- EXHIBIT C - Coding Form
- EXHIBIT D - PRP Match File Lists (Alpha and Code Order)
- EXHIBIT E - Types of Container Match File Lists (Alpha and Code Order)
- EXHIBIT F - Waste Type Match File Lists (Alpha and Code Order)
- EXHIBIT G - Document Type Match File Lists (Alpha and Code Order)
- EXHIBIT H - Assumptions Match File Lists (Alpha and Code Order)
- EXHIBIT I - Conventions in Developing Match Files

**Generator** - Any individual or organization that produces or owns hazardous substances and disposes of or arranges for the disposal of these substances.

**Transporter** - Any individual or organization that accepts hazardous substances for transport to treatment or disposal facilities and arranges for disposal of these substances.

In order to identify the PRPs and determine the volume contributed by each to the site, a transactional database will be developed. The SRSNE record collection will be reviewed to identify each unique shipment of waste, or waste-in transaction, to the site and to identify all documents supporting each unique waste-in transaction. Each waste-in transaction will be coded and entered into the database as one record. Each record will contain fields into which information about the transaction is entered. These fields include the following:

Order Number

Date

Generator

Transporter

*Other Party*

Gallon Volume (of the waste)

Number of Containers

Type of Containers

Pin Number (of the waste type)

Waste Types

Hazardous Waste Type Codes

Document Numbers (i.e., the reference numbers assigned by TechLaw to each of the supporting documents)

Document Types (i.e., the type of each supporting document)

Document Form Number (i.e., the form number of each supporting document, if available; for example, the hazardous waste manifest number)

Comments

Assumptions

The database will then be used to calculate the total volume for records identifying each PRP to determine each PRP's volume contribution, as well as identifying the specific documents associating each PRP with the site.

### **B. The SRSNE Document Collection**

TechLaw numbered the lower right-hand of each page of the SRSNE document collection with a six- or seven-digit number corresponding to the page's position within the original SRSNE submission. The first one or two digits represent the box number, and the last five digits represent the page's position within the box. For example, a document numbered "2 00001" will be the first page in box two of the original SRSNE collection.

TechLaw then reviewed the SRSNE document collection to identify those documents that identified waste-in transactions to the site. These included logbooks maintained by SRSNE from 1956 to 1974, and customer files maintained by SRSNE for each year from approximately 1981 to 1989. TechLaw photocopied these documents to produce working copies.

The working copies of the logbooks were retained in their original chronological order. TechLaw reorganized the working copy of the customer files in the original SRSNE submission into one chronological file for each customer. Hereinafter, the reorganized customer files will be referenced as PRP files.

A copy of a page of the logbook is included in Exhibit A. [Note: At this time, it is assumed that all transactions between 1956 and 1974 will be documented only by the logbooks.]

Also included in Exhibit A are the primary types of documents found in the PRP files created from the SRSNE customer files. The primary documents include the following:

hazardous waste manifest - a form required by Federal law to accompany all shipments of hazardous waste, identifying the parties and wastes involved in the shipment;

shipping order - a record accompanying a shipment, identifying the parties and wastes involved in the shipment;

SRSNE shipping order - a receiving/shipping form completed by SRSNE for a shipment of waste into the site;

SRSNE processing form - a waste processing form completed by SRSNE;

hazardous waste data sheet - a document identifying the nature of a customer's waste stream;

SRS Inc., lab report - a lab analysis by SRSNE of a customer's waste;

Recovery Quotation - a cost quotation made to a customer by SRSNE to process the customer's waste, based on analysis of a sample and information submitted by the customer on SRSNE's hazardous waste data sheet; and

Job sheet - a description of a shipment and an analysis of the waste stream in the shipment completed by SRSNE.

A sample of each document is included in Exhibit A. Each document in Exhibit A, with the exception of the SRS, Inc., lab reports and Recovery Quotations, have been annotated to illustrate where information for the database fields can be located. The SRS Inc., lab reports and Recovery Quotations will not be utilized in this coding project.

If the coder identifies documents other than those above, the coder will consult the supervisor for direction. As new document types are identified, they will be annotated and added to the collection of sample document types provided to the coders.

### III. CODING INSTRUCTIONS

#### A. Identifying a Waste-In Transaction

During this project, information on waste-in transactions to the site will be coded from the documents. A waste-in transaction is a unique shipment of waste from another party to the site (i.e., to SRSNE in Southington, Connecticut).

A single shipment to the site may consist of several waste types. For the purposes of this coding project, each unique waste type in a shipment will be coded as a unique waste-in transaction, or record.

**Example:**

The hazardous waste manifest lists the following line items:

Description	Containers No.	Type	Total Quantity	Unit Wt/Vol
Acetone	5	D	275	G
Trichlorethylene	3	D	165	G
Xylene	1	D	55	G

Three transactions would be coded and entered into the database--one for the acetone, one for the trichlorethylene, and one for the xylene. Most of the same supporting document(s) would be referenced for the three transactions (for example, the hazardous waste manifest would be cited as a supporting document for all three transactions).

The contents of each PRP file will be reviewed to identify unique waste-in transactions identified by the documents. Because of the varying purposes of the different document types, any one transaction may be supported by more than one type of document. There may also be instances where a unique waste-in transaction is identified by only one document. Assembling all documents for any unique transaction is important to prevent duplicate coding and entry into the database.

Two typical scenarios of supporting documents that will occur in this coding project will be: 1) an entry in the SRSNE log or 2) a situation where a generator submits a sample of its waste and a hazardous waste data sheet to SRSNE to determine whether SRSNE will handle its waste; SRSNE samples waste and completes a SRS Inc., lab report on the waste; the waste type is accepted by SRSNE, and SRSNE provides a Recovery Quotation to the generator; the generator sends a shipment of waste to SRSNE, which is accompanied by a hazardous waste manifest and possibly other shipping records (for example, shipping order, bill of lading, shipping memorandum); SRSNE completes a SRSNE shipping order, job sheet, and processing records when the waste is received and processed at SRSNE. Thus, a single transaction may be documented by only one document, as in the example of the SRSNE log, or may be documented by any number or all of the primary documents. [Note: For the purposes of this coding project, SRS, Inc., lab reports and Recovery Quotations will not be cited as supporting documents.]

A single document would be sufficient alone to identify a unique waste-in transaction if it evidenced that waste was shipped to the site and identifies the volume of waste included in the shipment. If these two parameters are not fulfilled, a transaction can not be coded. Thus, if a transaction is documented only by a hazardous waste manifest, SRSNE shipping order, shipping orders, job sheet, SRSNE processing document, logbook, or other document evidencing the arrival and/or processing of the shipment of a certain volume of waste at the site, a transaction should be coded. A hazardous waste data sheet without other documents is insufficient to identify a waste-in transaction. Although a sample was sent to the site, there is no evidence that the PRP subsequently decided to send its waste to SRSNE, and, as noted in the SRS, Inc., lab report, some PRP's wastes may have been rejected by SRSNE.

A single document may identify more than one unique transaction, as in the example hazardous waste manifest above. The hazardous waste data sheet frequently will support more than one transaction; it supports all transactions involving the specific waste type (noted by a unique pin number).

In matching documents from the PRP files for a single transaction, the following criteria should be used:

Matching dates received or processed, waste types, number of containers, gallon volumes, and involved parties on hazardous waste manifests, SRSNE processing documents, SRSNE shipping orders, job sheets, shipping orders, and other documents;

Matching waste types and pin numbers (referenced on the material safety data sheet as the "lab #");

Matching SRSNE order number/job number on SRSNE shipping orders, SRSNE processing documents, and job sheets; and

Annotations of the hazardous waste manifest number on other supporting documents.

Ideally, the name of the source of waste on all support documents from the PRP files for any transaction is the same; however, some of the source documents may list different parties as the source.

Exhibit B provides samples of matching support documents from the PRP files based on the parameters discussed above.

## **B. Coding Instructions**

Coding of information from the logbook, where all information will be available from one document, will be done directly into the computer (i.e., on-line coding). Coding of information from the PRP files, where numerous documents will need to be reviewed to identify the information for any one transaction, will be conducted by recording the information onto a coding form containing fields corresponding to the fields in the database. Information will then be entered into the database from this form. A copy of the coding form, showing all the fields in the database, is included as Exhibit C to this manual. Each transaction coded from the PRP files will be coded onto a separate form.

Section C., Database Fields, provides an explanation of the fields and also instructs the coder how to extract the information for these fields from the documents. Exhibit B, in addition to providing samples of matching supporting documents for a transaction, provides samples of completed PRP file coding forms.

As discussed in Section C., information is extracted directly from the documents when coding the order, date, gallon volume, number of containers, pin numbers, hazardous waste codes, document numbers, and document form numbers fields. Assigned codes from a match file list will be used to record the information for the generator, transporter, other party, type of containers, waste type, document type, and assumptions fields. Match files will be created in the database to associate a unique code to each unique PRP name, type of container, waste type, document type, and assumption encountered in coding. Where a match file code is not available to record information for a transaction, the coder will see the supervisor so that a new code can be added to the appropriate match file. The PRP, type of container, waste type, document type, and assumption match file lists are provided as Exhibits D to H, respectively, of this manual. Each match file list is provided in both code and alpha order. Exhibit I discusses conventions that will be used in assigning the names to codes for the match files.

When recording alphabetical characters on the coding form and when conducting on-line coding, all characters should be recorded in uppercase. When completing the coding form, letters should be printed, not written.

When recording information onto the coding form, it is important that information be recorded clearly, neatly, and consistently on the coding form. Data entry personnel must be able to read every character recorded on the coding form so that data entry may proceed with maximum speed and accuracy. To assure correct interpretation of characters that are particularly difficult for data entry personnel to distinguish, the following guidelines should be followed in recording information on the coding form:

To distinguish clearly between the letter "O" and the numeral zero, always place a slash through the numeral zero as follows:

0

To distinguish clearly between the letter "Z" and numeral two, always cross the stem of the "Z" and make the numeral two rounded as follows:

Z

To distinguish clearly between the numeral one, the numeral seven, and the uppercase "I", write them as follows:

Numeral one--no bar on top or bottom

1

Numeral seven--bar on top, no slash through stem

7

Uppercase "I"--full bar on top and bottom

I

To distinguish clearly between the numerals four and nine, make the four squared and open at the top and the nine rounded and closed at the top as follows:

4 9

To distinguish clearly between the letters "U" and "V", make the "U" rounded at the bottom and the "V" pointed at the bottom, as follows:

U V

To distinguish clearly between the numeral six and the letter "G", put a tail on the "G" as follows:

G

## **C. Database Fields**

### **1. Order Number**

The order number field identifies a control number assigned by SRSNE to waste processed at the site. [Note: Waste processed in any order may have arrived at the site in more than one shipment; thus, there may be more than one transaction for any order number. For example, order number 4001 was for 4,900 gallons of waste oil. This volume arrived at the site under two manifests, one accompanying a truck load of 2,900 gallons of waste oil and one accompanying a truck load of 2,000 gallons of waste oil. Two transactions would be coded that would both be recorded with order number 4001.]

The examples in Exhibit A show where the order number (also referenced as job number) can be located on each of the different types of supporting documents. As discussed above, the order number will be the same on all supporting documents for any one transaction.

For coding PRP files. Record the order number on the coding form as it is stated on the source documents.

### **2. Date**

The date field identifies the date of the transaction.

The examples in Exhibit A show where the date can be located on each of the different types of supporting documents.

When recording the date, month, day, and year will each be expressed as a 2-digit number, zero filled to the left. Where the month, or day is not available, '00' is to be used for the missing element. If the year is not available, the date should be coded as "00/00/00."

**Examples:**

October 18, 1986, is recorded as 10/18/86

March, 1961, is recorded as 03/00/61

1989 is recorded as 00/00/89

For coding logbook entries. Record the date listed in the first column of dates in the logbook. [Note: The year is not recorded on each page of the SRSNE log; however, the log was kept in chronological order. If the year is not stated on a page, look to previous pages to identify the year.]

For coding the PRP files. Record the date on which the shipment arrived at the site. This date should be the same or close to the date on the shipping records (i.e., hazardous waste manifest, shipping orders, etc.) and the processing records (i.e., job sheet, SRSNE processing documents). Where there is a minor discrepancy on the source documents for the date received, record, in order of priority:

the date SRSNE signed the hazardous waste manifest;

the date of the SRSNE shipping order;

the date from SRSNE processing record;

the date from the job sheet; then,

the date from shipping orders and other shipping records.

[Note: The date from shipping records may be slightly earlier than that on the processing documents. The date on the hazardous waste data sheet will be significantly earlier or later (in the case of an update) than the dates of any shipments.]

**3. Generator**

The generator is identified as the party which originated the waste which was shipped to SRSNE.

The examples in Exhibit A show where the generator's name, or source, can be located on each of the different types of supporting documents.

When the name of the generator is found, match it with its 4-digit code number (zeros filled to the left), which will be found on the PRP Match File List (see Exhibit D to this manual). If the generator's name cannot be found on the PRP Match File List, consult the coding supervisor so that a new code can be assigned, if necessary.

If no generator is identified by the supporting documents, use code "9999" for unknown.

For coding the PRP files. The following criteria should be used to identify the generator:

- a. If there is only one valid supporting document for a transaction, identify the source as the generator.
- b. If there are multiple valid supporting documents for a transaction that all list the same source, identify the source as the generator.
- c. Where different parties are named as the generator or source on different supporting documents for a single transaction, all supporting documents for the transaction should be closely examined to determine the roles of the parties involved in the transaction. In some cases, the supporting documents may be identifying the transporter or "other party" as the source.

Where there is a discrepancy, the generator should be identified as the source listed on shipping records (i.e., hazardous waste manifests, shipping memorandums, etc.) rather than on processing documents (i.e., SRSNE shipping order, SRSNE processing documents, job sheet), which may only identify the party being billed by SRSNE.

Identify the generator's four-digit code number and record the four-digit number onto the coding form.

#### 4. Transporter

The transporter is identified as the party which shipped or transported the waste to SRSNE.

The documents in Exhibit A illustrate where to locate the transporter's name, if available on the document. No transporter will be identified for transactions documented by the logbooks. The identity of the transporter will not be available from SRSNE processing records or SRSNE shipping orders.

When the name of the transporter is found, match it with its 4-digit code number (zeros filled to the left) which will be found on the PRP Match File List (see Exhibit D to this manual). If the transporter's name cannot be found on the PRP Match File List, see the coding supervisor so that a new code can be assigned, if necessary.

If no transporter is identified by the supporting documents, use code "9999" for unknown.

For coding PRP files. The transporter identified in the PRP files will be the first transporter identified on hazardous waste manifests or the carrier on shipping orders and job sheets.

On a document such as a shipping order or other record, which would have originated with a party other than the site, where the carrier is identified as "our truck," "OT," or other similar expression, the shipper should also be identified as the transporter. Similar expressions on a document originated by SRSNE (for example, the job sheet) would identify SRSNE as the transporter. On documents which originated with a party other than the site, where the carrier is identified as "your truck," "YT," "customer's truck," or other similar expressions, the party identified as the destination should be identified as the transporter. Similar expressions on a document originated by SRSNE (for example, the job sheet) would identify the customer as the transporter.

When the name of the transporter is found, match it with its four-digit code number and record the four-digit code onto the coding form.

#### 5. Other Party

In some instances, the name of a party other than that identified as the generator or transporter will appear on the documents.

When the name of another party is found, match it with its four-digit code number (zeros filled to the left), which will be found on the PRP Match File List (see Exhibit D to this manual). Record the four-digit code. If the other party's name cannot be found on the PRP Match File List, consult the coding supervisor so that a new code can be assigned, if necessary.

For coding logbook entries. No other party will be identified for transactions coded from the logbooks, and this field will not be displayed to the coder.

For coding the PRP files. Any fourth party involved in the transaction in addition to the generator, transporter, and SRSNE (the site) will be identified as an Other Party. For example, the manifest lists a second transporter, or the "plant" listed on the hazardous waste data sheets is not the same party as that listed as the "company name". In these instances, the second transporter and "plant" would be identified as Other Parties. Other names may also commonly be noted in the "Special Handling" section of the manifest. [Note: When the Other Party field is used, a code must be placed in the assumption field to identify the source of the other party's identification.]

If no Other Party is identified, place a line through this field on the coding form.

#### 6. Gallon Volume

The gallon volume field identifies the volume of waste, in gallons, received at SRSNE.

The examples in Exhibit A show where the volume can be located on the different supporting documents. Gallon volume will not be available on the hazardous waste data sheet.

For coding the PRP files. The gallon volume should be the same or similar on the support documents. Gallon volumes expressed may vary from document to document due to different estimations (for example, estimating 50 gallons per drum rather than 55 gallons per drum). Where there is a minor discrepancy on the source documents for the gallon volume, record the gallon volume from, in order of priority:

hazardous waste manifest;

SRSNE shipping order;

SRSNE processing record;

job sheet; then,

shipping orders and other shipping documents.

Record the volume in gallons. If no volume in gallons is available, place a line through this field on the coding form.

**7. Number of Containers**

This field identifies the number of containers in which the waste arrived at the site. The type of containers will be primarily expressed in drums or tank trucks.

Exception. Where there is no gallon volume and no number of containers available, but the weight of the shipment is available, the weight of the shipment should be captured in this field.

The examples in Exhibit A show where the number of containers can be located on the different supporting documents. The number of containers will not be available on the hazardous waste data sheet.

For coding the PRP files. The number of containers, if stated on each document, should be consistent on documents for a single transaction. If there is an inconsistency, consult the coding supervisor for direction.

Record the number of containers. If the number of containers is not available, place a line through this field on the coding form.

### **8. Type of Containers**

This field identifies the type of containers in which the waste arrived at the site.

The examples in Exhibit A show where the type of containers can be located on the different supporting documents. The type of containers will not be available on the hazardous waste data sheet.

When the type of container is identified, match it with its one-character code number which will be found on the Type Container Match File List (see Exhibit E to this manual). If the type of container cannot be found on the Type of Container Match File List, see the coding supervisor so that a new code can be assigned, if necessary. The three primary types of containers that will be coded, and their codes, are as follows:

D = Drums  
T = Tank truck  
P = Pounds  
N = Not stated

Drums designated by "D" will be 55-gallon drums. Unless otherwise stated, all drums will be assumed to have a capacity of 55 gallons. Drums will usually be stated as "drums," "dm," or "d" on the source documents. A tank truck will be stated as "tank truck," "tk," or "tt" on the source documents. Pounds will be stated as "pounds," "lb.," "lbs.," or "#."

For coding the PRP files. Identify the type of container and match it to its one-character code. Record the one-character code number on the coding form.

## 9. Waste Type

This field identified the type of waste which was delivered to SRSNE.

The examples in Exhibit A show where the waste type can be located on the different supporting documents.

When the name of the waste type is found, match it with its three-digit code, which will be found on the Waste Type Match File List (see Exhibit F to this manual). If the waste type cannot be found on the Waste Type Match File List, consult the coding supervisor so that a new code can be assigned, if necessary.

For purposes of identifying a type of waste from the waste type match file list, the words "waste," "used," or "spent" should be dropped from in front of a waste type. Also, when recording the name from the hazardous waste manifest, record only the shipping name; the hazard class and the ID number should be dropped from the waste type description. For example, "waste trichloroethylene ORM-A UN1710" would be recorded as "trichloroethylene."

If a single waste stream contains more than one type of waste (i.e., "wash solvents and acetone"), enter the code for each type of waste in the waste stream onto the coding form (i.e., "wash solvents" and "acetone").

If no waste type is stated on the supporting documents, use code "999" for "Not Stated."

For coding PRP files. If the waste type is available on more than one supporting document, select the waste type from the following documents, in order of priority:

hazardous waste manifest;

SRSNE shipping order;

job sheet; then,

shipping orders or other shipping documents.

Identify the three-digit code assigned to the waste type, and record the three-digit code.

## 10. Hazardous Waste Code

The hazardous waste code is a four-character code assigned by Federal or state regulations to identify the hazardous qualities of the waste.

The examples in Exhibit A show where the hazardous waste code can be located on the hazardous waste manifest and hazardous waste data sheet. None of the other primary documents show the hazardous waste code.

For coding logbook entries. No hazardous waste codes are available for the logbooks; thus, this field will not be displayed to the coder.

For coding the PRP files. Locate the hazardous waste code on the hazardous waste manifest or hazardous waste data sheet and record the code onto the coding form.

## 11. Pin Number

The pin number is a number assigned by SRSNE to different waste types received at SRSNE from different customers.

The examples in Exhibit A show where the pin number can be located on the different supporting documents from the PRP files. [Note: On the hazardous material data sheet, the pin number is identified as the lab number]. This information is not available from the SRSNE logbooks.

For coding the PRP files. Record the numbers and letters in the pin number onto the coding form. Do not record any spaces or dashes in the number. As discussed above, the pin number, if stated, should be the same on all supporting documents for a single transaction.

If no pin number is available for a transaction, place a line through this field on the coding form.

### 12. Document Numbers

This field identifies the six- or seven-digit number that has been assigned to the document by TechLaw. The number can be found in the lower right-hand corner of the document, as shown in Exhibit A.

The document number should be coded as a seven-digit number. Thus, if the number is a six-digit number, fill a zero to the left of the first digit.

Example: Document Number "1 00001" will be coded as "01 00001".

For coding the PRP files. Record the document number for all relevant supporting documents for a transaction onto the coding form. [Note: Do not include SRS, Inc., lab reports, or Recovery Quotations.]

### 13. Document Types

This field identifies the type of each supporting document. The types of supporting documents and their names, are provided in Exhibit A.

When the type of document is identified, match it with its two-character code, which will be found on the Document Type Match File List (see Exhibit F to this manual). If a new document type is identified, see the coding supervisor so that a new code can be assigned to the document type, and the document type can be added to the collection of sample document types.

For coding logbook entries. No entry will need to be made into this field by the coder. The computer will automatically assign the code "LB" (for logbook) to the document numbers entered.

For coding the PRP files. Identify the document type for each document number recorded. Record the two-character code onto the coding form.

#### 14. Document Form Numbers

This field identifies the form number of each support document, if available.

The examples in Exhibit A show where the document form number can be located on the hazardous waste manifest. None of the other primary documents have form numbers; however, as new document types are identified, other documents for which form numbers will

~~should be left blank~~  
~~from the logbook.~~

For coding the PRP files. Documents such as hazardous waste manifests have a unique form number. If a hazardous waste manifest is used as a supporting document, enter its form number onto the coding form.

#### 15. Comments

This field identifies any comments about the transaction which cannot be captured in other fields. Minimal use should be made of this field, since most relevant information should be contained in other fields.

One example of a use for this field would be when there was an illegible volume, where a comment such as "Volume illegible, could be 4,000 or 9,000 gallons" would be used.

In using this field, be concise and clear. Do not use abbreviations unless necessary.

For coding PRP files. Record the comments. If no comments are needed for a transaction, place a line through this field on the coding form.

## 16. Assumptions

This field identifies assumptions that are developed as circumstances occur, which cannot be handled with the basic coding guidance alone, and any assumptions made in coding information into the TDB.

When the coder finds an occasion in coding where basic guidance does not provide sufficient direction for coding the transaction, the coder should see the coding supervisor. If necessary, the coding supervisor will consult with EPA to determine how to handle the issues involved, and assumptions will be developed. Any assumptions will be added to an assumption list that will become part of the guidance.

Assumptions will be used to identify how the other party was identified. For example, where the Other Party is identified on the documents as the second transporter, an assumption will be coded identifying that the Other Party is the second transporter. Where the Other Party is the "plant" listed on the hazardous waste data sheet, an assumption will be coded identifying that the Other Party was identified as "plant" on the hazardous waste data sheet.

Where assumptions develop that are applicable to a transaction, the coder should code the appropriate assumption for a transaction by matching the assumption to its two-character code found on the Assumption Match File List (see Exhibit G to this manual). [Note: Where the Other Party field is used, an assumption should always be coded identifying how the Other Party was identified.]

For coding PRP files. Identify any assumptions. Record the two-character code for the assumption. If no assumptions are needed, place a line through this field on the coding form.

## 17. Transaction Number

This field identifies a number assigned by the computer to each unique transaction contained in the TDB. The transaction number will subsequently be used to access the unique record within the database. Since this number is automatically assigned by the computer, this field will not need to be coded.

**D. Database Fields Summary**

Only waste-in transactions to the site should be coded (i.e., those transactions involving shipments to SRSNE). Waste-out transactions should not be coded (i.e., those transactions involving shipments from SRSNE).

For coding the PRP files. When identifying the generator, transporter, and other party (if any), the shipping records (i.e., hazardous waste manifests, shipping orders, etc.) and hazardous waste data sheet will usually be more useful than the processing documents (i.e., SRSNE shipping order, SRSNE processing documents, job sheet). As a rule, the shipping records and hazardous waste data sheet will identify the generator and transporter, and may identify any other party involved in the transaction. Processing records will identify only the party billed by SRSNE. Every transaction will involve a generator and transporter, but only some of the transactions will involve another party. Careful review of the documents should be conducted where different sources are identified on the documents for a single transaction to identify the roles of the parties.

In identifying the date, volume, number of containers, and type of containers, the information will be provided on the hazardous waste manifests, shipping orders, SRSNE shipping orders, job sheets, SRSNE processing documents and other documents, but any of these parameters may be stated slightly different on the documents for a single transaction. Likewise, the waste type will be stated on each of these documents, excluding the SRSNE processing documents (waste type not listed), but may be stated differently amongst the documents for a single transaction. When coding these fields from the documents, the information should be selected, in order of priority, from:

hazardous waste manifest;

SRSNE shipping order;

SRSNE processing record;

job sheet; then,

shipping orders and other shipping records.

The hazardous waste code will be identified on the hazardous waste manifest only.

The order number (also referenced as job number) can be found on the SRSNE shipping order, job sheet, and SRSNE processing documents. The order number may infrequently also be noted on the other types of supporting documents. The order number should be the same on all supporting documents for a transaction.

The pin number (also referenced as the lab number) can be found on the SRSNE shipping order, SRSNE processing record, job sheet and hazardous material data sheet, and provides a means of associating the latter document type to other supporting documents for a transaction. The pin number may also be noted on the other supporting documents. Where available, the pin number should be the same on all supporting documents for a transaction.

The document reference number and type of each supporting document should be coded. Also, if the document has a form number (for example, the hazardous waste manifest number), this number should also be coded.

CONVENTIONS IN DEVELOPING MATCH FILES**

## CONVENTIONS IN DEVELOPING MATCH FILES

### I. GENERAL - ALL MATCH FILES

All uppercase letters should be used in recording names into the match files in the transactional database (TDB).

New codes for a match file will be assigned as needed by the coding supervisor, who will use the code order list to identify the next available code. The coding supervisor will keep lists of new codes and corresponding names, which will be displayed in the coding room. The new codes will be routinely added to the database, revised match file lists will be generated, the revised match file lists will be distributed to the coders, and the outdated match files lists will be discarded.

### II. PRP MATCH FILE

Codes will consist of a four-digit number (zeros filled to the left), for example "0001" and "1290."

If a document is available with the PRP's letterhead, the PRP's name should be entered into the match file as stated on the letterhead. Otherwise, identify the most complete name provided for the PRP.

The PRP's full name should be entered into the match file, followed by an acronym, if any. For example, if the PRP's name is stated as "Ace Chemical" and "Ace Chemical, Inc.," the PRP's name should be recorded as "Ace Chemical, Inc." "Aluminum Company of America," also known as "ALCOA," would be entered into the match file as "Aluminum Company of America (ALCOA)."

Except where noted below, abbreviations should not be used unless there is insufficient space to record the company's full name.

The name of the PRP may be abbreviated if the name of the PRP stated on the documents is abbreviated, and the proper interpretation of the abbreviation cannot be determined. This may especially occur with the SRSNE logbook entries.

If "Company," "Co.," or "Comp." is part of the PRP's name, it should be spelled out as "Company," unless 1) letterhead indicates that "company" is abbreviated in the proper name for the company, or 2) there is insufficient space to record the full name, in which case the abbreviation "Co." should be used.

If "Corporation" or "Corp." is part of the PRP's name, it should be spelled out as "Corporation," unless 1) letterhead indicates that "corporation" is abbreviated in the proper name for the company, or 2) there is insufficient space to record the full name, in which case, the abbreviation "Corp." should be used.

If "Inc." is part of the PRP's name, it should not be spelled out as "Incorporated," but recorded as "Inc.," unless letterhead indicates that "Incorporated" is part of the proper name of the company. Where "Inc." is used as part of a PRP's name, a comma should be placed before the "Inc."

For divisions of a company, the PRP's name should be recorded as "name of company-name of division."

Names of individuals should be recorded as "Last name, first name, middle initial." A comma should be used between the last name and first name, and the middle initial should be followed by a period. Where the name of a company starts with the name of an individual, however, the name should not be inverted. For example, the individual "Mark S. Swift" would be entered into the match file as "Swift, Mark S.," but "Mark S. Swift and Sons" would be entered into the match file as "Mark S. Swift and Sons." [Note: If it appears that a new PRP is identified that is an individual, always check that the name does not appear listed as a company on the match file before entering it as a new name to the match file.]

Where individual letters are used in the PRP's name, each should be followed by a period, for example, "A.B.C. Company," unless the company's letterhead specifically indicates that there should not be periods between the letters.

Where "the" is used in the PRP's name, the "the" should be placed at the end of the PRP's name, preceded by a comma, for example, "The William Penn Company" would be recorded as "William Penn Company, The."

Where the PRP is a department, agency, or facility of the U.S. Government, the PRP's name should be preceded by "U.S. Govt.-." For example, "Meade Air Force Base" would be recorded as "U.S. Govt.-Meade Air Force Base" and the "Department of the Interior" would be recorded as "U.S. Govt.-Department of the Interior."

Where the PRP is a department or agency of a state government, the PRP name should be preceded by the name of the state, using the U.S. Post Office abbreviation for the state. For example the "Pennsylvania Department of Environmental Resources" would be recorded as "PA Department of Environmental Resources."

Where the PRP is a department or agency of a local or county government, the PRP name should be preceded by the name of the locality or county, respectively. For example, the police department of Toledo, Ohio, should be recorded as "Toledo, OH, Police Department."

City, county, towns, and villages should be listed by name and state, for example, "Boston, Massachusetts" should be listed as "Boston, MA, City of."

For PRP names extracted from the SRSNE logs, record both the PRP name and location (town and city) stated in the logs.

### III. TYPE OF CONTAINER MATCH FILE

Codes used will consist of a one-character code, for example, "D" or "T."

Create a new code for drum sizes specifically stated as other than 55 gallons.

### IV. WASTE TYPE MATCH FILE

Codes used will consist of a three-digit number (zeros filled to the left), for example, "003."

The words "waste," "used," or "spent" should be dropped from in front of a waste type. For example, "acetone" on the match file will be used to correspond to "acetone," "waste acetone," and "spent acetone."

When recording a new waste type from the hazardous waste manifest, only the shipping name should be added to the match file; the hazard class and the ID number should be dropped from the waste type description. For example, "trichloroethylene" in the match file would correlate to the hazardous waste manifest description, "waste trichloroethylene ORM-A UN1710."

New codes should not be assigned to mixtures. The coder should code each of the individual components of the waste. For example, the waste stream of "acetone and water" should not be added to the match file. The waste stream should be coded as "acetone" and "water."

### V. DOCUMENT TYPE

Codes used will consist of a two-character code, for example "WM."

[Note: In addition to updating the match file, a copy of the new document should be obtained, the location of information

for the database fields noted, and the annotated document displayed in the coding room.]

**VI. ASSUMPTIONS**

Codes used will consist of a two-character code, for example "AA."

The description of the assumption should be stated as clearly as possible. Abbreviations should not be used unless necessary.

When an additional assumption appears necessary, the coding supervisor will contact and discuss the situation with EPA for approval of the assumption.
