Notes:

B - analyte observed in blank associated with sample and in sample

D - value reported from dilution run

J - estimated value

U - constituent not detected above reporting limit

mg/l - milligram/liter

ug/l - microgram/liter

28 Day *Nereis virens*
Survival and Growth Toxicity Tests

1.0 INTRODUCTION

This report presents the results of toxicity tests carried out on sediment samples collected from the Gowanus Canal Superfund Site in Brooklyn, New York. Samples were provided by CH2M Hill, Chantilly, Virginia. Biological testing was based on programs and protocols developed by the US EPA (2001) and ASTM (2009). Potential toxicological impacts of the sediment were determined by conducting 28 day toxicity tests with the marine poychaete worm, *Nereis virens*. All testing, toxicological and analytical, was performed at EnviroSystems, Incorporated (ESI), Hampton, New Hampshire.

Toxicity tests expose groups of organisms to environmental samples, a laboratory control and field reference sites for a specified period to assess potential impacts on a variety of endpoints, such as survival, growth or reproduction. Analysis of variance techniques are used to determine the relative toxicity of the samples as compared to the laboratory control and/or field reference sites. Endpoints for this study were survival and growth (measured as wet weight).

2.0 MATERIALS AND METHODS

2.1 General Methods, Biological Evaluations

Toxicological and analytical protocols used in this program follow procedures established by the U.S. EPA and U.S. Army Corps of Engineers (U.S. ACE) for testing of dredged material, as well as procedures outlined in *Standard Guide for Conducting Sediment Toxicity Test with Polychaetous Annelids* (ASTM 2009). These protocols provide standard approaches for physical and chemical analyses and for the evaluation of toxicological effects of sediments on aquatic invertebrates.

2.2 Test Species

Adult *N. virens* were obtained from ARO. Worms were collected in the field from the Damariscotta River in Boothbay Harbor, Maine and shipped to ARO. Damaged and inactive worms were not used in the assay.

2.3 Test Samples

Sediment samples collected from the Gowanus Canal Superfund Site were received at ESI under chain of custody. Once received, samples were inspected to determine integrity, given unique sample numbers and logged into the laboratory sample management database. Once logged in, the samples were placed in a secure refrigerated, 2 - 4 °C, storage area. A listing of sample sites, sample collection, and receipt information is summarized in Table 4.

Control sediment used in the worm assay was a natural marine sediment collected from Hampton Estuary in Hampton, NH, which was sieved to remove large debris and allow for inspection for other living organisms.

Overyling seawater was also obtained from the Hampton Estuary. Water from the estuary has been used for the culture and maintenance of test organisms at ESI since 1978. Seawater is obtained through a filter system located on the bottom of the estuary at a point approximately 1 mile from the open ocean. The water is classified as SA-1.

2.4 *N. virens* 28 Day Survival and Growth Toxicity Tests

The 28 day worm sediment tests were conducted according to the methods provided in ASTM (2009) and US EPA (2001). Endpoints measured at the completion of the assay were survival and growth. Growth was measured as wet weight and wet biomass.

Test vessels were 10 liter glass aquaria containing 1.5 liters of sediment and approximately 3.8 liters of overlying water. Aquaria were fitted with overflow spouts to allow for renewal of the overlying water. Static renewal of the overlying water provided approximately 5 volume additions of water/day to each aquarium. Test chambers were randomly placed after addition of test sediments. Placement locations for test chambers were generated by the CETIS® software program. The randomization work sheets are included in the data appendix. Vessels were maintained at 13±3°C in a temperature controlled room during the test. Temperature was recorded hourly using a temperature logger placed in a surrogate vessel. Salinity limits were established at 30±2‰. The photoperiod in the test chamber was set at 16:8 hour light:dark. Lighting was supplied by cool white fluorescent bulbs.

A total of 10 worms were randomly selected from the pool of organisms and added to each tank. Eight replicates were used for each treatment. Sediment and overlying water were added to the test vessels at least 24 hours prior to the addition of test organisms.

A daily observation record was maintained for test chambers. Mortalities and unusual behavior were recorded. If mortalities were observed the body was removed from the test chamber. The dissolved oxygen, pH, salinity, specific conductivity and temperature in the overlying water was measured in all tanks daily. Organisms were fed chopped clam on day 7 and chopped algae on days 14 and 21.

After 28 days exposure, the organisms were recovered from the sediments and counted. All living organisms were transferred to clean test vessels and maintained in clean seawater for 24 hours to allow for removal of sediment from the animals' digestive tract. After the depuration period, organisms were then weighed to the nearest 0.01 mg. The mean wet weight of surviving organisms was determined to assess growth. Organisms were then transferred to plastic bags and frozen. Frozen tissue samples are being held by ESI for 12 months at the request of the client.

2.5 Statistical Analysis

Survival and growth data were analyzed using CETIS® software to determine significant differences between the test sediments and both the associated laboratory control and reference sediments. Data sets were evaluated to determine normality of distribution and homogeneity of sample variance. Data sets were subsequently evaluated using the appropriate parametric or non-parametric Analysis of Variance (ANOVA) statistic. End of assay, Day-28, endpoints for statistical analysis were; survival and growth. Growth was measured as both wet weight and wet biomass. Pair-wise comparisons were made using the appropriate statistical evaluation. Statistical difference was evaluated at α=0.05.

2.6 Reference Toxicant Evaluation

As part of the laboratory quality control program, reference toxicant evaluations are conducted by ESI on a regular basis for each test species. These results provide relative health and response data while allowing for comparison with historic data sets. Results are summarized in Table 2.

2.7 Protocol Deviations

Review of the toxicity testing procedures and resulting data indicate that the salinity deviated from the recommended protocol limits of 30±2‰ during the assay. The maximum salinity range during the assay was 25.79 to 32.43‰. Review of the data documented that out of the 4,176 total readings, 250 of them were greater than 32‰ and only 3 were less than 28‰. These values, while exceeding the specifications in ESI's SOP, are within the acceptability criteria stated in the ASTM method protocol. It is the opinion of the study director that the observed excursions had no significant impact on the outcome of the assay.

Table 2. Reference Toxicant Evaluation. Gowanus Canal Superfund Site, Brooklyn, New York. July 2010.

Date	Endpoint		Value	Historic Mean/ Central Tendency	Acceptable Range	Reference Toxicant
Nereis virens						
08/07/10	Survival	LC-50	1.81	1.23	0.198 - 2.252	Copper (mg/L)

3.0 RESULTS AND DISCUSSION

3.1 Laboratory Control and Project Reference Site Performance

Review of the laboratory control data indicates that worm performance for all endpoints exceeded the minimum acceptability criteria specified by protocol. At the end of the assay, mean control survival was 97.5% with a coefficient of variation (CV) of 4.75%. The mean wet weight of surviving worms was 2.908 g/organism. The mean wet weight of 5 replicates of 10 randomly selected worms at the start of the assay was 2.82 g/organism. Minimum acceptable performance for the laboratory control is specified as $\geq$90% survival on day 28, with no individual replicates below 80% survival. The method does not specify limits for growth.

During daily water quality observations the temperature recorded for the assay had a mean value of12.71°C with a range of 11.34 to 15.46°C. Confirmation temperature data collected in a surrogate replicate documented a mean temperature of 11.5°C with a range of 10.4 to 13.5°C. Test acceptability criteria requires a mean temperature of 13±2°C, with maximum temporary fluctuations of 13±3°C.

Table 3. Summary of Acceptable Endpoints and Measurements. Gowanus Canal Superfund Site, Brooklyn, New York. July 2010.

Endpoint / Measurement	Protocol Criteria		Study 19825
Survival	lab mean ≥ 90% and no replicates <80%	Mean Survival %	97.5%
		Minimum Survival %	90.0%
		Protocol Met	Yes
Mean Temperature	13 ±2°C	daily / hourly	12.71 / 11.5
		Protocol Met	Yes / Yes
Minimum Temperature	10°C	daily / hourly	11.34 / 10.4
		Protocol Met	Yes / Yes
Maximum Temperature	16°C	daily / hourly	15.46 / 13.5
		Protocol Met	Yes / Yes
Salinity	30 ±2‰	Mean Salinity	31.12
		Minimum Salinity	25.79
		Maximum Salinity	32.43
		Protocol Met	Limits exceeded*

*See section 2.7 Protocol Deviations for a discussion.

3.2 Summary

This program utilized protocols developed by the U.S. EPA and ASTM to assess the potential toxicological impacts that exposure to sediments from the Gowanus Canal Superfund Site would have on invertebrates. Table 5 provides a summary of sample sites that demonstrated a negative effect, based on the finding of statistically significant reduction in an endpoint as compared to the laboratory control or reference site. Tables 6 through 9 provide summaries of assay endpoints and detailed statistical results for each sample location. Laboratory bench sheets, detailed summaries of survival, wet weights and associated statistical support data are included in Appendix A.

14	7/22/10	✓/✓	JTP/AM				

Notes: Refresh Twice Daily, ≈ 30 minutes each time.

* DO Low in position 13b, added more air lines as corrective action 7/26 JTP

Fed on 7/15/10 AM/JTP (3-5g Clams)

Fed on 7/22/10 AM/JTP (3-5g Green Algae)

Fed on 7/29/10 AM/JTP (3-5g Green Algae)

On day 21 7/29/10 positions # 16, 17, 53, +62 were not feed due to left over algae from last feeding on 7/30/10

Test Notes

Study#:	Client:	Species:
19875 ~~19830~~	HDR Engineering, Inc.	Nereis virens ~~*Leptocheirus plumulosus*~~

DO was low for position #'s 6, 23, 65, 85, 86, & 113. More air lines were added. 7/9 JTP

Temps were low in test vessels across from climate control units. Room temp was adjusted.

Pos # 47 experienced Low DO on 7/14/10 am

Pos # 48 experienced Low DO on 7/15/10 am

Pos # 20 experienced Low DO on 7/16/10. When DO has been low, more air lines have been added. This was the corrective action taken on 7/16

Nereis virens 28 Day Assay

Study Number: 19830

Client: HDR Engineering, Inc.

Project: Gowanus Canal Superfund Site

ESI SAMPLE ID	REP	WET WEIGHT (G)
Start Worms	A	22
	B	30.1
	C	32.5
	D	26.4
	E	30.0
RECORDED BY: DM		
DATE: 7-8-10 1240		

NOTES:

Number Worms per Replicate: 10

Average wet weight per worm: 2.82 Grams

Average wet weight per replicate: 28.2 Grams

Balance: AccuSeries Model 225D Serial#: 17008376

Alternate Balance: ID: Serial #:

Aquatic Research Organisms

DATA SHEET

CHAIN OF CUSTODY

I. Organism History

Species: Neries virens

Source: Lab reared_____ Hatchery reared_____ Field collected X

Collection date 7/7/10 Receipt date 7/7/10

Lot number 070710 Strain Wild

Brood Origination Damariscotta River, Boothbay Harbor, Maine

II. Water Quality

Temperature 15 °C Salinity 28-32 ppt DO Saturated

pH 7.8-8.2 Hardness N.A. ppm

III. Culture Conditions

System: Held at 4°C on moist seaweed

Diet: Flake Food_____ Phytoplankton_____ Trout Chow_____

Brine Shrimp_____ Rotifers_____ Other Not feed

Prophylactic Treatments:_____

Comments: Shipped on moistened seaweed, gel ice packs to keep cool.

IV. Shipping Information

Client: ESI # of Organisms: 2000

Carrier: PICK UP Date Shipped: 7/8/10

Tracking # n/a # of cartons_____

RELEASED BY: Stan Latsko DATE: TIME:

RECEIVED BY:_____ DATE: TIME:
