December 11, 2017

Mr. Dean Tagliaferro EPA Project Coordinator U.S. Environmental Protection Agency c/o Avatar Environmental 10 Lyman Street, Suite 2 Pittsfield, MA 01201

Re: GE-Pittsfield/Housatonic River Site Rest of River (GECD850) Operation, Monitoring, and Maintenance Plans for Woods Pond Dam and Rising Pond Dam

Dear Mr. Tagliaferro:

Section II.H.20 of the Modified RCRA Permit issued by the U.S. Environmental Protection Agency (EPA) to the General Electric Company (GE) on October 24, 2016 requires GE to submit a Dam Operation, Inspection, Monitoring, and Maintenance Plan. EPA's Revised Notice of Uncontested and Severable Permit Conditions, dated January 9, 2017, and GE's *Rest of River Initial Statement of Work*, submitted on May 12, 2017 and approved by EPA on July 10, 2017, provide that the non-stayed components of that requirement are the plans for Woods Pond and Rising Pond Dams. In accordance with that requirement, enclosed for EPA's review and approval are the Operation, Monitoring, and Maintenance (OM&M) Plans for Woods Pond Dam and Rising Pond Dam, prepared for GE by GZA GeoEnvironmental, Inc.. These documents present GE's plans to comply with Sections II.B.2.j.(1)(a) and (2)(a) of the Modified Permit insofar as those requirements apply to Woods Pond and Rising Pond Dams. They include, in appendices, updated Emergency Action Plans for these dams.

Please let me know if you have any questions or would like to discuss the enclosed OM&M Plans.

Very truly yours,

Jush T Sill

Andrew T. Silfer GE Project Coordinator

1.0 INTRODUCTION AND BACKGROUND

1.1 INTRODUCTION

This Operation, Monitoring, and Maintenance (OM&M) Plan for Woods Pond Dam, which has been prepared for the General Electric Company (GE) by GZA GeoEnvironmental, Inc. (GZA), describes the operation, inspection, and maintenance procedures that GE will implement for Woods Pond Dam, which is located on the Housatonic River on the border of Lee and Lenox, Massachusetts, and which is owned and operated by GE (**Figure 1**).

This OM&M Plan is submitted pursuant to Section II.H.20 of the Modified Permit issued by the United States Environmental Protection Agency (EPA) in October 2016 under the Resource Conservation and Recovery Act (RCRA) for the Rest of River portion of the GE-Pittsfield/Housatonic River Site and Section 3.6 of the *Rest of River Initial Statement of Work*, submitted by GE on May 12, 2017 and conditionally approved by EPA on July 10, 2017. It presents GE's plan to comply with Sections II.B.2.j.(1)(a) and (2)(a) of the Modified Permit insofar as those requirements apply to Woods Pond Dam. Section II.B.2.j.(1)(a) requires GE to minimize the releases of polychlorinated biphenyls (PCBs) from that impoundment by "ensuring inspection, monitoring, and maintenance" of the dam and impoundment. Section II.B.2.j.(2)(a) similarly requires GE to "operate, inspect, monitor, and maintain" Woods Pond Dam. It specifies that such activities "shall include, (i) maintaining the integrity of the dam to contain contaminated sediments and (ii) conducting materials handling and off-site disposal and engineering controls related to dam maintenance, repair, upgrades, and enhancement activities (including, but not limited to, addressing sedimentation in sluiceways, conveyances, and other channels that transport water over, through or around the dam); and (iii) ... all other related activities."

The procedures described herein have been developed in consideration of those requirements, as well as the guidance provided in in the Federal Emergency Management Agency (FEMA) publication entitled *Dam Safety: An Owner's Guidance Manual* (FEMA, 1987).

1.2 PURPOSE

The purpose of this OM&M Plan is to describe GE's proposed OM&M program for Woods Pond Dam. The overall objective of that program is to minimize releases of PCBs in sediments and surface water in Woods Pond that could be prevented by appropriate inspection, monitoring, and maintenance activities for the dam.

The responsibility for maintaining a safe dam rests with the dam owner. The Massachusetts Dam Safety Regulations state in 302 CMR 10.13 that "the owner shall be responsible and liable for damage to property of others or injury to persons, including but not limited to loss of life, resulting from the operation, failure of or misoperation of a dam."

Definitions of commonly used terms associated with dams are provided in **Appendix A**. This plan also contains visual inspection checklists for the quarterly and biennial inspections discussed in Section 3. An Emergency Action Plan (EAP) addressing emergency dam safety conditions is provided in **Appendix B**.

1.3 DESCRIPTION OF THE WOODS POND DAM

1.3.1 Dam Location

Town: Lee and Lenox

County: Berkshire

The left (east) abutment of Woods Pond Dam is located off Valley Street in Lee and can be accessed by vehicles. Valley Street extends northward through an industrial complex into a parking lot. A locked chain-link fence controls access from the parking lot to the outlet works and raceway embankment. The right (west) abutment is off Crystal Street in Lenox, adjacent to a set of railroad tracks. The railroad owner should be contacted for access over the tracks.

The gates leading to the raceway embankment and to the stoplog platform are padlocked. The Caretaker (identified below) has the keys for the padlocks at GE's 159 Plastics Avenue facility in Pittsfield, Massachusetts.

The Woods Pond Dam location is shown on the USGS East Lee, MA topographic map. The approximate coordinates are 73.2446°W longitude and 42.3472°N latitude, as shown on **Figure 1**.

1.3.2 Description of the Dam and Appurtenances

Woods Pond Dam is a run-of-the-river structure consisting of a concrete section as the right abutment, a primary spillway, and a controlled raceway structure as the left (east) abutment. Additionally, a raceway embankment runs upstream-downstream, forming the right (west) side of the raceway channel. The upstream end of this raceway embankment was the left abutment of a former dam.

The left section (referred to as the "closure structure") is formed of cellular steel sheetpiles capped with concrete. The crest of the section is at elevation 954.0 feet National Geodetic Vertical Datum of 1929 (NGVD) and is about 21 feet wide. Sheetpiles were driven to bedrock. The raceway embankment abuts the left concrete closure structure section on both the upstream and downstream sides.

The right concrete section is referred to as the non-overflow gravity section on the record drawings. This section is a concrete structure with a sloped downstream face and formed concrete walls on the upstream and downstream sides. The top elevation of the non-overflow gravity section is 954.0 feet NGVD. Although this structure is termed "non-overflow," this section of the dam is designed to overflow during the applicable Spillway Design Flood (SDF).

The dam's spillway is an uncontrolled, ogee-shaped concrete weir with a crest elevation of 948.3 feet NGVD. The spillway is about 140 feet long.

The raceway embankment consists of earth fill with riprap-protected slopes. The upstream end of the raceway embankment is the former left abutment of the previous dam that was located immediately upstream of the current dam. The downstream portion of the raceway embankment separates the raceway channel from the river. Although structurally connected to the current dam, the raceway embankment serves no functional role in the current dam. This upstream end has vertical stone masonry walls on the left side; these walls form the right side of the raceway channel. Raceway embankment slopes are protected by grouted riprap on the right side (spillway) upstream of the current dam and on both sides of the embankment downstream of the current dam. Around the raceway channel entrance, steel sheetpiles protect the approach and the discharge areas.

The raceway channel is formed from masonry walls extending about 90 feet upstream of the closure structure. Downstream of the closure structure, the left side of the channel is the streambank and the right side is the raceway embankment. The upstream entrance to the raceway is controlled by the closure structure containing up to five, 2-foot-high steel and concrete stoplogs, which are lifted using a gantry crane and hoist. The raceway closure structure is composed of formed concrete. A one-inch spacer is typically located between the second and third stoplogs at an elevation of 948.0 feet NGVD to provide flow into the raceway channel and help prevent water stagnation.

The downstream outlet of the raceway is a controlled concrete and masonry structure referred to as the raceway stoplog sluice structure. The purpose of the downstream raceway structure is to control the water level in the downstream mill pond and within the raceway. The controls consist of up to seven 14-inch-high steel stoplogs that were installed in 1991. A truck-mounted crane can be mobilized to install and remove the stoplog controls. Three of the stoplogs are typically left in-place to maintain the raceway and mill pond level between the Woods Pond impoundment and tailwater levels. The 1991 drawings indicate that a pressure grout injection program was performed in foundation soils along the perimeter of the raceway stoplog sluice structure to address seepage.

Instrumentation at the dam consists of three open standpipe piezometers in the downstream portion of the raceway embankment and a staff gage on the left spillway training wall.

1.3.3 Dam Construction History

The current dam was constructed in two phases in 1989 and in 1991 to replace the previous dam that was located about 80 to 250 feet upstream of the current dam. The first phase included the construction of the raceway closure structure, and the second phase was the construction of the spillway and non-overflow gravity section.

1.3.4 Drainage Area

The drainage area for the dam is approximately 170 square miles, and encompasses land within the Housatonic River Valley Wildlife Management Area. The drainage area is hilly with marshes and bogs.

1.3.5 <u>Reservoir Storage Volume</u>

Reservoir surface area and storage volume data presented below are based on previous analyses, as well as data developed for the 2007 *Structural Integrity Assessment and Inspection/Evaluation Report* (MWH, 2007). They are:

	Elevation (feet)	Storage Volume (acre-feet)
Normal Pool	948.8	460
Maximum Pool	955.8	5300
Spillway Design Flood (SDF) Pool	955.8	5300

1.3.6 <u>General Elevations</u>

<u>Feature</u>		Approx. Elev. (feet NGVD) ¹	
A.	Top of Dam	954.0 feet	
В.	Spillway Design Flood Pool	955.8 feet	
C.	Normal Pool	948.8± feet	
D.	Spillway Crest	948.3 feet	
E.	Low Level Outlet Invert	944 feet	

¹ Refer to the June 2017 Phase 1 Inspection/Evaluation Report (GZA, 2017) for elevation sources

- F. Streambed at Toe of the Dam936.4 to 942 feet
- G. Low Point along Toe of the Dam 936.4 feet

1.3.7 Dam Size and Hazard Classification

Woods Pond Dam has a maximum storage capacity of approximately 5,300 acre-feet and a structural height of about 17.6 feet. Refer to **Appendix A** for definitions of height of dam and storage. Therefore, in accordance with the classification procedures of the Massachusetts Department of Conservation and Recreation (MassDCR) Office of Dam Safety (ODS), under the Massachusetts Dam Safety Regulations in 302 CMR 10.00 as amended by Chapter 330 of the Acts of 2002, Woods Pond Dam is an **Large** size structure based on maximum storage above 1,000 acrefeet.

In accordance with MassDCR classification procedures, under the Massachusetts Dam Safety Regulations, Woods Pond Dam is classified as a dam with **Significant Hazard** potential.

1.3.8 Most Recent Inspection

The most recent visual engineering inspection of Woods Pond Dam was conducted by GZA in December 2016 and is described in GZA's June 2017 *Woods Pond Dam Phase I Inspection/Evaluation Report* (GZA,2017). Based on the results of that inspection, Woods Pond Dam was found to be in Satisfactory Condition and in compliance with the MassDCR's Dam Safety Regulations.

1.4 CURRENT KEY PERSONNEL AND THEIR RESPONSIBILITIES

GE is the owner of the Woods Pond Dam and is responsible for overseeing the operations and maintenance of the dam. The current Caretaker on GE's behalf is:

Kevin Mooney General Electric Company Global Operations – Environment, Health & Safety 159 Plastics Avenue Pittsfield, MA 01201 Daytime Phone: 413-553-6610 (Direct Office Number) Cell Phone: 413-441-4619

The current Alternate Caretaker on GE's behalf is:

Matthew Calacone General Electric Company Global Operations – Environment, Health & Safety 159 Plastics Avenue Pittsfield, MA 01201 Daytime Phone: 413-553-6614 (Direct Office Number) Cell Phone: 413-822-0082

GE contracts with consultants to assist in maintaining and inspecting the dam, including inspections following flooding or storm events as needed. Currently, Tetra Tech is responsible for these activities.

In addition, GE has retained a Professional Engineer experienced in dam engineering to conduct Phase 1 Inspections/Evaluations biennially and to review other dam issues on an as-needed basis. The current dam engineering consultant is:

Jonathan D. Andrews, P.E. GZA GeoEnvironmental, Inc. 249 Vanderbilt Avenue Norwood, Massachusetts 02062 Phone: (781) 278-5808 Cell: (781) 983-2881 Fax: (781) 278-5701

In the event that the Caretaker, Alternate Caretaker, or dam engineering consultant changes, GE will advise EPA of those changes.

2.0 OPERATIONS

This section describes the operation of Woods Pond Dam under normal and flood conditions. It also discusses the potential for dewatered conditions for dam maintenance.

2.1 RIVER FLOW INFORMATION

Previous engineering hydrologic and hydraulic (H&H) evaluations² have indicated that the Woods Pond Dam is able to safely pass the regulatory 500-year Spillway Design Flood (SDF).³ A summary of the previous H&H evaluations is presented in the following table.

Flood Return Period	Estimated Peak Discharge at Dam (cfs)	Estimated Peak Water Surface Elevation at Dam (ft, NGVD)
100-Year	11,700 cfs	
500-Year	12,100 cfs	955.8

There are two United States Geological Survey (USGS) stream gages near Woods Pond Dam; the Coltsville USGS No. 01197000 gage upstream and the Great Barrington USGS No. 01197500 gage downstream. The Coltsville gage is located on the East Branch of the Housatonic River and has approximately one-third the watershed of Woods Pond Dam. The Great Barrington gage has approximately 1.6 times the watershed of Woods Pond Dam. Thus, compared to actual flows at Woods Pond Dam, the Coltsville gage would tend to predict smaller peak river flows and the Great Barrington gage would tend to predict larger peak river flows.

Current and historical river flows for the East Branch of the Housatonic river at the Coltsville gage can be found at the AHPS website at <u>http://water.weather.gov/ahps2/hydrograph.php?gage=ctvm3&wfo=aly</u>. Predicted river flows for the Coltsville gage are added to the website during high flow periods. Current, historical, and predicted Housatonic River flows for the Great Barrington gage can be found at the Advanced Hydrologic Prediction Service (AHPS) website at <u>http://water.weather.gov/ahps2/hydrograph.php?wfo=aly&gage=gtbm3</u>. The AHPS predicted flows can be compared to the estimated peak discharges in the table above to plan flood operations and responses.

2.2 NORMAL OPERATIONS

No operator action is required for normal dam operations. The uncontrolled run-of-the river overflow spillway conveys flow downstream.

During normal operations, five stoplogs are typically in the raceway closure structure with a one-inch spacer between the second and third stoplogs, placing the top of stoplogs at elevation $954.0\pm$ feet NGVD. The downstream raceway stoplog structure is normally operated with three of the seven stoplogs in place. These stoplogs can be removed or added with a small truck-mounted crane.

² Refer to the June 2017 Phase 1 Inspection/Evaluation Report (GZA, 2017) for additional detail.

³ Spillway Design Flood (SDF) criteria for a Large sized, Significant Hazard Classification existing dam as specified in the Commonwealth of Massachusetts, Department of Environmental Management Dam Safety Regulations (302 CMR 10.14(6)).

2.3 FLOOD OPERATIONS

No operator action is required for river flow corresponding to a 100-year to 500-year return period flood event. As a routine matter, as discussed in Section 4, GE will keep the spillway and raceway approach and discharge areas clear of debris that could hinder flow during such an event. Floods on the order of a 500-year return period flood event may result in about 1.8 feet of overtopping of the gravity dam section of the structure; however, overflow resiliency is a design feature of the dam. Increased monitoring should be undertaken during times of gravity dam overtopping.

If the water level in the raceway approaches the top of the raceway embankment, GE will verify that three stoplogs are in place in the upstream raceway closure structure and remove stoplogs from the downstream raceway stoplog structure to minimize potential for overtopping the raceway embankment.

Actions during an actual or potential emergency are set forth in the Woods Pond Dam Emergency Action Plan (EAP), provided in **Appendix B**.

2.4 DEWATERED OPERATIONS

In the event that GE proposes to lower the water level in Woods Pond and dewater the spillway in order to perform maintenance or repairs, GE will develop a separate proposal and submit it to EPA for review and approval. That proposal will include a description of the proposed dewatering, as well as the monitoring and/or other actions that GE will undertake to monitor and control the potential releases of PCBs in that situation.

3.0 INSPECTIONS

This section describes GE's proposed routine inspection/observation program. These inspections will include regular quarterly inspections, biennial engineering inspections, inspections after large storm events, and other special inspections. The Woods Pond Dam Emergency Action Plan (**Appendix B**), will be followed during emergency conditions.

3.1 ROUTINE QUARTERLY INSPECTIONS

Quarterly inspections will be conducted by the Caretaker or by contracted personnel. A checklist for quarterly observations is included in **Appendix C**.

3.1.1 General Observations

The checklist from the previous quarter, as well as the checklists from any post-storm and ice-out observations from that quarter and the report on the most recent biennial engineering inspection, will be reviewed by the inspector prior to the quarterly inspection. During each quarterly inspection, the inspector will inspect the overflow concrete section, the raceway channel upstream and downstream structures, the spillway, the spillway training walls, and the raceway embankment. The inspector will note the impoundment and tailwater water levels, unusual conditions (whirlpools in the reservoir, etc.), debris on the crest, indicators of potential movement (i.e. cracks, sloughing of embankment, sinkholes, etc.), seepage, or any other unusual items that can be observed. During these inspections, close observation of the embankment condition is particularly important. Careful attention will be paid to signs of erosion, scouring, sloughing, and seepage in the embankment. The inspector will also take photographs from the locations and directions shown in **Appendix C**. If a change from the previous inspection is observed, that issue will be investigated and recorded.

The observations during the quarterly inspection will be recorded on the quarterly checklist in **Appendix C**. If significant changes in the condition of the dam are noticed, a Professional Engineer experienced in dam engineering will be contacted to review the condition of the dam.

3.1.2 Water Levels

During each quarterly inspection, observations of water levels will be made for the reservoir, tailwater, observation wells, and piezometers. All water levels will be recorded as part of the inspection report. Data collection sheets are included in **Appendix C**. If significant changes in water surface elevations are seen (up or down), these will be noted in the report. If the cause of the change is unknown, a Professional Engineer experienced in dam engineering will be contacted to review the observations.

Water levels at the dam and water levels/pressures at instruments will be measured using manual or electronic equipment. The following paragraphs explain the procedures for water level observations.

a. Water Surface Elevations:

A staff gauge has been painted onto the training wall on the left (east) abutment of the spillway to determine the impoundment water level. The water level in the raceway will be measured down from the top of the raceway structure by using a measuring tape to find the distance from the top of the raceway structure to the raceway channel water surface. The photographs below show the measuring points for the reservoir and the raceway channel water surface elevations.

Photo 1 : Reservoir (headwater) measuring point on left training wall.

Photo 2: Raceway channel level measuring point.

Photo 3: River (tailwater) measuring point.

b. Observation Well Readings:

During GE's quarterly inspections, water levels will be measured within observation wells BH-1, BH-2, and BH-3. The locations of these observation wells are shown on the figure in **Appendix C**. Water levels within the instruments will be measured manually using a water level indicator. The depth to water will be noted, and referenced to ground surface elevation. A data sheet to record future observation well measurements is included in **Appendix C**.

3.2 BIENNIAL ENGINEERING PHASE 1 INSPECTION/EVALUATIONS

The Massachusetts Dam Safety Regulations (302 CMR 10.00) require that a qualified Professional Engineer licensed in Massachusetts with experience in dam safety engineering perform an inspection of the dam once every five years. However, GE will arrange for such a dam safety inspection by such a licensed Professional Engineer, referred to as a Phase 1 inspection, on a biennial basis – i.e., every two years. The checklist used for such a Phase 1 visual inspection is included as **Appendix D**. The purpose of this independent visual dam safety inspection is to verify and supplement the results of the quarterly inspections. The inspecting engineer will be provided with the results of the quarterly inspection will be conducted in accordance with the MassDCR ODS requirements for a Phase 1 Inspection/Evaluation.

The final Phase 1 Inspection/Evaluation Report generated by the two-year inspection will follow the standard MassDCR Phase I format and will be submitted to the MassDCR ODS and EPA. The reports will also be kept on file for review during subsequent quarterly inspections. Note that, should the dam be determined to be in "Poor" or "Unsafe" condition, the MassDCR ODS may require follow-up inspections of the dam every three or six months.

3.3 POST-STORM OBSERVATIONS:

Observations of the dam will be made after high-flow events. For this purpose, a high-flow event is defined as a flow event with river flow of 1,500 cubic feet per second (cfs) or greater at the USGS gage on the Housatonic River near the East Bridge at Coltsville, which corresponds to the "Action Stage" of four feet above streambed, as determined by the National Weather Service. These post-storm observations will be made as soon as flood water

conditions have subsided and conditions allow safe access to the dam, and will include the same activities and use the same inspection form described in Section 3.1 for a quarterly inspection. When appropriate based on timing, a post-storm inspection may replace the quarterly inspection for the quarter in which the high-flow event occurs.

In addition, some limited dam observations will be made during major storms that are expected to result in flows over 1,500 cfs at the Coltsville gage, provided that safe access is available. These observations will be conducted to ensure that no significant damage is occurring to the dam as a result of the storm.

3.4 ICE-OUT OBSERVATIONS

Ice-out observations will be made in the spring and, if possible, will be combined with the spring quarterly inspection. During these inspections, particular attention will be paid to the spillway. Particular care will be taken to look for damage to the concrete of the spillway, training walls, non-overflow gravity section, raceway closure structure, and raceway stoplog sluice structure, as well as debris that may reduce spillway or raceway channel flow capacity. The results of this inspection will be recorded on the quarterly inspection checklist.

3.5 BEDROCK SCOUR INSPECTION

The scour hole at the toe of the spillway will be inspected once every ten years by topographic survey to evaluate the extents and possible growth of the eroded area in the bedrock. This inspection may be combined with the engineering Phase 1 visual inspection for the year involved; and the results will be included in the engineering Phase 1 Inspection/Evaluation Report covering the subject two-year period.

4.0 MAINTENANCE AND REPAIRS

This section describes the maintenance and repair activities that GE will perform at Woods Pond Dam. Routine maintenance, including the clearing debris and maintaining the embankment, aids in reducing future repair costs and helps provide for safe operation of the dam and appurtenant structures.

4.1 ROUTINE ANNUAL MAINTENANCE

Some maintenance activities will be regularly performed each year, generally on an annual basis (or more frequently as needed). These activities include the following:

<u>Vegetative Cutting</u> - GE will cut the vegetative cover on the embankments at least annually to prevent the growth of trees or brush on the embankments and to allow the embankments to be easily inspected. Woody or intrusive vegetation also will be removed from the riprap areas on an annual basis.

<u>Spillway and Raceway Cleaning</u> – GE will maintain the spillway approach area, raceway channel, and the upstream and downstream raceway control structure areas clear of debris to provide full hydraulic capacity. GE will remove debris annually, and more frequently as necessary if the free flow of water is being impacted. In addition, GE will remove debris, if present, when a major storm (as defined in Section 3.3) is forecast.

<u>Raceway Closure Structure Maintenance</u> – GE will exercise the raceway closure structure controls annually to ensure that they are properly functioning. This exercise will include removing and re-inserting the stoplogs into the. The stoplogs will be inspected when removed for signs of deterioration. Accumulated ice and debris (if any) will be removed from stop log spacers in the raceway closure structure to maintain flow through raceway channel. Any necessary repairs will be completed immediately, and records of the repairs will be kept. Exercising will be conducted under periods of low flow and be conducted in stages to reduce the impact of reservoir discharges.

4.2 OTHER MAINTENANCE OR REPAIRS

Apart from the above-described regular maintenance, other maintenance and repair activities will be routinely performed as needed in response to observations during the inspections (or other observations, if any). These activities include the following:

4.2.1 Embankments

<u>Repair of Sparse Vegetation and Erosion</u> – In the event that areas of missing or distressed grass cover or local erosion are identified on the raceway embankment top or slopes, those areas will be repaired, re-graded, and loamed and seeded as necessary.

<u>Tree Removal</u> – In instances where tree removal is necessary, the primary and secondary root system will be removed, and the resulting holes properly filled with compacted sand and gravel. Tree stumps greater than 6 inches will be removed and backfilled with suitable compacted fill using procedures outlined in FEMA 534. Tree removal will be performed under direction of a registered Professional Engineer familiar with and experienced in dam safety.

<u>Rodent Damage Control</u> – Rodents, such as groundhogs, muskrats, and beavers, are naturally attracted to the habitats created by dams and reservoirs and can endanger the structural integrity and proper performance of the

embankments. If rodent burrow holes are observed, the rodents will be removed if practicable and the burrow holes will be repaired. Where the damage consists of shallow holes scattered across the embankment, tamping of earth into the rodent holes is generally sufficient repair. Large burrows on an embankment will be filled using the following procedure: (a) Placement of a piece of metal stove or vent pipe vertically over the entrance to the den with a tight seal between the pipe and the den; (b) preparation of a mixture consisting of approximately 90 percent earth, 10 percent cement, and water added to produce a thin slurry; (c) pouring the slurry mixture into the hole; and (d) once the hole is filled, removal of the pipe and tamping additional dry earth into the entrance.

<u>Slope Traffic Damage Control</u> – Pedestrian and wildlife traffic on the embankment top or slopes can cause ruts which allow water to collect, causing saturation and softening of the embankment. Any ruts that develop will be repaired as soon as noticed.

<u>Riprap Damage Control</u> – GE will maintain the riprap as needed by periodically adding riprap to areas where it has become displaced by ice, clogged with debris or eroded material, or otherwise disturbed. GE will also replenish infill in slush grouted riprap areas as needed.

4.2.2 Spillway and Raceway Structures

<u>Sediment Removal</u> – Where observation of conveyances indicate build-up of excess sediment within the conveyances that may interfere with the flow of water, that excess sediment will be removed. Handling, management, and disposition of removed sediments and soils are described in Section 4.3.

<u>Sluiceway Structure Maintenance</u> – GE will exercise the sluiceway structure controls to ensure that they are properly functioning. This exercise will include removing and re-inserting the stoplogs into the structures and will be performed every ten years. The stoplogs will be inspected when removed for signs of deterioration. Any necessary repairs will be completed immediately, and records of the repairs will be kept. Exercising will be conducted under periods of low flow and be conducted in stages to reduce the impact of reservoir discharges.

<u>Concrete and Masonry Maintenance</u> – Where observations indicate damage to or deterioration of concrete and/or masonry surfaces, the damaged or deteriorated areas will be repaired, typically during summer months when pond levels and reservoir outflows are seasonally low. Specifically, GE will: (a) grout and fill any cracks that develop or open with time, as soon as they become evident; and (b) replace and repoint loosened blocks or mortar joints in the training walls.

<u>Metal Component Maintenance</u> - Periodic maintenance will be performed as needed on all exposed metal where submerged or exposed to air. GE will ensure the integrity of all contact surfaces between concrete and metal and, where necessary, re-grout those surfaces to preclude the build-up of water in the interface. Periodically, the metal stoplogs may require sandblasting and applications of corrosion inhibitors to preclude the build-up of rust.

4.2.3 <u>Other</u>

<u>Instrumentation Monitoring/Repair</u> – During the quarterly inspections, as described in Section 3.1.2, GE will obtain readings from the staff gauges and observation wells. Where these instruments have been damaged or are not working, they will be repaired.

<u>Security Item Repair</u> – Where observations indicate a need for repair of the chain link fence, gates, fence fabric, locks, chains, warning buoys, and/or platform railing, such repairs will be made.

<u>Other Repairs or Dam Upgrades</u> – In the event that the inspections indicate the need for other repairs or dam upgrades not identified above, those repairs or upgrades will be made.

4.2.4 <u>Timing</u>

Except as noted within the specific sections above, maintenance-level repairs will be completed within 60 days of observance. For repairs that require a longer period of time, GE will submit a schedule and plan to EPA.

4.3 HANDLING, MANAGEMENT, AND DISPOSITION OF SEDIMENTS AND SOILS

In the event that dam maintenance or repair activities or other response activities relating to Woods Pond Dam involve the handling, management, and/or disposition of sediments in Woods Pond or of soils adjacent to the dam, GE will take steps to ensure that those materials are properly handled, managed, and disposed of.

In general, any sediments/soils removed during such activities will be sent off-site for disposal. In such a case, the materials will be characterized for PCBs and other hazardous constituents as necessary to determine the appropriate management and off-site transport procedures and an appropriate permitted off-site disposal facility. Materials that are determined to contain PCBs at concentrations at or above 50 parts per million (ppm), which are regulated under the Toxic Substances Control Act (TSCA), will be managed as such and transported for disposal to an authorized off-site TSCA disposal facility. Materials (if any) that are found to constitute characteristic hazardous waste under RCRA will be handled as such and transported for disposal to an authorized hazardous waste disposal facility. Materials that contain PCB concentrations less than 50 ppm and do not constitute RCRA hazardous waste will be transported for disposal to an authorized solid waste disposal facility.

In the event that GE should wish to re-use some of all of the removed materials on-site, it will provide a specific proposal to EPA for approval, describing the sediments/soils proposed for re-use, the chemical and physical characteristics of those materials, the volume of those materials, the locations and depths for the proposed re-use, and other relevant information.

5.0 EMERGENCY RESPONSE

For the purposes of this OM&M Plan, an emergency is defined as a failure or other condition at Woods Pond Dam that results in an impending or actual sudden, uncontrolled release of water. Response procedures that will be followed in the event of such an emergency are presented in the EAP in **Appendix B**.

6.0 TRAINING

Personnel who are responsible for quarterly inspections (Caretaker, Alternate Caretaker, and contracted personnel) will be familiar with this OM&M Plan and will be formally trained prior to beginning their duties and at regular intervals. This training will be conducted biennially in conjunction with the biennial engineering inspections.

Personnel who are responsible for routine maintenance and repair items will be familiar with this OM&M Plan and review the procedures outlined above prior to beginning work. A copy of this OM&M Plan will be kept in an easily accessible area.

Biennial engineering inspections and large repairs will be conducted/designed by a Professional Engineer experienced in dam safety engineering.

7.0 RECORD-KEEPING AND REPORTING

7.1 <u>RECORD-KEEPING</u>

GE will maintain a file containing records and checklists on all quarterly, biennial, post-storm, and ice-out inspections. GE will also maintain records of all maintenance and repair work conducted at Woods Pond Dam and annual updates to the EAP.

7.2 <u>REPORTING</u>

The annual updates to the EAP will be provided to the distribution listed in the EAP, including EPA and the MassDCR ODS. GE will submit the biennial engineering Phase I Inspection/Evaluation Reports to EPA and ODS. Further reporting to EPA will be on an as-needed basis, but will include any of the other proposals to EPA described in this OM&M Plan (if necessary), as well as documentation of proposed major repairs.

8.0 SCHEDULE

The schedule of activities described in this OM&M Plan is summarized in the following table and will commence upon EPA's approval of this plan.

Inspection	and Ma	aintenance	Summary
------------	--------	------------	---------

Inspection	Frequency
Routine	Quarterly
Phase 1 Inspection/Evaluations	Biennial (every 2 years)
Ice Out	Annual (in conjunction with a quarterly inspection)
Post-Storm	After storm events (possibly in conjunction with a quarterly inspection, depending on timing); limited observations during storms
Scour Hole at Toe of Spillway	Once every 10 years (may be combined with a biennial engineering inspection)

Monitoring	Frequency
Headwater and Tailwater	Quarterly
Groundwater Levels	Quarterly
Concrete and Masonry	Quarterly
Metal Components	Quarterly

Maintenance Type	Frequency
Vegetative Cutting	Annual
Spillway and Raceway Structure Cleaning	At least annual and as needed, plus ahead of forecast
	high flows if needed
Raceway Closure Structure Testing & Maintenance	Annual
Sluiceway Structure Testing & Maintenance	Once every 10 years
Repair of Sparse Vegetation & Erosion	As needed
Tree Removal	As needed
Rodent Damage Control	As needed
Slope Traffic Damage Control	As needed
Riprap Damage Control	As needed
Sediment Removal from Conveyances	As needed
Concrete and Masonry Maintenance	As needed
Metal Component Maintenance	As needed
Instrument Maintenance	As needed
Security Item Maintenance	As needed
Other	As needed

FIGURES

APPENDIX A – CONDITION DESCRIPTIONS AND DAM TERMINOLOGY

COMMON DAM SAFETY DEFINITIONS

For a comprehensive list of dam engineering terminology and definitions, refer to 302 CMR 10.00 or other reference published by FERC, Dept. of the Interior Bureau of Reclamation, or FEMA. Please note that should discrepancies between definitions exist, those definitions included within 302 CMR 10.00 govern for dams located within the Commonwealth of Massachusetts.

Orientation

<u>Upstream</u> – The side of the dam that borders the impoundment.

<u>Downstream</u> – The high side of the dam, the side opposite the upstream side.

<u>Right</u> – The area to the right when looking in the downstream direction.

Left – The area to the left when looking in the downstream direction.

Dam Components

<u>Dam</u> – Any artificial barrier, including appurtenant works, which impounds or diverts water.

<u>Embankment</u> – The fill material, usually earth or rock, placed with sloping sides, such that it forms a permanent barrier that impounds water.

<u>Crest</u> – The top of the dam, usually containing a road or path across the dam.

<u>Abutment</u> – That part of a valley side against which a dam is constructed. An artificial abutment is sometimes constructed as a concrete gravity section to take the thrust of an arch dam where there is no suitable natural abutment.

<u>Appurtenant Works</u> – Structures, either in dams or separate therefrom, including but not be limited to, spillways; reservoirs and their rims; low-level outlet works; and water conduits including tunnels, pipelines, or penstocks, either through the dams or their abutments.

<u>Spillway</u> – A structure over or through which water flows are discharged. If the flow is controlled by gates or boards, it is a controlled spillway; if the fixed elevation of the spillway crest controls the level of the impoundment, it is an uncontrolled spillway.

Size Classification

(as listed in Massachusetts Dam Safety Regulations, 302 CMR 10.00)

Large – Structure with a height greater than 40 feet or a storage capacity greater than 1,000 acre-feet.

Intermediate – Structure with a height between 15 and 40 feet or a storage capacity of 50 to 1,000 acre-feet.

<u>Small</u> – Structure with a height between 6 and 15 feet and a storage capacity of 15 to 50 acre-feet.

Non-Jurisdictional – Structure less than 6 feet in height or having a storage capacity of less than 15 acre-feet.

Hazard Classification

(as listed in Massachusetts Dam Safety Regulations, 302 CMR 10.00)

<u>High Hazard (Class I)</u> – Dams located where failure will likely cause loss of life and serious damage to home(s), industrial or commercial facilities, important public utilities, main highway(s) or railroad(s).

<u>Significant Hazard (Class II)</u> – Dams located where failure may cause loss of life and damage to home(s), industrial or commercial facilities, secondary highway(s) or railroad(s), or cause the interruption of the use or service of relatively important facilities.

Low Hazard (Class III) – Dams located where failure may cause minimal property damage to others. Loss of life is not expected.

General

<u>EAP</u> – Emergency Action Plan – A predetermined (and properly documented) plan of action to be taken to reduce the potential for property damage and/or loss of life in an area affected by an impending dam failure.

<u>OM&M</u> – Operation, Monitoring, and Maintenance.

Normal Pool – The elevation of the impoundment during normal operating conditions.

<u>Acre-foot</u> – A unit of volumetric measure that would cover one acre to a depth of one foot. It is equal to 43,560 cubic feet. One million U.S. gallons = 3.068 acre feet.

<u>Height of Dam (Structural Height)</u> – The vertical distance from the lowest portion of the natural ground, including any stream channel, along the downstream toe of the dam to the lowest point on the crest of the dam.

<u>Hydraulic Height</u> – The height to which water rises behind a dam and the difference between the lowest point in the original streambed at the axis of the dam and the maximum controllable water surface.

<u>Maximum Water Storage Elevation</u> – The maximum elevation of water surface which can be contained by the dam without overtopping the embankment section.

<u>Spillway Design Flood (SDF)</u> – The flood used in the design of a dam and its appurtenant works particularly for sizing the spillway and outlet works, and for determining maximum temporary storage and height of dam requirements.

Maximum Storage Capacity – The volume of water contained in the impoundment at maximum water storage elevation.

Normal Storage Capacity – The volume of water contained in the impoundment at normal water storage elevation.

Condition Rating

<u>Unsafe</u> – Major structural*, operational, and maintenance deficiencies exist under normal operating conditions.

<u>Poor</u> – Significant structural*, operation and maintenance deficiencies are clearly recognized for normal loading conditions.

<u>Fair</u> – Significant operational and maintenance deficiencies, no structural deficiencies. Potential deficiencies exist under unusual loading conditions that may realistically occur. Can be used when uncertainties exist as to critical parameters.

<u>Satisfactory</u> – Minor operational and maintenance deficiencies. Infrequent hydrologic events would probably result in deficiencies.

<u>Good</u> – No existing or potential deficiencies recognized. Safe performance is expected under all loading including SDF.

* Structural deficiencies include but are not limited to the following:

- Excessive uncontrolled seepage (e.g., upwelling of water, evidence of fines movement, flowing water, erosion, etc.).
- Missing riprap with resulting erosion of slope.
- Sinkholes, particularly behind retaining walls and above outlet pipes, possibly indicating loss of soil due to piping, rather than animal burrows.
- Excessive vegetation and tree growth, particularly if it obscures features of the dam and the dam cannot be fully inspected.
- Deterioration of concrete structures (e.g., exposed rebar, tilted walls, large cracks with or without seepage, excessive spalling, etc.).
- Inoperable outlets (gates and valves that have not been operated for many years or are broken).

1.0 SUMMARY OF EAP RESPONSIBILITIES

Ultimately, the Town of Lee Police Chief and the Lenox Fire Chief will act as joint Incident Commanders in the event of an emergency at Woods Pond Dam. The following is a brief summary of critical responsibilities. An expanded discussion of roles and responsibilities is included in Section 6.0.

Dam Owner/ Operator- General Electric Company:

- Activate appropriate Notification Flowchart.
- Request assistance, as needed.
- Receive condition status reports and share with Incident Commander and emergency responders.
- Respond to emergencies at the facility.

Towns of Lee and Lenox Police Department, Fire Department and Emergency Management:

- Activate appropriate Notification Flowchart.
- Verify and assess emergency conditions (with assistance of Incident Commander).
- Determine the level of the emergency (i.e. Situation A, Situation B, etc.) (performed with assistance of Incident Commander).
- Activate EOC.
- Take corrective action at dam (for Situations B and C; performed with assistance of Incident Commander).
- Order evacuation of response personnel from potential hazard area at dam (for Situation A; performed with assistance of Incident Commander).
- Receive condition status reports from General Electric, the Massachusetts Emergency Management Agency (MEMA), and other on-site personnel.
- Notify downstream Public.
- Conduct evacuation from inundation areas within Town limits.
- Declaration of termination of emergency at dam (with assistance of Incident Commander).

The following agencies will support the Towns of Lee and Lenox and emergency responders by providing personnel and equipment (as requested by the Incident Commanders and available):

- Massachusetts Emergency Management Agency
- Massachusetts State Police
- Berkshire County Sheriff

2.0 NOTIFICATION FLOWCHART

2.1 INTRODUCTION

This Emergency Action Plan (EAP) for Woods Pond Dam addresses the General Electric Company's, and the Towns of Lee, Lenox, and Stockbridge's roles and responsibilities for potential and actual emergency conditions at the dam. Emergency situations are herein defined as conditions which have or could potentially lead to a sudden, uncontrolled release of water. **Figure 1 - Notification Flowchart** summarizes the key operational, governmental, and public safety personnel to be notified in the event of an emergency condition at the Woods Pond Dam. The objective of the flowchart provided herein is to outline clear, concise, and concurrent notifications. The organization of the flowchart is based on GZA GeoEnvironmental Inc.'s (GZA's) review of existing communication networks and discussions with the Towns of Lenox, Lee, and Stockbridge, and Commonwealth of Massachusetts personnel.

2.2 LIMITATIONS

The **Figure 1** - **Notification Flowchart** should be considered a "top-down" system for initial notifications. Other means and avenues of communication between and among key local and state emergency personnel that may develop may not be specifically depicted in the referenced flow chart as an emergency progresses. Also, as the emergency condition intensifies, normal telephone lines and some two-way radio frequencies may be overloaded or otherwise unavailable.

The Notification Flowchart is to be used as a guide during an emergency condition. For clarity and brevity, not all possible emergency phone numbers have been shown. However, additional names and notification information of persons are provided in the Contact Lists in **Tables 1 through 6**. Each notification "cell" on the flowchart may have its own subset of emergency numbers and procedures. **This EAP does not suggest that General Electric Company personnel take over the established responsibilities of other governmental and institutional elements (such as the police, fire and emergency management departments in the downstream communities) to enact their own emergency preparedness plans and to evacuate people.** However, the flowchart and outlined duties and responsibilities described herein provide a means for initial notification. It is assumed that state public safety entities and local police departments in potentially affected downstream communities will activate their own specific procedures for evacuation, sheltering, and mobilization of resources, once the initial warning is provided.

The Notification Flowchart relies heavily on the use of the Towns of Lenox and Lee's dispatch/call center.

Massachusetts State Police Barracks B-1/Lee Dispatch is the local State Police dispatch center and is located at 215 Laurel Street (Route 20) in Lee, MA.
The Town of Lenox dispatches emergency personnel from The Berkshire County Sheriff's Communication center which is located at 467 Cheshire Road in Pittsfield ,MA.

The Town of Lee dispatches emergency personnel from the Berkshire County Sheriff's Communication Center which is located at 467 Cheshire Road in Pittsfield MA.

The Town of Stockbridge Emergency Dispatch Center is the dispatch center for the town and is located at 50 Main Street in Stockbridge, MA.

All dispatch centers are staffed 24 hours a day, 7 days a week and are responsible for contacting the Emergency Management, Police, and Fire Departments, the Department of Public Works (DPW) contact and the specified government official for their respective towns. The Towns of Lee, Lenox, and Stockbridge are responsible for providing warning messages to their own residents.

2.3 SUPPLEMENTAL EMERGENCY CONTACT LISTS

Tables 1 through 6 provide detailed Alert Lists which provide names, position, title, telephone number, etc. for the following entities:

Table 1	General Electric Company Contact List
Table 2	Town of Lee Community Alert List
Table 3	Town of Lenox Community Alert List
Table 4	Town of Stockbridge Community Alert List
Table 5	State Agency Alert List
Table 6	Major Utilities List

These lists are considered to be a supplement to the information provided on Figure 1 - Notification Flowchart. The telephone numbers provided are often listed numbers. Some numbers are serviced 24 hours or have a call forwarding capability. However, as the emergency condition intensifies, all listed telephone lines may be in use with incoming calls and thus be unavailable.

Table 6 lists major utilities within the potential downstream impact area and includes telephone numbers for the applicable utility companies. The table has been provided for general reference purposes and is not intended to be an all-inclusive list. Primary responsibility for notifying key utilities, rail lines, etc. will rest with the individual community public safety agencies.

3.0 STATEMENT OF PURPOSE AND SCOPE

3.1 STATEMENT OF PURPOSE

The Emergency Action Plan (EAP) defines responsibilities and provides procedures designed to identify unusual and unlikely conditions which may endanger the Woods Pond Dam in time to take mitigative action and to notify the appropriate emergency management officials of possible, impending, or actual failure of the dam.

This EAP is a management document intended to be read, understood, annually tested, and updated before an emergency condition occurs. It is designed to outline the activities of the General Electric Company; the Towns of Lenox and Lee; and, other local and state emergency management officials within the framework of existing, in-place emergency management systems. It provides the planning basis for emergency detection, evaluation and classification; notification; evacuation; security, termination and follow-up; and preparedness. This EAP is subject to the limitations set forth in Appendix G.

3.2 SCOPE

The EAP sets forth basic procedures, duties, and responsibilities to be implemented by the Towns of Lenox and Lee and the General Electric Company (owner and operator of the dam) and other key operational and public safety personnel in the event of an emergency condition at the Woods Pond Dam.

An "emergency", for the purposes of this EAP, is defined as an impending or actual sudden uncontrolled release of water caused by a failure of the dam.

The major focus of the EAP is the description of the area of inundation resulting from a hypothetical dam break flood, and the development of a detailed notification plan that describes responsibilities to warn key operational personnel, local public safety agencies, state law enforcement, and emergency management agencies in the path of an anticipated dam break flood wave. The EAP also provides preparedness steps.

It should be noted that the overall contents of this EAP, including recommendations describing organization and duties, are not intended for the General Electric Company personnel to take over the responsibilities of the state and other local governmental entities. Rather, the EAP has been developed to be integrated within the framework of existing emergency preparedness plans. During the development of this EAP, GZA has coordinated with the Towns of Lee, Lenox, and Stockbridge, and other emergency preparedness personnel. The following public agencies will be directly involved in the event of the activation of this EAP:

- Town of Lenox
- Town of Lee

- Town of Stockbridge
- Massachusetts State Police
- Massachusetts Emergency Management Agency (MEMA)
- Department of Conservation and Recreation (DCR) Office of Dam Safety
- United States Army Corps of Engineers

This updated EAP was prepared to conform with new DCR requirements that the EAP format be consistent with the "Federal Guidelines for Dam Safety: *Emergency Action Planning for Dam Owners* (FEMA 64)," dated July 2013. The scope and format of this EAP generally conforms to the FEMA guidelines. In addition, the technical engineering aspects of the dam break flood routing analysis conforms to the Federal Energy Regulatory Commission (FERC) requirements outlined in their "Engineering Guidelines for the Evaluation of Hydropower Projects", issued October, 1993 and updated in 2007. Dam break analyses (prepared by others in 2006) are included in **Appendix A** and the inundation maps are discussed in Section 7.0 and located in **Appendix E**.

4.0 PROJECT DESCRIPTION

4.1 LOCATION

Woods Pond Dam is located in on the border of Lee and Lenox, in Berkshire County, Massachusetts. The dam is located perpendicular to Valley Street and Crystal Street near the Housatonic Street crossing. The dam impounds water from Housatonic River creating Woods Pond. The dam is at the longitude and latitude coordinates:

Longitude: -73.2446° Latitude: 42.3484°

4.2 OWNER\OPERATOR

The Woods Pond Dam is owned, operated, and maintained by the General Electric Company.

Dam Owner/Caretaker			
Name	General Electric Corporate Environmental Programs		
Mailing Address	159 Plastics Avenue		
Town	Pittsfield, MA 01201		
Destine Phone	413-553-6610 (Caretaker Direct Office Number)		
Daytime Filone	413-553-6603 (General Office Number)		
Emergency Phone	413-441-4619 (Caretaker Cell Phone)		

4.3 PURPOSE OF THE DAM

The original Woods Pond Dam was constructed in the 1800s for industrial water supply purposes to service the mill on the left side. A new replacement dam was constructed in 1990 immediately downstream of the original dam. The original dam was then dismantled. Currently, the dam impounds water for recreational and environmental purposes.

4.4 DESCRIPTION OF THE DAM AND APPURTENANCES

The engineering data presented below is based on available information in previous reports provided by the Owner.

The Dam is a run of the river structure consisting of a concrete section as the right abutment, a primary spillway, and a controlled raceway structure as the left abutment. Additionally, a raceway embankment runs upstream-downstream, forming the right side of the raceway channel. The upstream end of this raceway embankment was the left abutment of the former dam.

The left section (referred to as the "closure structure") is formed of cellular steel sheetpiles capped with concrete. The crest of the section is at elevation 954.0 feet National Geodetic

Vertical Datum of 1929 (NGVD) and is about 21 feet wide. Sheetpiles were driven to bedrock at depths varying from approximately 10 to 25 feet; the shallower sheetpiles are on the spillway end. The raceway embankment abuts the left concrete closure structure section on both the upstream and downstream sides.

The right concrete section is referred to as the non-overflow gravity section on the record drawings. This section is a concrete structure with a sloped downstream face and formed concrete training walls on the upstream and downstream sides. The top elevation of the non-overflow gravity section is 954.0 feet NGVD. Although this structure is termed "non-overflow" this section of the Dam is designed to withstand overflow during the spillway design flood.

The Dam's spillway is an uncontrolled, ogee-shaped concrete weir with a crest elevation of 948.3 feet NGVD. The spillway is about 140 feet long.

The raceway embankment is generally earth fill with riprap protected slopes. The upstream end of the raceway embankment is the former left abutment for the previous dam located immediately upstream of the current Dam. Although structurally connected to the Dam, this section of the old dam serves no functional role in the current Dam. This upstream end has vertical stone masonry walls on the left side that form one side of the raceway channel. Slopes are protected by grouted riprap on the right side of the upstream end and on both sides of the downstream end. Around the raceway entrance, steel sheetpiles protect the approach and the discharge areas.

The raceway channel is formed from masonry walls on each side, extending about 90 feet upstream of the closure structure. The left side is the streambank and the right side is the raceway embankment. The upstream entrance to the raceway is controlled by the closure structure containing up to five 2-foot-high steel and concrete stoplogs, which are lifted using a gantry crane and hoist. The raceway closure structure is composed of formed concrete. A one-inch spacer is located between the second and third stoplogs at an elevation of 948.0 feet NGVD to provide flow into the raceway channel and help prevent water stagnation.

The downstream outlet of the raceway is a controlled concrete and masonry structure referred to as the raceway stoplog sluice structure. The purpose of the downstream raceway structure is to control the water level in the downstream mill pond and within the raceway. The controls are comprised of up to seven 14-inch-high steel stoplogs that were installed in 1991. A truck-mounted crane is mobilized to operate these controls. Three of the stoplogs are typically left in-place to maintain the raceway and mill pond level between the Woods Pond impoundment and tailwater levels. The 1991 drawings indicate that a pressure grout injection program in the foundation soil along the perimeter of the structure was performed to address seepage.

Instrumentation at the Dam consists of three open standpipe piezometers in the downstream portion of the raceway embankment.

A preconstruction geotechnical exploration program conducted in 1988 determined that the Dam and appurtenant structures are founded on shallow "marbleized" bedrock, which is vertically bedded and is generally finely grained, hard with variable medium to close joint spacing. Details of the subsurface field investigation can be found in the General Design Report for Woods Pond Dam Rehabilitation.

4.5 OPERATIONS AND MAINTENANCE

The dam is operated and maintained by the General Electric Company. The Owner maintains files on the Woods Pond Dam, including inspection reports and results of investigations at their offices. The Owner conducts monthly and quarterly inspections as well as biennial Phase I inspections. The Owner mows grass and removes debris from the spillway regularly, and conducts maintenance activities and minor repairs on an as-needed basis. Each year from spring through fall, warning buoys will be deployed upstream of the spillway.

The operators and controls for the dam are operated by the Owner.

4.6 DCR SIZE CLASSIFICATION

Woods Pond Dam has a maximum storage capacity of approximately 5300 acre-feet and a structural height of about 17.6 feet. In accordance with Department of Conservation and Recreation Office of Dam Safety classification, under Commonwealth of Massachusetts dam safety rules and regulations stated in 302 CMR 10.00 as amended by Chapter 330 of the Acts of 2002, Woods Pond Dam is a Large size structure.

4.7 DCR HAZARD CLASSIFICATION

In accordance with Department of Conservation and Recreation classification procedures, under Commonwealth of Massachusetts dam safety rules and regulations stated in 302 CMR 10.00 as amended by Chapter 330 of the Acts of 2002, Woods Pond Dam is classified as a Significant Hazard potential dam.

5.0 EMERGENCY DETECTION, EVALUATION, AND CLASSIFICATION

5.1 EMERGENCY DETECTION

This section describes the detection of an unusual or emergency event at the dam and provides information to assist the Towns in determining the appropriate emergency level for the event.

Unusual or emergency events may be detected by:

- Observations at or near the dam by government personnel (local, state, or Federal), landowners, visitors to the dam, or the public;
- Earthquakes felt or reported in the vicinity of the dam; or
- Forewarning of weather conditions that may cause an unusual event or emergency event at the dam (for example, a severe weather or flash flood forecast).

5.2 EMERGENCY EVALUATION

The Incident Commanders (Lee Police Chief and Lenox Fire Chief) are to coordinate with the General Electric Company, Lee and Lenox DPWs and qualified professional dam engineer(s) to evaluate the severity of the observed dam safety issue. Incident Commanders from Lee and Lenox will coordinate activities due to the dam's location on the border between the two towns. The Towns of Lee and Lenox also have a mutual aid agreement.

5.3 EMERGENCY CLASSIFICATION

After an unusual or emergency event is detected or reported and evaluated, the Incident Commander is responsible for classifying the event into one of the following four conditions.

1. <u>Condition A:</u> Urgent; dam failure appears imminent or has occurred.

This is an extremely urgent situation when a dam failure is occurring or obviously is about to occur and cannot be prevented. Flash flooding will occur downstream of the dam.

2. <u>Condition B:</u> Potential dam failure situation, rapidly developing.

This situation may eventually lead to dam failure and flash flooding downstream, but there is not an immediate threat of dam failure. Time available to employ remedial actions may be hours or days.

3. <u>Non-Emergency Condition:</u> Unusual event, slowly developing.

This situation is not normal (e.g. an increased amount of seepage) but has not yet threatened the operation or structural integrity of the dam. If this situation worsens it could threaten the integrity of the dam.

4. <u>Non-Failure Emergency Condition</u>: No danger of dam failure, only flooding concerns.

Generally, this situation indicates that there is no sign of pending or imminent dam failure. This Condition is only used when there are flooding concerns caused by high reservoir/river/flow conditions are such that flooding is expected to occur downstream of the dam.

Examples of different situations that could occur at the dam and the corresponding emergency condition are presented in **Table 8**. Expanded descriptions of the observed conditions, including guidance on actions, are included in **Table 9** and **Appendix D**. Refer to **Appendix F** for examples of general conditions that could lead to dam failure¹.

¹Texas Commission on Environmental Quality, "Guidelines for Operation and Maintenance of Dams in Texas," Publication No. GI-357, November 2006.

6.0 GENERAL RESPONSIBILITIES UNDER THE EMERGENCY ACTION PLAN

6.1 DAM OWNER RESPONSIBILITIES

As owner, the General Electric Company has overall responsibility for care and maintenance of Woods Pond Dam. The following duties and responsibilities are assigned to on-site personnel for the five phases of emergency response. Within the context of the EAP, suggested duties and responsibilities should include the following:

1. Condition A: Failure of the Woods Pond Dam is imminent or has occurred

Once the Incident Commanders have determined that there is no longer any time available to safely attempt corrective measures to prevent failure, the "failure is imminent or has occurred" warning should be issued. Responsibilities of the General Electric Company include:

- Initiate the notification procedures for Condition A. Refer to Section 5.3 and Figure 1 Notification Flowchart.
- Continuously update the Incident Commanders of the emergency situation.
- Provide periodic updates to DCR as to condition of affected area, pool level, and discharge through the breach.

2. Condition B: A failure situation at Woods Pond Dam may be developing

Under this scenario, it is assumed that some time is available for further analyses/decisions to be made before dam failure is considered to be imminent. Dam failure may eventually occur but preplanned actions may avert or mitigate a full dam failure. Responsibilities of the General Electric Company include:

- Initiate notification procedures for Condition B. Refer to Section 5.3 and Figure 1 Notification Flowchart.
- Continuously update the Incident Commanders of the emergency situation to mobilize staff to the affected area to institute emergency repair procedures (if time and safety considerations permit).
- Contact dam engineering consultant for repair guidance.
- Provide periodic situation reports/emergency messages concerning ongoing repair efforts to DCR as outlined in **Figure 1 Notification Flowchart**. Also provide periodic updates to the Towns of Lee, Lenox, and Stockbridge through the Lee and Lenox Emergency Dispatch Centers.

3. Nonemergency, Unusual Event, Slowly Developing Condition

During an unusual, non-emergency condition, the situation is abnormal but has not yet threatened the integrity of the dam. The General Electric Company is responsible for monitoring the situation and for providing updates to the Incident Commanders. The Owner should seek guidance from a dam engineering consultant and from the DCR, as necessary.

Note that not all responsibilities of the Owner are listed above. Where duties fall into other specific categories (such as responsibilities for the Town of Lee or Lenox or responsibilities for termination and follow-up, etc.) these duties have been discussed separately in Sections 5.2, 5.3, 5.4 and 5.5.

4. <u>Non-Failure Emergency Condition</u>

During a non-failure emergency condition, flooding is expected to occur downstream but there is little danger of dam failure. The General Electric Company is responsible for performing a post-event assessment of Woods Pond Dam to determine if the dam has been damaged.

6.2 RESPONSIBILITY FOR NOTIFICATION

It is assumed that an emergency situation at Woods Pond Dam will be identified prior to complete structural failure. Although reaction time prior to complete failure may be limited, it is assumed that notification procedures can be initiated at Lee or Lenox Dispatch, depending upon the source of initial notification and the condition of the emergency.

<u>Condition A</u> calls for **immediate evacuation** and therefore notification priorities are given to the downstream communities of Lenox, Lee and Stockbridge.

<u>Condition B</u> allows for some evaluation of the condition by the General Electric Company, with the Towns of Lenox and Lee, prior to notification of the downstream community of Stockbridge.

The likely mode of initial identification of the emergency condition will be from a passer-by (i.e. Observer – General Public).

If the initial observation of an emergency is made by a General Electric Company Employee or Contractor, then he or she shall report the situation to the General Electric Company Dam Caretaker and the 911 dispatch center for the State Police. The State Police will then contact both Lee and Lenox Dispatches.

Lee Dispatch's first contact is to Lee Emergency Management which is in turn is responsible for providing notification to the emergency responders in Lee: Police, Fire, and Highway Departments, Board of Selectmen, and Town Manager.

Lenox Dispatch's first contact is to Lenox Emergency Management which is in turn is responsible for providing notification to the emergency responders in Lenox: Police, Fire, and Highway Departments, Board of Selectmen, and Town Manager.

The Towns of Lee and Lenox will work as one operative unit during an emergency at Woods Pond Dam, due to the dam's location on their border and on their mutual aid agreement. Lee/Lenox Dispatch shall contact first the Berkshire Sheriff's Office in Pittsfield and then Massachusetts Emergency Management Agency in Agawam. The Berkshire County Sheriff's Office then will provide notification to the emergency responders in Stockbridge: Emergency Management, Police and Fire Departments.

If the initial observation is made by the general public, the observer is expected to call 911 from either a cell phone or landline in the Towns of Lenox or Lee. A cell phone call will be directed to State Police, which will route the call to Lenox or Lee Dispatch, depending on the location of the caller. The contacted Dispatch and the following dispatch centers contacted are responsible for carrying out the same notification procedures described above for an emergency that is initially observed by a General Electric Company Employee. Once the communication reaches the local level, direct communication via radio or cell phone may be the quickest way to communicate amongst the local responders. Major announcements; however, will be distributed through the dispatch centers.

If time allows, the General Electric Company is responsible for contacting their Dam Engineering Consultant, and the Department of Conservation and Recreation for advice.

The primary elected official from each city or town shall contact MEMA or the Massachusetts State Police (MSP) if they deem assistance is or may be needed. Assistance can be requested from and updates can be provided to MEMA through the Web Emergency Operations Center (WebEOC). MEMA has the ability to issue flood watches and warnings to the public through the National Weather Service if appropriate. MEMA also has the ability to transmit warning messages to the public over the Emergency Alert System (EAS).

The Notification Flowchart provided in Section 1.0 summarizes the notification responsibilities listed above; however, individuals listed on the Flowchart may not be available, in which case alternates or designees may be involved in the notification procedures. Alternate contacts and additional phone numbers are listed in the Contact Lists provided in Tables 1 through 6. Initial means of notification will likely be made by telephone landlines or cellular telephones. Additional communication systems are listed in Section 6.6.

Upon notification of an emergency condition, the Towns of Lee, Lenox, and Stockbridge are responsible for providing direct warning to their residents via a pre-arranged warning system.

A discussion of evacuation responsibilities is included in Section 5.3. The Towns of Towns of Lee, Lenox, and Stockbridge will coordinate their responses from their Emergency Operations Centers (EOCs).

Preparation of warning messages should begin as soon as their potential need is apparent, which is likely to be immediately after initial notification. When time is available for their preparation, the initial message should contain pertinent information as to the severity of the problem, expected extent and timing of inundation at key population centers, and general instructions concerning evacuation. However, in some cases, an emergency condition may be declared when failure is imminent with little advance notice or time to compose a specific message intended for broadcast. The example messages below provide a model for the initial announcements in those cases. Subsequent announcements should be scripted so to provide additional data as the situation dictates.

Sample Message for Emergency Condition A – Announcement for Major Failure of Woods Pond Dam

In the event of a Condition A emergency, the Incident Commander or his or her designee has the authority to issue the following message to the emergency responders from the Towns Lenox, Lee, and Sudbury via telephone or local two-way radio.

Urgent: THE WOODS POND DAM IN LEE AND LENOX, MASSACHUSETTS HAS FAILED.

Woods Pond Dam, located on Crystal Street in Lenox and Valley Street in Lee, Massachusetts, is failing. Water from the dam is expected to cause widespread flooding along Route 20 and Route 102 in the towns of Lenox, Lee, and Stockbridge. The downstream area must be evacuated immediately. Repeat, Woods Pond Dam is failing; evacuate the area along low-lying portions of the Housatonic River.

We have activated the emergency action plan for this dam and are currently under emergency Condition A. Reference the evacuation map in your copy of the Emergency Action Plan.

Stay alert for further announcements. Updated information as to river levels, flood arrival times and evacuation efforts will be provided as soon as they are available.

This is an emergency. This is *identify your name and position*.

<u>Sample Message for Emergency Condition B – Announcement for Rapidly Developing</u> <u>Condition at Woods Pond Dam</u>

In the event of a Condition B emergency, the Incident Commander or his or her designee has the authority to issue the following message to the emergency responders from the Towns Lenox, Lee, and Stockbridge via telephone or local two-way radio.

Urgent: The Towns of Lenox and Lee have announced that a potential failure situation is developing at Woods Pond Dam in Lenox and Lee, Massachusetts.

We have an emergency condition at Woods Pond Dam, located on between Crystal Street in Lenox and Valley Street in Lee, Massachusetts. We have activated the emergency action plan for this dam and are currently under emergency Condition B.

We are implementing predetermined actions to respond to a rapidly developing situation that could result in dam failure.

Reference the evacuation map in your copy of the Emergency Action Plan.

Standby for periodic updates on the repair efforts at the dam and additional guidance on evacuate. We will advise you when the situation is resolved or if the situation gets worse.

This is identify your name and position.

Sample Message for Emergency Services Personnel to Communicate the Status of the Emergency with the Public

In the event of a Condition A emergency, the emergency managers for the Towns of Lenox, Lee, and Stockbridge have the authority to issue the following message to the general public through Reverse 911. This message may be modified for a Condition B emergency.

Urgent: This is an emergency message from the <u>name of community</u>. Listen carefully. Your life may depend on immediate action.

Woods Pond Dam, located on Crystal Street in Lenox and Valley Street in Lee, Massachusetts, is failing. Repeat Woods Pond Dam, located on Crystal Street in Lenox and Valley Street in Lee, Massachusetts, is failing.

If you are in or near this area, proceed immediately to high ground away from the valley. Do not travel on Routes 20 or 102 or return to your home to recover your possessions. You cannot outrun or drive away from the floodwave. Proceed immediately to high ground away from the valley.

This message will be repeated once.

The accurate and timely dissemination of emergency public information is very important to the overall success of an EAP.

6.3 RESPONSIBILITY FOR EVACUATION

Warning and evacuation planning are the responsibilities of local authorities who have the statutory obligation (i.e. the Towns of Lenox, Lee, and Stockbridge) within their respective communities. The Lenox, Lee, and Stockbridge Police Departments will provide traffic control for secondary and local roadways and direct evacuees along the major evacuation routes toward upland areas and away from the inundation areas shown on the inundation maps in Appendix E. In addition to traffic control, local police/fire department will provide a warning of the emergency by loudspeakers, door to door and Reverse 911. Emergency evacuation routes should also be broadcast simultaneously over local radio, television, cable stations. Additionally, the Towns of Lenox, Lee, and Stockbridge may request activation of the EAS through MEMA. The Towns of Lenox, Lee, and Stockbridge have limited resources and may request evacuation and/ or traffic control and resident warning assistance from the County Sheriff and the MSP. MSP will provide traffic control along major interstate highways, state highways, and bridges in accordance with the procedures prescribed in the Incident Command System (ICS). In addition, the Berkshire County Sheriff's Office will respond to emergency sites with emergency supply equipment, including shelter trailers and a portable command center.

According to dam break analysis, the inundation areas occur along the Housatonic River. Based on the generally northerly to southerly flow direction north of I-90 (the Mass Pike) within the downstream flood plain zone, the general evacuation direction adjacent to the east and west sides of the flooding should be toward the east and west, respectively, away from the flood plain zone north of I-90. South of I-90, where the flow direction is westerly (along the Housatonic River) and southerly (along Hop Brook), evacuation should be to the north and south along the Housatonic, and to the west along Hop Brook.

6.4 RESPONSIBILITY FOR DURATION, SECURITY, TERMINATION AND FOLLOW-UP

The Towns of Lenox and Lee each will have their own Incident Commander (Emergency Manager) who shall perform on-site monitoring of the situation at the dam and keep local authorities informed of developing conditions at the dam until the emergency has been terminated. The Towns of Lenox and Lee have a mutual aid relationship and will work closely.

The Towns of Lenox and Lee shall provide security measures to prevent unauthorized entry into the emergency area and establish access control points. Security measures may include warning signage, security tape, staffed outposts, etc. Additional materials may be provided by the Berkshire County Sheriff's Office.

Throughout the duration of an emergency, emergency responders shall update the Unusual Emergency Event Log, which is available in Table 10.

Whenever the EAP has been activated, an emergency level has been declared, all EAP actions have been completed, and the emergency is over, the EAP operations must eventually be terminated and follow-up procedures completed. The Incident Commander is responsible for terminating EAP operations and relaying this decision to Lee and Lenox Dispatches, then Stockbridge Dispatch. It is then the responsibility of each dispatch center to notify the same group of contacts that were notified during the original event notification process to inform those people that the event has been terminated.

Prior to the termination of an emergency Condition A event that has not caused actual dam failure, the Lee and Lenox Incident Commanders, with the assistance of General Electric Company and its Dam Engineer Consultant, will inspect the dam to determine whether any damage has occurred that could potentially result in loss of life, injury, or property damage. The DCR Office of Dam Safety may also participate in the inspection. If it is determined that conditions do not pose a threat to people or property, the Incident Commanders may terminate EAP operations as described above. If the severity of a Condition A emergency changes such that there is no longer a threat of imminent failure, the emergency changes such

that there is no longer a threat of dam failure, the Incident Commanders may terminate EAP operations as described above.

The General Electric Company shall document the emergency event and all actions that were taken. The General Electric Company shall also perform an initial damage assessment and shall also modify/ update the EAP based upon lessons learned during the emergency situation.

The Towns of Lenox, Lee, and Stockbridge should also document their responses and perform initial damage assessments. The results of their evaluations should be documented in written reports for their own files.

6.5 EAP COORDINATION RESPONSIBILITY

The General Electric Company is responsible for identifying the EAP Coordinator. The EAP Coordinator is responsible for EAP-related activities, including the following:

- Review and update, as necessary, EAP including notification procedures, contact lists, and responsibilities on at least a yearly basis (per 302 CMR 10.11). Updates should be recorded in Table 11, entitled "EAP Update Log".
- Conduct staff training and Orientation Seminars of proper procedures for surveillance and emergency repair.
- Conduct a biennial test of the validity of notification procedures and communication systems.
- Review and update available resources information.
- Be prepared to mobilize available on-site resources and obtain Contractors on short notice.

6.6 TYPICAL MEMA FUNCTIONS

If the primary elected official from each city or town deems assistance is or may be needed, he or she may contact MEMA. Typical MEMA functions include the following:

- Dispatch MEMA personnel to coordinate support activities with the local incident commander, when appropriate.
- Activate the State Emergency Operations Center when appropriate.
- Monitor and document potential or actual emergency situations resulting from failure of the Woods Pond Dam.
- Coordinate the delivery of assistance to local governments and State agencies as requested and available.
- Brief the Governor and advise him or her as to necessary actions.
- Assist Governor's Office with emergency and non-emergency public information releases.
- Transmit warning messages over EAS when the State EOC is activated.

- Receive and evaluate Situation Reports from local governments, State agencies, and utility companies.
- Prepare thorough documentation of emergency response activities and development of post-disaster reports on overall emergency operations by State government.
- Contact National Weather Service.

6.7 TYPICAL MASSACHUSETTS STATE POLICE FUNCTIONS

If the primary elected official from each city or town deems assistance is or may be needed, he or she may also contact MSP. Typical MSP functions include the following:

- Provide the key communication lines for rapid and simultaneous notification to local public safety within the affected inundated areas.
- Mobilize, deploy, and organize personnel for crowd and traffic control operations in support of evacuation.
- Provide personnel specifically trained in a wide range of expertise, and specialized equipment, as necessary, to support the public safety response to affected areas
- Issue initial emergency messages and situation updates and relay them via LEAPS to local public safety.
- Act as community liaison for MEMA.
- Report damage and other vital information including road closures, bridge failures, collapsed buildings, and casualty estimates.
- Conduct search and rescue operations.
- Control access to dangerous or impassable sections of State maintained and/or State patrolled roads.
- Provide assistance as requested to local public safety forces primarily for the purposes of search and rescue, route alerting, anti-looting, traffic control, curfew enforcement, and access control.
- Provide emergency transportation for town, state/federal officials, and engineering consultants.
- Provide emergency communications links through mobile units and the State Police communications.
- Provide departmental Situation Reports to MEMA throughout the increased readiness and emergency response phases of a disaster or emergency.
- Advise the Governor, as to necessary actions, particularly regarding the issuance of curfews and the need for National Guard support.
- Prepare thorough documentation and debriefing of State Police emergency response activities.

6.8 TYPICAL BERKSHIRE COUNTY SHERIFF FUNCTIONS

If the primary elected official from each city or town deems assistance is or may be needed, he or she may also contact the Berkshire County Sheriff. Typical BCS functions include the following:

- Provide specialized equipment to assist in emergency management including light towers with generators, and traffic safety equipment including programmable highway signs and barricades.
- Conduct search and rescue operations and provide equipment for off-road rescue operations.
- Conduct boat-based or underwater search and rescue operations.
- Provide assistance as requested to local public safety forces primarily for the purposes of search and rescue, route alerting, anti-looting, traffic control, curfew enforcement, and access control.
- Provide a mobile communications center/command post, and communications equipment including VHF and multiband radios and handheld GPS units with integrated radios
- Provide departmental Situation Reports to MEMA throughout the increased readiness and emergency response phases of a disaster or emergency.
- Prepare thorough documentation and debriefing of Sheriff's emergency response activities.

7.0 PREPAREDNESS

7.1 SURVEILLANCE PROCEDURES

The keys to the successful implementation of the EAP are the means, timeliness and accuracy of identifying potential emergencies. An emergency condition is one in which the occurrence of a significant hazard to life and/or property is possible or certain to occur (COE, 1983)². Conditions justifying declaration of an emergency condition may be imminent (Condition A) or may develop over a longer term (Condition B). However, in either case, such a declaration will likely come from the General Electric Company personnel who are familiar with the operations/maintenance history and existing conditions of the Woods Pond Dam.

Accordingly, GZA presents within this section, suggested recommendations for routine observation and inspections of the dam and appurtenant structures. Early identification of the existence or potential for occurrence of such emergency conditions is essential as a basis for initiating emergency repairs and for issuing appropriate notifications. Refer to Table 8 for key items for which the dam inspector(s) should be on the lookout during dam inspections. Refer to Appendix F for images of these key items.

- 1. Monthly visual observations should be conducted by General Electric Company. These observations should include a walk along the structure and across the bridge downstream of the dam to check for cracks, movement, seepage, boils and/or other signs of increased leakage or other unusual occurrences at the dam. These observations should be augmented with inspections after every major storm event (exceeding approximately 3 inches of rainfall).
- 2. A complete visual inspection of the Woods Pond Dam should be made by an engineer registered in the Commonwealth of Massachusetts who has extensive experience in dam inspections, per Massachusetts Dam Safety Regulations 302 CMR 10.10 (2) every 5 years. The inspection reports should document existing conditions, and present recommendations for maintenance and repairs, as necessary. The inspector should use the attached checklist.

At times of high reservoir levels, the frequency of inspection should be increased as appropriate. Anticipated flows in the Housatonic River can be planned for by using the National Weather Service's Advanced Hydrologic Prediction Service (http://water.weather.gov/ahps/), which forecasts the water levels in the channel. Other cases requiring more frequent inspection include:

1. Following a seismic (e.g. earthquake) event, other disturbance, or unusual movement, an immediate and thorough inspection should be undertaken by General Electric

² U.S. Army Corps of Engineers, The Hydrologic Engineering Center, "Example Emergency Plan for Blue Marsh Dam and Lake," Research Document No. 19, August 1983.

Company personnel, with follow-up by a Registered Professional Engineer. These inspections should be performed whenever monthly inspectors report unusual movement or there is an earthquake with reported damage in Berkshire County.

2. Increases in the amount of seepage, formation of new seeps or boils, or turbid (muddy) discharge.

Compilation and interpretation of all inspection reports and checklists should be completed by the General Electric Company personnel and kept on file.

7.2 RESPONSE DURING PERIODS OF DARKNESS

During normal business hours, response time of General Electric Company personnel to the site of an identified potential emergency condition would be rapid. Actual response time, especially during non-business hours, will be a function of how and by whom the initial emergency condition is discovered and by weather conditions. The Town of Lee and Lenox Dispatches are available 24 hours a day.

Please refer to Figure 1, the Notification Flowchart and Section 4.00 for special procedures for contacting General Electric Company personnel and local public safety officials.

Emergency power and remote lighting contingencies are available from the Town of Lee and Lenox. Additional power and remote lighting can be provided by the Berkshire County Sheriff's Office and by local Contractors.

7.3 ACCESS TO SITE

The Woods Pond Dam can be reached from I-90 following these directions:

- 1. Take Exit 2 (US-20W/Housatonic Street) towards Lee/Pittsfield;
- 2. In 0.8 miles, take a right onto Fuller Street;
- 3. Take the first left onto Greylock Street;
- 4. In 1.5 miles, continue onto Bradley Street;
- 5. In 0.3 miles, continue onto Mill Street;
- 6. In 0.6 miles, turn right onto Crystal Street;
- 7. Follow Crystal Street for 0.5 miles, then turn right onto Valley Mill Road;
- 8. Turn left at the end of Valley Mill Road, onto Valley Street, which is an access road through the mill parking lot.

The left (east) abutment of the dam is on the left side of Valley Street about 0.6 miles north from Valley Mill Road. The right (west) abutment of the dam is accessed over the train tracks paralleling Crystal Street about 0.6 miles north of the intersection of Crystal Road and Valley Mill Road.

7.4 EVALUATION OF DETECTION AND RESPONSE TIMING AND RESPONSE DURING WEEKENDS AND HOLIDAYS

During normal business hours, response time of the General Electric Company and Towns of Lenox and Lee personnel to the site of an identified potential emergency condition would be rapid. Actual response time, especially during non-business hours, will be a function of how and by whom the initial emergency condition is discovered and communicated. It will also be affected by weather conditions.

Response time could be impacted if the emergency event occurs on a weekends or holiday. The Towns of Lenox and Lee shall attempt to minimize the impact of weekends and holidays through their preparedness measures. Emergency phone numbers listed are for dispatch centers, which are operational 24 hours per day, 7 days per week. Dispatch centers have the ability to contact individuals during weekends and holidays.

7.5 RESPONSE DURING PERIODS OF ADVERSE WEATHER

General Electric Company personnel will be placed on a heightened state of readiness in the event of predicted or actual adverse weather conditions.

7.6 ALTERNATIVE SYSTEMS OF COMMUNICATION

In the event of an emergency condition, primary means of notification will be made by telephone landlines or cellular telephones; however, additional/alternative communication systems are listed below. The Contact Lists provided in Tables 1 through 6 contain responder contact information available to GZA at the time that this EAP was prepared. This contact information includes emergency dispatch phone numbers, office phone numbers, cell phone numbers, home phone numbers and radio frequencies, when available.

Should the method of primary communication being used fail, responders should be prepared to utilize alternative communication systems. During an ongoing emergency, many of the communication systems listed below will be vital communication links for use in directing and coordinating emergency operations, issuing alerts and warnings, and instructing the general public.

7.6.1 Local Two-Way Radio

The Police, Fire, and Highway Departments in the Towns of Lenox, Lee, and Stockbridge communicate through portable radios. Each department communicates via its Emergency Services Dispatch. The following are the Towns departments' radio frequencies:

Town	Police Department		Fire Department		DPW/Highway DEP.	
	Frequency	PL	Frequency	PL	Frequency	PL
	(MHz)	Code	(MHz)	Code	(MHz)	Code
Lenox	155.775	107.2	154.190	107.2	158.835	
Lee	155.775	107.2	154.310	107.2	154.040	107.2
Stockbridge	153.965	107.2	154.310	107.2	151.100	

Other radio contact capabilities include contact with Massachusetts Emergency Management Agency (MEMA), which operates on an 800 MHz trunked system, and the mobile communications system available from the Berkshire County Sheriff.

7.6.2 Emergency Alert System (EAS)

EAS allows government officials to access local radio and TV stations to communicate with the public in times of impending or actual emergency. To activate the EAS at the state level, a request may be directed to an Originating Primary Relay Station (usually an FM station located near the State capital) by the Governor, State Police, State Emergency Management, or the National Weather Service.

7.6.3 Internet Access Capabilities

The Towns of Lenox, Lee, and Stockbridge have internet access capabilities and may utilize the MEMA WebEOC portal (<u>https://webeoc.chs.state.ma.us/eoc7/</u>) to report an emergency condition, provide updates to MEMA and request assistance (manpower, materials, equipment, etc.) as needed.

7.6.4 Reverse 911

The Towns of Lenox, Lee, and Stockbridge utilize Reverse 911 (or equivalent) systems. Reverse 911 (or equivalent) systems would allow Town officials to send out pre-recorded messages to residents by telephone, during an emergency (flood) or a situation that requires public outreach to residents and businesses. Prerecorded messages would be sent out to entire communities or to specific locations depending on the nature of the emergency. In the case of a dam break flood wave, the notification system would be used to notify residents in the potential impact areas.

7.7 EMERGENCY SUPPLIES AND INFORMATION

7.7.1 Stockpiling Materials and Equipment

The General Electric Company has selected an Emergency Response Contractor to respond to an emergency situation at the dam: LB Corporation, whose contact

information is provided in the Table 7. The Towns of Lenox, Lee, and Stockbridge DPWs should be prepared to respond with additional equipment, material and labor as required.

7.7.2 Coordination of Information

There are no dams upstream that can be used to reduce flows into Woods Pond Dam.

7.7.3 Other Site-Specific Actions

Under the direction of the Incident Commanders, the Town of Lenox or Lee employees may provide manpower to perform emergency repair activities. If additional manpower is required, the Towns of Lenox or Lee may request the assistance of the National Guard through MEMA. The General Electric Company maintains an on-call relationship with a local contractor who can respond in times of emergency.

7.7.4 Alternate Sources of Power

Towns of Lee and Lenox Fire and Police Departments own portable generators which would be available during times of emergency to power lighting and mobile EOCs.

Additional power sources are available from MEMA and the Berkshire County Sheriff. It is noted that during a local or regional emergency incident, these resources may be in use by others and not available for use in an emergency response at the Woods Pond Dam.

7.8 PUBLIC AWARENESS AND COMMUNICATION

At the time that this EAP was developed, GE had not yet developed any public awareness measures that are specific to Woods Pond Dam.

8.0 INUNDATION MAPS

Note that the inundation maps available in **Appendix E** include a limited number of key landmarks within the impact area and presents estimated flood zones. However, the map does not include all possible structures and facilities that may be impacted due to a dam break of Woods Pond Dam. It is incumbent upon the Towns of Lenox, Lee, and Stockbridge, to locate key local landmarks and modify the inundation maps, as they deem appropriate.

GENERAL ELECTRIC EMERGENCY RESPONSE CONTRACTOR LIST

TABLE 8

GUIDANCE FOR DETERMINING THE EMERGENCY CONDITION

Event	Situation	Emergency Condition*
	Principal spillway blocked with debris and pool is rapidly rising	В
Spillways	Principal spillway severely blocked with debris or structurally damaged	NE
	Principal spillway leaking	NE
	Flood flows are overtopping the dam	А
	The reservoir elevation reaches the predetermined evacuation trigger elevation 953.5	
Flooding	NGVD (i.e. 0.5 feet below top of embankment)	А
Thooding	The reservoir elevation reaches the predetermined notification trigger elevation 953.0	
	NGVD (i.e. 1.0 foot below top of embankment; Consider rate of rise)	В
	National Weather Service issues a flood warning for the area	NE/NF
	Boils observed downstream of dam with cloudy discharge	В
C	New seepage areas with cloudy discharge or increasing flow rate	В
Seepage	New seepage areas in or near the dam	NE
	Boils observed downstream of dam	NE
Circleheles	Rapidly enlarging sinkhole	А
Sinkholes	Observation of new sinkhole in reservoir area or on embankment	В
Embankment	Cracks in the embankment with seepage	В
Cracking	New cracks in the embankment greater than 1/4-inch wide without seepage	NE
Embankment	Sudden or rapidly proceeding slides of the embankment slopes	А
Movement	Visual movement/slippage of the embankment slope	NE
Instruments	Instrumentation readings beyond predetermined values	NE
	Earthquake resulting in uncontrolled release of water from the dam	А
Earthquake	Earthquake resulting in visible damage to the dam or appurtenances	В
	Measurable earthquake felt or reported on or within 50 miles of the dam	NE
Sogurity Throat	Detonated bomb that has resulted in damage to the dam or appurtenances	А
Security Threat	Verified bomb threat that, if carried out, could result in damage to the dam	В
	Damage to dam or appurtenances that has resulted in uncontrolled water release	А
Calaria (Damage to dam or appurtenances that has resulted in seepage flow	В
Vandalism	Modification to the dam or appurtenances that could adversely impact the functioning of	
	the dam	NE
	Damage to dam or appurtenances with no impacts to the functioning of the dam	NE

* Emergency Conditions:

A: Urgent; dam failure appears imminent or is in progress

B: Potential dam failure situation, rapidly developing

NE: Non-emergency, unusual event, slowly developing

NF: Non-failure emergency condition, no danger of dam failure, only flooding concerns

Note: This table is based upon the 2007 ASDSO sample EAP format.

	results.	possible.	seepage into conduit.	
			Activate EAP. (Situation B).	

Woods Pond Dam File No. 19896.50 Page 4 of 6

Observed Conditions	Potential Effects of the Observed Conditions	Guide for Action	Data to be Reported Situation Report	Remarks
5. RESERVOIR WHIRLPOOLS	Usually caused by water flowing through a piping tunnel through the dam or abutment.	Lower the pool. An attempt should be made to plug the entrance with cobbles/boulders or stockpiled materials or anything else that is available. If the large material placed in the hole appears to have reduced the flow, continue adding progressively smaller material. When the flow is sufficiently reduced (Whirlpool disappears) place a granular blanket over the downstream outlet of the piping as noted above for problem, i.e., piping. Inspect abutments, dam, and downstream of dam for seepage areas, sinkholes, boils, etc.	Note the time observed, condition noted, location, and approximate size of whirlpool and the exit area downstream. <u>Activate EAP</u> . (Situation B).	Observe constantly for changes in the pond or the exit area.
6. SLIDES Upstream slope of abutments	<u>Not serious</u> , if slide does not intersect the crest or extend into the embankment more than 5 feet (measure perpendicular to the slope).	Start repairs as soon as possible. Mobilize town construction equipment and manpower or private contractor to perform necessary repairs.	Note: Location, time first observed, subsidence or building, whether water is emerging from slope, whether any movement can be visually detected and pool elevation.	Observe at least once a day.
	Could lead to failure, if slide passes through the crest, and water surface within 10 feet of the slumped crest.	Have labor, materials and equipment standing by as soon as possible. Start repairs as soon as possible.	Report same data as above. <u>Activate EAP</u> . (Situation B).	Observe constantly until necessary repairs are completed.
	<u>Failure imminent</u> , if: (1) the slide passes through the crest; and, (2) the water surface is at or near (less than 10 feet below) the top of the slumped crest.	Start lowering the reservoir. Use every means possible to armor the crest and to restore to original crest level.	Note: the time first observed location, whether water is emerging from downstream slope, whether any movement can be visually detected. <u>Activate EAP</u> (Situation A).	Observe constantly.

Woods Pond Dam File No. 19896.50 Page 5 of 6

Observed Conditions	Potential Effects of the Observed Conditions	Guide for Action	Data to be Reported Situation Report	Remarks
7. OVERTOPPING	<u>Could cause failure</u> , if water surface elevation is approaching the top of the dam and there is the potential for erosion of the downstream face or if the water surface elevation is at or above the top of the dam and erosion is occuring.	Increases releases through outlet structures if possible. Increase freeboard by building a sandbag berm, or an earthen berm or parapet wall that is covered with a membrane. Force water through the outlet structures. Fill eroded areas with sandbags acording to the pyramid placement method as soon as they begin to form. Cover large areas that have been sandbaged with a membrane to further prevent erosion.	Note the time, location and height of overtopping and the length of the crest that is being overtopped. Note the size of the area that is being eroded. <u>Activate EAP</u> (Situation B)	Observe constantly.
	Failure imminent, if significant erosion is observed on the downstream face of the dam or if a significent decrease in crest width occurs as a result of the erosion.	Construct an auxillary spillway on an abutment. Dig a channel (starting from the bottom at the abutment/ downstream channel contact). Line the channel with filter fabric and dump appropriately sized (large) riprap in the channel. Once the channel approaches five feet from the reservoir, break through the top 6 inches of the channel/ reservoir contact to allow flow to proceed through the construted channel, while placing additional riprap in the channel to minimize erosion. As the water level drops, slowly and incrementally proceed to break through the top of channel/ reservoir contact to allow additional water through the channel. Place additional riprap as needed.	Note the time, location and height of overtopping and the length of the crest that is being eroded. <u>Activate EAP</u> (Situation A)	Observe constantly.

Woods Pond Dam File No. 19896.50 Page 6 of 6

	Potential Effects of		Data to be Reported	
Observed Conditions	the Observed Conditions	Guide for Action	Situation Report	Remarks
		If riprap is depleted, sandbags may		
		be placed in the scarp area. Each		
		bag should be filled with sand and		
		tied to prevent loss of material.		
		Placement should be by hand,		
		sling, or other methods that would		
		prevent tearing of the bags. Bags		
		filled with clay and silts may be		
		used only if sand is not readily		
		available and other methods of		
		repair cannot be implemented.

3 FEET	3400

Notes:

1) Sandbag Preparation

- a. Utilize polypropylene or burlap bags about 14" 18" wide and 30" -36" deep.
- b. A heavy bodied or sandy soil is most desirable for filling sandbags. On-site soil sources may be utilized, as appropriate.
- c. Bags should be filled between one-third (1/3) to one-half (1/2) of their capacity. This keeps the bag from getting too heavy, and permits the bags to be stacked with a good seal.
- d. Untied sandbags are recommended for most situations. Tied sandbags should be used only for special situations when pre-filling and stockpiling may be required, or for specific purposes such as filling holes, holding objects in position, or to form barriers backed by supportive planks. Tied sandbags are generally easier to handle and stockpile.

2) Sandbag Placement

- a. Remove any debris from the area where the bags are to be placed.
- b. Fold the open end of the unfilled portion of the bag to form a triangle. If tied bags are used, flatten or flare the tied end.
- c. Place the partially filled bags lengthwise and parallel to the direction of flow, with the open end facing against the water flow.
- d. Tuck the flaps under, keeping the unfilled portion under the weight of the sack.
- e. Place succeeding bags on top, offsetting by one-half (1/2) filled length of the previous bag, and stamp into place to eliminate voids, and form a tight seal.
- f. Stagger the joint connections when multiple layers are necessary. For unsupported layers over three (3) courses high, use the pyramid placement method.

3) **Pyramid Placement Method**

The pyramid placement is used to increase the height of sandbag protection.

- a. Place the sandbags to form a pyramid by alternating header courses (bags placed crosswise) and stretcher courses (bags placed lengthwise).
- b. Stamp each bag in place, overlap sacks, maintain staggered joint placement, and tuck in any loose ends.
- c. Use the table on this Figure to estimate the number of bags required

Investigation and Analysis of Dambreak Floods

(From March 4, 2003 EAP by MWH)

APPENDIX A

INVESTIGATION OF POTENTIAL FLOOD LIMITS

Areas and streams downstream from Woods Pond Dam that would most likely be inundated in case of a failure of the dam have been identified.

A dam break study was not performed for Woods Pond Dam because it was not needed as per requirements of the DCR. The stream affected due to a failure would be the Housatonic River. There would be some backwater effect on small tributaries joining the Housatonic River (from upstream to downstream: a small unnamed stream, Washington Mountain Brook, Codding Brook, small unnamed stream, Goose Pond Brook and Hop Brook). Further downstream, the backwater effect on the tributaries might not be significant. **Appendix G** shows a portion of the Housatonic River and tributaries downstream from the dam.

Although the DCR does not require a dam failure inundation map for "significant" hazard (Class II) dams, the identification of roads and residences likely to be affected due to a failure of Woods Pond Dam was considered necessary for warning purposes. This required some approximation of inundation boundaries along the Housatonic River. To draw these inundation boundaries, guidance was obtained from two previous reports. First was the dam break analysis made by U.S. Army Corps of Engineers, Omaha District (COE), presented in the Woods Pond Dam Phase 1 Inspection Report, Lee and Lenox, Massachusetts, September 1987. The second report was the Flood Insurance Study for the town of Lee, Massachusetts, Berkshire County, Community No 250028, December 1981 by the Federal Emergency Management Agency (FEMA).

A hypothetical failure of Woods Pond Dam could occur either on a sunny day or during a flood. For failure under the sunny day condition, COE assumed the failure to occur at a reservoir elevation of 952.7 ft, 4.4 ft above the spillway crest. Failure under this condition resulted in a maximum outflow of about 11,200 cfs and a water surface elevation of about 948.2 feet at a distance of 0.5 mile downstream from the dam. The FEMA study indicated a 100-year flood of about 11,700 cfs and a 500-year flood of about 16,300 cfs.

The water surface elevations computed by FEMA for the 100-year flood in the river reach immediately downstream of the dam confirm the water surface elevation of 948.2 feet estimated by COE. Further downstream, the dam break flood wave will attenuate resulting in water surface elevations lower than the elevations based on a steady state flow of 11,200 cfs.

However, for a conservative estimate of the inundation limits under a sunny day failure, the water surface elevations computed by FEMA corresponding to a flow of 11,700 cfs were used. The inundation limits are shown on Appendix G by a solid line.

Inundation downstream from the dam during the spillway design flood or a flood approaching the probable maximum flood (PMF) would be extensive compared to the solid line shown on Appendix G. Contribution to the inundation area due to failure of the dam during a flood would not be significant because of the small storage behind the dam at the spillway crest elevation, only 460 acre-feet (COE). Due to flood surcharge, the storage will be about 5,300 acre-feet at elevation 954.0, the top of the abutments.

Under flood conditions, the COE assumed the dam to fail when the old canal (raceway) embankment would have been overtopped by two feet. For failure under this condition, the maximum outflow would be about 16,000 cfs. This flow is nearly same as the 500-year flood estimated by FEMA. The inundation limits based on this flood and assuming a steady state flow are shown as dotted lines on Appendix G. The limits are conservative because a flood wave due to dam failure would attenuate and the water surface elevations would be lower than those shown.

Appendix B

Plans for Training, Exercising, Updating and Posting the EAP

APPENDIX B PLANS FOR TRAINING, EXERCISING, UPDATING, AND POSTING THE EAP

TRAINING

Training of the General Electric Company (GE) personnel and their contractors involved in the routine inspections of the dam and the implementation of the EAP shall be conducted to ensure their familiarity with all elements of the plan and their responsibilities under the plan. This training will include safety related problem detection and evaluation.

The 2014 EAP for Woods Pond Dam is a major revision to the document. The last such major revision was in 2003. Given the significant changes to EAP, Orientation Meetings will be held with the pertinent representatives of GE and the Towns of Lenox, Lee, and Stockbridge to review the new EAP.

The focus of the Orientation Meetings will be on clarifying the roles, procedures, and responsibilities associated with the implementation of the EAP for the Woods Pond Dam. The general purpose is for meeting participants to evaluate plans and procedures and to resolve questions of coordination and assignment of responsibilities.

GE will be responsible for scheduling these meetings.

The key issues for discussion include, but are not necessarily limited to, the following:

- Familiarization with the overall framework and specific details of Figure 1 Notification Flowchart.
- Familiarization with alternate means of communication.
- Review differences between Emergency Condition A (failure imminent), Emergency Condition B (potential hazardous situation developing), Non-Emergency Condition (unusual event, slowly developing) and Non-Failure Emergency Condition (no danger of dam failure, only flooding concerns) and notification procedures for each situation.
- Identification and differentiation of problem conditions at the dam observed during routine surveillance and maintenance.
- The Incident Commanders (the Lee Police Chief and Lenox Fire Chief) will function as "Incident Commander" as per the Incident Command System (ICS).
- Review of general Emergency Repair Procedures and Guidelines for Woods Pond Dam EAP.
- Review of emergency operation procedures at the Woods Pond Dam.
- Review duties of other key emergency agencies.

EXERCISING

The need to test the EAP through tabletop exercises or field drills should be determined by the Incident Commanders identified in the EAP (the Lee Police Chief and Lenox Fire Chief). GE will fully cooperate in any tabletop exercises of field drills determined to be necessary

Should the Incident Commanders determine that exercising the EAP is required, the Federal Guidelines for Emergency Action Planning for Dams (FEMA 64) recommends a combination of discussion-based and operations-based exercises. Descriptions of each, from FEMA 64, are shown below.

Discussion-based exercises familiarize participants with current plans, policies, agreements, and procedures, or may be used to develop new plans, policies, agreements, and procedures. The following are types of discussion-based exercises:

- Seminar A seminar is an informal discussion designed to orient participants to new or updated plans, policies, or procedures (e.g., a seminar to review a new Evacuation Standard Operating Procedure). Seminars should include internal discussions as well as coordination with emergency management authorities and other organizations with a role in EAP implementation.
- *Workshop* A workshop resembles a seminar but is used to build specific products such as a draft plan or policy. For example, a Training and Exercise Plan Workshop is used to develop a Multi-Year Training and Exercise Plan.
- *Tabletop Exercise* A tabletop exercise involves key personnel discussing simulated scenarios in an informal setting. Tabletop exercises can be used to assess plans, policies, and procedures.
- *Games* A game is a simulation of operations that often involves two or more teams, usually in a competitive environment, using rules, data, and procedures designed to depict an actual or assumed real-life situation.

Operations-based exercises validate plans, policies, agreements and procedures; clarify roles and responsibilities; and identify resource gaps in an operational environment. Types of operations-based exercises are:

- **Drill** A drill is a coordinated, supervised activity usually employed to test a single operation or function within a single entity, such as testing sirens and warning systems, calling suppliers, checking material on hand, and conducting a call-down drill of those listed on the Notification Flowchart.
- *Functional Exercise* A functional exercise examines and/or validates the coordination, command, and control between various multi-agency coordination centers, such as Emergency Operation Centers (EOCs) and Joint Field Offices. A functional exercise does not involve any "boots on the ground" such as first responders or emergency officials responding to an incident in real time.
- *Full-Scale Exercises* A full-scale exercise is a multi-agency, multijurisdictional, multi-discipline exercise involving functional (e.g., Joint Field Office, EOC, "boots on the ground" response to a simulated event, such as activation of the EOC and role-playing to simulate an actual dam failure). Functional and full-scale exercises are considered comprehensive exercises that provide the necessary verification, training, and practice to improve the EAP and the operational readiness and coordination efforts of all parties responsible for responding to emergencies at a dam. The basic difference between these two exercise types is that a full-scale exercise involves actual

field movement and mobilization; in a functional exercise, field activity is simulated.

<u>UPDATING</u>

The Woods Pond Dam EAP will be periodically updated to reflect changes in names or titles of project operations, attendants, and other personnel with specific, designated responsibilities for actions in an emergency. The EAP will be annually reviewed and updated, as necessary. This may include changes in **Figure 1 - Notification Flowchart**, Contact Lists, the Downstream Residents List or other information critical to providing notification to affected persons, Federal, State, and local agencies. In addition, any input from Federal, State, or local agencies should also be incorporated into the updated EAP document. GE will be responsible for updating the EAP.

GE has continuing responsibility to review the adequacy of the Woods Pond Dam EAP in light of any significant changes in upstream or downstream circumstances which might affect water flows or the location or extent of the areas, persons, or property that might be harmed due to a sudden release of water from Woods Pond Dam. Promptly after becoming aware of necessary changes to keep the EAP workable, GE will consult and cooperate with appropriate Federal, State, or local agencies responsible for public safety/emergency management to determine any advisable revision to the EAP.

GE will provide all holders of the EAP, copies of all revisions. Revised pages, maps, etc. should be marked, "Revision month/day/year" and revised material should be highlighted.

POSTING OF THE NOTIFICATION FLOWCHART

Figure 1 - Notification Flowchart should be posted and a 3-ring bound copy of the completed EAP should be available to each of the entities listed in the flowchart and contact lists.

The following have copies of the EAP:

- GE
- Town of Lenox Emergency Management
- Town of Lee Emergency Management
- Town of Stockbridge Emergency Management
- MEMA
- DCR Office of Dam Safety

J:\19,000-20,999\19896\19896-30.JDA\EAP Update 2013\Woods\Appendices\Appendix B - Plans for Training, Exercising, Updating and Posting the EAP\Woods Appendix B (MC).docx

Appendix C

Site-Specific Concerns

APPENDIX C SITE-SPECIFIC CONCERNS

Each dam and downstream area is unique. Woods Pond Dam is accessible at both abutments, but as a run-of-the-river dam, they are not accessible from each other. The right (west) abutment is accessible via an access road from Crystal Road, over a set of train tracks. The left (east) side is located at a mill building.

Paragraph 123.a of the Consent Decree executed by the General Electric Company and various federal and state agencies, as of October 27, 2000 concerning the GE-Pittsfield/Housatonic River Site has set forth requirements for the maintenance of Woods Pond Dam. Pursuant to the decree, the General Electric Company has included concerned organizations on Figure 1, Flowchart.

Appendix D

Emergency Repair

APPENDIX D EMERGENCY REPAIR

GENERAL

In this section, potential emergency conditions that may affect the function of the Woods Pond Dam are identified and appropriate remedial actions are discussed herein. The intent is to facilitate emergency repair in cases where response time is critical and/or communications are disrupted which may delay the on-site arrival of the General Electric Company's dam safety engineer.

Potential natural phenomena and manmade forces which could affect the stability or function of the Woods Pond Dam include floods, earthquakes, inherent instability, aging and deterioration, accidents and sabotage.

While the cause of the damage is important, the remedial action to be undertaken is mostly dependent on certain characteristic signs of distress which indicate particular types of problems in earthen embankment dams. The following is a general description of conditions and corresponding corrective actions to be undertaken in emergency conditions to mitigate or delay the collapse of the dam. An action guide is presented in the Table 9, entitled "Emergency Repair Guidelines." This table was originally developed by the Army Corps of Engineers and has been modified by GZA to incorporate site-specific conditions at the dam. The Town of Lee or Lenox personnel should become familiar with these procedures to reduce response time in the event of an emergency.

The emergency repair procedures outlined in Table 9 are to be supervised by the Town. The following document potential remedial systems:

Figure 3Boil RingFigure 4Boil Ring Maintenance InstructionsFigure 5Granular BlanketFigure 6Temporary Erosion ProtectionFigure 7Sandbag Berm Construction

At all times, utmost care should be given to the safety of personnel engaged in the remedial activities. If failure is imminent or cannot be effectively delayed, then remedial activities should cease and all personnel ordered out of the unsafe area by the senior staff at the scene. For observed conditions that are out of the norm, a qualified dam safety engineer (Massachusetts Registered Professional Engineer) should be consulted immediately, to assess the severity of the problem and recommended corrective measures.

EXCESS SEEPAGE

One of the leading causes of failures of embankment dams is embankment or foundation seepage/piping. Excess seepage leading to embankment failure may be caused by malfunctioning toe drains, presence of vegetative growth and extensive root systems within the embankment, burrowing of small animals, or high reservoir pool levels creating high hydrostatic heads.

Controlled seepage through the toe of an earthen dam embankment is normal. However, rapid or significant increases in flow through the toe may begin to carry out fine soil materials, create sand boils, and produce new seep areas along the downstream face. Normal toe discharge is generally clear. Remedial actions should be taken if toe seepage quantities suddenly increase and become turbid (cloudy or muddy).

Piping is a process in which seepage dislodges and transports soil particles as it daylights on the downstream face of an embankment. An open channel forms at the point of seepage exit and works its way progressively into the embankment as erosion continues. Eventually, a completely open channel is formed through the embankment. Piping may also originate inside an embankment from any internal voids into which water can flow. Abandoned conduits could initiate piping if cracks develop in these structures. Cracks could form as a result of structural deterioration or settlement under static or earthquake loads. Slope failures extending through an embankment's core create another potential source of piping. The soils along the failure plane will be weakened and will likely be more permeable.

Internal erosion is defined as flow seeking and eroding a preferential flow path within or below the dam. This mode of failure is a soil removal process from within the embankment, and, if not corrected, will accelerate over time and ultimately lead to the collapse of the earth embankment structure. Individual "boils" downstream of the embankment dam can be an indicator that this type of failure mechanism is developing.

Individual boils or small areas of seepage can be controlled on a temporary basis by ringing them with sandbags, stone, or other materials. Refer to Figures 3 and 4 for schematics of "ringing a boil" including estimated quantities of required personnel and material.

SAND BAGS / OVERTOPPING

Sand bag berms are one of the most common methods for temporarily increasing freeboard to reduce overtopping of a dam during a flood event. Figure 7 provides information on proper methods for constructing sandbag berms. Sandbag berm construction can be highly effective but requires appropriate material and is labor intensive. The maximum effective height should be limited to approximately three feet. (Source: Flood Fighting: How To Use Sandbags, US Army Corps of Engineers). GZA recommends that the General Electric Company make arrangements with a local supplier to be able to obtain sandbags in the event of an overtopping emergency. Sand to fill the sand bags should be obtained from a local sand and gravel pit.

Problem	Probable Cause and Possible Consequences	Recommended Actions		
Longitudinal Crack (Figure 5.3a)	 Uneven settlement between adjacent sections or zones within the embankment. Foundation failure causing loss of support to embankment. Initial stages of embankment slide. Creates local area of low strength within an embankment. Could be the point of initiation of future structural movement, deformation or failure. Provides entrance point for surface runoff into embankment, allowing saturation of adjacent embankment area and possible lubrication which could lead to localized failure. 	 Inspect crack and carefully record location, length, depth, width, alignment, and other pertinent physical features. Immediately stake out limits of cracking. Monitor frequently. Engineer should determine cause of cracking and supervise steps necessary to reduce danger to dam and correct condition. Effectively seal the cracks at the crest surface to prevent infiltration by surface water. Continue to routinely monitor crest for evidence of further cracking. 		
Vertical Displacement (Figure 5.3b)	 Vertical movement between adjacent sections of the embankment. Structural deformation or failure caused by structure stress or instability, or by fail- ure of the foundation. Creates local area of low strength within embankment which could cause future movement. Leads to structural instability or failure. Creates entrance point for surface water that could further lubricate failure plane. Reduces available embankment cross- section. 	 Carefully inspect displacement and record its location, vertical and horizon- tal displacement, length and other physi- cal features. Immediately stake out lim- its of cracking. Engineer should determine cause of displacement and supervise all steps nec- essary to reduce danger to dam and cor- rect condition. Excavate area to the bottom of the dis- placement. Backfill excavation using competent material and correct construc- tion techniques, under supervision of engineer. Continue to monitor areas routinely for evidence of cracking or movement. (See Chapter 6.) 		

Cave-In on Crest	Transver Crackin	Figure 5.3d
Problem	Probable Cause and Possible Consequences	Recommended Actions
Cave-in On Crest (Figure 5.3c)	 Rodent activity. Hole in outlet conduit is causing erosion of embankment material. Internal erosion or piping of embankment material by seepage. Breakdown of dispersive clays within embankment by seepage waters. Void within dam could cause localized caving, sloughing, instability or reduced embankment cross-section. Entrance point for surface water. 	 Carefully inspect and record location and physical characteristics (depth, width, length) of cave-in. Engineer should determine cause of cave-in and supervise all steps necessary to reduce threat to dam and correct con- dition. Excavate cave-in, slope sides of exca- vation and backfill hole with competent material using proper construction tech- niques. (See Chapter 7.) This should be supervised by engineer. ENGINEER REQUIRED
Transverse Cracking (Figure 5.3d)	 Uneven movement between adjacent segments of the embankment. Deformation caused by structural stress or instability. Can provide a path for seepage through the embankment cross-section. Provides local area of low strength within embankment. Future structural movement, deformation or failure could begin. Provides entrance point for surface run- off to enter embankment. 	 Inspect crack and carefully record crack location, length, depth, width and other pertinent physical features. Stake out lim- its of cracking. Engineer should determine cause of cracking and supervise all steps necessary to reduce danger to dam and correct con- dition. Excavate crest along crack to a point below the bottom of the crack. Then backfilling excavation using competent material and correct construction tech- niques. This will seal the crack against seepage and surface runoff. (See Chapter 7.) This should be supervised by engineer. Continue to monitor crest routinely for evidence of future cracking. (See Chapter 4.)

Figure 5.3 (cont.) Inspection Guidelines - Embankment Crest

ENGINEER REQUIRED

Figure 5.3 (cont.) Inspection Guidelines - Embankment Crest

Problem	Probable Cause and Possible Consequences	Recommended Actions	
Crest Misalignment (Figure 5.3e)	 Movement between adjacent parts of the structure. Uneven deflection of dam under loading by reservoir. Structural deformation or failure near area of misalignment. Area of misalignment is usually accompanied by low area in crest which reduces freeboard. Can produce local areas of low embankment strength which may lead to failure. 	 Establish monuments across crest to determine exact amount, location, and extent of misalignment. Engineer should determine cause of misalignment and supervise all steps nec- essary to reduce threat to dam and cor- rect condition. Following remedial action, monitor crest monuments according to a sched- ule to detect any movement. (See Chapter 6.) ENGINEER REQUIRED 	
Low Area in Crest (Figure 5.3f)	 Excessive settlement in the embankment or foundation directly beneath the low area in the crest. Internal erosion of embankment mate- rial. Foundation spreading to upstream and/ or downstream direction. Prolonged wind erosion of crest area. Improper final grading following con- struction. Reduces freeboard available to pass flood flows safely through spillway. 	 Establish monuments along length of crest to determine exact amount, loca- tion, and extent of settlement in crest. Engineer should determine cause of low area and supervise all steps necessary to reduce possible threat to the dam and correct condition. Reestablish uniform crest elevation over crest length by filling in low area using proper construction techniques. This should be supervised by engineer. Reestablish monuments across crest of dam and routinely monitor monuments to detect any settlement.

Inspection	Guidelines - Embankment Seepa	age Areas
Excessive Quantity and/or Muddy Water Exiting From a Point	Stream of Exiting Throu Near the	Water gh Cracks Crest
Figure 5.4a		Figure 5.4b
Problem	Probable Cause and Possible Consequences	Recommended Actions
Excessive Quantity and/or Muddy Water Exiting From a Point (Figure 5.4a)	 Water has created an open pathway, channel or pipe through the dam. The water is eroding and carrying embankment material. Large amounts of water have accumu- lated in the downstream slope. Water and embankment materials are exiting at one point. Surface agitation may be causing the muddy water. Rodents, frost action or poor construc- tion have allowed water to create an open pathway or pipe through the embankment. Continued flows can saturate parts of the embankment and lead to slides in the area. Continued flows can further erode em- bankment materials and lead to failure of the dam. 	 Begin measuring outflow quantity and establishing whether water is getting muddier, staying the same or clearing up. If quantity of flow is increasing, water level in reservoir should be lowered until flow stabilizes or stops. Search for opening on upstream side and plug if possible. A qualified engineer should inspect the condition and recommend further ac- tions to be taken. ENGINEER REQUIRED
Stream of Water Exiting Through Cracks Near the Crest (Figure 5.4b)	 Severe drying has caused shrinkage of embankment material. Settlement in the embankment or foun- dation is causing the transverse cracks. Flow through the crack can cause failure of the dam. 	 Plug upstream side of crack to stop flow. Lower water level in the reservoir should be lowered until below level of cracks. A qualified engineer should inspect the condition and recommend further actions.

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Large Area Wet or Producing Flow	Marked Change in Vegetation	Bulge in Large Wet Area
Figure 5.4e	Figure 5.4f	Figure 5.4g
Problem	Probable Cause and Possible Consequences	Recommended Actions
Large Area Wet or Producing Flow (Figure 5.4e)	A seepage path has developed through the abutment or embankment materials and failure of the dam can occur. 1. Increased flows could lead to erosion of embankment material and failure of the dam. 2. Saturation of the embankment can lead to local slides which could cause failure of the dam.	 Stake out the saturated area and monitor for growth or shrinking. Measure any outflows as accurately as possible. Reservoir level may need to be lowered if saturated areas grow at a fixed storage level or if flow increases. A qualified engineer should inspect the condition and recommend further actions. ENGINEER REQUIRED
Marked Change in Vegetation (Figure 5.4f)	 Embankment materials are supplying flow paths. Natural seeding by wind. Change in seed type during early post- construction seeding. Can show a saturated area. 	 Use probe and shovel to establish if the materials in this area are wetter than surrounding areas. If area shows wetness, when surround- ing areas are dry or drier, a qualified en- gineer should inspect the condition and recommend further actions. ENGINEER REQUIRED
Bulge in Large Wet Area (Figure 5.4g)	Downstream embankment materials have begun to move. Failure of the embankment resulting from massive sliding can follow these early move- ments.	 Compare embankment cross-section to the end of construction condition to see if observed condition may reflect end of construction. Stake out affected area and accurately measure outflow. A qualified engineer should inspect the condition and recommend further actions.

inspecti	on duidennes - concrete opstrea	
Large Increase in Flow or Sediment in Drain Outfall	d Deteriorated Acrete Face	Cracks Due to Drying
Figure 5.5a	Figure 5.5b	Figure 5.5c
Problem	Probable Cause and Possible Consequences	Recommended Actions
Large Increase in Flow or Sediment in Drain Outfall (Figure 5.5a)	Shortened seepage path or increased stor- age levels. 1. Higher-velocity flows can cause erosion of drain, then embankment materials. 2. Can lead to piping failure.	 Accurately measure outflow quantity and determine amount of increase over previous flow. Collect jar samples to compare turbidity. If either quantity or turbidity has in- creased by 25%, a qualified engineer should evaluate the condition and recom- mend further actions. ENGINEER REQUIRED
Cracked Deteriorated Concrete Face (Figure 5.5b)	Concrete deteriorated from weathering. Joint filler deteriorated or displaced. Soil is eroded behind the face and caverns can be formed. Unsupported sections of concrete crack. Ice action may displace con- crete.	 Determine cause. Either patch with grout or contact engineer for permanent repair method. If damage is extensive, a qualified en- gineer should inspect the condition and recommend further actions. ENGINEER REQUIRED
Cracks Due to Drying (Figure 5.5c)	Soil loses its moisture and shrinks, causing cracks. <i>Note:</i> Usually limited to crest and downstream slope. Heavy rains can fill cracks and cause small parts of embankment to move along inter- nal slip surface.	 Monitor cracks for increases in width, depth , or length. A qualified engineer should inspect condition and recommend further actions. ENGINEER REQUIRED

Figure 5.5 Inspection Guidelines - Concrete Upstream Slope

<section-header></section-header>	Erosion ChannelsContractionContractionFigure 5.6b	Excessive Erosion in Earth-Slide Causes Concentrated Flows
Problem	Probable Cause and Possible Consequences	Recommended Actions
Excessive Vegetation or Debris in Channel (Figure 5.6a)	Accumulation of slide materials, dead trees, excessive vegetative growth, etc., in spill- way channel. Reduced discharge capacity; overflow of spillway, overcropping of dam. Prolonged overtopping can cause failure of the dam.	Clean out debris periodically; control vegetative growth in spillway channel. Install log boom in front of spillway en- trance to intercept debris.
Erosion Channels (Figure 5.6b)	Surface runoff from intense rainstorms or flow from spillway carries surface material down the slope, resulting in continuous troughs. Livestock traffic creates gullies where flow concentrates varies. Unabated erosion can lead to slides, slumps or slips which can result in reduced spill- way capacity. Inadequate spillway capacity can lead to embankment overtopping and result in dam failure.	Photograph condition. Repair damaged areas by replacing eroded material with compacted fill. Protect areas against fu- ture erosion by installing suitable rock riprap. Re-vegetate area if appropriate. Bring condition to the attention of the engineer during next inspection.
Excessive Erosion in Earth-Slide Causes Concentrated Flows (Figure 5.6c)	Discharge velocity too high; bottom and slope material loose or deteriorated; chan- nel and bank slopes too steep; bare soil un- protected; poor construction protective surface failed. Disturbed flow pattern; loss of material, increased sediment load downstream, col- lapse of banks; failure of spillway; can lead to rapid evacuation of the reservoir through the severely eroded spillway.	Minimize flow velocity by proper design. Use sound material. Keep channel and bank slopes mild. Encourage growth of grass on soil surface. Construct smooth and well- compacted surfaces. Protect surface with riprap, asphalt or concrete. Repair eroded portion using sound con- struction practices.

Figure 5.6 Inspection Guidelines - Spillways

San Tana

Figure 5.6 <i>(cont.)</i> Inspection Guidelines - Spillways				
End of Spillway Chute Undercut	Wall Displacement	Large Cracks		
Figure 5.6d	Figure 5.6e	Figure 5.6f		
Problem	Probable Cause and Possible Consequences	Recommended Actions		
End of Spillway Chute Undercut (Figure 5.6d)	Poor configuration of stilling basin area. Highly erodible materials. Absence of cut- off wall at end of chute. Structural damage to spillway structure; collapse of slab and wall lead to costly repair.	Dewater affected area; clean out eroded area and properly backfill. Improve stream channel below chute; provide properly sized riprap in stilling basin area. Install cutoff wall.		
Wall Displacement (Figure 5.6e)	Poor workmanship; uneven settlement of foundation; excessive earth and water pres- sure; insufficient steel bar reinforcement of concrete. Minor displacement will create eddies and turbulence in the flow, causing erosion of the soil behind the wall. Major displace- ment will cause severe cracks and eventual failure of the structure.	Reconstruction should be done accord- ing to sound engineering practices. Foun- dation should be carefully prepared. Ad- equate weep holes should be installed to relieve water pressure behind wall. Use enough reinforcement in the concrete. Anchor walls to present further displace- ment. Install struts between spillway walls. Clean out and backflush drains to assure proper operations. Consult an en- gineer before actions are taken.		
Large Cracks (Figure 5.6f)	Construction defect; local concentrated stress; local material deterioration; founda- tion failure, excessive backfill pressure. Disturbance in flow patterns; erosion of foundation and backfill; eventual collapse of structure.	ENGINEER REQUIRED Large cracks without large displacement should be repaired by patching. Surrounding areas should be cleaned or cut out before patching material is ap- plied. (See Chapter 7.) Installation of weep holes or other actions may be needed.

TEXAS COMMISSION ON ENVIRONMENTAL QUALITY

Appendix G

Limitations

APPENDIX I LIMITATONS

Use of Report

1. GZA GeoEnvironmental, Inc. (GZA) prepared this Emergency Action Plan Update (EAP) on behalf of, and for the exclusive use of the General Electric Company (Client) for the stated purpose(s) and location(s) identified in the EAP. Use of this report, in whole or in part, at other locations, or for other purposes, may lead to inappropriate conclusions; and we do not accept any responsibility for the consequences of such use(s). Further, reliance by any party not identified in the EAP, for any use, without our prior written permission, shall be at that party's sole risk, and without any liability to GZA.

Standard of Care

- 2. Our findings and conclusions are based on the work conducted as part of the Scope of Services set forth in the EAP and reflect our professional judgment. These findings and conclusions must be considered not as scientific or engineering certainties, but rather as our professional opinions based on the limited data gathered during the course of our work. Conditions other than described in this report may be found at the subject location(s).
- 3. The preparation of the EAP was performed using the degree of skill and care ordinarily exercised by qualified professionals performing the same type of services at the same time, under similar conditions, at the same or a similar property. No warranty, expressed or implied, is made.

General

- 4. The observations described in this EAP were made under the conditions stated therein. The conclusions presented were based solely upon the services described therein, and not on scientific tasks or procedures beyond the scope of described services or the time and budgetary constraints imposed by the Client.
- 5. In preparing the EAP, GZA relied on certain information provided by the Client, state and local officials, and other parties referenced therein available to GZA at the time of the evaluation. GZA did not attempt to independently verify the accuracy or completeness of all information reviewed or received during the course of this evaluation.
- 6. Observations were made of the site and of structures on the site as indicated within the EAP. Where access to portions of the structure or site, or to structures on the site was unavailable or limited, GZA renders no opinion as to the condition of that portion of the site or structure. In particular, it is noted that water levels in the impoundment and elsewhere and/or flow over the spillway may have limited GZA's ability to make observations of underwater portions of the structure. Excessive vegetation, when present, also inhibits observations.

- 7. In reviewing this EAP, it should be realized that the reported condition of the dam is based on observations of field conditions during the course of this study along with data made available to GZA. It is important to note that the condition of a dam depends on numerous and constantly changing internal and external conditions, and is evolutionary in nature. It would be incorrect to assume that the present condition of the dam will continue to represent the condition of the dam at some point in the future. Only through continued inspection and care can there be any chance that unsafe conditions be detected.
- 8. It should be noted that the overall contents of this EAP, including recommendations describing organization and duties, are not intended for the dam owner to usurp the responsibility of other state and local governmental entities responsible for the evacuation of people and protection of life and property.
- 9. It should be understood that this EAP is intended for use in dam emergency conditions only, and does not address any other emergency operation. This plan should be used at all times in conjunction with established General Electric Company, Town of Lee and Town of Lenox policies and procedures.
- 10. Any GZA hydrologic analysis presented herein is for the rainfall volumes and distributions stated herein. For storm conditions other than those analyzed, the response of the site's spillway, impoundment, and drainage network has not been evaluated.
- 11. The dam breach analysis and inundated areas shown on the Inundation Maps included in this document reflect events of an extremely remote nature. They are not in any way intended to reflect upon the integrity of the dam.
- 12. The analysis presented is for the breach scenarios stated herein. For conditions other than those analyzed, the estimated flood wave and resulting inundation area has not been analyzed.
- 13. It should be clearly understood that the limits of flooding developed through the modeling effort and presented on the Inundation Map is approximate and should be used by public safety personnel as a guideline for establishing emergency notification and evacuation zones. The results shown on the accompanying Inundation Map and Profile are a function of the method, procedures, and assumptions employed for the model. Actual inundation areas will depend on actual failure conditions and may therefore differ somewhat from areas shown on the maps.

	NID ID #: MA00250
	INSPECTION SUMMARY
DATE OF INSPECTION:	DATE OF PREVIOUS INSPECTION:
TEMPERATURE/WEATHER:	ARMY CORP PHASE I: YES NO If YES, date September 1979
CONSULTANT: <u>GZA GeoEnvironmental, Inc.</u>	PREVIOUS DCR PHASE I: YES NO If YES, date
BENCHMARK/DATUM: <u>NGVD</u>	
OVERALL CONDITION:	DATE OF LAST REHABILITATION: 2011-2013
EL. POOL DURING INSP.:	EL. TAILWATER DURING INSP.:
<u>1</u>	PERSONS PRESENT AT INSPECTION
NAME	TITLE/POSITION <u>REPRESENTING</u>
	EVALUATION INFORMATION
E1) TYPE OF DESIGN	E8) LOW-LEVEL OUTLET COND.
E2) LEVEL OF MAINTENANCE	E9) SPILLWAY DESIGN FLOOD
E3) EMERGENCY ACTION PLAN	E10) GENERAL CONDITIONS
E4) EMBANKMENT SEEPAGE	E11) ESTIMATED REPAIR COST
E5) EMBANKMENT CONDITION	ROADWAY OVER CREST □ YES ☑ NO
E6) CONCRETE CONDITION	BRIDGE NEAR DAM □ YES ☑ NO
E7) LOW-LEVEL OUTLET CAP
