result	Action for Samples
ICB/CCB (Positive)	≥IDL/DL but ≤ LOQ	Nondetect	No action
		≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ	Use Resolution Consultants professional judgment (see below [1])
	>LOQ	≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ but < ICB/CCB Result	Qualify at level of Blank Result with a "U" or Qualify result as unusable
		>ICB/CCB but <10x the ICB/CCB result	Qualify as estimated (J)
		≥10x ICB/CCB	No action is taken based on Resolution Consultants professional judgment
ICB/CCB (Negative)	< (-LOQ)	Nondetect	Use Resolution Consultants professional judgment and qualify as estimated (UJ)
		≥IDL/DL but < LOQ	Use Resolution Consultants professional judgment and qualify results < LOQ as estimated (J-)
		< 10x LOQ	Qualify results >LOQ but <10x LOQ as estimated (J-)
		≥10x LOQ	No action is taken based on Resolution Consultants professional judgment
	≤ -IDL/DL and ≥ -LOQ	Nondetect	Use Resolution Consultants professional judgment, qualify as estimated (UJ)
		≥IDL/DL and <5x |neg. blank|	Use Resolution Consultants professional judgment, qualify results as estimated (J-)

Blank Type	Blank Result	Sample Result	Action for Samples
PB / EB/ FB (Positive)	> LOQ	≥IDL/DL but ≤ LOQ	Qualify as nondetect (U) at the LOQ
		>LOQ but < 10x Blank Result	Qualify results as unusable
		≥10x Blank Result	No action
	≥IDL/DL but ≤LOQ	Nondetect	No action
		≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ	Use Resolution Consultants professional judgment (see below [1])
PB (Negative)	< (-LOQ)	< 10x LOQ	Qualify positive results <10x LOQ as estimated (J-) and nondetects as estimated (UJ)
		≥10x LOQ	No action

[1] Establish an action level (AL) at 5x the blank contamination. If sample result is <AL, qualify the reported result with a U.

If positive and negative blanks are reported for an analyte in the calibration blanks, pick the highest blank (absolute value) and use the table above with the following modifications:

Blank Type	Blank Results	Actions in Table to Use	Modifications
ICB/CCB	Positive > Negative	ICB/CCB (Positive)	Estimate nondetects (UJ)
	Negative > Positive	ICB/CCB (Negative)	Estimate J

Qualified sample results are shown in Table 1.

ICP Interference Check Standards

The ICP interference check standards (ICSA, ICSAB) were reviewed for conformance.

All criteria were met for the ICSA and ICSAB.

MS Results

The MS %Rs were reviewed for conformance with the QC acceptance criteria.

The MS %Rs were within the QC acceptance criteria.

Laboratory Duplicate Results

The laboratory duplicate relative percent differences (RPDs) were reviewed for conformance.

The laboratory duplicate RPDs were within the QC acceptance criteria.

LCS Results

The LCS %Rs were reviewed for conformance with the QC acceptance criteria.

The LCS %Rs were within the QC acceptance criteria.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC acceptance criterion of ≤30% for aqueous matrices. This criterion applies if both results were greater than five times the limit of quantitation (LOQ).

All field duplicate precision criteria were met.

ICP/MS Serial Dilution Results

The serial dilution percent differences (%Ds) were reviewed for conformance with the QC acceptance criteria.

The serial dilution %Ds were within the QC acceptance criteria.

ICP/MS Internal Standard Performance

ICP/MS Internal standard performance was reviewed for conformance with the QC acceptance criteria. Internal standards were within the QC acceptance criteria and/or qualifications were not required.

Sample Results/Reporting Issues

All analytes detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

All criteria were met.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Attachment B

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0813
Analyses/Method:	EPA SW-846 Method 6020A for Metals (ICP-MS) EPA SW-846 Method 7470A for Mercury in Liquid Waste (Manual Cold-Vapor Technique)
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Linda Adams/Resolution Consultants — Completed on: 12/08/2016
Reviewed by:	Cathy Larson/Resolution Consultants — File Name: R0813_Metals

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 6, 7, and 8, 2016.

Sample ID	Matrix/Sample Type
MW09-02S-ME45-1	Ground water
MW09-02S-ME45-1-F	Ground water
MW09-03D-ME45-1	Ground water
MW09-03D-ME45-1-F	Ground water
MW09-08S-ME45-1	Ground water
MW09-ME45-FD02	Field Duplicate of MW09-08S-ME45-1
MW09-08S-ME45-1-F	Ground water
MW09-ME45-FD02-F	Field Duplicate of MW09-08S-ME45-1-F
MW09-10D-ME45-1	Ground water
MW09-10D-ME45-1-F	Ground water
MW09-10S-ME45-1	Ground water
MW09-10S-ME45-1-F	Ground water
MW09-21D-ME45-1	Ground water
MW09-21D-ME45-1-F	Ground water
MW09-23D-ME45-1	Ground water
MW09-23D-ME45-1-F	Ground water
MW09-23S-ME45-1	Ground water
MW09-23S-ME45-1-F	Ground water
MW09-24S-ME45-1	Ground water
MW09-24S-ME45-1-F	Ground water

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 6020A, Inductively Coupled Plasma-Mass Spectrometry* (USEPA, 1996);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 7470A, Mercury in Liquid Waste or SW-846 Method 7471B, Mercury in Solid or Semisolid Waste, as appropriate (Manual Cold-Vapor Technique)* (USEPA, 1996);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following parameters (where applicable to the method):

✓	Data completeness (chain-of-custody[COC])/sample integrity
✓	Holding times and sample preservation
✓	ICP/MS Instrument tuning
✗	Initial calibration/continuing calibration verification
✗	Laboratory blanks/equipment blanks
✓	ICP interference check standards
NA	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
NA	Laboratory duplicate results
✓	Laboratory control sample (LCS) results
✓	Field duplicate results
NA	ICP/MS serial dilution results
✓	ICP/MS internal standard performance
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a quality control (QC) nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. No data were rejected. Selected data points were estimated and/or negated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

ICP/MS Instrument Tuning

ICP/MS tuning results were reviewed for conformance with the QC acceptance criteria to ensure that:

- the proper tuning solution was used with elements representing all of the mass regions of interest;
- the tunings were performed at the beginning of each analysis and prior to calibration;
- the tuning solution was analyzed at least 4 times as required by the method;
- the mass calibration was within 0.1 amu of the true value for all masses within the region of interest;
- the resolution was verified to be <0.9 amu full width at 10% peak height; and
- the %RSD was ≤ 5% for the analytes contained in the tuning solution.

The QC acceptance criteria were met.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- all criteria were met for the calibration curves
- the initial calibration verification (ICV) percent recovery (%R) criteria were met;
- the continuing calibration verification standard (CCV) method percent difference (%Ds) were met; and
- the low level check standards %R criteria were met

Nonconformances are summarized in Attachment A in Table A-1. Data qualification to the analytes associated with the specific ICV and/or CCV was as follows:

Criteria	Action	
	Detect	Non-detect
Calibration not performed	R	R
Calibration incomplete	Use professional judgment J or R	Use professional judgment UJ or R
Correlation coefficient < 0.995, %D outside ±30%, or y-intercept ≥ CRQL	J	UJ
ICV/CCV %R < 75%	Use professional judgment J- or R	R
ICV/CCV %R 75-89%	J	UJ
ICV/CCV %R 90-110%	No qualification	No qualification
ICV/CCV %R 111-125%	J+	No qualification
ICV/CCV %R > 125%	Use professional judgment J+ or R	No qualification

Qualified sample results are shown in Table 1.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks were evaluated as to whether there were contaminants detected above the detection limit (DL). Equipment blanks were not collected since dedicated sampling equipment was used for ground water samples. Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Method results were reviewed for conformance with the QC acceptance criteria. Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

Nonconformances are summarized in Attachment A in Table A-2. Sample results were qualified as follows:

Blank Type	Blank Result	Sample Result	Action for Samples
ICB/CCB (Positive)	≥IDL/DL but ≤ LOQ	Nondetect	No action
		≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ	Use Resolution Consultants professional judgment (see below [1])
	>LOQ	≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ but < ICB/CCB Result	Qualify at level of Blank Result with a "U" or Qualify result as unusable
		>ICB/CCB but <10x the ICB/CCB result	Qualify as estimated (J)
		≥10x ICB/CCB	No action is taken based on Resolution Consultants professional judgment
ICB/CCB (Negative)	< (-LOQ)	Nondetect	Use Resolution Consultants professional judgment and qualify as estimated (UJ)
		≥IDL/DL but < LOQ	Use Resolution Consultants professional judgment and qualify results < LOQ as estimated (J)
		< 10x LOQ	Qualify results >LOQ but <10x LOQ as estimated (J)
		≥10x LOQ	No action is taken based on Resolution Consultants professional judgment
	≤ -IDL/DL and ≥ -LOQ	Nondetect	Use Resolution Consultants professional judgment, qualify as estimated (UJ)
		≥IDL/DL and <5x |neg. blank|	Use Resolution Consultants professional judgment, qualify results as estimated (J-)

Blank Type	Blank Result	Sample Result	Action for Samples
PB / EB/ FB (Positive)	> LOQ	≥IDL/DL but ≤ LOQ	Qualify as nondetect (U) at the LOQ
		>LOQ but < 10x Blank Result	Qualify results as unusable
		≥10x Blank Result	No action
	≥IDL/DL but ≤LOQ	Nondetect	No action
		≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ	Use Resolution Consultants professional judgment (see below [1])
PB (Negative)	< (-LOQ)	< 10x LOQ	Qualify positive results <10x LOQ as estimated (J) and nondetects as estimated (UJ)
		≥10x LOQ	No action

[1] Establish an action level (AL) at 5x the blank contamination. If sample result is <AL, qualify the reported result with a U.

If positive and negative blanks are reported for an analyte in the calibration blanks, pick the highest blank (absolute value) and use the table above with the following modifications:

Blank Type	Blank Results	Actions in Table to Use	Modifications
ICB/CCB	Positive > Negative	ICB/CCB (Positive)	Estimate nondetects (UJ)
	Negative > Positive	ICB/CCB (Negative)	Estimate J

Qualified sample results are shown in Table 1.

ICP Interference Check Standards

The ICP interference check standards (ICSA, ICSAB) were reviewed for conformance.

All criteria were met for the ICSA and ICSAB.

MS/MSD Results

MS/MSD analyses were not performed on the samples in this SDG. MS results for ground water samples in SDG R0814 were in control and no validation action was taken.

Laboratory Duplicate Results

The laboratory duplicate analyses were not performed on the samples in this SDG. Laboratory duplicate results for ground water samples in SDG R0814 were in control and no validation action was taken.

LCS Results

The LCS %Rs were reviewed for conformance with the QC acceptance criteria.

The LCS %Rs were within the QC acceptance criteria.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC acceptance criterion of ≤50% for solid matrices and ≤30% for aqueous matrices. This criterion applies if both results were greater than five times the limit of quantitation (LOQ).

All field duplicate precision criteria were met.

ICP/MS Serial Dilution Results

Serial dilution analyses were not performed on the samples in this SDG. Results for the serial dilution for ground water samples in SDG R0814 were in control and no validation action was taken.

ICP/MS Internal Standard Performance

ICP/MS Internal standard performance was reviewed for conformance and was within the QC acceptance criteria.

Sample Results/Reporting Issues

All analytes detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

All criteria were met.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Attachment B

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 7 and 8, 2016.

Sample ID	Matrix/Sample Type
MW09-09S-ME45-1	Ground water
MW09-09S-ME45-1-F	Ground water
MW09-14D-ME45-1	Ground water
MW09-14D-ME45-1-F	Ground water
MW09-20D-ME45-1	Ground water
MW09-ME45-FD03	Field Duplicate of MW09-20D-ME45-1
MW09-20D-ME45-1-F	Ground water
MW09-ME45-FD03-F	Field Duplicate of MW09-20D-ME45-1-F
MW09-20I-ME45-1	Ground water
MW09-20I-ME45-1-F	Ground water

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 6020A, Inductively Coupled Plasma-Mass Spectrometry* (USEPA, 1996);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 7470A, Mercury in Liquid Waste (Manual Cold-Vapor Technique)* (USEPA, 1996);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);

- *USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review* (September 2016);
- Laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following parameters (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
✓	ICP/MS Instrument tuning
✓	Initial calibration/continuing calibration verification
✗	Laboratory blanks/equipment blanks
✓	ICP interference check standards
✓	Matrix spike (MS) results
✓	Laboratory duplicate results
✓	Laboratory control sample (LCS) results
✗	Field duplicate results
✓	ICP/MS serial dilution results
✓	ICP/MS internal standard performance
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. The symbol (✗) indicates that a quality control (QC) nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, non-conformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. No data were rejected. Selected data points were estimated and/or negated due to non-conformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times/Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

ICP/MS Instrument Tuning

ICP/MS tuning results were reviewed for conformance with the QC acceptance criteria to ensure that:

- the proper tuning solution was used with elements representing all of the mass regions of interest;
- the tunings were performed at the beginning of each analysis and prior to calibration;
- the tuning solution was analyzed at least 4 times as required by the method;
- the mass calibration was within 0.1 amu of the true value for all masses within the region of interest;
- the resolution was verified to be <0.9 amu full width at 10% peak height; and
- the %RSD was ≤ 5% for the analytes contained in the tuning solution.

The QC acceptance criteria were met. Note, the laboratory reported peak width at 5% peak height which is more conservative than the above requirement and criteria were met.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- all criteria were met for the calibration curves
- the initial calibration verification (ICV) percent recovery (%R) criteria were met;
- the continuing calibration verification standard (CCV) method percent difference (%Ds) were met; and
- the low level check standards (CRI or CRA) %R criteria were met.

The QC acceptance criteria were met.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks were evaluated as to whether there were contaminants detected above the detection limit (DL). Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Method results were reviewed for conformance with the QC acceptance criteria. Equipment blanks were not collected since dedicated sampling equipment was used for ground water samples. Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

Nonconformances are summarized in Attachment A in Table A-1. Sample results were qualified as follows:

Blank Type	Blank Result	Sample Result	Action for Samples
ICB/CCB (Positive)	≥IDL/DL but ≤ LOQ	Nondetect	No action
		≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ	Use Resolution Consultants professional judgment (see below [1])
	>LOQ	≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ but < ICB/CCB Result	Qualify at level of Blank Result with a "U" or Qualify result as unusable
		>ICB/CCB but <10x the ICB/CCB result	Qualify as estimated (J)
		≥10x ICB/CCB	No action is taken based on Resolution Consultants professional judgment
ICB/CCB (Negative)	< (-LOQ)	Nondetect	Use Resolution Consultants professional judgment and qualify as estimated (UJ)
		≥IDL/DL but < LOQ	Use Resolution Consultants professional judgment and qualify results < LOQ as estimated (J-)
		< 10x LOQ	Qualify results >LOQ but <10x LOQ as estimated (J-)
		≥10x LOQ	No action is taken based on Resolution Consultants professional judgment
	≤ -IDL/DL and ≥ Q	Nondetect	Use Resolution Consultants professional judgment, qualify as estimated (UJ)
		≥IDL/DL and <5x |neg. blank|	Use Resolution Consultants professional judgment, qualify results as estimated (J)
PB / EB/ FB (Positive)	> LOQ	≥IDL/DL but ≤ LOQ	Qualify as nondetect (U) at the LOQ
		>LOQ but < 10x Blank Result	Qualify results as unusable
		≥10x Blank Result	No action
	≥IDL/DL but ≤LOQ	Nondetect	No action
		≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ	Use Resolution Consultants professional judgment (see below [1])
PB (Negative)	< (-LOQ)	< 10x LOQ	Qualify positive results <10x LOQ as estimated (J-) and nondetects as estimated (UJ)
		≥10x LOQ	No action

[1] Establish an action level (AL) at 5x the blank contamination. If sample result is <AL, qualify the reported result with a U.

Qualified sample results are shown in Table 1.

ICP Interference Check Standards

The ICP interference check standards (ICSA, ICSAB) were reviewed for conformance.

All criteria were met for the ICSA and ICSAB.

MS Results

The MS %Rs were reviewed for conformance with the QC acceptance criteria.

The MS %Rs were within the QC acceptance criteria.

Laboratory Duplicate Results

The laboratory duplicate relative percent differences (RPDs) were reviewed for conformance.

The laboratory duplicate RPDs were within the QC acceptance criteria.

LCS Results

The LCS %Rs were reviewed for conformance with the QC acceptance criteria.

The LCS %Rs were within the QC acceptance criteria.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC acceptance criterion of ≤50% for solid matrices and ≤30% for aqueous matrices. This criterion applies if both results were greater than 5 times the limit of quantitation (LOQ).

Nonconformances are summarized in Attachment A in Table A-2. Data qualification on the basis of field duplicate RPDs was as follows:

Actions: (Based on Resolution Consultants professional judgment)

Criteria	RPD	Action	
		Detected	Nondetected
Sample and duplicate are nondetect results	Not calculable (NC)	No qualification	No qualification
Sample and duplicate results <SLOQ	Not applicable	No qualification	No qualification
Sample and duplicate results ≥5xSLOQ	>30% Aqueous >50% All other sample types	J	Not Applicable
Sample and duplicate results are >SLOQ and <5xSLOQ	>60% Aqueous >100% All other sample types	J	Not Applicable
If sample or duplicate result is =SLOQ and the other is not detected	NC	J	UJ
If sample or duplicate result is <SLOQ and the other is not detected	NC	No qualification	No qualification

Qualified sample results are summarized in Table 1.

ICP/MS Serial Dilution Results

The serial dilution percent differences (%Ds) were reviewed for conformance with the QC acceptance criteria.

The serial dilution %Ds were within the QC acceptance criteria.

ICP/MS Internal Standard Performance

ICP/MS Internal standard performance was reviewed for conformance and was within the QC acceptance criteria.

Sample Results/Reporting Issues

All analytes detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

All criteria were met.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Attachment B

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 12, 13, 14, 15, and 16, 2016.

Sample ID	Matrix/Sample Type
MW09-14IA-ME45-1	Ground water
MW09-14IA-ME45-1-F	Ground water
MW09-ME45-FD05	Field Duplicate of MW09-14IA-ME45-1
MW09-ME45-FD05-F	Field Duplicate of MW09-14IA-ME45-1-F
P09-01-ME45-1	Ground water
P09-01-ME45-1-F	Ground water
P09-02A-ME45-1	Ground water
P09-02A-ME45-1-F	Ground water
P09-04A-ME45-1	Ground water
P09-04A-ME45-1-F	Ground water
P09-06B-ME45-1	Ground water
P09-06B-ME45-1-F	Ground water
P09-07B-ME45-1	Ground water
P09-08B-ME45-1	Ground water
P09-08B-ME45-1-F	Ground water
P09-09-ME45-1	Ground water
P09-09-ME45-1-F	Ground water
P09-10-ME45-1	Ground water
P09-10-ME45-1-F	Ground water
P09-11B-ME45-1	Ground water

Sample ID	Matrix/Sample Type
P09-11B-ME45-1-F	Ground water
P09-12B-ME45-1	Ground water
P09-12B-ME45-1-F	Ground water

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 6020A, Inductively Coupled Plasma-Mass Spectrometry* (USEPA, 1996);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 7470A, Mercury in Liquid Waste or SW-846 Method 7471B, Mercury in Solid or Semisolid Waste, as appropriate (Manual Cold-Vapor Technique)* (USEPA, 1996);
- *EPA New England Environmental Data Review Program Guidance* (April 2013)*;*
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following parameters (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✗	Holding times and sample preservation
✓	ICP/MS Instrument tuning
✓	Initial calibration/continuing calibration verification
✗	Laboratory blanks/equipment blanks
✓	ICP interference check standards
✗	Matrix spike (MS) results
✓	Laboratory duplicate results
✓	Laboratory control sample (LCS) results
✓	Field duplicate results
✓	ICP/ICPMS serial dilution results
✓	ICP/MS internal standard performance
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a quality control (QC) nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were

noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. Selected data points were estimated, negated, and/or rejected due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

The sample ID for laboratory sample R0838-29 should be MW09-14IA-ME45-1 (with a capital letter "I") not MW09-141A-ME45-1 (with the number one). Revised data were not requested. No other actions were required except to note this discrepancy.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The holding time for mercury is 28 days, and 180 days for other metals. Qualify detected results as estimated low (J-) and reject nondetects (R).

Nonconformances are summarized in Attachment A in Table A-1.

Qualified sample results are shown in Table 1.

ICP/MS Instrument Tuning

ICP/MS tuning results were reviewed for conformance with the QC acceptance criteria to ensure that:

- the proper tuning solution was used with elements representing all of the mass regions of interest;
- the tunings were performed at the beginning of each analysis and prior to calibration;
- the tuning solution was analyzed at least 4 times as required by the method;
- the mass calibration was within 0.1 amu of the true value for all masses within the region of interest;
- the resolution was verified to be <0.9 amu full width at 5% peak height; and
- the %RSD was ≤ 5% for the analytes contained in the tuning solution.

The QC acceptance criteria were met.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- all criteria were met for the calibration curves
- the initial calibration verification (ICV) percent recovery (%R) criteria were met;
- the continuing calibration verification standard (CCV) method percent difference (%Ds) were met; and
- the low level check standards (CRI or CRA) %R criteria were met.

The QC acceptance criteria were met.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks were evaluated as to whether there were contaminants detected above the detection limit (DL). Equipment rinsate blank samples were not collected for ground water samples.

Method blank results were reviewed for conformance with the QC acceptance criteria. Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

Nonconformances are summarized in Attachment A in Table A-2. Sample results were qualified as follows:

Blank Type	Blank Result	Sample Result	Action for Samples
ICB/CCB (Positive)	≥IDL/DL but ≤ LOQ	Nondetect	No action
		≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ	Use Resolution Consultants professional judgment (see below [1])
	>LOQ	≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ but < ICB/CCB Result	Qualify at level of Blank Result with a "U" or Qualify result as unusable
		>ICB/CCB but <10x the ICB/CCB result	Qualify as estimated (J)
		≥10x ICB/CCB	No action is taken based on Resolution Consultants professional judgment
ICB/CCB (Negative)	< (-LOQ)	Nondetect	Use Resolution Consultants professional judgment and qualify as estimated (UJ)
		≥IDL/DL but < LOQ	Use Resolution Consultants professional judgment and qualify results < LOQ as estimated (J-)
		< 10x LOQ	Qualify results >LOQ but <10x LOQ as estimated (J-)
		≥10x LOQ	No action is taken based on Resolution Consultants professional judgment
	≤ -IDL/DL and ≥ -LOQ	Nondetect	Use Resolution Consultants professional judgment, qualify as estimated (UJ)
		≥IDL/DL and <5x |neg. blank|	Use Resolution Consultants professional judgment, qualify results as estimated (J-)

Blank Type	Blank Result	Sample Result	Action for Samples
PB / EB/ FB (Positive)	> LOQ	≥IDL/DL but ≤ LOQ	Qualify as nondetect (U) at the LOQ
		>LOQ but < 10x Blank Result	Qualify results as unusable
		≥10x Blank Result	No action
	≥IDL/DL but ≤LOQ	Nondetect	No action
		≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ	Use Resolution Consultants professional judgment (see below [1])
PB (Negative)	< (-LOQ)	< 10x LOQ	Qualify positive results <10x LOQ as estimated (J-) and nondetects as estimated (UJ)
		≥10x LOQ	No action

[1] Establish an action level (AL) at 5x the blank contamination. If sample result is <AL, qualify the reported result with a U.

If positive and negative blanks are reported for an analyte in the calibration blanks, pick the highest blank (absolute value) and use the table above with the following modifications:

Qualified sample results are shown in Table 1.

ICP Interference Check Standards

The ICP interference check standards (ICSA, ICSAB) were reviewed for conformance.

All criteria were met for the ICSA and ICSAB.

MS Results

The MS %Rs were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-3. Data qualification on the basis of MS nonconformances was as follows:

Spike Sample Actions for Mercury Analysis

Criteria	Action	
	Detect	Non-detect
Matrix Spike %R < 30%	J-	R
Matrix Spike %R 30-74%	J-	UJ
Matrix Spike %R 75-125%	No qualification	No qualification
Matrix Spike %R > 125%	J+	No qualification

Notes: MS actions apply to all samples of the same matrix. This qualification will also be applied to the results of all samples within a given area of the site, if deemed appropriate.

1. If the sample result (SR) > 4x the spike concentration (S), no action is taken.

Qualified sample results are shown in Table 1.

Laboratory Duplicate Results

The laboratory duplicate relative percent differences (RPDs) were reviewed for conformance.

The laboratory duplicate RPDs were within the QC acceptance criteria and/or qualification of the sample results was not required.

LCS Results

The LCS%Rs were reviewed for conformance with the QC acceptance criteria.

The LCS %Rs were within the QC acceptance criteria.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC acceptance criterion of ≤50% for solid matrices and ≤30% for aqueous matrices. This criterion applies if both results were greater than five times the limit of quantitation (LOQ).

All field duplicate precision criteria were met and/or qualification of the sample results was not required.

ICP/MS Serial Dilution Results

The serial dilution percent differences (%Ds) were reviewed for conformance with the QC acceptance criteria.

The serial dilution %Ds were within the QC acceptance criteria.

ICP/MS Internal Standard Performance

ICP/MS Internal standard performance was reviewed for conformance and was within the QC acceptance criteria.

Sample Results/Reporting Issues

All analytes detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

Due to dilutions, the nondetect results for several analytes exceeded the project action limit and may not be usable for project objectives.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 27, 2016.

Sample ID	Matrix/Sample Type
ALLENHARBOR-ME45-1	Ground water
ALLENHARBOR-ME45-1-F	Ground water
MW09-ME45-FD06	Field Duplicate of Allenharbor-ME45-1
MW09-ME45-FD06-F	Field Duplicate of Allenharbor-ME45-1-F

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 6020A, Inductively Coupled Plasma-Mass Spectrometry* (USEPA, 1998);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 7470A (*USEPA, 1994*), Mercury in Liquid Waste (Manual Cold-Vapor Technique)* (USEPA, 1996);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following parameters (where applicable to the method):

- ✓ Data completeness (chain-of-custody [COC])/sample integrity
- ✓ Holding times and sample preservation
- ✓ ICP/MS Instrument tuning
- ✓ Initial calibration/continuing calibration verification
- ✗ Laboratory blanks/equipment blanks
- ✓ ICP interference check standards
- ✗ Matrix spike (MS) results
- ✓ Laboratory duplicate results
- ✓ Laboratory control sample (LCS) results
- ✓ Field duplicate results
- ✓ ICP/ICPMS serial dilution results
- ✓ ICP/MS internal standard performance
- ✓ Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a quality control (QC) nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. Selected data points were estimated and/or negated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

ICP/MS Instrument Tuning

ICP/MS tuning results were reviewed for conformance with the QC acceptance criteria to ensure that:

- the proper tuning solution was used with elements representing all of the mass regions of interest;
- the tunings were performed at the beginning of each analysis and prior to calibration;
- the tuning solution was analyzed at least 4 times as required by the method;
- the mass calibration was within 0.1 amu of the true value for all masses within the region of interest;
- the resolution was verified to be <0.9 amu full width at 5% peak height; and
- the %RSD was ≤5% for the analytes contained in the tuning solution.

The QC acceptance criteria were met.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- all criteria were met for the calibration curves
- the initial calibration verification (ICV) percent recovery (%R) criteria were met;
- the continuing calibration verification standard (CCV) method percent difference (%Ds) were met; and
- the low level check standards (CRI or CRA) %R criteria were met.

The QC acceptance criteria were met.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks and equipment rinsate blanks were evaluated as to whether there were contaminants detected above the detection limit (DL).

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Method blanks were reviewed for conformance with the QC acceptance criteria. Equipment blanks were not collected for ground water samples. Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

Nonconformances are summarized in Attachment A in Table A-1. Sample results were qualified as follows:

Blank Type	Blank Result	Sample Result	Action for Samples
ICB/CCB (Positive)	≥IDL/DL but ≤ LOQ	Nondetect	No action
		≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ	Use Resolution Consultants professional judgment (see below [1])
	>LOQ	≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ but < ICB/CCB Result	Qualify at level of Blank Result with a "U" or Qualify result as unusable
		>ICB/CCB but <10x the ICB/CCB result	Qualify as estimated (J)
		≥10x ICB/CCB	No action is taken based on Resolution Consultants professional judgment
ICB/CCB (Negative)	< (-LOQ)	Nondetect	Use Resolution Consultants professional judgment and qualify as estimated (UJ)
		≥IDL/DL but < LOQ	Use Resolution Consultants professional judgment and qualify results < LOQ as estimated (J-)
		< 10x LOQ	Qualify results >LOQ but <10x LOQ as estimated (J-)
		≥10x LOQ	No action is taken based on Resolution Consultants professional judgment
	≤ -IDL/DL and ≥ -LOQ	Nondetect	Use Resolution Consultants professional judgment, qualify as estimated (UJ)
		≥IDL/DL and <5x |neg. blank|	Use Resolution Consultants professional judgment, qualify results as estimated (J)
PB / EB/ FB (Positive)	> LOQ	≥IDL/DL but ≤ LOQ	Qualify as nondetect (U) at the LOQ
		>LOQ but < 10x Blank Result	Qualify results as unusable
		≥10x Blank Result	No action
	≥IDL/DL but ≤LOQ	Nondetect	No action
		≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ	Use Resolution Consultants professional judgment (see below [1])
PB (Negative)	< (-LOQ)	< 10x LOQ	Qualify positive results <10x LOQ as estimated (J-) and nondetects as estimated (UJ)
		≥10x LOQ	No action

[1] Establish an action level (AL) at 5x the blank contamination. If sample result is <AL, qualify the reported result with a U.

If positive and negative blanks are reported for an analyte in the calibration blanks, pick the highest blank (absolute value) and use the table above with the following modifications:

Blank Type	Blank Results	Actions in Table to Use	Modifications
ICB/CCB	Positive > Negative	ICB/CCB (Positive)	Estimate nondetects (UJ)
	Negative > Positive	ICB/CCB (Negative)	Estimate J

Qualified sample results are shown in Table 1.

ICP Interference Check Standards

The ICP interference check standards (ICSA, ICSAB) were reviewed for conformance.

All criteria were met for the ICSA and ICSAB.

MS Results

The MS %Rs were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-2. Data qualification on the basis of MS nonconformances was as follows:

Spike Sample Actions for ICP/MS Analysis

Criteria	Action	
	Detect	Non-detect
Matrix Spike %R < 30% Post-digestion spike %R < 75%	J-	R
Matrix Spike %R < 30% Post-digestion spike %R ≥ 75%	J	UJ
Matrix Spike %R 30-74% Post-digestion Spike %R < 75%	J-	UJ
Matrix Spike %R 30-74% Post-digestion spike %R ≥ 75%	J	UJ
Matrix Spike %R > 125% Post-digestion spike %R > 125%	J+	No qualification
Matrix Spike %R > 125% Post-digestion spike %R ≤ 125%	J	No qualification
Matrix Spike %R < 30% No post-digestion spike performed (e.g., not required for Ag)	J-	R
Matrix Spike %R 30-74% No post-digestion spike performed (e.g., not required for Ag)	J-	UJ
Matrix Spike %R 75-125% Post-digestion spike not required	No qualification	No qualification
Matrix Spike %R > 125% No post-digestion spike performed (e.g., not required for Ag)	J+	No qualification

Spike Sample Actions for Mercury Analysis

Criteria	Action	
	Detect	Non-detect
Matrix Spike %R < 30%	J-	R
Matrix Spike %R 30-74%	J-	UJ
Matrix Spike %R 75-125%	No qualification	No qualification
Matrix Spike %R > 125%	J+	No qualification

Notes: MS actions apply to all samples of the same matrix. This qualification will also be applied to the results of all samples within a given area of the site, if deemed appropriate.

1. If the sample result (SR) > 4x the spike concentration (S), no action is taken.

Qualified sample results are shown in Table 1.

Laboratory Duplicate Results

The laboratory duplicate relative percent differences (RPDs) were reviewed for conformance.

The laboratory duplicate RPDs were within the QC acceptance criteria.

LCS Results

The LCS %Rs were reviewed for conformance with the QC acceptance criteria.

The LCS %Rs were within the QC acceptance criteria.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC acceptance criterion of ≤50% for solid matrices and ≤30% for aqueous matrices. This criterion applies if both results were greater than five times the limit of quantitation (LOQ).

All field duplicate precision criteria were met and/or data qualification was not required.

ICP/MS Serial Dilution Results

The serial dilution percent differences (%Ds) were reviewed for conformance with the QC acceptance criteria.

The serial dilution %Ds were within the QC acceptance criteria.

ICP/MS Internal Standard Performance

ICP/MS Internal standard performance was reviewed for conformance and was within the QC acceptance criteria.

Sample Results/Reporting Issues

All analytes detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Attachment B

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Attachment C

Reason Codes and Explanations

Reason Code	Explanation
be	Equipment blank contamination
bf	Field blank contamination
bl	Laboratory blank contamination
c	Calibration issue
d	Reporting limit raised due to chromatographic interference
fd	Field duplicate RPDs
h	Holding times
i	Internal standard areas
k	Estimated Maximum Possible Concentration (EMPC)
l	LCS recoveries
lc	Labeled compound recovery
ld	Laboratory duplicate RPDs
lp	Laboratory control sample/laboratory control sample duplicate RPDs
m	Matrix spike recovery
md	Matrix spike/matrix spike duplicate RPDs
nb	Negative laboratory blank contamination
p	Chemical preservation issue
r	Dual column RPD
q	Quantitation issue
s	Surrogate recovery
su	Ion suppression
t	Temperature preservation issue
x	Percent solids

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 12, 13, 14, and 16, 2016.

Sample ID	Matrix/Sample Type
P09-01-ME45-1	Ground water
P09-02A-ME45-1	Ground water
P09-03A-ME45-1	Ground water
P09-04A-ME45-1	Ground water
P09-06B-ME45-1	Ground water
P09-07B-ME45-1	Ground water
P09-08B-ME45-1	Ground water
P09-09-ME45-1	Ground water
P09-10-ME45-1	Ground water
P09-11B-ME45-1	Ground water
P09-12B-ME45-1	Ground water
SP09-01-ME45-1	Ground water
MW09-ME45-FD04	Field Duplicate of SP09-01-ME45-1
SP09-02-ME45-1	Ground water
SP09-03-ME45-1	Ground water

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Standard Methods For The Examination Of Water And Wastewater*;
- *EPA New England Environmental Data Review Program Guidance* (April 2013);

- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

- ✓ Data completeness (chain-of-custody[COC])/sample integrity
- ✓ Holding times and sample preservation
- ✓ Initial calibration/continuing calibration verification
- ✓ Laboratory blanks/equipment blanks
- ✓ Matrix spike (MS)/matrix duplicate (MD) and/or matrix spike duplicate (MSD) results
- ✓ Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
- ✓ Field duplicate results
- ✓ Sample results/reporting issues

The symbol (✓) indicates that no results were qualified based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a quality control (QC) nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. There were no results qualified on the basis of this data review.

RESULTS

Data Completeness (COC)/Sample Integrity

The laboratory report was reviewed and found to be complete. No sample integrity issues were noted.

Holding Times and Sample Preservation

Sample preservation requirements and preparation/analysis holding times were met and/or qualification of the data was not required.

Initial Calibration/Continuing Calibration Verification

Initial calibration and continuing calibration criteria were met and/or qualification of the data was not required.

Laboratory Blanks/Equipment Blanks

Laboratory and field blanks were free of contamination and/or qualification of data due to blank contamination was not required. Equipment blanks were not collected for ground water samples.

MS/MD and/or MSD Results

All MS/MD/MSD criteria were met and/or qualification of the data was not required.

LCS/LCSD Results

LCS and/or LCSD criteria were met and/or qualification of the data was not required.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results are greater than five times the limit of quantitation (LOQ). The results for sulfide were nondetect in the field duplicate pair; therefore, precision was deemed acceptable. A field duplicate pair was not submitted for salinity analysis.

Sample Results/Reporting Issues

No other issues were narrated.

QUALIFICATION ACTIONS

No sample results were qualified as a result of this data review.

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 27, 2016.

Sample ID	Matrix/Sample Type
ALLENHARBOR-ME45-1	Ground water
MW09-ME45-FD06	Field Duplicate of Allenharbor-ME45-1

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Standard Methods For The Examination Of Water And Wastewater*;
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
NA	Initial calibration/continuing calibration verification

- ✓ Laboratory blanks/equipment blanks
- ✓ Matrix spike (MS)/matrix duplicate (MD)/matrix spike duplicate (MSD) results
- ✓ Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
- ✓ Field duplicate results
- ✓ Sample results/reporting issues

The symbol (✓) indicates that no results were qualified based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a quality control (QC) nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. There were no results qualified on the basis of this data review.

RESULTS

Data Completeness (COC)/Sample Integrity

The laboratory report was reviewed and found to be complete. No sample integrity issues were noted.

Holding Times and Sample Preservation

Sample preservation requirements and preparation/analysis holding times were met and/or qualification of the data was not required.

Initial Calibration/Continuing Calibration Verification

Initial calibration and continuing calibration criteria are not applicable to this method. Qualification of the data was not required.

Laboratory Blanks/Equipment Blanks

Laboratory blanks were free of contamination and/or qualification of data due to blank contamination was not required. Equipment blanks were not collected for ground water samples.

MS/MD/MSD Results

MS/MSD analyses were not performed on a sample from this data set. All MD criteria were met and/or qualification of the data was not required.

LCS/LCSD Results

LCS and/or LCSD criteria were met and/or qualification of the data was not required.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results are greater than five times the quantitation limit (QL). All QC acceptance criteria were met.

Sample Results/Reporting Issues

No other issues were narrated.

QUALIFICATION ACTIONS

No sample results were qualified as a result of this data review.

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 12 and 13, 2016.

Sample ID	Matrix/Sample Type
SED09-01-ME45-1	Sediment
SED09-02A-ME45-1	Sediment
SD09-ME45-FD01	Field Duplicate of SED09-02A-ME45-1
SED09-03A-ME45-1	Sediment
SED09-04A-ME45-1	Sediment
SED09-05A-ME45-1	Sediment
SED09-09-ME45-1	Sediment
SED09-10-ME45-1	Sediment
SED09-11B-ME45-1	Sediment
SED09-ME45-TB01	Trip Blank

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8260C, Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry* (USEPA, 2006);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
✓	GC/MS performance checks
✗	Initial calibration/continuing calibration verification
✓	Laboratory blanks/trip blanks/equipment blanks
✓	Surrogate spike recoveries
✗	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✓	Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
✓	Field duplicates
✓	Internal standards
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. Selected data points were qualified as estimated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria. The QC acceptance criteria were met.

GC/MS Performance Checks

The data were reviewed to ensure that the 4-bromofluorobenzene (BFB) tuning was performed at the correct frequency and that the method acceptance criteria were met. All samples were analyzed within 12 hours of the BFB tunes.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and/or response factor (RF) method acceptance criteria were met;
- the initial calibration verification standard (ICV) percent recovery acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met; and
- the retention time method acceptance criteria were met.

Nonconformances are summarized in Attachment A in Table A-1, A-2, A-3 and A-4. Data qualification to the analytes associated with the specific ICAL and/or CCV was as follows:

ICAL and CCV Response Factor Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results[2]
RF<minimum RF (Table 4 method 8260C)	J	R[1]
[1]Resolution Consultants professional judgment may be used to either raise reporting level or to estimate reporting limit if low standard response is adequate.		
[2]Sample results qualified as not detected (U) due to blank contamination are not rejected, but estimated (UJ).		

ICAL Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected
%RSD > 15% and quantitation based on mean RF	J	UJ
r or r^2 < 0.99 and quantitation based on linear regression	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

ICV Recovery Nonconformances

Criteria	Actions*	
	Detected Results	Nondetected
Recovery > 120%	J+	No qualification
Recovery < 80%	J-	UJ
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

CCV Linearity Nonconformances

Criteria		Actions	
		Detected Results	Nondetected Results
Opening CCV	Closing CCV		
%D > 20%	%D > 50%	J	UJ
%Drift >20%	%Drift >50%	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used			

Qualified sample results are shown in Table 1.

The RFs for acetone and 2-butanone did not meet the method 8260C requirements for initial and/or continuing calibrations as required by the QSM. The nonconformances are summarized in Table A-1 and A-4. The RFs for acetone and 2-butanone met the National Functional Guidelines requirements. Professional judgement was used to qualify the results for acetone and 2-butanone as estimated (J/UJ).

Laboratory Blanks/Trip Blanks/Equipment Blanks

Laboratory method blanks, trip blanks, and equipment rinsate blanks were evaluated as to whether there were contaminants detected above the detection limit (DL).

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

MS and/or MSD Results

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-5. Data qualification to the analytes associated with the specific MS/MSD nonconformances was as follows:

Criteria	Action	
	Detected Compounds	Nondetected Compounds
%R>UL	J+	No qualification
20% ≤ %R < LL	J-	UJ
%R <20% (see note 1)	J-	R*
RPD >UL	J	No qualification
Note: Actions are applied to the native unspiked sample only (see note 2) *When the native sample concentration is >4X the concentration of the spike added (based on Region I criteria), evaluate the MS, MSD, and native sample with regards to %RSD rather than %R (Resolution Consultants professional judgment).		

1. Based on NFG 2016 VOC guidance, Resolution Consultants professional judgment is used to reject (R) non-detects in associated samples for any analyte with < 20% recovery. Also, Resolution Consultants professional judgment is used to estimate (UJ) rather the reject (R) sample results previously negated (U) on the basis of blank contamination.
2. If a field duplicate sample was also collected for the native sample chosen for MS/MSD analysis, professional judgment is used to apply MS/MSD actions to the corresponding field duplicate sample as well as the native sample.

Qualified sample results are shown in Table 1.

LCS/LCSD Results

The LCS/LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

Field Duplicates

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than two times the limit of quantitation (LOQ). All QC acceptance criteria were met.

Internal Standards

The internal standard (IS) recoveries were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

Sample Results/Reporting Issues

All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

Any sample that was analyzed at a dilution because of high concentrations of target or non-targets was checked to confirm that the results and/or sample-specific LOQs and limits of detection (LODs) were adjusted accordingly by the laboratory.

The percent solids data were reviewed to ensure that NFG 2016 specified criteria were met.

All percent solids criteria were met.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
JN	The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Attachment C

Reason Codes and Explanations

Reason Code	Explanation
be	Equipment blank contamination
bf	Field blank contamination
bl	Laboratory blank contamination
bt	Trip blank contamination
c	Calibration issue
d	Reporting limit raised due to chromatographic interference
fd	Field duplicate RPDs
h	Holding times
i	Internal standard areas
k	Estimated Maximum Possible Concentration (EMPC)
l	LCS or OPR recoveries
lc	Labeled compound recovery
ld	Laboratory duplicate RPDs
lp	Laboratory control sample/laboratory control sample duplicate RPDs
m	Matrix spike recovery
md	Matrix spike/matrix spike duplicate RPDs
nb	Negative laboratory blank contamination
p	Chemical preservation issue
r	Dual column RPD
q	Quantitation issue
s	Surrogate recovery
su	Ion suppression
t	Temperature preservation issue
x	Percent solids
y	Serial dilution results
z	ICS results

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0888
Analyses/Method:	EPA SW-846 Method 8260C for VOCs (GC/MS) / 8260C
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Elissa McDonagh/Resolution Consultants Completed on: 12/05/2016
Reviewed by:	Kristin Rutherford/Resolution Consultants File Name: R0888_VOC

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 26, 2016.

Sample ID	Matrix/Sample Type
SD-EB01-ME45	Equipment blank
SED09-06B-ME45-1	Soil
SED09-07B-ME45-1	Soil
SED09-08B-ME45-1	Soil
SED09-12B-ME45-1	Soil
SED09-ME45-FD02	Field Duplicate of SED09-08B-ME45-1
SED09-ME45-TB02	Trip blank

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8260C, Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry* (USEPA, 2006);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
✓	GC/MS performance checks
✗	Initial calibration/continuing calibration verification
✓	Laboratory blanks/trip blanks/equipment blanks
✗	Surrogate spike recoveries
NA	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✓	Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
✓	Field duplicates
✓	Internal standards
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. Selected data points were qualified as estimated, due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria. The QC acceptance criteria were met.

GC/MS Performance Checks

The data were reviewed to ensure that the 4-bromofluorobenzene (BFB) tuning was performed at the correct frequency and that the method acceptance criteria were met. All samples were analyzed within 12 hours of the BFB tunes.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and/or response factor (RF) method acceptance criteria were met;
- the initial calibration verification standard (ICV) percent recovery acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met; and
- the retention time method acceptance criteria were met.

Nonconformances are summarized in Attachment A in Tables A-1, A-2 and A-3. Data qualification to the analytes associated with the specific ICAL and/or CCV was as follows:

ICAL and CCV Response Factor Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results[2]
RF<minimum RF (Table 4 method 8260C)	J	R[1]
[1]Resolution Consultants professional judgment may be used to either raise reporting level or to estimate reporting limit if low standard response is adequate.		
[2]Sample results qualified as not detected (U) due to blank contamination are not rejected, but estimated (UJ).		

ICAL Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected
%RSD > 15% and quantitation based on mean RF	J	UJ
r or r^2 < 0.99 and quantitation based on linear regression	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

ICV Recovery Nonconformances

Criteria	Actions*	
	Detected Results	Nondetected Results
Recovery > 120%	J+	No qualification
Recovery < 80%	J-	UJ
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

CCV Linearity Nonconformances

Criteria		Actions	
		Detected Results	Nondetected Results
Opening CCV	Closing CCV		
%D > 20%	%D > 50%	J	UJ
%Drift >20%	%Drift >50%	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used			

Qualified sample results are shown in Table 1.

The RFs for acetone, 2-butanone and tetrachloroethene did not meet the method 8260C requirements for initial and/or continuing calibrations as required by the QSM. The nonconformances are summarized in Tables A-1 and A-3. The RFs for acetone, 2-butanone and tetrachloroethene met the National Functional Guidelines requirements. Professional judgment was used to qualify the results for acetone, 2-butanone and tetrachloroethene as estimated (J/UJ).

Laboratory Blanks/Trip Blanks/Equipment Blanks

Laboratory method blanks, trip blanks, and equipment rinsate blanks were evaluated as to whether there were contaminants detected above the detection limit (DL).

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required. There were no detected target analytes reported in trip blank sample SED-ME45-TB02 or equipment blank sample SD-EB01-ME45.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-4. Data qualification on the basis of surrogate recovery nonconformances was as follows:

Criteria	Action	
	Detected Compounds	Nondetected Compounds
%R > Upper Limit (UL)	J+	No qualification
20% ≤%R < Lower Limit (LL)	J-	UJ
%R < 20%	J-	R

Qualified sample results are shown in Table 1.

MS and/or MSD Results

MS/MSD analyses were not performed on samples reported in this SDG. There were no validation actions taken on this basis.

LCS/LCSD Results

The LCS/LCSD %Rs and/or relative percent recoveries (RPDs) were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

Field Duplicates

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than two times the limit of quantitation (LOQ). All QC acceptance criteria were met.

Internal Standards

The internal standard (IS) recoveries were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

Sample Results/Reporting Issues

All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

Any sample that was analyzed at a dilution because of high concentrations of target or non-targets was checked to confirm that the results and/or sample-specific LOQs and limits of detection (LODs) were adjusted accordingly by the laboratory.

The percent solids data were reviewed to ensure that NFG 2016 specified criteria were met.

All percent solids criteria were met.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
JN	The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0837
Analyses/Method:	EPA SW-846 Method 8270D-SIM for SVOCs (GC/MS) / 8270D-SIM
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Kristin Rutherford/Resolution Consultants Completed on: 11/17/2016
Reviewed by:	Linda Adams/Resolution Consultants File Name: R0837_PAH

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 12 and 13, 2016.

Sample ID	Matrix/Sample Type
SD09-ME45-FD01	Field duplicate of SED09-02A-ME45-1
SED09-01-ME45-1	Sediment
SED09-02A-ME45-1	Sediment
SED09-03A-ME45-1	Sediment
SED09-04A-ME45-1	Sediment
SED09-05A-ME45-1	Sediment
SED09-09-ME45-1	Sediment
SED09-10-ME45-1	Sediment
SED09-11B-ME45-1	Sediment

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8270D-SIM, Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry/Selected Ion Monitoring* (USEPA, 2014);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

- ✓ Data completeness (chain-of-custody [COC])/sample integrity
- ✓ Holding times and sample preservation
- ✓ Gas Chromatography/Mass Spectrometry (GC/MS) Performance Checks
- ✓ Initial calibration/continuing calibration verification
- ✓ Laboratory blanks/equipment blanks
- ✓ Surrogate spike recoveries
- ✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results
- ✓ Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
- ✓ Field duplicate results
- ✓ Internal standard recoveries
- ✓ Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a quality control (QC) nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. No data were rejected. Selected data points were estimated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

GC/MS Performance Checks

The data were reviewed to ensure that the decafluorotriphenylphosphine (DFTPP) tuning was performed at the correct frequency and that the method acceptance criteria were met. All samples were analyzed within 12 hours of the DFTPP tunes.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and/or response factor method acceptance criteria were met;
- the initial calibration verification standard (ICV) percent recovery acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met; and
- the retention time method acceptance criteria were met.

The QC acceptance criteria were met.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks and equipment rinsate blanks were evaluated as to whether there were contaminants detected above the detection limit (DL).

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required. There were no detected target analytes reported in equipment blank sample SD-EB01-ME45, reported in SDG R0888.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria.

All QC acceptance criteria were met.

MS/MSD Results

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-1. Data qualification to the analytes associated with the specific MS/MSD nonconformances was as follows:

Actions: (Based on NFG 2016, Region 1, and Resolution Consultants professional judgment)

Criteria	Action	
	Detected Compounds	Nondetected Compounds
%R> UL	J+	No qualification
10% ≤ %R < LL	J-	UJ
%R <10%	J-	R
%RPD > UL	J	No qualification

Notes:

1. Resolution Consultants professional judgment is used to estimate (UJ) rather the reject (R) sample results previously negated (U) on the basis of blank contamination.

2. If a field duplicate sample was also collected for the native sample chosen for MS/MSD analysis, professional judgment is used to apply MS/MSD actions to the corresponding field duplicate sample as well as the native sample.

Qualified sample results are shown in Table 1.

LCS/LCSD Results

The LCS/LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria.

All QC acceptance criteria were met.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than five times the limit of quantitation (LOQ).

All QC acceptance criteria were met and/or qualification of the data was not required.

Internal Standard Recoveries

The internal standard (IS) recoveries were reviewed for conformance with the QC acceptance criteria.

All QC acceptance criteria were met.

Sample Results/Reporting Issues

All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

Any sample that was analyzed at a dilution due to high concentrations of target or non-targets was checked to ensure that the results and/or sample specific limits of detection (LODs) and LOQs were adjusted accordingly by the laboratory.

The percent solids data were reviewed to ensure that NFG 2016 specified criteria were met.

All percent solids criteria were met.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 26, 2016.

Sample ID	Matrix/Sample Type
SD-EB01-ME45	Aqueous Equipment Blank
SED09-06B-ME45-1	Sediment
SED09-07B-ME45-1	Sediment
SED09-08B-ME45-1	Sediment
SED09-12B-ME45-1	Sediment
SED09-ME45-FD02	Field duplicate of SED09-08B-ME45-1

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8270D, Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry and Mass Spectrometry/Selected Ion Monitoring* (USEPA, 2014);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following parameters (where applicable to the method):

- ✓ Data completeness (chain-of-custody [COC])/sample integrity
- ✓ Holding times and sample preservation
- ✓ Gas Chromatography/Mass Spectrometry (GC/MS) Performance Checks
- ✗ Initial calibration/continuing calibration verification
- ✓ Laboratory blanks/equipment blanks
- ✓ Surrogate spike recoveries
- ✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results
- ✗ Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
- ✗ Field duplicate results
- ✓ Internal standard results
- ✓ Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a quality control (QC) nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. No data were rejected. Selected data points were estimated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria. The QC acceptance criteria were met.

GC/MS Performance Checks

The data were reviewed to ensure that the decafluorotriphenylphosphine (DFTPP) tuning was performed at the correct frequency and that the method acceptance criteria were met. All samples were analyzed within 12 hours of the DFTPP tunes.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and/or response factor (RF) method acceptance criteria were met;
- the initial calibration verification standard (ICV) percent recovery acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met; and
- the retention time method acceptance criteria were met.

Nonconformances are summarized in Attachment A in Table A-1. Data qualification to the analytes associated with the specific ICAL and/or CCV was as follows:

ICAL and CCV Response Factor Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results[2]
RF<minimum RF (Table 4 method 8270D)	J	R[1]
[1]Resolution Consultants professional judgment may be used to either raise reporting level or to estimate reporting limit if low standard response is adequate.		
[2]Sample results qualified as not detected (U) due to blank contamination are not rejected, but estimated (UJ).		

ICAL Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected
%RSD > 15% and quantitation based on mean RF	J	UJ
r or r^2 < 0.99 and quantitation based on linear regression	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

ICV Recovery Nonconformances

Criteria	Actions*	
	Detected Results	Nondetected Results
Recovery > 120%	J+	No qualification
Recovery < 80%	J-	UJ
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

CCV Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results
%D > 20%	J	UJ
%Drift >20%	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

Qualified sample results are shown in Table 1.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks and equipment rinsate blanks were evaluated as to whether there were contaminants detected above the detection limit (DL).

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required. There were no detected target analytes reported in equipment blank sample SD-EB01-ME45.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

MS and/or MSD Results

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria. Nonconformances are summarized in Attachment A in Table A-2. Data qualification to the analytes associated with the specific MS/MSD nonconformances was as follows:

Actions: (Based on NFG 2016, Region 1, and Resolution Consultants professional judgment)

Criteria	Action	
	Detected Compounds	Nondetected Compounds
%R> UL	J+	No qualification
10% ≤ %R < Lower limit	J-	UJ
%R <10%	J-	R
%RPD > UL	J	No qualification

Notes:

1. Resolution Consultants professional judgment is used to estimate (UJ) rather the reject (R) sample results previously negated (U) on the basis of blank contamination.

2. If a field duplicate sample was also collected for the native sample chosen for MS/MSD analysis,

professional judgment is used to apply MS/MSD actions to the corresponding field duplicate sample as well as the native sample.

Qualified sample results are shown in Table 1.

LCS/LCSD Results

The LCS/LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria. The laboratory presented laboratory control limits instead of QSM criteria; therefore, results were also compared to the QSM criteria.

Nonconformances are summarized in Attachment A in Table A-3. Data qualification to the analytes associated with the specific LCS/LCSD %Rs and/or RPDs was as follows:

Criteria[1]	Action[2]	
	Detected Compounds	Nondetected Compounds
%R or RPD > UL	J+	No qualification
10%≥%R < LL	J-	UJ
%R < 10%	J-	R
[1] In the absence of NFG 2016 guidance for LCS results, NFG 2016 MS/MSD guidance was applied with Resolution Consultants professional judgment.		
[2]If the %R of more than half of the analytes are not within limits, then reject (R) nondetects for the analytes with <10% recovery and estimate (J/UJ) all other analyte(s) in the associated samples.		

Qualified sample results are shown in Table 1.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than five times the limit of quantitation (LOQ).

Nonconformances are summarized in Attachment A in Table A-4. Data qualification to the analytes associated with the specific field duplicate RPDs was as follows:

Criteria	RPD	Action	
		Detected	Nondetected
Sample and duplicate are nondetect results	Not calculable (NC)	No qualification	No qualification
Sample and duplicate results ≥5xLOQ	>30 (aqueous) >50 (solids)	J	Not Applicable
Sample and duplicate results <5xLOQ	>60 (aqueous) >100 (solids)	J	Not Applicable
If sample or duplicate result is >5xLOQ and the other is not detected	NC	J	UJ
If sample or duplicate result is <5xLOQ and the other is not detected	NC	No qualification	No qualification

Actions: (Resolution Consultants professional judgment was used)

Qualified sample results are shown in Table 1.

Internal Standard Results

The internal standard (IS) recoveries were reviewed for conformance with the QC acceptance criteria.

All QC acceptance criteria were met.

Sample Results/Reporting Issues

All compounds detected at concentrations less than the LOQ but greater than the limit of detection (LOD) were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

The percent solids data were reviewed to ensure that NFG 2016 specified criteria were met.

All percent solids criteria were met.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Attachment B

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
JN	The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0837
Analyses/Method:	EPA SW-846 Method 8081B for Organochlorine Pesticides (GC/ECD) and EPA SW-846 Method 8082A for PCBs (GC/ECD)
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Kristin Rutherford/Resolution Consultants Completed on: 12/12/2016
Reviewed by:	Linda Adams/Resolution Consultants File Name: R0837_PEST_PCB

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 12 and 13, 2016.

Sample ID	Matrix/Sample Type
SED09-01-ME45-1	Sediment
SED09-02A-ME45-1	Sediment
SD09-ME45-FD01	Field Duplicate of SED09-02A-ME45-1
SED09-09-ME45-1	Sediment
SED09-10-ME45-1	Sediment

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8081B, Organochlorine Pesticides by Gas Chromatography* (USEPA, 2007);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8082A, Polychlorinated Biphenyls (PCBs) by Gas Chromatography* (USEPA, 2007);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
✓	GC/ECD Instrument Performance Check
✗	Initial calibration/continuing calibration verification
✓	Laboratory blanks/equipment blanks
✗	Surrogate spike recoveries
✗	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✓	Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
✓	Field duplicate results
✓	Sulfur clean-up
✗	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. Selected data points were qualified as estimated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC) / Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

GC/ECD Instrument Performance Check

Instrument performance check standards were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met and/or qualification of the sample results was not required.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and method acceptance criteria were met;
- the second-source calibration verification (ICV) method acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) acceptance criteria were met.

Nonconformances are summarized in Attachment A in Table A-1.

All initial calibration criteria were met for pesticides and PCBs. No qualifications were required for PCB CCVs.

Data qualification on the basis of the pesticide CCVs was as follows:

Pesticides Continuing Calibration

Criteria	Actions[1]	
	Detected	Nondetected
%D or %Drift >20%	J	UJ
[1] Actions are applied to positive results reported from the nonconforming column. Do not qualify nondetect results unless both columns are noncompliant.		

Qualified results are shown in Table 1.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks and equipment rinsate blanks were evaluated as to whether there were contaminants detected above the detection limit (DL).

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required. There were no detected target analytes reported in equipment blank sample SD-EB01-ME45, reported in SDG R0888.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance.

Nonconformances are summarized in Attachment A in Table A-2. Data qualification on the basis of surrogate recoveries was as follows:

Actions: (Based on NFG 2016)

Criteria	Action	
	Detected	**Nondetected**
%R <10% (undiluted)	J-	R
%R <10% (diluted)	Use professional judgment**	Use professional judgment**
%R ≥10% but is < LL	J-	UJ
%R > UL but ≤200%	J+	No qualification
%R >200	J+	Use professional judgment**
** Use professional judgment in qualifying data, as surrogate recovery problems may not directly apply to target compounds.		

Qualified sample results are shown in Table 1.

MS/MSD Results

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-3. Data qualification to the analytes associated with the specific MS/MSD nonconformances was as follows:

Criteria	Action	
	Detected Compounds	**Nondetected Compounds**
%R> UL	J+	No qualification
20% ≤ %R < LL	J-	UJ
%R <20% (see note 1)	J-	R*
%RPD > UL	J	No qualification
Note: Actions are applied to the native unspiked sample only (see note 2) *When the native sample concentration is >4X the concentration of the spike added (based on Region I criteria), evaluate the MS, MSD, and native sample with regards to %RSD rather than %R (Resolution Consultants professional judgment)		

Qualified sample results are shown in Table 1.

LCS/LCSD Results

The LCS and/or LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria.

The LCS and/or LCSD %Rs and/or RPDs were within the QC acceptance criteria.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than two times the sample limit of quantitation (LOQ).

All QC acceptance criteria were met.

Sulfur Clean-up

Sulfur clean-up was performed on the samples in this data set. Data qualification was not required.

Sample Results/Reporting Issues

For detected results for both pesticides and PCBs, the laboratory reported the lower of the two values between the two columns. Based on DoD QSM v5.0, positive results should be reported from the primary column. No actions were taken except to note this discrepancy.

All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation

Dual Column Precision

Sample results were reviewed to ensure that the dual column precision RPD criteria were met.

Nonconformances are summarized in Attachment A in Table A-4. Data qualification on the basis of dual column RPDs was as follows:

Actions: (Based on Resolution Consultants professional judgment)

Criteria	Action
RPD > 40 and no interference	J (report higher result)
RPD > 40 and interference on 1 column	J (report result from column without interference)
RPD > 40 and interference on both columns	J (report lower result)

Qualified results are shown in Table 1.

Percent Solids

The percent solids data were reviewed to ensure that NFG specified criteria were met.

All percent solids criteria were met.

Multiple Aroclors

Multiple Aroclors were not detected in any samples in this data set.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
JN	The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0888
Analyses/Method:	EPA SW-846 Method 8081B for Organochlorine Pesticides (GC/ECD) and EPA SW-846 Method 8082A for PCBs (GC/ECD)
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Kristin Rutherford/Resolution Consultants Completed on: 12/05/2016
Reviewed by:	Constance Lapite/Resolution Consultants File Name: R0888_Pest_PCB

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 26, 2016.

Sample ID	Matrix/Sample Type
SD-EB01-ME45	Aqueous Equipment Blank

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8081B, Organochlorine Pesticides by Gas Chromatography* (USEPA, 2007);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8082A, Polychlorinated Biphenyls (PCBs) by Gas Chromatography* (USEPA, 2007);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
✓	GC/ECD Instrument Performance Check
✗	Initial calibration/continuing calibration verification
✓	Laboratory blanks/equipment blanks
✓	Surrogate spike recoveries
NA	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✓	Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
NA	Field duplicate results
NA	Sulfur Clean-up
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. Selected data points were qualified as estimated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

GC/ECD Instrument Performance Check

Instrument performance check standards were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met and/or qualification of the sample results was not required.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and method acceptance criteria were met;
- the second-source calibration verification (ICV) method acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) acceptance criteria were met.

Nonconformances are summarized in Attachment A in Tables A-1a and A-1b. Data qualification on the basis of the initial calibration was as follows:

PCBs Initial Calibration

Criteria	Actions[3]	
	Detected Results	Nondetected Results
%RSD > 20% for each peak	J	UJ
r < 0.995 or r^2 < 0.99 for each peak[1]	J[2]	UJ[2]

[1] 6 points required for second order; 7 points required for third order
[2] No guidance in NFG, thus Resolution Consultants professional judgment was used.
[3] In the absence of an ICAL for a particular Aroclor, Resolution Consultants professional judgment was used as follows: If the traditional model of a linear calibration was employed by the laboratory, validation actions were applied to Aroclors with similar retention time ranges. Actions were applied to Aroclors 1016, 1221, 1232, 1242, and 1248 when Aroclor 1016 exceeded ICAL criteria and actions were applied to Aroclors 1248, 1254, and 1260 when Aroclor 1260 exceeded ICAL criteria. If multipoint calibration was performed for the individual Aroclors, the calibration factors for those calibrations were used to evaluate linearity.

Pesticides Initial Calibration

Criteria	Actions	
	Detected Results	Nondetected Results
%RSD > 20%	J	UJ[1]
r < 0.995 or r^2 < 0.99 for each peak[2,3]	J[4]	UJ[4]

[1] NFG recommends professional judgment, thus Resolution Consultants professional judgment was used
[2] 6 points required for second order; 7 points required for third order
[3] For toxaphene and technical chlordane each peak, not the average must meet the criteria
[4] No guidance in NFG, thus Resolution Consultants professional judgment was used

Data qualification on the basis of the ICVs was as follows:

PCBs Second-Source Calibration Verification

Criteria	Actions[1,2]	
	Detected	Nondetected
%D or %Drift[3] >20% for each peak	J	UJ

[1] Actions are applied to positive results reported from the nonconforming column. Do not qualify nondetect results unless both columns are noncompliant.
[2] In the absence of a ICV for a particular Aroclor, Resolution Consultants professional judgment was used to apply validation actions to Aroclors with similar retention time ranges. Actions were applied to Aroclors 1016, 1221, 1232, 1242, and 1248 when Aroclor 1016 exceeded ICV criteria and actions were applied to Aroclors 1248, 1254, and 1260 when Aroclor 1260 exceeded ICV criteria.
[3] No guidance for % drift in NFG, thus Resolution Consultants professional judgment was used.

Pesticides Second-Source Calibration Verification

Criteria	Actions[1]	
	Detected	Nondetected
%D or %Drift >20%	J	UJ

[1] Actions are applied to positive results reported from the nonconforming column. Do not qualify nondetect results unless both columns are noncompliant.

Data qualification on the basis of the CCVs was as follows:

PCBs Continuing Calibration

Criteria	Actions[1,2]	
	Detected	Nondetected
%D or %Drift[3] >20% for each peak	J	UJ

[1] Actions are applied to positive results reported from the nonconforming column. Do not qualify nondetect results unless both columns are noncompliant.
[2] In the absence of a CCV for a particular Aroclor, Resolution Consultants professional judgment was used to apply validation actions to Aroclors with similar retention time ranges. Actions were applied to Aroclors 1016, 1221, 1232, 1242, and 1248 when Aroclor 1016 exceeded CCV criteria and actions were applied to Aroclors 1248, 1254, and 1260 when Aroclor 1260 exceeded CCV criteria.
[3] No guidance for % drift in NFG, thus Resolution Consultants professional judgment was used.

Pesticides Continuing Calibration

Criteria	Actions[1]	
	Detected	Nondetected
%D or %Drift >20%	J	UJ
[1] Actions are applied to positive results reported from the nonconforming column. Do not qualify nondetect results unless both columns are noncompliant.		

Qualified results are shown in Table 1.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks and equipment rinsate blanks were evaluated as to whether there were contaminants detected above the detection limit (DL).

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required. There were no detected target analytes reported in equipment blank sample SD-EB01-ME45.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance.

The surrogate recoveries were within the QC acceptance criteria.

MS/MSD Results

MS/MSD analyses were not performed on samples reported in this SDG. There were no validation actions taken on this basis.

LCS/LCSD Results

The LCS and/or LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria.

The LCS and/or LCSD %Rs and/or RPDs were within the QC acceptance criteria.

Field Duplicate Results

There were no field duplicate samples submitted with this data set. No validation actions were taken on this basis.

Sulfur Clean-up

Sulfur clean-up was not applicable for aqueous samples.

Sample Results/Reporting Issues

For detected results for both pesticides and PCBs, the laboratory reported the lower of the two values between the two columns. Based on DoD QSM v5.0, positive results should be reported from the primary column. No actions were taken except to note this discrepancy.

All compounds detected at concentrations less than the LOQ but greater than the limit of detection (LOD) were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation

Dual Column Precision

Sample results were reviewed to ensure that the dual column precision RPD criteria were met. Since the equipment blank was nondetect for pesticides and PCBs, precision was deemed acceptable.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 12 and 13, 2016.

Sample ID	Matrix/Sample Type
SED09-01-ME45-1	Sediment
SED09-02A-ME45-1	Sediment
SD09-ME45-FD01	Field Duplicate of SED09-02A-ME45-1
SED09-03A-ME45-1	Sediment
SED09-04A-ME45-1	Sediment
SED09-05A-ME45-1	Sediment
SED09-09-ME45-1	Sediment
SED09-10-ME45-1	Sediment
SED09-11B-ME45-1	Sediment

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 6010C, Inductively Coupled Plasma-Atomic Emission Spectrometry* (USEPA, 1996);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 7470A, Mercury in Liquid Waste or SW-846 Method 7471B, Mercury in Solid or Semisolid Waste, as appropriate (Manual Cold-Vapor Technique)* (USEPA, 1996);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);

- *USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following parameters (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✗	Holding times and sample preservation
✓	Initial calibration/continuing calibration verification
✗	Laboratory blanks/equipment blanks
✓	ICP interference check standards
✗	Matrix spike (MS) results
✗	Laboratory duplicate results
✓	Laboratory control sample (LCS) results
✗	Field duplicate results
✓	ICP serial dilution results
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a quality control (QC) nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. No data were rejected. Selected data points were estimated and/or negated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

Holding time for mercury is 28 days, and 180 days for other metals. Qualify detected results for mercury as estimated low (J-).

Nonconformances are summarized in Attachment A in Table A-1.

Qualified sample results are shown in Table 1.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- all criteria were met for the calibration curves
- the initial calibration verification (ICV) percent recovery (%R) criteria were met;
- the continuing calibration verification standard (CCV) method percent difference (%Ds) were met; and
- the low level check standards (CRI or CRA) %R criteria were met.

The QC acceptance criteria were met.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks and equipment rinsate blanks were evaluated as to whether there were contaminants detected above the detection limit (DL). Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Method and equipment rinsate results were reviewed for conformance with the QC acceptance criteria. The equipment blank was reported in R0888. Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

Nonconformances are summarized in Attachment A in Table A-2. Sample results were qualified as follows:

Blank Type	Blank Result	Sample Result	Action for Samples
ICB/CCB (Positive)	≥IDL/DL but ≤ LOQ	Nondetect	No action
		≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ	Use Resolution Consultants professional judgment (see below [1])
	>LOQ	≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ but < ICB/CCB Result	Qualify at level of Blank Result with a "U" or Qualify result as unusable
		>ICB/CCB but <10x the ICB/CCB result	Qualify as estimated (J)
		≥10x ICB/CCB	No action is taken based on Resolution Consultants professional judgment

Blank Type	Blank Result	Sample Result	Action for Samples
ICB/CCB (Negative)	< (-LOQ)	Nondetect	Use Resolution Consultants professional judgment and qualify as estimated (UJ)
		≥IDL/DL but < LOQ	Use Resolution Consultants professional judgment and qualify results < LOQ as estimated (J-)
		< 10x LOQ	Qualify results >LOQ but <10x LOQ as estimated (J-)
		≥10x LOQ	No action is taken based on Resolution Consultants professional judgment
	≤ -IDL/DL and ≥ -LOQ	Nondetect	Use Resolution Consultants professional judgment, qualify as estimated (UJ)
		≥IDL/DL and <5x |neg. blank|	Use Resolution Consultants professional judgment, qualify results as estimated (J)
PB / EB/ FB (Positive)	> LOQ	≥IDL/DL but ≤ LOQ	Qualify as nondetect (U) at the LOQ
		>LOQ but < 10x Blank Result	Qualify results as unusable
		≥10x Blank Result	No action
	≥IDL/DL but ≤LOQ	Nondetect	No action
		≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ	Use Resolution Consultants professional judgment (see below [1])
PB (Negative)	< (-LOQ)	< 10x LOQ	Qualify positive results <10x LOQ as estimated (J-) and nondetects as estimated (UJ)
		≥10x LOQ	No action

[1] Establish an action level (AL) at 5x the blank contamination. If sample result is <AL, qualify the reported result with a U.

Qualified sample results are shown in Table 1.

ICP Interference Check Standards

The ICP interference check standards (ICSA, ICSAB) were reviewed for conformance.

All criteria were met for the ICSA and ICSAB.

MS Results

The MS and %Rs were reviewed for conformance with the QC acceptance criteria. MS results were provided for all project metals with the exception of aluminum.

Nonconformances are summarized in Attachment A in Table A-3. A post digestion spike was analyzed for these compounds and recoveries were in control. Data qualification on the basis of MS nonconformances was as follows:

Criteria	Action	
	Detect	Non-detect
Matrix Spike %R < 30% Post-digestion spike %R < 75%	J-	R
Matrix Spike %R < 30% Post-digestion spike %R ≥ 75%	J	UJ
Matrix Spike %R 30-74% Post-digestion Spike %R < 75%	J-	UJ
Matrix Spike %R 30-74% Post-digestion spike %R ≥ 75%	J	UJ
Matrix Spike %R > 125% Post-digestion spike %R > 125%	J+	No qualification

Criteria	Action	
	Detect	Non-detect
Matrix Spike %R > 125% Post-digestion spike %R ≤ 125%	J	No qualification
Matrix Spike %R < 30% No post-digestion spike performed (e.g., not required for Ag)	J-	R
Matrix Spike %R 30-74% No post-digestion spike performed (e.g., not required for Ag)	J-	UJ
Matrix Spike %R 75-125% Post-digestion spike not required	No qualification	No qualification
Matrix Spike %R > 125% No post-digestion spike performed (e.g., not required for Ag)	J+	No qualification

Notes: MS actions apply to all samples of the same matrix. This qualification will also be applied to the results of all samples within a given area of the site, if deemed appropriate.

1. If the sample result (SR) > 4x the spike concentration (S), no action is taken.
2. If any analyte does not meet the %R criteria and a post digestion spike (PDS) analysis was performed, use professional judgement to assess the results.
3. If the MS does not meet %R criteria, qualify all associated samples.

Qualified sample results are shown in Table 1.

Laboratory Duplicate Results

The laboratory duplicate relative percent differences (RPDs) were reviewed for conformance.

Nonconformances are summarized in Attachment A in Table A-4. Data qualification on the basis of laboratory duplicate RPDs was as follows:

Sample Results	RPD	Action (Detect/Nondetect)
≥5x LOQ (both sample and duplicate)	RPD>20%	Estimate (J/UJ)
<5x LOQ (either sample and/or duplicate)	if absolute difference is > the LOQ, estimate (J) positive results <5x the LOQ and nondetects (UJ).	

Qualified sample results are shown in Table 1.

LCS Results

The LCS %Rs were reviewed for conformance with the QC acceptance criteria.

The LCS %Rs were within the QC acceptance criteria.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC acceptance criterion of ≤50% for solid matrices and ≤30% for aqueous matrices. This criterion applies if both results were greater than five times the limit of quantitation (LOQ).

Nonconformances are summarized in Attachment A in Table A-5. Data qualification on the basis of field duplicate RPDs was as follows:

Actions: (Based on Resolution Consultants professional judgment)

Criteria	RPD	Action	
		Detected	Nondetected
Sample and duplicate are nondetect results	Not calculable (NC)	No qualification	No qualification
Sample and duplicate results <SLOQ	Not applicable	No qualification	No qualification
Sample and duplicate results ≥5xSLOQ	>30% Aqueous >50% All other sample types	J	Not Applicable
Sample and duplicate results are >SLOQ and <5xSLOQ	>60% Aqueous >100% All other sample types	J	Not Applicable
If sample or duplicate result is =SLOQ and the other is not detected	NC	J	UJ
If sample or duplicate result is <SLOQ and the other is not detected	NC	No qualification	No qualification

Qualified sample results are summarized in Table 1.

ICP Serial Dilution Results

The serial dilution percent differences (%Ds) were reviewed for conformance with the QC acceptance criteria.

The serial dilution %Ds were within the QC acceptance criteria.

Sample Results/Reporting Issues

All analytes detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

Resolution Consultants professional judgment was used to qualify sample results with percent solids that were <30%.

All criteria were met.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Attachment B

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Attachment C

Reason Codes and Explanations

Reason Code	Explanation
be	Equipment blank contamination
bf	Field blank contamination
bl	Laboratory blank contamination
c	Calibration issue
d	Reporting limit raised due to chromatographic interference
fd	Field duplicate RPDs
h	Holding times
i	Internal standard areas
k	Estimated Maximum Possible Concentration (EMPC)
l	LCS recoveries
lc	Labeled compound recovery
ld	Laboratory duplicate RPDs
lp	Laboratory control sample/laboratory control sample duplicate RPDs
m	Matrix spike recovery
md	Matrix spike/matrix spike duplicate RPDs
nb	Negative laboratory blank contamination
p	Chemical preservation issue
r	Dual column RPD
q	Quantitation issue
s	Surrogate recovery
su	Ion suppression
t	Temperature preservation issue
x	Percent solids
y	Serial dilution results
z	ICS results

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0888
Analyses/Method:	EPA SW-846 Method 6010C for Metals (ICP-AES) EPA SW-846 Method 7470A for Mercury in Liquid Waste (Manual Cold-Vapor Technique) and EPA SW-846 Method 7471B for Mercury in Solid or Semisolid Waste (Manual Cold-Vapor Technique)
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM

Prepared by:	Linda Adams/Resolution Consultants	Completed on: 12/09/2016
Reviewed by:	Cathy Larson/Resolution Consultants	File Name: R0888_Metals

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 26, 2016.

Sample ID	Matrix/Sample Type
SD-EB01-ME45	Equipment blank
SED09-06B-ME45-1	Sediment
SED09-07B-ME45-1	Sediment
SED09-08B-ME45-1	Sediment
SED09-ME45-FD02	Field Duplicate of SED09-08B-ME45-1
SED09-12B-ME45-1	Sediment

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 6010C, Inductively Coupled Plasma-Atomic Emission Spectrometry* (USEPA, 1996);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 7470A, Mercury in Liquid Waste or SW-846 Method 7471B, Mercury in Solid or Semisolid Waste, as appropriate (Manual Cold-Vapor Technique)* (USEPA, 1996);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following parameters (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
✓	Initial calibration/continuing calibration verification
✗	Laboratory blanks/equipment blanks
✓	ICP interference check standards
✗	Matrix spike (MS) results
✗	Laboratory duplicate results
✓	Laboratory control sample (LCS) results
✗	Field duplicate results
✗	ICP serial dilution results
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a quality control (QC) nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. No data were rejected. Selected data points were estimated and/or negated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- all criteria were met for the calibration curves
- the initial calibration verification (ICV) percent recovery (%R) criteria were met;
- the continuing calibration verification standard (CCV) method percent difference (%Ds) were met; and
- the low level check standards %R criteria were met.

The QC acceptance criteria were met.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks and equipment rinsate blanks were evaluated as to whether there were contaminants detected above the detection limit (DL). Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Method and equipment rinsate results were reviewed for conformance with the QC acceptance criteria. Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

Nonconformances are summarized in Attachment A in Table A-1. Sample results were qualified as follows:

Blank Type	Blank Result	Sample Result	Action for Samples
ICB/CCB (Positive)	≥IDL/DL but ≤ LOQ	Nondetect	No action
		≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ	Use Resolution Consultants professional judgment (see below [1])
	>LOQ	≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ but < ICB/CCB Result	Qualify at level of Blank Result with a "U" or Qualify result as unusable
		>ICB/CCB but <10x the ICB/CCB result	Qualify as estimated (J)
		≥10x ICB/CCB	No action is taken based on Resolution Consultants professional judgment

Blank Type	Blank Result	Sample Result	Action for Samples
ICB/CCB (Negative)	< (-LOQ)	Nondetect	Use Resolution Consultants professional judgment and qualify as estimated (UJ)
		≥IDL/DL but < LOQ	Use Resolution Consultants professional judgment and qualify results < LOQ as estimated (J-)
		< 10x LOQ	Qualify results >LOQ but <10x LOQ as estimated (J-)
		≥10x LOQ	No action is taken based on Resolution Consultants professional judgment
	≤ -IDL/DL and ≥ -LOQ	Nondetect	Use Resolution Consultants professional judgment, qualify as estimated (UJ)
		≥IDL/DL and <5x |neg. blank|	Use Resolution Consultants professional judgment, qualify results as estimated (J)
PB / EB/ FB (Positive)	> LOQ	≥IDL/DL but ≤ LOQ	Qualify as nondetect (U) at the LOQ
		>LOQ but < 10x Blank Result	Qualify results as unusable
		≥10x Blank Result	No action
	≥IDL/DL but ≤LOQ	Nondetect	No action
		≥IDL/DL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ	Use Resolution Consultants professional judgment (see below [1])
PB (Negative)	< (-LOQ)	< 10x LOQ	Qualify positive results <10x LOQ as estimated (J-) and nondetects as estimated (UJ)
		≥10x LOQ	No action

[1] Establish an action level (AL) at 5x the blank contamination. If sample result is <AL, qualify the reported result with a U.

If positive and negative blanks are reported for an analyte in the calibration blanks, pick the highest blank (absolute value) and use the table above with the following modifications:

Blank Type	Blank Results	Actions in Table to Use	Modifications
ICB/CCB	Positive > Negative	ICB/CCB (Positive)	Estimate nondetects (UJ)
	Negative > Positive	ICB/CCB (Negative)	Estimate (J)

Qualified sample results are shown in Table 1.

ICP Interference Check Standards

The ICP interference check standards (ICSA, ICSAB) were reviewed for conformance.

All criteria were met for the ICSA and ICSAB.

MS Results

The MS %Rs were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-2. Data qualification on the basis of MS nonconformances was as follows:

Criteria	Action	
	Detect	Non-detect
Matrix Spike %R < 30% Post-digestion spike %R < 75%	J-	R
Matrix Spike %R < 30% Post-digestion spike %R ≥ 75%	J	UJ
Matrix Spike %R 30-74% Post-digestion Spike %R < 75%	J-	UJ
Matrix Spike %R 30-74% Post-digestion spike %R ≥ 75%	J	UJ
Matrix Spike %R > 125% Post-digestion spike %R > 125%	J+	No qualification
Matrix Spike %R > 125% Post-digestion spike %R ≤ 125%	J	No qualification
Matrix Spike %R < 30% No post-digestion spike performed (e.g., not required for Ag)	J-	R
Matrix Spike %R 30-74% No post-digestion spike performed (e.g., not required for Ag)	J-	UJ
Matrix Spike %R 75-125% Post-digestion spike not required	No qualification	No qualification
Matrix Spike %R > 125% No post-digestion spike performed (e.g., not required for Ag)	J+	No qualification

Notes: MS actions apply to all samples of the same matrix. This qualification will also be applied to the results of all samples within a given area of the site, if deemed appropriate.

1. If the sample result (SR) > 4x the spike concentration (S), no action is taken.
2. If any analyte does not meet the %R criteria and a post digestion spike (PDS) analysis was performed, use professional judgement to assess the results.
3. If the MS does not meet %R criteria, qualify all associated samples.

Apply actions to all samples of the same matrix.

Qualified sample results are shown in Table 1.

Laboratory Duplicate Results

The laboratory duplicate relative percent differences (RPDs) were reviewed for conformance.

Nonconformances are summarized in Attachment A in Table A-3. Data qualification on the basis of laboratory duplicate RPDs was as follows:

Sample Results	RPD	Action (Detect/Nondetect)
≥5x LOQ (both sample and duplicate)	RPD>20%	Estimate (J/UJ)
<5x LOQ (either sample and/or duplicate)	if absolute difference is > the LOQ, estimate (J) positive results <5x the LOQ and nondetects (UJ).	

Actions apply to all samples of the same matrix.

Qualified sample results are shown in Table 1.

LCS Results

The LCS %Rs were reviewed for conformance with the QC acceptance criteria.

The LCS %Rs were within the QC acceptance criteria.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC acceptance criterion of ≤50% for solid matrices and ≤30% for aqueous matrices. This criterion applies if both results were greater than 5 times the limit of quantitation (LOQ).

Nonconformances are summarized in Attachment A in Table A-4. Data qualification on the basis of field duplicate RPDs was as follows:

Actions: (Based on Resolution Consultants professional judgment)

Criteria	RPD	Action	
		Detected	Nondetected
Sample and duplicate are nondetect results	Not calculable (NC)	No qualification	No qualification
Sample and duplicate results ≤5x LOQ	Not applicable	No qualification	No qualification
Sample and duplicate results >5x LOQ	>30% Aqueous >50% All other sample types	J	Not Applicable
Sample and duplicate results are >5x LOQ and ≤5x LOQ	>60% Aqueous >100% All other sample types	J	Not Applicable
If sample or duplicate result is > 5x LOQ and the other is not detected	NC	J	UJ
If sample or duplicate result is ≤ 5x LOQ and the other is not detected	NC	No qualification	No qualification

Actions apply to all samples of the same matrix.

Qualified sample results are summarized in Table 1.

ICP Serial Dilution Results

The serial dilution percent differences (%Ds) were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-5. Data qualification on the basis of serial dilution %Ds was as follows:

%D	Qualify Results
>10%	Estimate (J) detected results

Apply actions to all samples in the same preparation batch.

Qualified sample results are shown in Table 1.

Sample Results/Reporting Issues

All analytes detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

Resolution Consultants professional judgment was used to qualify sample results with percent solids that were <30%.

All criteria were met.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Attachment B

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Attachment C

Reason Codes and Explanations

Reason Code	Explanation
be	Equipment blank contamination
bf	Field blank contamination
bl	Laboratory blank contamination
c	Calibration issue
d	Reporting limit raised due to chromatographic interference
fd	Field duplicate RPDs
h	Holding times
i	Internal standard areas
k	Estimated Maximum Possible Concentration (EMPC)
l	LCS recoveries
lc	Labeled compound recovery
ld	Laboratory duplicate RPDs
lp	Laboratory control sample/laboratory control sample duplicate RPDs
m	Matrix spike recovery
md	Matrix spike/matrix spike duplicate RPDs
nb	Negative laboratory blank contamination
p	Chemical preservation issue
r	Dual column RPD

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0837
Analyses/Method:	Standard Methods 4500_S_D for Sulfide (Methylene Blue)
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Kristin Rutherford/Resolution Consultants Completed on: 12/06/2016
Reviewed by:	Linda Adams/Resolution Consultants File Name: R0837_Sulfide

SUMMARY

The sample listed below was collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 13, 2016.

Sample ID	Matrix/Sample Type
SED09-11B-ME45-1	Sediment

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Standard Methods For The Examination Of Water And Wastewater*;
- *EPA New England Environmental Data Review Program Guidance* (April 2013)*;*
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following parameters:

- ✓ Data completeness (chain-of-custody [COC])/sample integrity
- ✓ Holding times and sample preservation
- ✓ Initial calibration/continuing calibration verification
- ✓ Laboratory blanks/equipment blanks

- ✓ Matrix spike (MS) results
- ✓ Laboratory Duplicate Results
- ✓ Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
- ✓ Field duplicates
- ✓ Sample results/reporting issues

The symbol (✓) indicates that no results were qualified based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a quality control (QC) nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. There were no results qualified on the basis of this data review.

RESULTS

Data Completeness (COC)/Sample Integrity

The laboratory report was reviewed and found to be complete. No sample integrity issues were noted.

Holding Times and Sample Preservation

Sample preservation requirements and preparation/analysis holding times were met and/or qualification of the data was not required.

Initial Calibration/Continuing Calibration Verification

Initial and continuing calibration criteria were met and/or qualification of the data was not required.

Laboratory Blanks/Equipment Blanks

Laboratory and equipment blanks were free of contamination and/or qualification of data due to blank contamination was not required. The equipment blank, SD-EB01-ME45, was reported in SDG R0888 and was free of contamination.

MS Results

MS analysis was not performed on the sample in this data set. MS results for sediment samples from this site, reported in SDG R0838, were in control and no validation action was taken.

Laboratory Duplicate Results

Laboratory duplicate analyses were not performed on the sample in this data set. Laboratory duplicate results for sediment samples from this site, reported in SDG R0838, were in control and no validation action was taken.

LCS/LCSD Results

LCS and/or LCSD criteria were met and/or qualification of the data was not required.

Field Duplicate Results

Field duplicates were not submitted with this data set. There were no data validation actions made on this basis.

Sample Results/Reporting Issues

No other issues were narrated and percent solids were >30% for all sediment samples.

QUALIFICATION ACTIONS

No sample results were qualified as a result of this data review.

- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following parameters:

- ✓ Data completeness (chain-of-custody [COC])/sample integrity
- ✓ Holding times and sample preservation
- ✓ Initial calibration/continuing calibration verification
- ✓ Laboratory blanks/equipment blanks
- ✓ Matrix spike (MS)/matrix duplicate (MD) and/or matrix spike duplicate (MSD) results
- ✓ Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
- ✓ Field duplicate results
- ✓ Sample results/reporting issues

The symbol (✓) indicates that no results were qualified based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a quality control (QC) nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. There were no results qualified on the basis of this data review.

RESULTS

Data Completeness (COC)/Sample Integrity

The laboratory report was reviewed and found to be complete. No sample integrity issues were noted.

Holding Times and Sample Preservation

Sample preservation requirements and preparation/analysis holding times were met and/or qualification of the data was not required.

Initial Calibration/Continuing Calibration Verification

Initial and continuing calibration criteria were met and/or qualification of the data was not required.

Laboratory Blanks/Equipment Blanks

Laboratory and field blanks were free of contamination and/or qualification of data due to blank contamination was not required.

Matrix Spike (MS)/Matrix Duplicate (MD) and/or Matrix Spike Duplicate (MSD) Results

All MS/MD/MSD criteria were met and/or qualification of the data was not required.

Laboratory Control Sample (LCS)/Laboratory Control Sample Duplicate (LCSD) Results

LCS and/or LCSD criteria were met and/or qualification of the data was not required.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results are greater than five times the quantitation limit (QL).

The results for sulfide in the field duplicate pair were nondetect; therefore, precision was deemed acceptable.

Sample Results/Reporting Issues

No other issues were narrated and percent solids were > 30% for all sediment samples.

QUALIFICATION ACTIONS

No sample results were qualified as a result of this data review.

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on December 13 and 14, 2016.

Sample ID	Matrix/Sample Type
BLENDER BLANK_121516	Equipment blank
ET09-03-ME45R-1	Tissue
ET09-04-ME45R-1	Tissue
ET09-05-ME45R-1	Tissue
ET09-ME45R-FD01	Field Duplicate of ET09-05-ME45R-1
ET09-06-ME45R-1	Tissue
ET09-07-ME45R-1	Tissue
ET09-08-ME45R-1	Tissue
ET09-09-ME45R-1	Tissue
ET09-10-ME45R-1	Tissue
ET09-11-ME45R-1	Tissue
ET09-12-ME45R-1	Tissue

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8270D and 8270D-SIM, Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry/Selected Ion Monitoring* (USEPA, 2014);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);

- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following parameters:

✓ Data completeness (chain-of-custody [COC])/sample integrity
✓ Holding times and sample preservation
✓ Gas Chromatography/Mass Spectrometry (GC/MS) Performance Checks
✗ Initial calibration/continuing calibration verification
✓ Laboratory blanks/equipment blanks
✗ Surrogate spike recoveries
✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✗ Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
✓ Field duplicate results
✓ Internal standard results
✓ Sample results/reporting issues

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

It was noted during review that the SAP SVOC list of analytes included N-Nitrosodimethylamine. This analyte was not reported by the laboratory. Also, the compound 2,2'-oxybis (1-chloropropane) was reported by the laboratory, but this compound was not listed in the SAP. No actions were taken except to note these discrepancies.

Sample ET09-11-ME45R-1 was listed twice on the COC. The sample ID listed on the sample container for sample ET09-11-ME45R-1 which was collected on 12/14/16 identified the sample as ET09-04-ME45R-1. The sample collected on 12/14/16 was logged in by the laboratory using the sample ID that was noted on the sample container.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

GC/MS Performance Checks

The data were reviewed to ensure that the decafluorotriphenylphosphine (DFTPP) tuning was performed at the correct frequency and that the method acceptance criteria were met. All samples were analyzed within 12 hours of the DFTPP tunes.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and/or response factor method acceptance criteria were met;
- the initial calibration verification standard (ICV) percent recovery acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met; and
- the retention time method acceptance criteria were met.

Nonconformances are summarized in Attachment A in Tables A-1a and A-1b. Data qualification to the analytes associated with the specific ICAL and/or CCV was as follows:

ICAL and CCV Response Factor Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results[2]
RF<minimum RF (Table 4 method 8270D)	J	R[1]
[1]Resolution Consultants professional judgment may be used to either raise reporting level or to estimate reporting limit if low standard response is adequate.		
[2]Sample results qualified as not detected (U) due to blank contamination are not rejected, but estimated (UJ).		

ICAL Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected
%RSD > 15% and quantitation based on mean RF	J	UJ
r or r^2 < 0.99 and quantitation based on linear regression	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

ICV Recovery Nonconformances

Criteria	Actions*	
	Detected Results	Nondetected Results
Recovery > 120%	J+	No qualification
Recovery < 80%	J-	UJ
* No guidance in NFG, thus Resolution Consultants professional judgment was used		

CCV Linearity Nonconformances

Criteria	Actions	
	Detected Results	Nondetected Results
%D > 20% (except ending CCV >50%[1])	J	UJ
%Drift >20%	J*	UJ*
* No guidance in NFG, thus Resolution Consultants professional judgment was used [1]DoD QSM 5.0 criteria		

Qualified sample results are shown in Table 1.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks and equipment rinsate blanks were evaluated as to whether there were contaminants detected above the detection limit (DL).

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Tables A-2a and A-2b. Data qualification on the basis of surrogate recovery nonconformances was as follows:

Actions: (Based on NFG 2016, except as noted)

Actions are only taken when one surrogate %R is <10% or when 2 or more surrogates in one fraction are outside limits.

Actions apply to only the compounds in the affected fraction, *i.e.* if 2 acid surrogate %Rs are below the LL, then all acid compounds will be qualified as indicated in the table.

Criteria	Action	
	Detected Results	Nondetected Results
%R> upper limit (UL)	J+	No qualification
10% ≤ %R < lower limit (LL)[1]	J-	UJ
%R <10% (sample dilution is not a factor)[1]	J-	R
%R <10% (sample dilution is a factor)[1,2]	No qualification	No qualification

[1] NFG 2016 does not list a minimum limit. Based on Region 1 and Resolution Consultants professional judgment, a minimum limit of 10% was used.

[2] If there is no surrogate information due to dilution then estimate (J/UJ) all results. However, in cases where there is surrogate information from multiple runs then base the surrogate actions on the least diluted run.

Qualified sample results are shown in Table 1.

MS/MSD Results

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-3a and A-3b. Data qualification to the analytes associated with the specific MS/MSD nonconformances was as follows:

Actions: (Based on NFG 2016, Region 1, and Resolution Consultants professional judgment)

Criteria	Action	
	Detected Compounds	Nondetected Compounds
%R> UL	J+	No qualification
10% ≤ %R < LL*	J-	UJ
%R <10%*	J-	R
%RPD > UL	J	No qualification

* NFG 2016 does not list a minimum limit. Based on Region 1 and Resolution Consultants professional judgment, a minimum limit of 10% was used.

Notes:

1. Based on NFG 2016 SVOC guidance, Resolution Consultants professional judgment is used to reject (R) non-detects in all associated samples for any analyte with < 10% recovery. Also, Resolution Consultants professional judgment is used to estimate (UJ) rather the reject (R) sample results previously negated (U) on the basis of blank contamination.

Qualified sample results are shown in Table 1.

LCS/LCSD Results

The LCS/LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria. For SVOCs, control limits in the QSM were used by the laboratory and for the 8270D SIM method, the laboratory presented laboratory control limits. Results analyzed by 8270D SIM were also compared to the QSM criteria.

Nonconformances are summarized in Attachment A in Table A-4. Data qualification to the analytes associated with the specific LCS %Rs or RPDs was as follows:

Criteria[1,2]	Action[3]	
	Detected Compounds	Nondetected Compounds
%R or RPD > UL	J+	No qualification
10%≥%R < LL	J-	UJ
%R < 10%	J-	R
[1] In the absence of NFG 2016 guidance for LCS results, NFG 2016 MS/MSD guidance was applied with Resolution Consultants professional judgment. [2] NFG 2016 MS/MSD does not list a minimum limit. Based on Region 1 and Resolution Consultants professional judgment, a minimum limit of 10% was used.		
[3]If the %R of more than half of the analytes are not within limits, then reject (R) nondetects for the analytes with <10% recovery and estimate (J/UJ) all other analyte(s) in the associated samples.		

Qualified sample results are shown in Table 1.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than five times the limit of quantitation (LOQ).

All QC acceptance criteria were met and/or qualification of the data was not required.

Internal Standard Results

The internal standard (IS) recoveries were reviewed for conformance with the QC acceptance criteria.

All QC acceptance criteria were met.

Sample Results/Reporting Issues

All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

All analytes reported using method 8270D SIM were also reported using 8270D. The reporting limit is lower for the SIM method; therefore duplicate results for 8270D were noted as “not reported” in the database.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
JN	The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Attachment C

Reason Codes and Explanations

Reason Code	Explanation
be	Equipment blank contamination
bf	Field blank contamination
bl	Laboratory blank contamination
c	Calibration issue
d	Reporting limit raised due to chromatographic interference
fd	Field duplicate RPDs
h	Holding times
i	Internal standard areas
k	Estimated Maximum Possible Concentration (EMPC)
l	LCS or OPR recoveries
lc	Labeled compound recovery
ld	Laboratory duplicate RPDs
lp	Laboratory control sample/laboratory control sample duplicate RPDs
m	Matrix spike recovery
md	Matrix spike/matrix spike duplicate RPDs
nb	Negative laboratory blank contamination
p	Chemical preservation issue
r	Dual column RPD
q	Quantitation issue
s	Surrogate recovery
su	Ion suppression
t	Temperature preservation issue
x	Percent solids
y	Serial dilution results
z	ICS results

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R1136
Analyses/Method:	EPA SW-846 Method 8081B for Organochlorine Pesticides (GC/ECD)
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Kristin Rutherford/Resolution Consultants Completed on: 01/31/2017
Reviewed by:	Linda Adams/Resolution Consultants File Name: R1136_PEST

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on December 13 and 14, 2016.

Sample ID	Matrix/Sample Type
BLENDER BLANK_121516	Equipment blank
ET09-03-ME45R-1	Tissue
ET09-04-ME45R-1	Tissue
ET09-05-ME45R-1	Tissue
ET09-ME45R-FD01	Field Duplicate of ET09-05-ME45R-1
ET09-06-ME45R-1	Tissue
ET09-07-ME45R-1	Tissue
ET09-08-ME45R-1	Tissue
ET09-09-ME45R-1	Tissue
ET09-10-ME45R-1	Tissue
ET09-11-ME45R-1	Tissue
ET09-12-ME45R-1	Tissue

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 8081B, Organochlorine Pesticides by Gas Chromatography* (USEPA, 2007);
- *EPA New England Environmental Data Review Program Guidance* (April 2013);
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following parameters:

- ✓ Data completeness (chain-of-custody [COC])/sample integrity
- ✓ Holding times and sample preservation
- ✓ Initial calibration/continuing calibration verification
- ✓ Laboratory blanks/equipment blanks
- ✗ Surrogate spike recoveries
- ✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results
- ✓ Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
- ✓ Field duplicate results
- ✓ Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. No data were rejected. Selected data points were qualified as estimated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Sample ET09-11-ME45R-1 was listed twice on the COC. The sample ID listed on the sample container for sample ET09-11-ME45R-1 which was collected on 12/14/16 identified the sample as ET09-04-ME45R-1. The sample collected on 12/14/16 was logged in by the laboratory using the sample ID that was noted on the sample container.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and method acceptance criteria were met;
- the second-source calibration verification (ICV) method acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) acceptance criteria were met.

All criteria were met and/or data qualification was not required.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks and equipment rinsate blanks were evaluated as to whether there were contaminants detected above the detection limit (DL).

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required. There were no detected target analytes reported in equipment blank sample (BLENDER BLANK).

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance.

Nonconformances are summarized in Attachment A in Table A-1. Data qualification on the basis of surrogate recoveries was as follows:

Criteria[2]	Action	
	Detected Compounds	Nondetected Compounds
%R>upper limit (UL)	J+	No qualification[1]
10% ≤ %R < lower limit (LL)	J-	UJ
%R <10% (sample dilution is not a factor)	J-	R
%R <10% (sample dilution is a factor)	No qualification[2]	No qualification[2]

[1] NFG recommends no NFG recommends no qualification if %R >UL, but <200%, and professional judgment if %R >200%, thus Resolution Consultants professional judgment was used.
[2] Resolution Consultants professional judgment was used.

Note: If there is no surrogate information due to dilution then estimate (J/UJ) all results. However, in cases where there is surrogate information from multiple runs then base the surrogate actions on the least diluted run.

Qualified sample results are shown in Table 1.

MS/MSD Results

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-2. Data qualification to the analytes associated with the specific MS/MSD nonconformances was as follows:

Criteria	Action	
	Detected Compounds	Nondetected Compounds
%R> UL	J+	No qualification
20% ≤ %R < LL	J-	UJ
%R <20%	J-	R*
%RPD > UL	J	No qualification
Note: Actions are applied to the native unspiked sample only *When the native sample concentration is >4X the concentration of the spike added (based on Region I criteria), evaluate the MS, MSD, and native sample with regards to %RSD rather than %R (Resolution Consultants professional judgment)		

Qualified sample results are shown in Table 1.

LCS/LCSD Results

The LCS and/or LCSD %Rs and/or RPDs were reviewed for conformance with the QC acceptance criteria.

The %Rs and/or RPDs were within the QC acceptance criteria and/or qualification of the sample results was not required.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than two times the sample limit of quantitation (LOQ).

All QC acceptance criteria were met.

Sample Results/Reporting Issues

For detected results for both pesticides, the laboratory reported the lower of the two values between the two columns. Based on DoD QSM v5.0, positive results should be reported from the primary column. No actions were taken except to note this discrepancy.

All compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation

Dual Column Precision

Sample results were reviewed to ensure that the dual column precision RPD criteria were met. Since all sample results were nondetect, precision was deemed acceptable.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

ET09-10-ME45R-1	LINDANE	35	37	49	135	6	30
ET09-10-ME45R-1	DIELDRIN	33	36	56	136	10	30
ET09-10-ME45R-1	ENDRIN	23	29	57	140	23	30
ET09-10-ME45R-1	METHOXYCHLOR	38	39	52	143	4	30
ET09-10-ME45R-1	4,4-DDD	28	30	56	139	6	30
ET09-10-ME45R-1	4,4-DDE	33	42	56	134	25	30
ET09-10-ME45R-1	HEPTACHLOR	27	29	47	136	7	30
ET09-10-ME45R-1	ENDOSULFAN I	28	34	53	132	19	30

All sample results were qualified as estimated (UJ) since majority of spiked compounds failed %R criteria in MS and MSD.

Attachment B

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
JN	The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Data Validation Report

Project:	Site 07 Calf Pasture Point and Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	Eurofins Spectrum Analytical
Service Request:	R1136
Analyses/Method:	EPA Method 680 for the Determination of PCB Homologs by Gas Chromatography/Mass Spectrometry
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Paula DiMattei/Resolution Consultants — Completed on: 1/26/2017
Reviewed by:	Linda Adams/Resolution Consultants — File Name: R1136_PCB congeners

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 07 Calf Pasture Point and Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on December 13-14, 2017.

Sample ID	Matrix/Sample Type
Blender Blank-121516	Equipment blank
ET09-03-ME45R-1	Shellfish
ET09-04-ME45R-1	Shellfish
ET09-05-ME45R-1	Shellfish
ET09-06-ME45R-1	Shellfish
ET09-07-ME45R-1	Shellfish
ET09-08-ME45R-1	Shellfish
ET09-09-ME45R-1	Shellfish
ET09-10-ME45R-1	Shellfish
ET09-11-ME45R-1	Shellfish
ET09-12-ME45R-1	Shellfish
ET09-ME45R-FD01	Field duplicate of ET09-05-ME45R-1

- *DoD Quality Systems Manual (QMS) for Environmental Laboratories, version 5.0* (July 2013);
- *USEPA Method 680: Determination of Pesticides and PCBs in Water and Soil/Sediment by Gas Chromatography/Mass Spectrometry* (November 1985);
- *EPA New England, Environmental Data Review Program Guidance* (USEPA, April 2013);
- *USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016); and
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants' professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following parameters (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
✓	GC/MS performance checks
✓	Initial calibration/continuing calibration verification
✓	Laboratory blanks/equipment blanks
✗	Surrogate spike recoveries
✗	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✓	Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) results
✗	Field duplicate results
✓	Internal standard results
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. An "NA" indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. Selected data points were qualified as estimated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Sample ET09-11-ME45R-1 was listed twice on the COC. The sample ID listed on the sample container for sample ET09-11-ME45R-1 which was collected on 12/14/16 identified the sample as

ET09-**04**-ME45R-1. The sample collected on 12/14/16 was logged in by the laboratory using the sample ID that was noted on the sample container.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

GC/MS Performance Checks

The lab monitors the ratios of the primary and confirmatory ions at each level of chlorination with the exception of nonachlorobiphenyl as stipulated in the method. All ion ratios were within the QC acceptance limits.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r^2), and method acceptance criteria were met;
- the second-source calibration verification (ICV) method acceptance criteria were met; and
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) acceptance criteria were met.

All QC acceptance criteria were met.

Laboratory Blanks/Equipment Blanks

Laboratory method blanks and equipment rinsate blanks are evaluated as to whether there are contaminants detected above the detection limit (DL). Target compounds were not detected in the laboratory method blanks or blender blank associated with the samples in this data set.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance. Nonconformances are summarized in Attachment A in Table A-1. Data qualification was as follows:

Actions: (Based on NFG 2016)

Criteria	Action	
	Detected	**Nondetected**
%R <10% (undiluted)	J-	R
%R <10% (diluted)	Use professional judgment**	Use professional judgment**
%R ≥10% but is < LL	J-	UJ
%R > UL but ≤200%	J+	No qualification
%R >200	J+	Use professional judgment**
** Use professional judgment in qualifying data, as surrogate recovery problems may not directly apply to target compounds.		

Qualified sample results are shown in Table 1.

MS/MSD Results

The MS/MSD %Rs and relative percent differences (RPDs) were reviewed for conformance with the QC acceptance criteria. Nonconformances are summarized in Attachment A in Table A-2. Data qualification was as follows:

Actions: (Based on NFG 2016)

Criteria	Action	
	Detected	Nondetected
%R <20%	J-	R
%R ≥20% but is < LL	J-	UJ
%R > UL	J+	No qualification
%RPD > QC limit	J	No qualification

Qualified sample results are shown in Table 1.

LCS/LCSD Results

The LCS and LCSD %Rs and RPDs were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤50% for solid matrices and ≤30% for aqueous matrices. These criteria apply if both results were greater than two times the sample limit of quantitation (LOQ).

Nonconformances are summarized in Attachment A in Table A-3. Data qualification was as follows:

Actions: (Resolution Consultants professional judgment was used)

Criteria	RPD	Action	
		Detected	Nondetected
Sample and duplicate are nondetect results	Not calculable (NC)	No qualification	No qualification
Sample and duplicate results ≥2xLOQ	>30 (aqueous) >50 (solids)	J	Not Applicable
Sample and duplicate results <2xLOQ	>60 (aqueous) >100 (solids)	J	Not Applicable
If sample or duplicate result is >2xLOQ and the other is not detected	NC	J	UJ
If sample or duplicate result is <2xLOQ and the other is not detected	NC	No qualification	No qualification

Qualified sample results are shown in Table 1.

Internal Standard Results

The internal standard recoveries were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

Sample Results/Reporting Issues

If applicable, all compounds detected at concentrations less than the LOQ but greater than the DL were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on December 13 and 14, 2016.

Sample ID	Matrix/Sample Type
BLENDER BLANK_121516	Laboratory Equipment blank
ET09-03-ME45R-1	Tissue
ET09-04-ME45R-1	Tissue
ET09-05-ME45R-1	Tissue
ET09-ME45R-FD01	Field Duplicate of ET09-05-ME45R-1
ET09-06-ME45R-1	Tissue
ET09-07-ME45R-1	Tissue
ET09-08-ME45R-1	Tissue
ET09-09-ME45R-1	Tissue
ET09-10-ME45R-1	Tissue
ET09-11-ME45R-1	Tissue
ET09-12-ME45R-1	Tissue

Data validation activities were conducted with reference to:

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 6010C, Inductively Coupled Plasma-Atomic Emission Spectrometry* (USEPA, 1996);
- *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods SW846, specifically SW-846 Method 7470A, Mercury in Liquid Waste or SW-846 Method 7471B, Mercury in Solid or Semisolid Waste, as appropriate (Manual Cold-Vapor Technique)* (USEPA, 1996);
- *EPA New England Environmental Data Review Program Guidance (April 2013)* ;
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, AECOM professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following parameters (where applicable to the method):

✓	Data completeness (chain-of-custody (COC)/sample integrity
✓	Holding times/sample preservation
✓	Initial calibration/continuing calibration verification
✗	Laboratory blanks/equipment blanks
✓	ICP interference check standards
✓	Matrix spike (MS) results
✓	Laboratory duplicate results
✓	Laboratory control sample (LCS) results
✗	Field duplicate results
✓	ICP/ICPMS serial dilution results
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. The symbol (✗) indicates that a quality control (QC) nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. Selected data points were estimated and/or negated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness(COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Sample ET09-11-ME45R-1 was listed on the COC twice. A sample container was received labeled ET09-04-ME45R-1 which was not listed on the COC. Sample ET09-04-ME45R-1 was reported as Lab Sample ID R1136-11 and the inconsistency and corrective action was documented in the laboratory sample receipt forms.

Holding Times/Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria.

The QC acceptance criteria were met.

Initial Calibration/Continuing Calibration Verification

Calibration data for the metals analyses were reviewed for conformance with the QC acceptance criteria to ensure that:

- all criteria were met for the calibration curves
- the initial calibration verification (ICV) percent recovery (%R) criteria were met;
- the continuing calibration verification standard (CCV) method %Rs were met; and
- the low level check standards (CRI or CRA) %R criteria were met.

The QC acceptance criteria were met.

Laboratory Blanks/Equipment Blanks

Laboratory blanks and a blender blank were evaluated as to whether there were contaminants detected above the detection limit (DL). Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detections in the blender blank sample were first qualified as not detected if they were associated with laboratory blank contamination. Detections remaining in the blender blank were then used to qualify the tissue samples. Laboratory blank and blender blank results were reviewed for conformance with the QC acceptance criteria. Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

Nonconformances are summarized in Attachment A in Table A-1a and A-1b. Sample results were qualified as follows:

Blank Type	Blank Result	Sample Result	Action for Sample
ICB/CCB (Positive)	≥IDL/MDL but ≤ LOQ	Nondetect	No action
		≥IDL/MDL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ	Use Reslution Consultants professional judgment (see below [1])
	>LOQ	≥IDL/MDL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ but < ICB/CCB Result	Qualify at level of Blank Result with a "U" or Qualify result as unusable
		>ICB/CCB but <10x the ICB/CCB result	Qualify as estimated (J)
		≥10x ICB/CCB	No action is taken based on Resolution Consultants professional judgment
ICB/CCB (Negative)	< (-LOQ)	Nondetect	Use Resolution Consultants professional judgment and qualify as estimated (UJ)
		≥IDL/MDL but < LOQ	Use Resolution Consultants professional judgment and qualify results < LOQ as estimated (J)
		< 10x LOQ	Qualify results >LOQ but <10x LOQ as estimated (J)
		≥10x LOQ	No action is taken based on Resolution Consultants professional judgment
	≤ -IDL/Mand ≥ -LOQ	Nondetect	Use Resolution Consultants professional judgment, qualify as estimated (UJ)
		≥IDL/MDL and <5x |neg. blank|	Use Resolution Consultants professional judgment, qualify results as estimated (J)
PB / EB/ FB (Positive)	> LOQ	≥IDL/MDL but ≤ LOQ	Qualify as nondetect (U) at the LOQ
		>LOQ but < 10x Blank Result	Qualify results as unusable
		≥10x Blank Result	No action
	≥IDL/MDL but ≤LOQ	Nondetect	No action
		≥IDL/MDL but ≤LOQ	Qualify as nondetect (U) at the LOQ
		> LOQ	Use Resolution Consultants professional judgment (see below [1])
PB (Negative)	< (-LOQ)	< 10x LOQ	Qualify positive results <10x LOQ as estimated (J) and nondetects as estimated (UJ)
		≥10x LOQ	No action

[1] Establish an action level (AL) at 5x the blank contamination. If sample result is <AL, qualify the reported result with a U.

Qualified sample results are shown in Table 1.

ICP Interference Check Standards

The ICP interference check standards (ICSA, ICSAB) were reviewed for conformance.

All criteria were met for the ICSA and ICSAB.

MS Results

The MS %Rs were reviewed for conformance with the QC acceptance criteria.

The MS %Rs were within the QC acceptance criteria.

Resolution Consultants
250 Apollo Drive
Chelmsford, MA 01824

978.905.2100 tel
978.905.2101 fax

Laboratory Duplicate Results

The laboratory duplicate relative percent differences (RPDs) were reviewed for conformance.

The laboratory duplicate RPDs were within the QC acceptance criteria.

LCS Results

The LCS %Rs were reviewed for conformance with the QC acceptance criteria.

The LCS %Rs were within the QC acceptance criteria.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC acceptance criterion of ≤50% for solid matrices and ≤30% for aqueous matrices. This criterion applies if both results were greater than 5 times the limit of quantitation (LOQ).

Nonconformances are summarized in Attachment A in Table A-2. Data qualification on the basis of field duplicate RPDs was as follows:

Actions: (Based on Resolution Consultants professional judgment)

Criteria	RPD	Action	
		Detected	Nondetected
Sample and duplicate are nondetect results	Not calculable (NC)	No qualification	No qualification
Sample and duplicate results <5xLOQ	Not applicable	No qualification	No qualification
Sample and duplicate results ≥5xLOQ	>30% Aqueous >50% All other sample types	J	Not Applicable
Sample and duplicate results are >5xLOQ and <5xSLOQ	>60% Aqueous >100% All other sample types	J	Not Applicable
If sample or duplicate result is =5xLOQ and the other is not detected	NC	J	UJ
If sample or duplicate result is <5xLOQ and the other is not detected	NC	No qualification	No qualification

Qualified sample results are summarized in Table 1.

ICP/ICPMS Serial Dilution Results

The serial dilution percent differences (%Ds) were reviewed for conformance with the QC acceptance criteria.

The serial dilution %Ds were within the QC acceptance criteria.

Sample Results/Reporting Issues

All analytes detected at concentrations less than the limit of quantitation (LOQ) but greater than the method detection limit (MDL) were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

Percent solids were not measured for the tissue samples.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Attachment B

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Attachment C

Reason Codes and Explanations

Reason Code	Explanation
be	Equipment blank contamination
bf	Field blank contamination
bl	Laboratory blank contamination
c	Calibration issue
d	Reporting limit raised due to chromatographic interference
fd	Field duplicate RPDs
h	Holding times
i	Internal standard areas
k	Estimated Maximum Possible Concentration (EMPC)
l	LCS recoveries
lc	Labeled compound recovery
ld	Laboratory duplicate RPDs
lp	Laboratory control sample/laboratory control sample duplicate RPDs
m	Matrix spike recovery
md	Matrix spike/matrix spike duplicate RPDs
nb	Negative laboratory blank contamination
p	Chemical preservation issue
r	Dual column RPD
q	Quantitation issue
s	Surrogate recovery
su	Ion suppression
t	Temperature preservation issue
x	Percent solids
y	Serial dilution results
z	ICS results

Data Validation Report

Project:	Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville
Laboratory:	EUROFINS SPECTRUM ANALYTICAL
Service Request:	R0832
Analyses/Method:	EPA Method 3C for Methane (GC) and EPA Method TO-15, VOCs Collected in Canisters
Validation Level:	Tier 1 Plus
Resolution Consultants Project Number:	60273164.SA.DM
Prepared by:	Elissa McDonagh/Resolution Consultants Completed on: 12/07/16
Reviewed by:	Linda Adams/Resolution Consultants File Name: R0832_3C and TO-15

SUMMARY

The samples listed below were collected by Resolution Consultants from the Site 09 Allen Harbor Landfill LTM, Former NCBC Davisville site on September 9, 2016.

Sample ID	Matrix/Sample Type
GV09-01-ME45-1	Air sample
GV09-02-ME45-1	Air sample
GV09-ME45-FD01	Field Duplicate of GV09-02-ME45-1
GV09-03-ME45-1	Air sample
GV09-04-ME45-1	Air sample
GV09-05-ME45-1	Air sample

Data validation activities were conducted with reference to

- *DoD Quality Systems Manual (QSM) for Environmental Laboratories, version 5.0* (July 2013);
- *EPA method TO-15*
- *Modified EPA 3C*
- *EPA New England Environmental Data Review Program Guidance (April 2013)*;
- *EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures* (April 2013);
- *USEPA National Functional Guidelines for Superfund Organic Methods Data Review* (September 2016);
- laboratory quality control (QC) limits, as applicable.

The USEPA Region 1 and National Data Validation Functional Guidelines were modified to accommodate the non-CLP methodologies. In the absence of method-specific information, laboratory quality control (QC) limits, DoD QSM 5.0, or project-specific requirements, Resolution Consultants professional judgment was used as appropriate.

REVIEW ELEMENTS

The data were evaluated based on the following review elements (where applicable to the method):

✓	Data completeness (chain-of-custody [COC])/sample integrity
✓	Holding times and sample preservation
✓	Gas Chromatography/Mass Spectrometry (GC/MS) performance checks
✓	Initial calibration/continuing calibration verification
✓	Laboratory blanks/trip blanks/equipment blanks
✗	Surrogate spike recoveries
NA	Matrix spike (MS) and/or matrix spike duplicate (MSD) results
✓	Laboratory control sample (LCS) results
✓	Lab Duplicate results
✓	Field duplicate results
✓	Internal standard recoveries
✓	Sample results/reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that a QC nonconformance resulted in the qualification of data. Any QC nonconformance that resulted in the qualification of data is discussed below. In addition, nonconformances or other issues that were noted during validation, but did not result in qualification of data, may be discussed for informational purposes only.

The data appear valid as reported and may be used for decision making purposes. No data were rejected. Selected data points were qualified as estimated due to nonconformances of certain QC criteria (see discussion below). Qualified sample results are presented in Table 1.

RESULTS

Data Completeness (COC)/Sample Integrity

The data package was reviewed and found to meet acceptance criteria for completeness:

- The COCs were reviewed for completeness of information relevant to the samples and requested analyses, and for signatures indicating transfer of sample custody.
- The laboratory sample login sheet(s) were reviewed for issues potentially affecting sample integrity, including the condition of sample containers upon receipt at the laboratory.
- Completeness of analyses was verified by comparing the reported results to the COC requests.

Holding Times and Sample Preservation

Sample preservation and preparation/analysis holding times were reviewed for conformance with the QC acceptance criteria. The QC acceptance criteria were met.

GC/MS Performance Checks

The data were reviewed to ensure that the 4-bromofluorobenzene (BFB) tuning was performed at the correct frequency and that the method acceptance criteria were met. All samples were analyzed within 12 hours of the BFB tunes.

Initial Calibration/Continuing Calibration Verification

Calibration data were reviewed for conformance with the QC acceptance criteria to ensure that:

- the initial calibration (ICAL) percent relative standard deviation (%RSD), correlation coefficient (r)/coefficient of determination (r2), and/or response factor (RF) method acceptance criteria were met;
- the initial calibration verification standard (ICV) percent recovery acceptance criteria were met;
- the continuing calibration verification standard (CCV) method percent difference or percent drift (%Ds) and RF acceptance criteria were met; and
- the retention time method acceptance criteria were met.

The QC acceptance criteria were met.

Laboratory Blanks/Trip Blanks/Equipment Blanks

Laboratory method blanks were evaluated as to whether there were contaminants detected above the detection limit (DL). Equipment blanks and trip blanks were not submitted with the samples in this SDG. No validation action was taken.

Data validation qualifications for individual samples are based on the maximum contaminant concentration detected in all associated blanks.

Detected results in blanks are not discussed in this data validation report if the associated results were nondetect or if qualification of sample results was not required.

The QC acceptance criteria were met and/or qualification of the sample results was not required.

Surrogate Spike Recoveries

The surrogate recoveries (%Rs) were reviewed for conformance with the QC acceptance criteria.

Nonconformances are summarized in Attachment A in Table A-1. Data qualification on the basis of surrogate recovery nonconformances was as follows:

Criteria	Action	
	Detected Compounds	Nondetected Compounds
%R > Upper Limit (UL)	J+	No qualification
20% ≤%R < Lower Limit (LL)	J-	UJ
%R < 20%	J-	R

Qualified sample results are shown in Table 1.

MS/MSD Results

MS/MSD analyses were not performed on samples reported in this SDG. There were no validation actions taken on this basis.

LCS Results

The LCS %Rs were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

Lab Duplicate Results

Lab duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤20% for air matrices. These criteria apply if both results were greater than two times the limit of quantitation (LOQ). All QC acceptance criteria were met.

Field Duplicate Results

Field duplicate RPDs were reviewed for conformance with the Resolution Consultants QC criteria of ≤30% for air matrices. These criteria apply if both results were greater than two times LOQ. All QC acceptance criteria were met.

Internal Standard Recoveries

The internal standard (IS) recoveries were reviewed for conformance with the QC acceptance criteria. All QC acceptance criteria were met.

Sample Results/Reporting Issues

All compounds detected at concentrations less than the LOQ but greater than the limit of detection (LOD) were qualified by the laboratory as estimated (J). This "J" qualifier was retained during data validation.

Any sample that was analyzed at a dilution because of high concentrations of target or non-targets was checked to confirm that the results and/or sample-specific LOQs and LODs were adjusted accordingly by the laboratory.

QUALIFICATION ACTIONS

Sample results qualified as a result of validation actions are summarized in Table 1. All actions are described above.

Attachment B

Qualifier Codes and Explanations

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased high.
J-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample and is potentially biased low.
JN	The analyte was tentatively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual quantitation limit necessary to accurately and precisely measure the analyte in the sample.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Attachment C

Reason Codes and Explanations

Reason Code	Explanation
be	Equipment blank contamination
bf	Field blank contamination
bl	Laboratory blank contamination
bt	Trip blank contamination
c	Calibration issue
d	Reporting limit raised due to chromatographic interference
fd	Field duplicate RPDs
h	Holding times
i	Internal standard areas
k	Estimated Maximum Possible Concentration (EMPC)
l	LCS or OPR recoveries
lc	Labeled compound recovery
ld	Laboratory duplicate RPDs
lp	Laboratory control sample/laboratory control sample duplicate RPDs
m	Matrix spike recovery
md	Matrix spike/matrix spike duplicate RPDs
nb	Negative laboratory blank contamination
p	Chemical preservation issue
r	Dual column RPD
q	Quantitation issue
s	Surrogate recovery
su	Ion suppression
t	Temperature preservation issue
x	Percent solids
y	Serial dilution results
z	ICS results

Attachment C

Institutional Control Checklist

INSTITUTIONAL CONTROL INSPECTION CHECKLIST
for LAND USE CONTROL AND IMPLEMENTATION PLAN
Parcel 10, Zone 3
(Includes OU1, Site 09)

A. Annual Certification:

Name: THOMAS J. MULLIGAN

Affiliation: TOWN MANAGER, TOWN of NORTH KINGSTOWN

Signature: Thomas J. Mulligan

Date: 12/21/2016

B. Documentation Inspection:

Inspect documentation to ensure no permits have been issued to change the use of the Site, build residential or commercial units, or install ground-water supply wells, including the following:

	ITEM	CHECK ONE	COMMENTS*
1.	Any related notice(s) filed with the Town of North Kingstown, RIDEM, or CRMC?	☐ Yes ☑ No	
2.	Any related building permits found?	☐ Yes ☑ No	
3.	Any related Department of Public Works Permits found?	☐ Yes ☑ No	
4.	Any related Zoning permits or variances found?	☐ Yes ☑ No	
5.	Any related Conservation Commission findings, proposals, or notices of intent found?	☐ Yes ☑ No	

C. Physical On-Site Inspection:

Name: Rachel MacPhee

Affiliation: Resolution Consultants

Signature:

Date: 09/23/16

	ITEM	CHECK ONE	COMMENTS*
1.	Land-Use Condition; i.e. Buildings Present? If yes, is there evidence of damage to the remedy?	☐ Yes ☒ No ☐ Yes ☒ No	
2.	Evidence of any ground-water supply wells? If yes, is there evidence of damage to the remedy?	☐ Yes ☒ No ☐ Yes ☒ No	
3.	Weather Conditions?	--	Sunny 285°F

*If the answer to a question is 'Yes', use the 'Comments' column to explain, e.g. list type(s) and names(s) of notices, permits, variances, notices of intent found; describe the type and location of where a building or ground-water supply well was observed.

Attachment D

Site Inspection Report

SITE INSPECTION REPORT

ALLEN HARBOR LANDFILL, NCBC DAVISVILLE, RHODE ISLAND

INSPECTOR NAME: Rachel MacPhee

POST-CLOSURE YEAR: 2016

SIGNATURE:

DATE & TIME OF INSPECTION: 09/28/16 10:00-15:00

WEATHER: Sunny, 80°F

TIDES: high tide: 06:40; low tide: 12:16

Component/Frequency	What to Inspect	Observations/Comments
Landfill Cap Inspection Annually during LTM sampling event.	Erosion, differential settling, vegetation coverage, vegetation maintenance, and animal burrowing.	Overall, the landfill cap is in good condition with little erosion or settling. • Small amounts of soil have washed from the cap and onto the revetment, leading to small patches of grass, moss, and other plants growing on the revetment. (Photo 1) • Several small animal burrows were observed on the landfill, mostly concentrated along the edge of the landfill cap. • Large animal burrow / erosion area observed on the southern area of the landfill in between well MW09-05S and MW09-24D/24S observed during 2015 inspection is recovering well. Depression is gone and grass is growing. • In some areas along the edge of the landfill cap, the geotextile liner is exposed (Photo 2) • No areas of erosion were observed. • The wooden fence was in moderately good condition; several broken rails were replaced. • Animal burrows and exposed geotextile liner were filled in with soil from the Soil Stockpile and seeded. (Photo 3) • See the "Vegetation and Shrub Inspection" section below for a description of vegetation conditions on site. **Recommendation:** Backfill new burrows, areas of exposed liner, and areas of erosion each year. Continue to replace broken rails on the fence. Continue monitoring program.

Storm Drainage System Inspection Annually during LTM sampling event.	Sediment accumulation, subsidence, erosion, vegetative growth, ponding, and obstructions to flow.	<u>Southern Drainage Channel</u> • The channel is in good condition overall. There is some vegetation and sedimentation in the channel. No flow was observed during inspection; however the flow path was not obstructed. • Cord Grass growth was observed around the southern culvert, but flow path does not appear to be impeded. (Photo 4) • The surrounding revetment was in good condition. Some organic sheen was observed in the water. <u>Northern Drainage Channel</u> • The culvert on the west side of the road had slight vegetative growth which is not hindering flow through channel. (Photo 5) • The east side of the culvert and the channel are in good condition. (Photo 6) <u>Southern Landfill Drain</u> • The screen and drain are in good condition. Some slight damage to the screen observed, but is not hindering the flow path. • There is minor algal growth and debris in the drain (Photo 7). <u>Northern Drainage Swale and Landfill Drain</u> • There is some vegetation growth within the northern drainage swale. Flow is not impeded. (Photo 8). • Some damage to the screen and nearby shrub growth were observed. Flow path was not obstructed. **Recommendation:** Monitor vegetative growth around drainage channel culverts. Monitor damage to southern landfill and northern drainage swale screens. Continue clearing vegetation in the drainage channels during yearly landfill maintenance. Continue monitoring program.
Gas Vent and Monitoring Well Survey Biennially	Survey the elevations of the benchmark points on the gas vents and the tops of the monitoring wells. Compare the elevations to the as-built elevations at the completion of construction.	A landfill settlement survey was completed on October 31, 2016. See Section 5 of the 2016 Five Year monitoring Report for a summary and analysis of the survey.

Gas Monitoring Vents Inspection Annually during LTM sampling event.	Damage to riser pipes, vents, screen on vents, and settlement in surrounding area. Damage to the fence and gate, rusted or damaged locks, and signs of intrusion.	Each of the five gas vents is in good condition. The riser pipes, vents, screens, and surrounding fence were in good condition. There were no signs of intrusion or settlement and the posted "No Smoking" signs were well-secured and gates are secure. **Recommendation:** Continue monitoring program.
Access Ramp Inspection Annually during LTM sampling event.	Potholes, ruts, settlement, vegetative growth, and erosion.	The entrance gate is in good condition. There is a shallow area of erosion (about 10 feet long) along the south side of the entrance ramp, likely a result of precipitation. Otherwise, there is no significant erosion, vegetative growth, potholes, or settlement. (Photo 9) Soil stockpile and tarp replaced during the 2015 inspection are in good condition. (Photo 10). **Recommendation:** Continue to monitor deterioration of Soil Stockpile erosion controls during landfill maintenance. Conduct repairs as needed. .
Restricted Shell Fishing Sign Inspection Annually during LTM sampling event.	Damaged or illegible signs, stability and integrity of the sign footings.	All three Restricted Shell Fishing Signs are in good condition. No bolts were missing and there were no new signs of vandalism. As observed in the 2015 inspection, the letters are beginning to peel on the central sign. (Photo 11). **Recommendation:** Continue monitoring program, especially regarding peeling letters on central sign.

Vegetation and Shrub Inspection Annually during LTM sampling event.	Areas of stressed vegetation larger than 6-ft square, vehicle ruts, erosion, need for maintenance such as mowing, watering, hydroseeding, planting, mulching, etc., Inspect shrubs to assess the need for maintenance such as watering or replacement.	There is good, consistent grass cover across the landfill cap. The grass is short due to recent mowing efforts. There are no large shrubs or saplings other than the planted cedar evergreen trees. (Photo 12). There are no significant ruts and the driving path is in good condition with no significant areas of erosion. Trees that were damaged by landscaping rope continue to recover well. (Photo 13) **Recommendation:** Continue monitoring and maintenance of landfill cap.
Revetment Slope Inspection Annually during LTM sampling event.	Inspect the slope for potential areas of sliding and/or stone displacement.	Overall, the revetment is in good condition; the slope is smooth, consistent, with little signs of sliding or displacement. Exposed geotextile liner, minor areas of soil erosion, and small animal borrows observed at the top of the revetment slope were backfilled with soil from the soil stockpile and seeded. There are few pieces of debris scattered across the revetment which appear to have been washed in by tides. This debris is minor, and does not appear to be impacting cord grass growth in the wetland or compromise the stability of the slope. **Recommendation:** Continue monitoring program.
Surveying Biennially	Survey the elevations of the settlement monitoring points and compare them against the as-built elevations.	A landfill settlement survey was completed on October 31, 2016. See Section 5of the 2016 Five Year monitoring Report for a summary and analysis of the survey.

Breakwater Structure Inspection Annually during LTM sampling event.	Inspect the breakwater structure for areas of sliding and stone displacement.	The breakwater structure is in good condition with no areas of significant settling, erosion, or stone displacement. (Photo 14). There are several areas with a build-up of broken mussel and clam shells across the top of the breakwater. **Recommendation:** Continue monitoring program.
Surveying Biennially	Survey the elevations of the settlement monitoring points on the breakwater structure and compare them against the as-built elevations.	A landfill settlement survey was completed on October 31, 2016. See Section 5 of the 2016 Five Year monitoring Report for a summary and analysis of the survey.

Created Wetland Annually during LTM sampling event.	Inspect wetland plants for percent survivability, physical appearance, density of growth, and presence of invasive wetland species in 3 locations: 1. Created wetland between the landfill revetment and the breakwater structure. 2. Planted wetland just north of the capped area. 3. Salt marsh enhancement area located along the north shore of Allen Harbor.	<u>Constructed Wetland</u> • There is excellent cord grass cover throughout the majority of the wetland. (Photo 15) Sea-lavender (Limonium carolinianum or nashi) was found growing in several areas against the revetment slope. This is a native marsh plant, and is also listed as "suitable for restoration plantings in coastal environment" by the CT Coastal Planting Guide. • Large holes created by sediment sampling near P09-05 were observed, consistent with previous year's inspections. • Consistent with previous years, a large salt panne has developed near these sediment holes. (Photo 16). • Several smaller salt pannes were also observed throughout the wetland. • The area of stressed vegetation observed during the 2015 inspection along the breakwater from P09-08 to the end of the breakwater has recovered significantly. Some debris washed in by violent wave action can still be seen on the revetment slope adjacent to this area. (Photo 17) <u>Salt Marsh Enhancement Area / Planted Wetland</u> • Invasive common reed (*Phragmites australis*) was observed on the west side of the planted wetland / enhancement area, growing alongside the Cord Grass. • A large wetland containing >90% of the common reed (*Phragmites australis*) can be found to the west of the bike path. The northern drainage swale drains this wetland in to Allen Harbor. **Recommendation:** Continue monitoring program. Navy does not suggest removing the common invasive reed from the study area. Doing so might cause instability and erosion in the shoreline.
Groundwater Monitoring System Inspection Annually during LTM sampling event.	Rusted locks, subsidence, well casing damage, or vandalism.	The monitoring wells are in good condition. See the attached monitoring well inspection table. **Recommendation:** Continue monitoring program.

Shellfish Inspection Annually during LTM sampling event.	Presence or absence of shellfish in the created wetland between the landfill revetment and the breakwater structure. Type (i.e., ribbed mussel, hard or soft-shell clam, oyster, etc.). General location, extent, and abundance.	Crabs, fish fry, oysters and other sea life noted on the harbor side of the breakwater. Burrow holes and evidence of sediment macroinvertebrates were observed in the constructed wetland. Ribbed Mussels were found in wetland sampling locations ET09-07 and ET09-08. Healthy quahog beds were observed at sampling locations ET-05, ET-08, ET-10, and ET-12. Several areas of broken shellfish shells were observed along the top of the breakwater. (Photo 18) **Recommendation:** Continue monitoring program.
