2010

Gowanus Canal –

Remedial Investigation

Brooklyn, NY

Property Address: 365 Bond St.
Monitoring Well Soil Borings Installed at Address: GC-MW-5 & GC-MW-6
Intermediate Monitoring Wells Installed at Address: GC-MW-5I & GC-MW-6I
Shallow Monitoring Wells Installed at Address: GC-MW-5S & GC-MW-6S

GC-MW-5

The soil samples from the soil boring installed for the intermediate well (situated approximately 61 feet from the canal) contained 15 VOCs, 53 SVOCs, 3 pesticides, 0 PCBs, and 86 metals. From these, 1 VOC, 0 SVOCs, 0 pesticides, 0 PCBs, and 1 metal exceeded the screening value. The VOC occurring at the highest concentration above screening value was acetone (66 µg/kg). The metal occurring at the highest concentration above screening value was mercury (0.93 mg/kg).

Shallow groundwater

The shallow well (depth of approximately14 ft bgs and situated approximately 61 feet from the canal) contained 12 VOCs, 11 SVOCs, 0 pesticides, 0 PCBs, and 13 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 2 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (2,400 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately35 ft bgs and situated approximately 61 feet from the canal) contained 4 VOCs, 11 SVOCs, 0 pesticides, 0 PCBs, and 9 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (3,450 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

GC-MW-6

The soil samples from the soil boring installed for the intermediate well (situated approximately 216 feet from the canal) contained 29 VOCs, 91 SVOCs, 1 pesticide, 0 PCBs, and 103 metals. From these, 2 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 1 metal exceeded the screening value. The VOC occurring at the highest concentration above screening value was acetone (67 µg/kg). The metal occurring at the highest concentration above screening value was selenium (5.8 mg/kg).

Shallow groundwater

The shallow well (depth of approximately14 ft bgs and situated approximately 216 feet from the canal) contained 6 VOCs, 12 SVOCs, 0 pesticides, 0 PCBs, and 15 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 2 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (3,630 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately35 ft bgs and situated approximately 35 feet from the canal) contained 1 VOC, 11 SVOCs, 0 pesticides, 0 PCBs, and 11 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 4 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (42,300 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

Analytical Soil Results

2010

Gowanus Canal –

Remedial Investigation

Brooklyn, NY

Property Address: 160 3rd St.
Monitoring Well Soil Borings Installed at Address: GC-MW-7 & GC-MW-8
Intermediate Monitoring Wells Installed at Address: GC-MW-7I & GC-MW-8I
Shallow Monitoring Wells Installed at Address: GC-MW-7S & GC-MW-8S

GC-MW-7

The soil samples from the soil boring installed for the intermediate well (situated approximately 9 feet from the canal) contained 13 VOCs, 68 SVOCs, 7 pesticides, 0 PCBs, and 55 metals. From these, 5 VOCs, 5 SVOCs, 0 pesticides, 0 PCBs, and 0 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was ethylbenzene (190,000 µg/kg). The SVOC occurring at the highest concentration above screening value was naphthalene (120,000 µg/kg).

Shallow groundwater

The shallow well (depth of approximately14 ft bgs and situated approximately 9 feet from the canal) contained 7 VOCs, 16 SVOCs, 0 pesticides, 0 PCBs, and 11 metals. From these, 3 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was ethylbenzene (16 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was manganese (583 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately33 ft bgs and situated approximately 9 feet from the canal) contained 6 VOCs, 16 SVOCs, 0 pesticides, 0 PCBs, and 16 metals. From these, 5 VOCs, 2 SVOCs, 0 pesticides, 0 PCBs, and 5 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was ethylbenzene (460 J µg/L). The SVOC occurring at the highest concentration above screening criteria was biphenyl (72 J µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (6,290 J µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

GC-MW-8

The soil samples from the soil boring installed for the intermediate well (situated approximately 140 feet from the canal) contained 17 VOCs, 24 SVOCs, 5 pesticides, 0 PCBs, and 104 metals. From these, 2 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 1 metal exceeded the screening value. The VOC occurring at the highest concentration above screening value was acetone (99 J µg/kg). The metal occurring at the highest concentration above screening value was arsenic (16.6 mg/kg).

Shallow groundwater

The shallow well (depth of approximately14 ft bgs and situated approximately 140 feet from the canal) contained 3 VOCs, 10 SVOCs, 0 pesticides, 0 PCBs, and 15 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (5,850 J µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately39 ft bgs and situated approximately 140 feet from the canal) contained 7 VOCs, 4 SVOCs, 0 pesticides, 0 PCBs, and 15 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs,

and 3 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (4,650 J µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

Analytical Soil Results

2010

Gowanus Canal –

Remedial Investigation

Brooklyn, NY

Property Address: 186-220 3rd St.
Monitoring Well Soil Borings Installed at Address: GC-MW-37 & GC-MW-38
Intermediate Monitoring Wells Installed at Address: GC-MW-37I & GC-MW-38I
Shallow Monitoring Wells Installed at Address: GC-MW-37S & GC-MW-38S

GC-MW-37

The soil samples from the soil boring installed for the intermediate well (situated approximately 31 feet from the canal) contained 43 VOCs, 135 SVOCs, 6 pesticides, 0 PCBs, and 146 metals. From these, 2 VOCs, 4 SVOCs, 0 pesticides, 0 PCBs, and 4 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was acetone (95 µg/kg). The SVOC occurring at the highest concentration above screening value was benzo(a)anthracene (8,400 µg/kg). The metal occurring at the highest concentration above screening value was lead (537 mg/kg).

Shallow groundwater

The shallow well (depth of approximately20 ft bgs and situated approximately 31 feet from the canal) contained 3 VOCs, 11 SVOCs, 0 pesticides, 0 PCBs, and 17 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (7,880 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately42 ft bgs and situated approximately 31 feet from the canal) contained 8 VOCs, 16 SVOCs, 0 pesticides, 0 PCBs, and 13 metals. From these, 3 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was ethylbenzene (16 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (1,470 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

GC-MW-38

The soil samples from the soil boring installed for the intermediate well (situated approximately 33 feet from the canal) contained 6 VOCs, 96 SVOCs, 1 pesticide, 0 PCBs, and 112 metals. From these, 2 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 1 metal exceeded the screening value. The VOC occurring at the highest concentration above screening value was acetone (200 µg/kg). The metal occurring at the highest concentration above screening value was mercury (1.5 mg/kg).

Shallow groundwater

The shallow well (depth of approximately14 ft bgs and situated approximately 33 feet from the canal) contained 2 VOCs, 11 SVOCs, 0 pesticides, 0 PCBs, and 17 metals. From these, 0 VOCs, 1 SVOC, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The SVOC occurring at the highest concentration above screening criteria was 2,4-dinitrotoluene (11 J µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (8,100 J µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately39 ft bgs and situated approximately 33 feet from the canal) contained 5 VOCs, 16 SVOCs, 0 pesticides, 0 PCBs, and 14 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 4

metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (1,520 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

2010

Gowanus Canal –

Remedial Investigation

Brooklyn, NY

Property Address: 403 3rd St.
Monitoring Well Soil Borings Installed at Address: GC-MW-39
Intermediate Monitoring Wells Installed at Address: GC-MW-39I
Shallow Monitoring Wells Installed at Address: GC-MW-39S

GC-MW-39

The soil samples from the soil boring installed for the intermediate well (situated approximately 106 feet from the canal) contained 47 VOCs, 181 SVOCs, 22 pesticides, 0 PCBs, and 137 metals. From these, 13 VOCs, 17 SVOCs, 0 pesticides, 0 PCBs, and 7 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was ethylbenzene (8,600 µg/kg). The SVOC occurring at the highest concentration above screening value was naphthalene (85,000 µg/kg). The metals occurring at the highest concentrations above screening value were lead and barium (both at 1,030 mg/kg).

Shallow groundwater

The shallow well (depth of approximately21 ft bgs and situated approximately 106 feet from the canal) contained 11 VOCs, 9 SVOCs, 0 pesticides, 0 PCBs, and 18 metals. From these, 5 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 4 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was ethylbenzene (88 J µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (6,140 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately40 ft bgs and situated approximately 106 feet from the canal) contained 7 VOCs, 13 SVOCs, 0 pesticides, 0 PCBs, and 17 metals. From these, 5 VOCs, 2 SVOCs, 0 pesticides, 0 PCBs, and 4 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was toluene (210 J µg/L). The SVOC occurring at the highest concentration above screening criteria was hexachloroethane (33 J µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (10,200 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

Gowanus Canal –

Remedial Investigation

Brooklyn, NY

Property Address: 6th St. Basin – Canal Side
Monitoring Well Soil Borings Installed at Address: GC-MW-23
Intermediate Monitoring Wells Installed at Address: GC-MW-23I
Shallow Monitoring Wells Installed at Address: GC-MW-23S

GC-MW-23

The soil samples from the soil boring installed for the intermediate well (situated approximately 73 feet from the canal) contained 49 VOCs, 114 SVOCs, 37 pesticides, 0 PCBs, and 145 metals. From these, 17 VOCs, 21 SVOCs, 0 pesticides, 0 PCBs, and 1 metal exceeded the screening value. The VOC occurring at the highest concentration above screening value was ethylbenzene (680,000 J µg/kg). The SVOC occurring at the highest concentration above screening value was naphthalene (440,000 µg/kg). The metal occurring at the highest concentration above screening value was mercury (1.2 J mg/kg).

Shallow groundwater

The shallow well (depth of approximately13 ft bgs and situated approximately 73 feet from the canal) contained 6 VOCs, 20 SVOCs, 0 pesticides, 0 PCBs, and 14 metals. From these, 0 VOCs, 2 SVOCs, 0 pesticides, 0 PCBs, and 4 metals exceeded the screening criteria. The SVOC occurring at the highest concentration above screening criteria was 2,4-dimethylphenol (17 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (8,320 J µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately39 ft bgs and situated approximately 73 feet from the canal) contained 6 VOCs, 16 SVOCs, 0 pesticides, 0 PCBs, and 11 metals. From these, 5 VOCs, 2 SVOCs, 0 pesticides, 0 PCBs, and 2 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was benzene (1,600 µg/L). The SVOC occurring at the highest concentration above screening criteria was biphenyl (32 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (5,160 J µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

Gowanus Canal –

Remedial Investigation

Brooklyn, NY

Property Address: B&A 9th St. Warehouse
Monitoring Well Soil Borings Installed at Address: GC-MW-20, GC-MW-21 & GC-MW-42
Intermediate Monitoring Wells Installed at Address: GC-MW-20I, GC-MW-21I & GC-MW-42I
Shallow Monitoring Wells Installed at Address: GC-MW-20S, GC-MW-21S & GC-MW-42S

GC-MW-20

The soil samples from the soil boring installed for the intermediate well (situated approximately 48 feet from the canal) contained 33 VOCs, 103 SVOCs, 18 pesticides, 0 PCBs, and 90 metals. From these, 11 VOCs, 19 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was ethylbenzene (240,000 µg/kg). The SVOC occurring at the highest concentration above screening value was naphthalene (1,300,000 µg/kg). The metal occurring at the highest concentration above screening value was lead (533 mg/kg).

Shallow groundwater

The shallow well (depth of approximately14 ft bgs and situated approximately 48 feet from the canal) contained 6 VOCs, 13 SVOCs, 0 pesticides, 0 PCBs, and 16 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (24,000 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately39 ft bgs and situated approximately 48 feet from the canal) contained 8 VOCs, 12 SVOCs, 0 pesticides, 0 PCBs, and 19 metals. From these, 6 VOCs, 1 SVOC, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was benzene (350 J µg/L). The SVOC occurring at the highest concentration above screening criteria was biphenyl (36 J µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (20,800 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

GC-MW-21

The soil samples from the soil boring installed for the intermediate well (situated approximately 149 feet from the canal) contained 25 VOCs, 60 SVOCs, 1 pesticide, 0 PCBs, and 98 metals. From these, 1 VOC, 0 SVOCs, 0 pesticides, 0 PCBs, and 0 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was acetone (71 µg/kg).

Shallow groundwater

The shallow well (depth of approximately14 ft bgs and situated approximately 149 feet from the canal) contained 0 VOCs, 8 SVOCs, 0 pesticides, 0 PCBs, and 14 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (3,360 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately38 ft bgs and situated approximately 149 feet from the canal) contained 0 VOCs, 3 SVOCs, 0 pesticides, 0 PCBs, and 13 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (1,120 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

GC-MW-42

The soil samples from the soil boring installed for the intermediate well (situated approximately 12 feet from the canal) contained 27 VOCs, 52 SVOCs, 6 pesticides, 1 PCB, and 83 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 0 metals exceeded the screening value. No compounds exceeded the screening values at this location.

Shallow groundwater

The shallow well (depth of approximately14 ft bgs and situated approximately 12 feet from the canal) contained 2 VOCs, 7 SVOCs, 0 pesticides, 0 PCBs, and 10 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 1 metal exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was selenium (dissolved) (30.2 J µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately38 ft bgs and situated approximately 12 feet from the canal) contained 1 VOC, 3 SVOCs, 0 pesticides, 0 PCBs, and 15 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (1,960 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

Analytical Soil Results

2010

Gowanus Canal –

Remedial Investigation

Brooklyn, NY

Property Address: 503-537 Smith St.
Monitoring Well Soil Borings Installed at Address: GC-MW-11 & GC-MW-12
Intermediate Monitoring Wells Installed at Address: GC-MW-11I & GC-MW-12I
Shallow Monitoring Wells Installed at Address: GC-MW-11S & GC-MW-12S

GC-MW-11

The soil samples from the soil boring installed for the intermediate well (situated approximately 67 feet from the canal) contained 77 VOCs, 171 SVOCs, 29 pesticides, 0 PCBs, and 142 metals. From these, 14 VOCs, 29 SVOCs, 0 pesticides, 0 PCBs, and 0 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was ethylbenzene (100,000 µg/kg). The SVOC occurring at the highest concentration above screening value was naphthalene (3,100,000 µg/kg).

Shallow groundwater

The shallow well (depth of approximately15 ft bgs and situated approximately 67 feet from the canal) contained 9 VOCs, 15 SVOCs, 0 pesticides, 0 PCBs, and 17 metals. From these, 7 VOCs, 2 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was benzene (610 J µg/L). The SVOC occurring at the highest concentration above screening criteria was 2,4-dimethylphenol (330 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (9,720 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately45 ft bgs and situated approximately 67 feet from the canal) contained 8 VOCs, 12 SVOCs, 0 pesticides, 0 PCBs, and 14 metals. From these, 7 VOCs, 1 SVOC, 0 pesticides, 0 PCBs, and 5 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was ethylbenzene (690 µg/L). The SVOC occurring at the highest concentration above screening criteria was biphenyl (45 J µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (5,050 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

GC-MW-12

The soil samples from the soil boring installed for the intermediate well (situated approximately 205 feet from the canal) contained 65 VOCs, 74 SVOCs, 2 pesticides, 0 PCBs, and 137 metals. From these, 10 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 0 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was m,p xylenes (170,000 µg/kg).

Shallow groundwater

The shallow well (depth of approximately15 ft bgs and situated approximately 205 feet from the canal) contained 9 VOCs, 12 SVOCs, 0 pesticides, 0 PCBs, and 18 metals. From these, 6 VOCs, 1 SVOC, 0 pesticides, 0 PCBs, and 5 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was toluene (13,000 J µg/L). The SVOC occurring at the highest concentration above screening criteria was 2,4-dimethylphenol (22 J µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (26,700 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately45 ft bgs and situated approximately 205 feet from the canal) contained 8 VOCs, 1 SVOC, 0 pesticides, 0 PCBs, and 15 metals. From these, 1 VOC, 0 SVOCs, 0 pesticides, 0 PCBs, and 4 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was 1,2-dichloroethane (30 J µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (20,400 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

Gowanus Canal –

Remedial Investigation

Brooklyn, NY

Property Address: 118 2nd Ave.
Monitoring Well Soil Borings Installed at Address: GC-MW-44, GC-MW-45, GC-MW-46 & GC-MW-47
Intermediate Monitoring Wells Installed at Address: GC-MW-44I, GC-MW-45I, GC-MW-46I & GC-MW-47I
Shallow Monitoring Wells Installed at Address: GC-MW-44S, GC-MW-45S, GC-MW-46S & GC-MW-47S

GC-MW-44

The soil samples from the soil boring installed for the intermediate well (situated approximately 45 feet from the canal) contained 58 VOCs, 105 SVOCs, 2 pesticides, 0 PCBs, and 136 metals. From these, 5 VOCs, 3 SVOCs, 0 pesticides, 0 PCBs, and 5 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was acetone (560 ug/kg). The SVOC occurring at the highest concentration above screening value was benzo(a)anthracene (2,400 µg/kg). The metal occurring at the highest concentration above screening value was lead (1,190 mg/kg).

Shallow groundwater

The shallow well (depth of approximately14 ft bgs and situated approximately 45 feet from the canal) contained 2 VOCs, 11 SVOCs, 0 pesticides, 0 PCBs, and 17 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 4 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (47,700 J µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately45 ft bgs and situated approximately 45 feet from the canal) contained 8 VOCs, 10 SVOCs, 0 pesticides, 0 PCBs, and 14 metals. From these, 3 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 4 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was cis-1,2-dichloroethylene (240 J µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (11,200 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

GC-MW-45

The soil samples from the soil boring installed for the intermediate well (situated approximately 50 feet from the canal) contained 45 VOCs, 128 SVOCs, 11 pesticides, 0 PCBs, and 4 metals. From these, 17 VOCs, 16 SVOCs, 0 pesticides, 0 PCBs, and 4 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was ethylbenzene (120,000 µg/kg). The SVOC occurring at the highest concentration above screening value was naphthalene (340,000 µg/kg). The metal occurring at the highest concentration above screening value was lead (955 mg/kg).

Shallow groundwater

The shallow well (depth of approximately15 ft bgs and situated approximately 50 feet from the canal) contained 2 VOCs, 18 SVOCs, 0 pesticides, 0 PCBs, and 15 metals. From these, 0 VOCs, 3 SVOCs, 0 pesticides, 0 PCBs, and 2 metals exceeded the screening criteria. The SVOC occurring at the highest concentration above screening criteria was 2,4-dinitrotoluene (69 J µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (1,250 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately41 ft bgs and situated approximately 50 feet from the canal) contained 10 VOCs, 20 SVOCs, 0 pesticides, 0 PCBs, and 10 metals. From these, 4 VOCs, 3 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was

ethylbenzene (810 J µg/L). The SVOC occurring at the highest concentration above screening criteria was biphenyl (55 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (3,420 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

GC-MW-46

The soil samples from the soil boring installed for the intermediate well (situated approximately 52 feet from the canal) contained 38 VOCs, 82 SVOCs, 0 pesticides, 0 PCBs, and 169 metals. From these, 1 VOC, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was acetone (240 µg/kg). The metal occurring at the highest concentration above screening value was arsenic (19.8 mg/kg).

Shallow groundwater

No shallow monitoring well installed at this location.

Intermediate groundwater

The intermediate well (depth of approximately57 ft bgs and situated approximately 52 feet from the canal) contained 9 VOCs, 9 SVOCs, 0 pesticides, 0 PCBs, and 13 metals. From these, 7 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was cis-1, 2-dichloroethylene (500 J µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (7,570 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

GC-MW-47

The soil samples from the soil boring installed for the intermediate well (situated approximately 35 feet from the canal) contained 40 VOCs, 145 SVOCs, 17 pesticides, 0 PCBs, and 102 metals. From these, 19 VOCs, 25 SVOCs, 2 pesticides, 0 PCBs, and 1 metal exceeded the screening value. The VOC occurring at the highest concentration above screening value was ethylbenzene (240,000 µg/kg). The SVOC occurring at the highest concentration above screening value was naphthalene (2,100,000 µg/kg). The pesticide occurring at the highest concentration above screening value was endrin (77 µg/kg). The metal occurring at the highest concentration above screening value was mercury (1.2 mg/kg).

Shallow groundwater

The shallow well (depth of approximately28 ft bgs and situated approximately 35 feet from the canal) contained 7 VOCs, 17 SVOCs, 0 pesticides, 0 PCBs, and 15 metals. From these, 6 VOCs, 2 SVOCs, 0 pesticides, 0 PCBs, and 4 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was ethylbenzene (740 J µg/L). The SVOC occurring at the highest concentration above screening criteria was biphenyl (25 J µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (25,200 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately44 ft bgs and situated approximately 35 feet from the canal) contained 10 VOCs, 22 SVOCs, 0 pesticides, 0 PCBs, and 12 metals. From these, 6 VOCs, 3 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was ethylbenzene (340 J µg/L). The SVOC occurring at the highest concentration above screening criteria was 2,4-

dinitrotoluene (100 J µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (14,600 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

DEP- Hamilton Ave. Asphalt Plant (MW17 & MW18 & MW19)

Analytical Soil Results

Property Address: DEP – Hamilton Ave. Asphalt Plant
Monitoring Well Soil Borings Installed at Address: GC-MW-17, GC-MW-18 & GC-MW-19
Intermediate Monitoring Wells Installed at Address: GC-MW-17I, GC-MW-18I, GC-MW-18I & GC-MW-19I
Shallow Monitoring Wells Installed at Address: GC-MW-17S, GC-MW-18S & GC-MW-19S

GC-MW-17

The soil samples from the soil boring installed for the intermediate well (situated approximately 51 feet from the canal) contained 30 VOCs, 107 SVOCs, 0 pesticides, 0 PCBs, and 134 metals. From these, 7 VOCs, 9 SVOCs, 0 pesticides, 0 PCBs, and 2 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was acetone (10,000 µg/kg). The SVOC occurring at the highest concentration above screening value was benzo(a)anthracene (14,900 µg/kg). The metal occurring at the highest concentration above screening value was lead (1,170 mg/kg).

Shallow groundwater

The shallow well (depth of approximately15 ft bgs and situated approximately 51 feet from the canal) contained 2 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 9 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was manganese (860 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately44 ft bgs and situated approximately 51 feet from the canal) contained 10 VOCs, 3 SVOCs, 0 pesticides, 0 PCBs, and 13 metals. From these, 2 VOCs, 1 SVOC, 0 pesticides, 0 PCBs, and 4 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was benzene (826 µg/L). The SVOC occurring at the highest concentration above screening criteria was phenol (4.6 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (24,800 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

GC-MW-18

The soil samples from the soil boring installed for the intermediate well (situated approximately 33 feet from the canal) contained 42 VOCs, 199 SVOCs, 1 pesticide, 0 PCBs, and 174 metals. From these, 11 VOCs, 15 SVOCs, 0 pesticides, 0 PCBs, and 0 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was acetone (178,000 µg/kg). The SVOC occurring at the highest concentration above screening value was naphthalene (344,000 µg/kg).

Shallow groundwater

The shallow well (depth of approximately15 ft bgs and situated approximately 33 feet from the canal) contained 9 VOCs, 13 SVOCs, 1 pesticide, 0 PCBs, and 11 metals. From these, 3 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was ethylbenzene (7.3 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (2,650 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately57 ft bgs and situated approximately 33 feet from the canal) contained 14 VOCs, 17 SVOCs, 0 pesticides, 0 PCBs, and 14 metals. From these, 7 VOCs, 2 SVOCs, 0 pesticides, 0 PCBs, and 5

metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was trichloroethylene (207 µg/L). The SVOC occurring at the highest concentration above screening criteria was biphenyl (30.7 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (22,900 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

GC-MW-19

The soil samples from the soil boring installed for the intermediate well (situated approximately 280 feet from the canal) contained 44 VOCs, 105 SVOCs, 0 pesticides, 0 PCBs, and 162 metals. From these, 6 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 0 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was acetone (1,460 µg/kg).

Shallow groundwater

The shallow well (depth of approximately15 ft bgs and situated approximately 280 feet from the canal) contained 3 VOCs, 5 SVOCs, 0 pesticides, 0 PCBs, and 9 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (3,940 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately59 ft bgs and situated approximately 280 feet from the canal) contained 3 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 10 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (2,970 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

Gowanus Canal –

Remedial Investigation

Brooklyn, NY

Property Address: 627 Smith St.
Monitoring Well Soil Borings Installed at Address: GC-MW-13 & GC-MW-14
Intermediate Monitoring Wells Installed at Address: GC-MW-13I & GC-MW-14I
Shallow Monitoring Wells Installed at Address: GC-MW-13S & GC-MW-14S

GC-MW-13

The soil samples from the soil boring installed for the intermediate well (situated approximately 32 feet from the canal) contained 7 VOCs, 82 SVOCs, 1 pesticide, 0 PCBs, and 136 metals. From these, 5 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 1 metal exceeded the screening value. The VOC occurring at the highest concentration above screening value was m,p xylenes (11,000 µg/kg). The metal occurring at the highest concentration above screening value was arsenic (17 mg/kg).

Shallow groundwater

The shallow well (depth of approximately14 ft bgs and situated approximately 32 feet from the canal) contained 6 VOCs, 16 SVOCs, 0 pesticides, 0 PCBs, and 17 metals. From these, 5 VOCs, 4 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was benzene (470 µg/L). The SVOC occurring at the highest concentration above screening criteria was 2,4-dimethylphenol (490 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (9,880 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately56 ft bgs and situated approximately 32 feet from the canal) contained 7 VOCs, 15 SVOCs, 0 pesticides, 0 PCBs, and 12 metals. From these, 1 VOC, 1 SVOC, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was ethylbenzene (6.8 µg/L). The SVOC occurring at the highest concentration above screening criteria was biphenyl (28 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (8,910 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

GC-MW-14

The soil samples from the soil boring installed for the intermediate well (situated approximately 139 feet from the canal) contained 27 VOCs, 103 SVOCs, 4 pesticides, 0 PCBs, and 170 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 0 metals exceeded the screening value. No compounds exceeded the screening values at this location.

Shallow groundwater

The shallow well (depth of approximately14 ft bgs and situated approximately 139 feet from the canal) contained 6 VOCs, 8 SVOCs, 0 pesticides, 0 PCBs, and 11 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was manganese (3,000 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately56 ft bgs and situated approximately 139 feet from the canal) contained 9 VOCs, 7 SVOCs, 0 pesticides, 0 PCBs, and 15 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs,

and 3 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (11,900 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

Gowanus Canal –

Remedial Investigation

Brooklyn, NY

Property Address: National Grid – Smith St.
Monitoring Well Soil Borings Installed at Address: GC-MW-40 & GC-MW-41
Intermediate Monitoring Wells Installed at Address: GC-MW-40I & GC-MW-41I
Shallow Monitoring Wells Installed at Address: GC-MW-40S & GC-MW-41S

GC-MW-40

The soil samples from the soil boring installed for the intermediate well (situated approximately 191 feet from the canal) contained 66 VOCs, 145 SVOCs, 5 pesticides, 1 PCB, and 193 metals. From these, 15 VOCs, 44 SVOCs, 0 pesticides, 0 PCBs, and 2 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was benzene (550,000 µg/kg). The SVOC occurring at the highest concentration above screening value was naphthalene (11,000,000 µg/kg). The metal occurring at the highest concentration above screening value was mercury (1.9 mg/kg).

Shallow groundwater

No shallow groundwater sample collected at this location due to the presence of NAPL.

Intermediate groundwater

The intermediate well (depth of approximately58 ft bgs and situated approximately 191 feet from the canal) contained 7 VOCs, 17 SVOCs, 0 pesticides, 0 PCBs, and 11 metals. From these, 2 VOCs, 2 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was benzene (32 µg/L). The SVOC occurring at the highest concentration above screening criteria was phenol (74 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was manganese (6,340 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

GC-MW-41I

The soil samples from the soil boring installed for the intermediate well (situated approximately 345 feet from the canal) contained 34 VOCs, 125 SVOCs, 15 pesticides, 0 PCBs, and 208 metals. From these, 11 VOCs, 28 SVOCs, 0 pesticides, 0 PCBs, and 0 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was m,p xylenes (64,000 µg/kg). The SVOC occurring at the highest concentration above screening value was phenanthrene (4,300,000 µg/kg).

Shallow groundwater

The shallow well (depth of approximately14 ft bgs and situated approximately 345 feet from the canal) contained 10 VOCs, 16 SVOCs, 0 pesticides, 0 PCBs, and 11 metals. From these, 5 VOCs, 3 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was benzene (120 µg/L). The SVOC occurring at the highest concentration above screening criteria was 2,4-dimethylphenol (80 J µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (7,510 J µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately58 ft bgs and situated approximately 345 feet from the canal) contained 0 VOCs, 12 SVOCs, 0 pesticides, 0 PCBs, and 8 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was manganese (2,100 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

Gowanus Canal –

Remedial Investigation

Brooklyn, NY

Property Address: 764 Court St. (Amerada Hess)
Monitoring Well Soil Borings Installed at Address: GC-MW-15 & GC-MW-16
Intermediate Monitoring Wells Installed at Address: GC-MW-15I & GC-MW-16I
Shallow Monitoring Wells Installed at Address: GC-MW-15S & GC-MW-16S

GC-MW-15

The soil samples from the soil boring installed for the intermediate well (situated approximately 32 feet from the canal) contained 47 VOCs, 122 SVOCs, 15 pesticides, 0 PCBs, and 167 metals. From these, 0 VOCs, 14 SVOCs, 0 pesticides, 0 PCBs, and 5 metals exceeded the screening value. The SVOC occurring at the highest concentration above screening value was benzo(a)anthracene (39,000 µg/kg). The metal occurring at the highest concentration above screening value was lead (628 mg/kg).

Shallow groundwater

The shallow well (depth of approximately13 ft bgs and situated approximately 32 feet from the canal) contained 0 VOCs, 2 SVOCs, 0 pesticides, 0 PCBs, and 19 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 5 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (3,010 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately60 ft bgs and situated approximately 32 feet from the canal) contained 0 VOCs, 1 SVOC, 0 pesticides, 0 PCBs, and 16 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 4 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (1,410 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

GC-MW-16

The soil samples from the soil boring installed for the intermediate well (situated approximately 254 feet from the canal) contained 42 VOCs, 75 SVOCs, 5 pesticides, 0 PCBs, and 144 metals. From these, 0 VOCs, 2 SVOCs, 0 pesticides, 0 PCBs, and 1 metal exceeded the screening value. The SVOC occurring at the highest concentration above screening value was chrysene (1,300 µg/kg). The metal occurring at the highest concentration above screening value was mercury (0.82 mg/kg).

Shallow groundwater

The shallow well (depth of approximately14 ft bgs and situated approximately 254 feet from the canal) contained 7 VOCs, 15 SVOCs, 0 pesticides, 0 PCBs, and 17 metals. From these, 1 VOC, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was isopropylbenzene (cumene) - (19 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (25,700 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately59 ft bgs and situated approximately 254 feet from the canal) contained 0 VOCs, 12 SVOCs, 0 pesticides, 0 PCBs, and 15 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (1,390 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

Gowanus Canal –

Remedial Investigation

Brooklyn, NY

Property Address: Nevins St. & Douglass St.
Monitoring Well Soil Borings Installed at Address: GC-MW-33
Intermediate Monitoring Wells Installed at Address: GC-MW-33I
Shallow Monitoring Wells Installed at Address: GC-MW-33S

GC-MW-33

The soil samples from the soil boring installed for the intermediate well (situated approximately 236 feet from the canal) contained 49 VOCs, 70 SVOCs, 0 pesticides, 0 PCBs, and 105 metals. From these, 6 VOCs, 1 SVOC, 0 pesticides, 0 PCBs, and 0 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was ethylbenzene (2,700 µg/kg). The SVOC occurring at the highest concentration above screening value was phenol (340 µg/kg).

Shallow groundwater

The shallow well (depth of approximately14 ft bgs and situated approximately 236 feet from the canal) contained 14 VOCs, 7 SVOCs, 0 pesticides, 0 PCBs, and 16 metals. From these, 3 VOCs, 1 SVOC, 0 pesticides, 0 PCBs, and 4 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was benzene (15 µg/L). The SVOC occurring at the highest concentration above screening criteria was phenol (25 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (33,900 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately39 ft bgs and situated approximately 236 feet from the canal) contained 8 VOCs, 13 SVOCs, 0 pesticides, 0 PCBs, and 14 metals. From these, 5 VOCs, 1 SVOC, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was ethylbenzene (720 J µg/L). The SVOC occurring at the highest concentration above screening criteria was biphenyl (51µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (9,990 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

Gowanus Canal –

Remedial Investigation

Brooklyn, NY

Property Address: Sackett St. (West Side of the Canal)
Monitoring Well Soil Borings Installed at Address: GC-MW-4
Intermediate Monitoring Wells Installed at Address: GC-MW-4I
Shallow Monitoring Wells Installed at Address: GC-MW-4S

GC-MW-4

The soil samples from the soil boring installed for the intermediate well (situated approximately 271 feet from the canal) contained 23 VOCs, 57 SVOCs, 4 pesticides, 0 PCBs, and 93 metals. From these, 0 VOCs, 1 SVOC, 0 pesticides, 0 PCBs, and 0 metals exceeded the screening value. The SVOC occurring at the highest concentration above screening value was 4-methylphenol (p-cresol) - (470 µg/kg).

Shallow groundwater

The shallow well (depth of approximately14 ft bgs and situated approximately 271 feet from the canal) contained 1 VOC, 1 SVOC, 0 pesticides, 0 PCBs, and 18 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (20,900 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately39 ft bgs and situated approximately 271 feet from the canal) contained 3 VOCs, 10 SVOCs, 0 pesticides, 0 PCBs, and 8 metals. From these, 2 VOCs, 1 SVOC, 0 pesticides, 0 PCBs, and 2 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was cis-1,2-dichloroethylene (17 µg/L). The SVOC occurring at the highest concentration above screening criteria was bis(2-ethylhexyl) phthalate (77 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was manganese (823 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

Analytical Soil Results

2010

Gowanus Canal –

Remedial Investigation

Brooklyn, NY

Property Address: Filled-in 1st St. Turning Basin
Monitoring Well Soil Borings Installed at Address: GC-MW-27
Intermediate Monitoring Wells Installed at Address: GC-MW-27I
Shallow Monitoring Wells Installed at Address: GC-MW-27S

GC-MW-27

The soil samples from the soil boring installed for the intermediate well (situated approximately 151 feet from the canal) contained 38 VOCs, 116 SVOCs, 24 pesticides, 0 PCBs, and 119 metals. From these, 21 VOCs, 37 SVOCs, 3 pesticides, 0 PCBs, and 16 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was m,p xylenes (47,000 µg/kg). The SVOC occurring at the highest concentration above screening value was phenanthrene (1,100,000 µg/kg). The pesticide occurring at the highest concentration above screening value was P,P'-DDE (19,000 µg/kg). The metal occurring at the highest concentration above screening value was barium (1,170 mg/kg).

Shallow groundwater

The shallow well (depth of approximately23 ft bgs and situated approximately 151 feet from the canal) contained 10 VOCs, 16 SVOCs, 0 pesticides, 0 PCBs, and 13 metals. From these, 1 VOC, 1 SVOC, 0 pesticides, 0 PCBs, and 4 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was chlorobenzene (7 µg/L). The SVOC occurring at the highest concentration above screening criteria was benzo(a)pyrene (0.48 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (6,110 J µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately47 ft bgs and situated approximately 151 feet from the canal) contained 12 VOCs, 17 SVOCs, 0 pesticides, 0 PCBs, and 10 metals. From these, 5 VOCs, 1 SVOC, 0 pesticides, 0 PCBs, and 2 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was ethylbenzene (150 J µg/L). The SVOC occurring at the highest concentration above screening criteria was biphenyl (41 J µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (6,950 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

Filled in 1st St. Turning Basin (MW27)
VOC Concentrations in Soils (ug/kg)
Gowanus Canal Remedial Investigation
Brooklyn, New York

Analytical Soil Results

2010

Gowanus Canal –

Remedial Investigation

Brooklyn, NY

Property Address: 6th St. Basin (2nd Ave. Side)
Monitoring Well Soil Borings Installed at Address: GC-MW-24
Intermediate Monitoring Wells Installed at Address: GC-MW-24I
Shallow Monitoring Wells Installed at Address: GC-MW-24S

GC-MW-24

The soil samples from the soil boring installed for the intermediate well (situated approximately 35 feet from the canal) contained 47 VOCs, 150 SVOCs, 13 pesticides, 0 PCBs, and 137 metals. From these, 6 VOCs, 11 SVOCs, 0 pesticides, 0 PCBs, and 4 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was ethylbenzene (72,000 µg/kg). The SVOC occurring at the highest concentration above screening value was naphthalene (250,000 µg/kg). The metal occurring at the highest concentration above screening value was manganese (3,830 mg/kg).

Shallow groundwater

The shallow well (depth of approximately16 ft bgs and situated approximately 35 feet from the canal) contained 10 VOCs, 10 SVOCs, 0 pesticides, 0 PCBs, and 21 metals. From these, 4 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 7 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was ethylbenzene (11 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (9,840 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately40 ft bgs and situated approximately 35 feet from the canal) contained 4 VOCs, 5 SVOCs, 0 pesticides, 0 PCBs, and 11 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 2 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (307 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

Gowanus Canal –

Remedial Investigation

Brooklyn, NY

Property Address: 491 Smith St.
Monitoring Well Soil Borings Installed at Address: GC-MW-9 & GC-MW-10
Intermediate Monitoring Wells Installed at Address: GC-MW-9I & GC-MW-10I
Shallow Monitoring Wells Installed at Address: GC-MW-9S & GC-MW-10S

GC-MW-9

The soil samples from the soil boring installed for the intermediate well (situated approximately 28 feet from the canal) contained 16 VOCs, 108 SVOCs, 5 pesticides, 0 PCBs, and 124 metals. From these, 4 VOCs, 7 SVOCs, 0 pesticides, 0 PCBs, and 2 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was acetone (10,600 µg/kg). The SVOC occurring at the highest concentration above screening value was benzo(a)anthracene (2,850 µg/kg). The metal occurring at the highest concentration above screening value was lead (650 mg/kg).

Shallow groundwater

The shallow well (depth of approximately15 ft bgs and situated approximately 28 feet from the canal) contained 1 VOC, 10 SVOCs, 0 pesticides, 0 PCBs, and 14 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 6 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (18,500 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately39 ft bgs and situated approximately 28 feet from the canal) contained 6 VOCs, 12 SVOCs, 0 pesticides, 0 PCBs, and 14 metals. From these, 5 VOCs, 2 SVOCs, 0 pesticides, 0 PCBs, and 5 metals exceeded the screening criteria. The VOC occurring at the highest concentration above screening criteria was benzene (1,730 µg/L). The SVOC occurring at the highest concentration above screening criteria was biphenyl (21.9 µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was iron (13,700 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

GC-MW-10

The soil samples from the soil boring installed for the intermediate well (situated approximately 329 feet from the canal) contained 16 VOCs, 168 SVOCs, 7 pesticides, 0 PCBs, and 124 metals. From these, 7 VOCs, 16 SVOCs, 0 pesticides, 0 PCBs, and 3 metals exceeded the screening value. The VOC occurring at the highest concentration above screening value was acetone (12,200 µg/kg). The SVOC occurring at the highest concentration above screening value was benzo(b)fluoranthene (37,000 µg/kg). The metal occurring at the highest concentration above screening value was lead (666 mg/kg).

Shallow groundwater

The shallow well (depth of approximately15 ft bgs and situated approximately 329 feet from the canal) contained 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 7 metals. From these, 0 VOCs, 0 SVOCs, 0 pesticides, 0 PCBs, and 4 metals exceeded the screening criteria. The metal occurring at the highest concentration above screening criteria (excluding sodium) was manganese (2,080 µg/L).

Shallow groundwater at this location is expected to discharge to the canal.

Intermediate groundwater

The intermediate well (depth of approximately45 ft bgs and situated approximately 329 feet from the canal) contained 2 VOCs, 17 SVOCs, 0 pesticides, 0 PCBs, and 10 metals. From these, 0 VOCs, 1 SVOC, 0 pesticides, 0 PCBs,

and 4 metals exceeded the screening criteria. The SVOC occurring at the highest concentration above screening criteria was benzo(a)pyrene (0.53 J µg/L). The metal occurring at the highest concentration above screening criteria (excluding sodium) was manganese (2,210 µg/L).

Intermediate groundwater at this location is expected to discharge to the canal.

Contaminated groundwater discharging to the canal would affect the quality of the water in the canal.

Gowanus Canal Remedial Investigation – Brooklyn, NY

Notes on Soil and Groundwater Analytical Tables:

Analytical laboratory results of soil and groundwater samples collected within this property are presented in the following tables. Samples were collected in the summer of 2010 during the USEPA led remedial investigation of the Gowanus Canal Superfund Site. Analytical results for each sample collected within this property are shown including detected chemical concentrations and non-detected concentrations (designed with a U qualifier). The analytical method detection limit (MDL) is shown for non-detected compounds. The units for analytical results are specified in each table header.

Data Qualifiers:

B – Analyte detected in an associated blank

J – Concentration Estimated

N – Presumptive evidence of a compound based on a mass spectral library search

U – Constituent not detected above the MDL

R-Rejected

Table Acronyms

ft – feet

S-Split Sample

N-Normal sample

Notes:
R-based on following in listed order: B1, C, D, E1, E2, and E3.
S-the lesser of I or K.
T-the Lesser of F or G2 or H if no F or G2 are available.
AA-AD-values for compunds detected in tissue samples are identified.

Notes:
R-based on following in listed order: B1, C, D, E1, E2, and E3.
S-the lesser of I or K.
T-the Lesser of F or G2 or H if no F or G2 are available.
AA-AD-values for compunds detected in tissue samples are identified.

APPENDIX C

List Of Evaluation Criteria

Gowanus Canal Remedial Investigation

Notes:
R-based on following in listed order: B1, C, D, E1, E2, and E3.
S-the lesser of I or K.
T-the Lesser of F or G2 or H if no F or G2 are available.
AA-AD-values for compunds detected in tissue samples are identified.

Page Intentionally Left Blank

Notes:

1 – Total PAH concentrations are based on the sum of the sixteen PAHs: naphthalene, acenaphthalene, acenaphthene, fluorene, phenanthrene, anthracene, fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenz(a,h)anthracene, and benzo(g,h,i)perylene.

2 – Total DDT concentrations are based on the sum of the six DDT isomers, 2,4'-DDD, 4,4'-DDD, 2,4'-DDE, 4,4'-DDE, 2,4'-DDT and 4,4'-DDT

3 – Total PCBs are based on the sum of detected aroclors: aroclor 1016, aroclor 1221, aroclor 1232, aroclor 1242, aroclor 1248, aroclor 1254, aroclor 1260, aroclor 1260, aroclor 1262 and aroclor 1268.

4 – ER-L = Effects Range–Low. Effects levels are the updated and revised values from Long et al. (1995) - NOAA = National Oceanic and Atmospheric Administration.

5 – TEL = threshold effects level. Source document is MacDonald (1994); FDEP = Florida Department of Environmental Protection.

6 - Source document is Long and Morgan (1991).

7 – Value shown for alpha- and gamma-chlordane corresponds to chlordane.

8 - Value shown for each aroclor corresponds to sum of PCB compounds.

9 – Units not noted for metals. Value reported as shown in source document.

10 - Value shown for each benzo(k)fluoranthene and benzo(a)fluoranthene corresponds to total benzofluoranthene.

11 - Compounds other than metals, phenol, 2-methylphenol, 4-methylphenol, 2,4-dimethyl phenol and pentachlorophenol are reported in mg/kg organic carbon (ppm carbon) - The listed chemical parameter criteria represent concentrations in parts per million, "normalized," or expressed, on a total organic carbon basis. To normalize to total organic carbon, the dry weight concentration for each parameter is divided by the decimal fraction representing the percent total organic carbon content of the sediment.

12 - All metals reported in mg/kg dry weight (parts per million [ppm] dry)

13 - Phenol, 2-methylphenol, 4-methylphenol, 2,4-dimethyl phenol and pentachlorophenol reported in mg/kg dry weight (parts per million (ppm) dry).

14 – MacDonald et al., 1996. Ecotox. 5(4):253.

15 – Canadian Sediment Quality Guidelines for the protection of Aquatic Life, Summary Tables Update 2002, www.ccme.ca/publications/cegg_rcqe.html

16 - Based on SLC approach using sensitive species HC 5%; ES&T 2005 39(14): 5148-515.

17 - This criterion is based on carcinogenicity of 10^{-6} risk. Alternate risk levels may be obtained by moving the decimal point (e.g., for a risk level of 10^{-5}, move the decimal point in the recommended criterion one place to the right).

18 - This recommended water quality criterion was derived using the cancer slope factor of 1.4 (LMS exposure from birth).

19 - This criterion has been revised to reflect The Environmental Protection Agency's q1* or RfD, as contained in the Integrated Risk Information System (IRIS) as of May 17, 2002. The fish tissue bioconcentration factor (BCF) from the 1980 Ambient Water Quality Criteria document was retained in each case.

20 - Although a new RfD is available in IRIS, the surface water criteria will not be revised until the National Primary Drinking Water Regulations: Stage 2 Disinfectants and Disinfection Byproducts Rule (Stage 2 DBPR) is completed, since public comment on the relative source contribution (RSC) for chloroform is anticipated.

21 - The organoleptic effect criterion is more stringent than the value for priority toxic pollutants.

22 - This criterion has been revised to reflect the Environmental Protection Agency's cancer slope factor (CSF) or reference dose (RfD), as contained in the Integrated Risk Information System (IRIS) as of (Final FR Notice June 10, 2009). The fish tissue bioconcentration factor (BCF) from the 1980 Ambient Water Quality Criteria document was retained in each case.

23 - No criterion for protection of human health from consumption of aquatic organisms excluding water was presented in the 1980 criteria document or in the *1986 Quality Criteria for Water*. Nevertheless, sufficient information was presented in the 1980 document to allow the calculation of a criterion, even though the results of such a calculation were not shown in the document.

24 - The freshwater criterion for this metal is expressed as a function of hardness (mg/L) in the water column. The value given here corresponds to a hardness of 100 mg/L. Criteria values for other hardness may be calculated from the following: CMC (dissolved) = $\exp\{m_A [\ln(\text{hardness})] + b_A\}$ (CF), or CCC (dissolved) = $\exp\{m_C [\ln(\text{hardness})] + b_C\}$ (CF) and the parameters specified in Appendix B-Parameters for Calculating Freshwater Dissolved Metals Criteria That Are Hardness-Dependent.

25 - EPA is currently reassessing the criteria for arsenic.

26 - This recommended water quality criterion for arsenic refers to the inorganic form only.

27 - This human health criterion is the same as originally published in the Red Book (EPA 440/9-76-023, July, 1976) which predates the 1980 methodology and did not utilize the fish

ingestion BCF approach. This same criterion value is now published in the Gold Book (Quality Criteria for Water: 1986. EPA 440/5-86-001).

28 - This recommended water quality criterion is expressed as total cyanide, even though the IRIS RFD used to derive the criterion is based on free cyanide. The multiple forms of cyanide that are present in ambient water have significant differences in toxicity due to their differing abilities to liberate the CN-moiety. Some complex cyanides require even more extreme conditions than refluxing with sulfuric acid to liberate the CN-moiety. Thus, these complex cyanides are expected to have little or no 'bioavailability' to humans. If a substantial fraction of the cyanide present in a water body is present in a complexed form (e.g., $Fe_4[Fe(CN)_6]_3$), this criterion may be over conservative.

29 – Applies to dissolved form.

30 - The Criterion Continuous Concentration (CCC) is an estimate of the highest concentration of a material in surface water to which an aquatic community can be exposed indefinitely without resulting in an unacceptable effect.

31 - This water quality criterion is based on a 304(a) aquatic life criterion that was derived using the 1985 Guidelines (104 pp.) (*Guidelines for Deriving Numerical National Water Quality Criteria for the Protection of Aquatic Organisms and Their Uses*, PB85-227049, January 1985) and was issued in one of the following criteria documents: Arsenic) (EPA 440/5-84-033), Cadmium (EPA 822-R-01-001), Chromium (EPA 440/5-84-029), Copper) (EPA 440/5-84-031), Cyanide) (EPA 440/5-84-028), Lead (EPA 440/5-84-027), Nickel (EPA 440/5-86-004), Pentachlorophenol (EPA 440/5-86-009), Toxaphene, (EPA 440/5-86-006), Zinc (EPA 440/5-87-003).

32 - This Criterion is based on 304(a) aquatic life criterion issued in 1980, and was issued in one of the following documents: Aldrin/Dieldrin (153 pp.) (EPA 440/5-80-019), Chlordane (68 pp.) (EPA 440/5-80-027), (175 pp.) (EPA 440/5-80-038), Endosulfan (155 pp.) (EPA 440/5-80-046), Endrin (103 pp.) (EPA 440/5-80-047), Heptachlor (EPA 440/5-80-052), Hexachlorocyclohexane (EPA 440/5-80-054), Silver (EPA 440/5-80-071). The Minimum Data Requirements and derivation procedures were different in the 1980 Guidelines than in the 1985 Guidelines. For example, a "CMC" derived using the 1980 Guidelines was derived to be used as an instantaneous maximum. If assessment is to be done using an averaging period, the values given should be divided by 2 to obtain a value that is more comparable to a CMC derived using the 1985 Guidelines.

33 - This criterion is based on a 304(a) aquatic life criterion issued in 1980 or 1986, and was issued in one of the following documents: Aldrin/Dieldrin (EPA 440/5-80-019), Chlordane, DDT (EPA 440/5-80-038), Endrin (EPA 440/5-80-047), Heptachlor (EPA 440/5-80-052), Polychlorinated biphenyls (EPA 440/5-80-068), Toxaphene (EPA 440/5-86-006). This CCC is currently based on the Final Residue Value (FRV) procedure. Since the publication of the Great Lakes Aquatic Life Criteria Guidelines in 1995 (60 FR 15393-15399, March 23, 1995), the Agency no longer uses the Final Residue Value procedure for deriving CCCs for new or revised 304(a) aquatic life criteria. Therefore, the Agency anticipates that future revisions of this CCC will not be based on the FRV procedure.

34 - This value was derived from data for heptachlor and the criteria document provides insufficient data to estimate the relative toxicities of heptachlor and heptachlor epoxide.

35 - This value was derived from data for endosulfan and is most appropriately applied to the sum of alpha-endosulfan and beta-endosulfan.

36 - This criterion applies to DDT and its metabolites (i.e., the total concentration of DDT and its metabolites should not exceed this value).

37 - The derivation of this value is presented in the Red Book (EPA 440/9-76-023, July, 1976).

38 - This recommended water quality criterion was derived from data for arsenic (III), but is applied here to total arsenic, which might imply that arsenic (III) and arsenic (V) are equally toxic to aquatic life and that their toxicities are additive. In the arsenic criteria document (EPA 440/5-84-033, January 1985), Species Mean Acute Values are given for both arsenic (III) and arsenic (V) for five species and the ratios of the SMAVs for each species range from 0.6 to 1.7. Chronic values are available for both arsenic (III) and arsenic (V) for one species; for the fathead minnow, the chronic value for arsenic (V) is 0.29 times the chronic value for arsenic (III). No data are known to be available concerning whether the toxicities of the forms of arsenic to aquatic organisms are additive.

39 - Freshwater and saltwater criteria for metals are expressed in terms of the dissolved metal in the water column. The recommended water quality criteria value was calculated by using the previous 304(a) aquatic life criteria expressed in terms of total recoverable metal, and multiplying it by a conversion factor (CF). The term "Conversion Factor" (CF) represents the recommended conversion factor for converting a metal criterion expressed as the total recoverable fraction in the water column to a criterion expressed as the dissolved fraction in the water column. (Conversion Factors for saltwater CCCs are not currently available. Conversion factors derived for saltwater CMCs have been used for both saltwater CMCs and CCCs). See "," (49 pp., 3MB) October 1, 1993, by Martha G. Prothro, Acting Assistant Administrator for Water, available from the Water Resource center and 40CFR§131.36(b)(1). Conversion Factors applied in the table can be found in Appendix A to the Preamble-Conversion Factors for Dissolved Metals. Office of Water Policy and Technical Guidance on Interpretation and Implementation of Aquatic Life Metals Criteria (PDF)

40 - When the concentration of dissolved organic carbon is elevated, copper is substantially less toxic and use of Water-Effect Ratios might be appropriate.

41 - This recommended water quality criterion was derived in *Ambient Water Quality Criteria Saltwater Copper Addendum* (Draft, April 14, 1995) and was promulgated in the Interim final National Toxics Rule (60 FR 22228-222237, May 4, 1995).

42 - This recommended water quality criterion was derived on page 43 of the mercury criteria document (EPA 440/5-84-026, January 1985). The saltwater CCC of 0.025 ug/L given on page 23 of the criteria document is based on the Final Residue Value procedure in the 1985 Guidelines. Since the publication of the Great Lakes Aquatic Life Criteria Guidelines in 1995 (60 FR 15393-15399, March 23, 1995), the Agency no longer uses the Final Residue Value procedure for deriving CCCs for new or revised 304(a) aquatic life criteria.

43 - This recommended water quality criterion was derived from data for inorganic mercury (II), but is applied here to total mercury. If a substantial portion of the mercury in the water column is methylmercury, this criterion will probably be under protective. In addition, even though inorganic mercury is converted to methylmercury and methylmercury bioaccumulates to a great extent, this criterion does not account for uptake via the food chain because sufficient data were not available when the criterion was derived.

44 - The selenium criteria document (EPA 440/5-87-006, September 1987) provides that if selenium is as toxic to saltwater fishes in the field as it is to freshwater fishes in the field, the status of the fish community should be monitored whenever the concentration of selenium exceeds 5.0 g/L in salt water because the saltwater CCC does not take into account uptake via the food chain.

45 - This recommended water quality criterion is expressed as g free cyanide (as CN)/L.

46 - SQuiRTs – Screening Quick Reference Table for Inorganics in Water. These tables were developed for screening purposes only: they do not represent official NOAAA policy and do not constitute criteria or clean-up levels. All Attempts have been made to ensure accuracy; however, NOAA is not liable for errors. Values are subject to changes as new data becomes available.

47 – Primary entry is the US Ambient Water Quality Criteria, followed by the lowest of Tier II Secondary Acute Values (SAVs) or available standards and guidelines.

48 - *- LOEL

49 – C - Value for chemical class

50 - A - Avian

51 - x 0.1 – chronic value derived by division of acute value by 10
52 – Value shown and CAS number corresponds to 1,1,2-trichloroethene; no value or CAS number shown for TCE.
53 - S - value for summation of isomers

54 - NZ – Australian & New Zealand ECLs and Trigger values: ANZECC Oct 2000, Volume 1., The Guidelines. www.mfe.govt.nz/publications/

55 – Value shown corresponds to 1,2,4-trichlorobenzene; no value or CAS number shown for 1,2,3-trichlorobenzene.

56 - P - proposed

57 - Eco – EPA EcoUpdate, Ecotox thresholds, EPA 540/F-95/038.

58 - BC – British Columbia Water Quality Guidelines (either working or recommended): http://www.env.gov.bc.ca/wat/wg/

59 - ½- Criteria maximum concentration (CMC) is halved to compare to 1985 Guideline derivation.

60 – Applies to the sum of cis- and trans-1,3-dichloropropene, CAS Nos. 10061-01-5 and 10061-02-6, respectively.

61 – Applies to the sum of phenolic compounds.

62 - For constituents where the calculated SCO was lower than the rural soil background concentration as determined by the Department and Department of Health rural soil survey, the rural soil background concentration is used as the Track 2 SCO value for this use of the site.

63 – For constituents where the calculated SCO was lower than the contract required quantitation limit (CRQL), the CRQL is used as the SCO value.

64 -Value shown corresponds to total xylenes.

65 - The SCOs for industrial use and the protection of groundwater were capped at a maximum value of 1000 ppm.

66 - Value shown corresponds to dichlorobenzenes.

67 – Water quality criteria used are taken from Togs 1.1.1. If a water quality criterion was not listed in TOGS 1.1.1, then an EPA criterion was used. These are annotated with the suffix (E). EPA criteria were extracted from the "Water Quality Criteria Summary" chart (EPA, 1991).

68 – Water quality standards and guidance values are New York State regulatory terms that are essentially synonymous with the EPA term criterion. A standard is a water quality criterion that has been adopted into regulation. A guidance is a water quality criterion that has been derived in the same manner as a standard, but has not yet been adopted into regulation, or subjected to public review and comment. When referring to water quality in this document, the use of the general term criteria will mean either a New York standard or a guidance value.

69 – Criteria applies to DDT only.

70 through 85 – not used

86 – Criteria based on "Total PCBs"

87 – Criteria based on Total DDT.

88 – Criteria based on chlordane.

89 – Criteria based on endrin.

Tissue Residue Analysis

Chemical concentrations measured in crab and fish tissues collected during the Phase 3 investigation were used in the baseline ecological risk assessment (BERA), along with the other lines of evidence first discussed in Section 2.3 of the ecological risk assessment (ERA), to evaluate potential risks to benthic macroinvertebrates and fish. The approach for conducting this evaluation and its results are discussed in the following sections.

Evaluated Tissue Residue Data

A detailed description of the crab and fish tissue collected during the Phase 3 sample effort and used in the ERA is presented in Section 2.5 of the RI. Whole-body crab, small prey fish, and larger fish species tissue chemical residue concentrations were used to directly screen for potential risks to these species. The following subsections discuss the approach used to estimate tissue residue exposure concentrations for these species.

Crab

The wet weight, weighted average whole-body crab tissue residue concentration of each chemical was estimated for each of the 12 crab samples according to the procedures presented in Section 5.1.3 of the ERA. Table 5-1 of the ERA summarizes the maximum and mean wet weight tissue residue concentrations for the combined crab tissue samples. These whole-body wet weight concentrations are used in this attachment to evaluate the potential for adverse effects to benthic macroinvertebrates.

Small Prey Fish

Small prey fish tissue concentration estimates were based on whole-body concentrations measured with four Atlantic tomcod and four mummichog samples (eight total small prey fish samples) collected from the Gowanus Canal (Table 2-5 of the RI). The chemical concentrations determined in each of the eight small prey fish samples were combined to estimate the maximum and mean wet weight chemical concentrations for small prey fish in the Gowanus Canal. Table 5-3 of the ERA summarizes the maximum and mean wet weight concentrations for the combined small prey fish samples. These whole-body wet weight concentrations are used in this attachment to evaluate the potential for adverse effects to benthic macroinvertebrates.

Larger Fish Species

Larger fish tissue whole-body concentration estimates were based on concentrations measured in 13 samples from three larger fish species (six Atlantic eel, five striped bass, and two white perch) that were collected from the Gowanus Canal (Table 2-5 of the RI).

Wet weight, weighted average whole-body tissue residue concentrations were estimated for each of the larger fish species by taking a weighted average of the chemical residue

concentrations measured in edible and corresponding offal tissue (skin included) samples. Weighted average whole-body tissue wet weight residue concentrations were estimated for each of the 13 fish samples using the following lab-measured data:

- Measured chemical concentrations in the fillet (two fillets/fish) sample;
- Measured chemical concentrations detected in the corresponding offal sample;
- Total wet weight mass of the fillet sample; and
- Total wet weight mass of the offal sample.

For each of the 13 fish samples, a weighted average whole body concentration was calculated for each chemical by taking the weighted average concentration of the chemical detected in the fillet and offal tissues using the following equation:

$$FWBTC_x = \frac{[[(FTC_x)(FTW)] + [(OC_x)(OW)]]}{TW}$$

Where:

$FWBTC_x$ = Weighted average fish whole body tissue concentration for constituent *x* (wet weight)
FTC_x = Fillet tissue concentration for constituent *x* (wet weight)
FTW = Fillet tissue weight (wet weight)
OC_x = Offal tissue concentration for constituent *x* (wet weight)
OW = Offal tissue weight (wet weight)
TW = Total weight of fillet and offal tissues (wet weight)

The chemical concentrations determined in each of the 13 fish samples were then combined by species to estimate the maximum and mean wet weight chemical concentrations for each larger fish species within the Gowanus Canal. Tables E-1 through E-3 summarize the maximum and mean wet weight concentrations for each species. These whole-body wet weight concentrations are used in this attachment to screen the potential for adverse effects to fish.

Approach to Risk Evaluation

Benthic Macroinvertebrates

The BERA further evaluated benthic macroinvertebrate (blue crab) tissue to refine the estimate of risk for benthic macroinvertebrates. Whole-body wet weight tissue residue concentrations in composite crab samples collected from Gowanus Canal were compared to literature-based tissue residue benchmark concentrations for decapods to evaluate the potential for adverse effects to benthic macroinvertebrates. The maximum and mean wet weight concentrations determined for the 12 crab samples collected from Gowanus Canal are summarized in Table 5-1 of the ERA.

A literature review was conducted to identify available aquatic invertebrate tissue residue screening values for this evaluation. The screening values selected for this assessment were based primarily on conservative values identified for the BERA associated with the Lower Passaic River Restoration Project (LPRRP) via the technical memorandum "Refinement of

Toxicity Values and Development of Critical Biota Residues and Biomagnification Factors (BMFs), Conceptual Site Model/Problem Formulation, Lower Passaic River Restoration Project, March 3, 2006" (Battelle, 2006). The majority of the toxicological data used to develop tissue screening values for the LPRRP were obtained from the U.S. Army Corps of Engineers' Environmental Residue-Effects Database (http://el.erdc.usace.army.mil/ered). Additional tissue residue data were also obtained from the broader scientific literature. A summary of the tissue residue screening benchmarks selected for use in this BERA, as well as the sources of these values, is presented in Table E-4.

Maximum Allowable Toxicant Concentrations (MATCs) were presented in the above cited memorandum, while the no-observed-effect concentration (NOEC) and the lowest-observed-effect concentration (LOEC) values were used for screening in this BERA. The MATC is the geometric mean of the NOEC and LOEC. The underlying NOEC and LOEC values, which were used to derive the MATC, were thus used in this evaluation. The NOEC represents the concentration below which adverse effects are not expected, while the LOEC represents the concentration above which adverse effects are expected. Both values were used for the evaluation in order to place bounds on the range of concentrations in which a potential risk would occur.

Following selection of the screening benchmarks, HQs were derived for each chemical in the BERA by dividing both the maximum and mean crab tissue residue concentrations by the corresponding screening value. Chemicals were identified as COCs if the maximum tissue concentrations exceeded either the NOEC or the LOEC.

Water-Column-Dwelling Aquatic Life

The BERA further evaluated fish tissue to refine the estimate of risk for water-column-dwelling aquatic life. Whole-body fish tissue residue concentrations detected in samples collected from Gowanus Canal were compared to literature-based tissue residue benchmark concentrations for fish to evaluate the potential for adverse effects to fish populations. Both small prey fish (mummichog and Atlantic tomcod) and larger fish (striped bass, white perch, American eel) species captured from the canal were used in this analysis. The maximum and mean wet weight concentrations determined for small prey fish species collected from Gowanus Canal is summarized in Table 5-3 of the ERA. The maximum and mean wet weight concentrations determined for larger fish species collected from Gowanus Canal are summarized in Tables E-1 through E-3.

A literature review was conducted to identify available tissue residue screening values for this evaluation. Both NOEC and LOEC were used for screening. The NOEC represents the concentration below which adverse effects are not expected, while the LOEC represents the concentration above which adverse effects are expected. Both values were used for this evaluation in order to bound the range of concentrations in which a potential risk is likely to occur. A summary of the fish tissue residue screening benchmarks selected for use in the BERA is presented in Table E-5.

The source of LPRRP BERA tissue screening values used for invertebrates (Battelle 2006) was also the primary source of fish tissue screening values for this BERA. Additional tissue residue data were also obtained from the broader scientific literature. A summary of the fish tissue residue screening benchmarks selected for use in the BERA, as well as the sources of these values, is presented in Table E-5.

Following selection of the screening benchmarks, HQs were derived for each parameter in the BERA by dividing both the maximum and mean tissue residue concentrations for each evaluated fish species by the screening value. Chemicals were identified as COCs if the maximum tissue concentrations exceeded either the NOEC or LOEC.

Risk Evaluation

This section presents a final evaluation of risks to benthic macroinvertebrates and water-column-dwelling aquatic life using the data and approach discussed in this attachment. The outcome of this step is a final list of COCs for each medium-pathway-receptor combination identified for evaluation. Because risk to each receptor is being evaluated using multiple data inputs, conclusions about the potential for adverse effects to each receptor will be based on a weight-of-evidence analysis of the available data. The results of this evaluation should be used, along with consideration of the other lines of evidence evaluated for these receptors, to draw conclusions about the overall potential for adverse effects to ecological receptors in the Gowanus Canal.

Benthic Macroinvertebrates

The maximum and mean concentrations of DDE, total DDTs, copper, mercury, silver, and zinc had HQs exceeding 1 when compared to the NOEC and LOEC (Table E-6 and E-7). The maximum and mean concentrations of total PAHs had HQs exceeding 1 when compared to the NOEC (Table E-6), while only the maximum concentration of total PAHs had HQs exceeding when compared to the LOEC (Table E-7). Fifteen PAHs and 8 metals were detected in crab tissue samples; however, screening benchmarks were not available for these chemicals, and the potential for adverse effects to blue crabs could not be evaluated.

Water-Column-Dwelling Aquatic Life

The following sections present the results of the whole-body fish tissue residue analysis for the combined small prey fish species (mummichog and Atlantic tomcod) and for each larger fish species (striped bass, white perch, and American eel).

Small Prey Fish. The maximum and mean concentrations of total PCB congeners, copper, mercury, and selenium had HQs exceeding 1 when compared to the NOEC and LOEC (Tables E-8 and E-9). The maximum concentrations of DDE, DDT, and lead had HQs exceeding 1 when compared to the NOEC and LOEC (Tables E-8 and E-9), while the mean concentrations of these chemicals could not be evaluated because they were detected in only a single fish sample. The maximum and mean concentrations of alpha-chlordane and the maximum concentrations of endrin and gamma-chlordane had HQs exceeding 1 when compared to the NOEC (Table E-8), but not when compared to the LOEC (Table E-9). Nine inorganic chemicals were detected but could not be evaluated because screening benchmarks were not available for those chemicals.

American Eel. The maximum and mean concentrations of total PCB congeners, alpha-chlordane, DDD, copper, mercury, and selenium had HQs exceeding 1 when compared to the NOEC and LOEC (Tables E-10 and E-11). The maximum concentrations of DDE, DDT, and lead had HQs exceeding 1 when compared to the NOEC and LOEC (Tables E-10 and E-11), while the mean concentrations of these chemicals could not be evaluated because they were detected in only a single eel sample. The maximum and mean concentrations of gamma-chlordane and the maximum concentration of dieldrin had HQs exceeding 1 when compared to the NOEC (Table E-10), but not when compared to the LOEC (Table E-11). Nine inorganic chemicals were detected but could not be evaluated because screening benchmarks were not available for those chemicals.

Striped Bass. The maximum and mean concentrations of DDE, DDD, DDT, total PCB congeners, copper, mercury, and selenium had HQs exceeding 1 when compared to the NOEC and LOEC (Tables E-12 and E-13). The maximum concentration of total DDT had an HQ exceeding 1 when compared to the NOEC and LOEC (Tables E-12 and E-13), while the mean concentration of this chemical could not be evaluated because it was detected in only one fish sample. The maximum and mean concentrations of alpha-chlordane and the maximum concentration of gamma-chlordane had HQs exceeding 1 when compared to the NOEC (Table E-12), but not when compared to the LOEC (Table E-13). Eight inorganic chemicals were detected but could not be evaluated because screening benchmarks were not available for those chemicals.

White Perch. The maximum and mean concentrations of total PCB congeners, copper, mercury, and selenium had HQs exceeding 1 when compared to the NOEC and LOEC (Tables E-14 and E-15). The maximum concentrations of DDT and silver had HQs exceeding 1 when compared to the NOEC and LOEC (Tables E-14 and E-15), while the mean concentrations of these chemicals could not be evaluated because they were detected in only a single fish sample. The maximum and mean concentrations of alpha-chlordane and the maximum concentration of gamma-chlordane had HQs exceeding 1 when compared to the NOEC (Table E-14), but not when compared to the LOEC (Table E-15). Seven inorganic chemicals were detected but could not be evaluated because screening benchmarks were not available for those chemicals.

Risk Summary and Conclusions

Benthic Macroinvertebrate Communities

Risks to benthic macroinvertebrate communities were evaluated primarily through the use of laboratory-based sediment bioassays, which were conducted with two sediment-dwelling invertebrates (amphipods and polychaetes), and through the comparison of sediment chemical concentrations to literature-based screening benchmarks. Chemical concentrations measured in crab tissue also indicate a potential for adverse effects to benthic macroinvertebrates. Among these chemicals, PAHs and several metals (copper, mercury and silver), were detected in canal sediment at concentrations exceeding those detected in the Gowanus Bay reference samples (Table 4-5 of the RI), suggesting those chemicals represent a potential site-related risk.

Water-Column-Dwelling Aquatic Life Communities

Chemical concentrations measured in fish tissue indicate a potential for adverse effects to water-column-dwelling aquatic life. Several of the chemicals indicating risk in one or more fish species, including PCBs and several metals (copper, mercury and silver), were detected in canal sediment at concentrations exceeding those detected in the Gowanus Bay reference samples (Table 4-5 of the RI), suggesting those chemicals represent a potential site-related risk.

Alpha-chlordane	2 / 2 (100%)	8.46 - 9.02	GC-TI401-WP	9.02	8.74
Gamma-chlordane	1 / 1 (100%)	7.78 - 7.78	GC-TI401-WP	7.78	---
Methoxychlor	1 / 2 (50.0%)	26.5 - 26.5	GC-TI401-WP	26.5	---
P,P'-DDT	1 / 1 (100%)	14.9 - 14.9	GC-TI401-WP	14.9	---
Polychlorinated Biphenyl Congeners (ng/kg)					
Total PCB Congeners	2 / 2 (100%)	901000 - 1110000	GC-TI401-WP	1110000	1010000
Metals (mg/kg)					
Calcium	2 / 2 (100%)	5800 - 9940	GC-TI401-WP	9940	7870
Copper	2 / 2 (100%)	6.36 - 18.2	GC-TI401-WP	18.2	12.3
Iron	2 / 2 (100%)	13.5 - 14.3	GC-TI401-WP	14.3	13.9
Magnesium	2 / 2 (100%)	266 - 371	GC-TI401-WP	371	319
Manganese	2 / 2 (100%)	0.933 - 4.31	GC-TI401-WP	4.31	2.62
Mercury	2 / 2 (100%)	0.146 - 0.153	GC-TI401-WP	0.153	0.15
Potassium	2 / 2 (100%)	1830 - 2000	GC-TI401-WP	2000	1920
Selenium	2 / 2 (100%)	1.36 - 1.47	GC-TI401-WP	1.47	1.42
Silver	1 / 2 (50.0%)	0.415 - 0.415	GC-TI401-WP	0.415	---
Sodium	2 / 2 (100%)	805 - 1090	GC-TI401-WP	1090	948
Zinc	2 / 2 (100%)	12.0 - 16.8	GC-TI401-WP	16.8	14.4
Cyanide, Total	2 / 2 (100%)	0.455 - 0.951	GC-TI401-WP	0.951	0.703

TABLE E-4
Whole Body Crab Tissue Screening Benchmarks
Gowanus Canal Remedial Investigation
Brooklyn, New York

Detected Constituents	mg/kg (wet weight) NOEC	LOEC	Test Species	Endpoint	Source	Notes
Polychlorinated Biphenyls						
Total PCBs	0.42	1.1	Grass shrimp	Mortality - LOED	Hansen et al 1974 (LOEC); Nimmo et al. 1974 (NOEC)	
Polycyclic Aromatic Hydrocarbons						
Total PAHs	0.022	0.22	Blue mussel	Reproduction - LOED	Eertman et al . 1995	Based on exposure to fluoranthene; NOEC is LOEC divided by 10
Pesticides						
DDT, total	0.000180	0.0018	Freshwater amphipod	Mortality – LD50	Villalobos et al. 2003	exposure to 4,4'-DDE; NOEC is LOEC divided by 10
Inorganics						
Arsenic	--	--	--	--	--	--
Copper	0.086	0.86	Littleneck clam	Mortality - LD11	Roesijadi 1980	NOEC is LOEC divided by 10
Iron	--	--	--	--	--	--
Manganese	--	--	--	--	--	--
Mercury	0.0095	0.095	Estuarine copepod	Reproduction – ED50	Hook and Fisher, 2002	NOEC is LOEC divided by 10
Silver	0.0019	0.019	Estuarine copepod	Reproduction - ED68	Hook and Fisher, 2001	NOEC is LOEC divided by 10
Zinc	0.13	1.3	Estuarine copepod	Reproduction - ED50	Hook and Fisher, 2002	NOEC is LOEC divided by 10
Cyanide, Total	--	--	--	--	--	--

TABLE E-5
Whole Body Fish Tissue Screening Benchmarks
Gowanus Canal Remedial Investigation
Brooklyn, New York

Detected Constituents	mg/kg (wet weight) NOEC	LOEC	Test Species	Endpoint	Source	Notes
Polychlorinated Biphenyls						
Total PCBs	0.0025	0.025	Japanese medaka	Reproduction – ED11	Nakayama et al. 2005	NOEC is LOEC devided by 10
Pesticides						
Alpha-Chlordane	0.001	0.01	Sheepshead minnow	Mortality - ED5	Schimmel et al. 1976	value for chlordane; NOEC is LOEC devided by 10
DDT, total	0.000039	0.0018	Japanese medaka	Mortality - NOED/LOED	Villalobos et al. 2003	based on exposure to 4,4'-DDE
Dieldrin	0.011	0.11	Rainbow trout	Growth - LOED	Dillon 1984	NOEC is LOEC devided by 10
Endrin	0.00115	0.0115	Largemouth bass	Mortality - LOED	Fabacher 1976	NOEC is LOEC devided by 10
Gamma-Chlordane	0.001	0.01	Sheepshead minnow	Mortality - ED5	Schimmel et al. 1976	value for chlordane; NOEC is LOEC devided by 10
Methoxychlor	0.06	1.64	Striped mullet (field-caught)	Mortality	Lee et al. 1975	
Inorganics						
Aluminum	--	--	--	--	--	--
Arsenic	1.5	2	Rainbow trout	Growth	McGeachy and Dixon 1990	
Chromium	--	--	--	--	--	--
Copper	0.002	0.02	Channel catfish	Growth - LOED	Murai et al. 1981	NOEC is LOEC devided by 10
Iron	--	--	--	--	--	--
Lead	0.028	0.28	Rainbow trout	Growth - ED11	Hansen et al. 2004	NOEC is LOEC devided by 10
Manganese	--	--	--	--	--	--
Mercury	0.001	0.01	Mummichog	Growth – ED146	Matta et al. 2001	Value for Methyl mercury; NOEC is LOEC devided by 10
Selenium	0.6	0.68	Bluegill	Mortality	Cleveland et al. 1993	
Silver	0.024	0.24	Rainbow trout	Reproduction - NOED	Guadagnolo 2001	NOEC is LOEC devided by 10
Zinc	0.284	--	Guppy	Mortality - NOED	Pierson 1981	
Cyanide, Total	--	--	--	--	--	--

Mercury	2 / 2 (100%)	2	---	0.16 - 0.19	GC-TI401-WP	0.175

TABLE 4-2
List of Evaluation Criteria Used to Evaluate the Nature and Extent of Contamination
Gowanus Canal Remedial Investigation
Brooklyn, New York

Surface Sediment, Subsurface Sediment, CSO Sediment

The standards / criteria below are used to evaluate the degree of contamination found in the surface sediments in the Gowanus Canal. These standards / criteria are also used to provide a perspective on the concentrations in subsurface sediments and sediments. The results for the surface sediment reference locations are also compared to the results for the surface sediment locations within the canal.

A. U.S. Environmental Protection Agency (USEPA). 2010. Residential soil RSL from EPA Regional Screening Table, May 2010. RSLs based on noncancer risk divided by 10 to account for exposure to more than one constituent that effects the same target organ.
http://www.epa.gov/reg3hwmd/risk/human/rb-concentration_table/Generic_Tables/index.htm

The standards / criteria listed below are used in the following order to create criteria R: 1) use criteria B1 first; 2) if no criteria available for a constituent under B1, go to C; 3) if no criteria available for a constituent under B1 and C, go to D; and 4) if no criteria available for a constituent under B1, C, and D, go to E and use in this order – E1, E2, E3.

B. New York State Department of Environmental Conservation (NYSDEC). 1999. Technical Guidance for Screening Contaminated Sediments. New York State Department of Environmental Conservation. (Benthic aquatic life chronic toxicity values for saltwater (designated SW)
B1 - NYSDEC 1999 Benthic Aquatic Life Chronic Toxicity (2% TOC)
B2 - NYSDEC 1999 Benthic Aquatic Life Chronic Toxicity (6.5% TOC) – included for informational purposes only

C. Jones, D.S., G.W. Suter II, and R.N. Hull. 1997. Toxicological benchmarks for screening contaminants of potential concern for effects on sediment-associated biota: 1997 revision. Environmental Restoration Division, ORNL Environmental Restoration Program. ES/ER/TM-95/R4. (Marine and estuarine benchmarks, lower of ER-L or TEL values)

D. Washington Department of Ecology (WDOE). 1995. Chapter 173-204 WAC, Sediment Management Standards. http://www.ecy.wa.gov/biblio/wac173204.html (Marine Sediment Quality Standards; presented in Table 1, under WAC 173-204-320)

E. Buchman, M.F., 2008. NOAA Screening Quick Reference Tables, NOAA OR&R Report 08-1, Seattle WA, Office of Response and Restoration Division, National Oceanic and Atmospheric Administration, 34 pages. (Marine surface water, chronic values)
E1 - SQuiRTs 2008 Mar SD TEL
E2 - SQuiRTs 2008 Mar SD ERL
E3 - SQuiRTs 2008 Mar SD PEL

Surface Water, CSO Water, Pipe Outfall Water

The standards / criteria below are used to evaluate the degree of contamination found in the surface water in the Gownus Canal. These standards / criteria are also used to provide a perspective on the concentrations in CSO water, and pipe outfall discharges. The results for the surface water reference locations are also compared to the results for the surface water locations within the canal.

The standards / criteria listed below are used in the following order to create criteria T and S:

Criteria T: Use the lesser of F or G2; use H if no F or G2 criteria available for a constituent.

Criteria S: 1) use criteria L1 first; 2) if no criteria available for a constituent under L1, go to I; and 3) if no criteria available for a constituent under L1 and I, go to K.

F. U.S. Environmental Protection Agency (USEPA). 2009. National Recommended Water Quality Criteria. Office of Water, Office of Science and Technology. Human Health for Consumption of Organism only.

G. New York State DEC, Chapter X, Division of Water, Part 703: Surface Water and Groundwater Quality Standards and Groundwater Effluent Limitations. Values correspond to classification of canal (SD) and classification of Bay (I) and are the standards for Health-fish consumption and recreation.
G1 - NYSDEC Chapter X for surface water (fish consumption) I H(FC) – included for informational purposes only, applies to Gowanus Bay
G2 - NYSDEC Chapter X for SW (fish consumption) SD H(FC)

H. U.S. Environmental Protection Agency (USEPA). 2010. Tap Water RSL from EPA Regional Screening Table, May 2010.
RSLs based on noncancer divided by 10 to account for exposure to more than one constituent that effects the s ame target organ.

I. U.S. Environmental Protection Agency (USEPA). 2009. National Recommended Water Quality Criteria. Office of Water, Office of Science and Technology. 4303T. Saltwater chronic value (CCC) for the protection of aquatic life.

J. New York State Department of Environmental Conservation (NYSDEC). 1998. Water Quality Standards and Analytical Support. http://www.dec.ny.gov/chemical/23842.html. Chronic marine values for protection of aquatic life. (Note that these values have been incorporated into reference L and this reference is included here only to indicate that it was also reviewed).

K. Buchman, M.F., 2008. NOAA Screening Quick Reference Tables, NOAA OR&R Report 08-1, Seattle WA, Office of Response and Restoration Division, National Oceanic and Atmospheric Administration, 34 pages. Marine surface water, chronic values.

L. New York State DEC, Chapter X, Division of Water, Part 703: Surface Water and Groundwater Quality Standards and Groundwater Effluent Limitations . Values correspond to classification of canal (SD) and classification of Bay (I) and are the standards for Aquatic-Chronic toxicity.
L1 - NYSDEC Chapter X for surface water (aquatic chronic toxicity) I A(C) – included for informational purposes only, applies to Gowanus Bay

Groundwater

Groundwater was evaluated to assess groundwater interactions with the surface water in the canal. For completeness and to provide a perspective on the significance of detected concentrations at the locations where the monitoring wells were installed, the detected concentrations in groundwater are compared to the standards / criteria listed below.

The standards / criteria listed below are used in the following order to create criteria 1) use criteria N1 first; 2) if no criteria available for a constituent under N1, go to O1; and 3) if no criteria available for a constituent under N1 and O1, go to O2.

N. U.S. Environmental Protection Agency (USEPA). Maximum Contaminant Levels and MCLGs. http://www.epa.gov/safewater/contaminants/index.html (N1 is MCLs, N2 is MCLGs).

O. New York State DEC, Chapter X, Division of Water, Part 703: Surface Water and Groundwater Quality Standards and Groundwater Effluent Limitations. Values correspond to classification of groundwater along the canal (GA) and are the standards for Health-Water Source and Aesthetic -Water Source (includes O1 and O2).

Air

P. U.S. Environmental Protection Agency (USEPA). 2010. Residential air RSLs from EPA Regional Screening Table, May 2010. RSLs based on noncancer risk divided by 10 to account for exposure to more than one constituent that effects the same target organ.
http://www.epa.gov/reg3hwmd/risk/human/rb-concentration_table/Generic_Tables/index.htm

Soil

Soils were evaluated at the locations where monitoring wells were installed. For completeness and to provide a perspective on the significance of detected concentrations at the locations where the monitoring wells were installed, detected concentrations in soils are compared to the standards / criteria listed below.

Q. New York State DEC. 2009. Subpart 375-6: Remedial Program Soil Cleanup Objectives. December 14, 2006 and NYSDEC Draft CP/Soil Cleanup Guidance, November 4, 2009. Values used correspond to restricted use soil cleanup objectives; Protection of Groundwater.

TABLE 4-2

TABLE 4-3
Summary of Evaluation Criteria Used to Evaluate Nature and Extent of Contamination
Gowanus Canal Remedial Investigation
Brooklyn, New York

Medium	Evaluation Criteria		
	Human Health Risk	**Ecological Risk**	**General**
Sediment - surface in canal	A	R (developed using this order:B1, C, D, E1, E2, and E3)	
Sediment – CSOs	A	R (developed using this order:B1, C, D, E1, E2, and E3)	
Sediment – subsurface soft	A	R (developed using this order:B1, C, D, E1, E2, and E3)	
Sediment – subsurface native	A	R (developed using this order:B1, C, D, E1, E2, and E3)	
Surface water in canal - dry and wet events	T (lesser of F or G2, H if no F or G2)	S (lesser of I or K)	
Surface water – CSOs	T (lesser of F or G2, H if no F or G2)	S (lesser of I or K)	
Surface water - pipe outfalls	T (lesser of F or G2, H if no F or G2)	S (lesser of I or K)	
Tissue	M	AC and AD (fish); AA and AB (crab)	
Groundwater			N1, O1,O2
Soil			Q
Air	P		

Evaluation criteria for each letter are defined in Table 4-2.

TABLE 2-1

Chronology of Remedial Investigation Activities and Dates Performed

Gowanus Canal Remedial Investigation

Brooklyn, New York

Investigation	Date	Summary of Remedial Investigation Activity
Bathymetric Survey	January 5, 2010	Survey to measure sediment surface elevations within the canal.
Sediment Coring	January 27 - 29, 2010 March 3 - April 15, 2010	USEPA collected sediment cores in the canal.
Surface Sediment Sampling	June 17 - July 1, 2010	USEPA collected surface sediment samples from the canal and from reference locations.
Surface Water - Dry Weather Sampling	June 19, 2010 July 26, 2010	USEPA collected surface water samples in dry weather conditions from the canal, reference locations, and one location from the Buttermilk Channel. One additional surface water sample was collected in July 2010 in an area with a sheen.
Surface Water - Wet Weather Sampling	July 13, 2010	USEPA collected surface water samples in wet weather conditions from the canal, reference locations, and one location from the Buttermilk Channel.
Fish and Shellfish Tissue Sampling	June 21 - July 9, 2010	USEPA collected tissue samples from species of fish and crab in the canal and from reference locations.
Air Sampling (Round 1)	July 7 - 9, 2010	USEPA collected air samples from locations along the canal and at predominately upwind background locations away from the canal. Samples were collected before the start of the canal aeration system.
Air Sampling (Round 2)	July 28 - 29, 2010	Same as above but after the start of the canal aeration system.
Combined Sewer Outfalls - Dry Weather Sampling	June 30 - July 1, 2010	USEPA collected sediment and water samples from manholes upland of CSO outfalls to the canal.
Combined Sewer Outfalls - Wet Weather Sampling 1	July 13, 2010	USEPA collected water samples from manholes upland of CSO outfalls to the canal. Not all outfalls were sampled because rainfall stopped before sampling was completed.
Combined Sewer Outfalls - Wet Weather Sampling 2	September 28, 2010	USEPA collected water samples from manholes upland of CSO outfalls to the canal. Not all outfalls were sampled because rainfall stopped.
Combined Sewer Outfalls - Wet Weather Sampling 3	September 30 - October 1, 2010	USEPA collected water samples from manholes upland of CSO outfalls to the canal. All outfalls were sampled.
Pipe Outfalls - Dry Weather Sampling	September 1 - 7, 2010	USEPA collected samples from actively discharging pipes.
Pipe Outfalls - Tracing and Video survey	October - December 2010	USEPA ERT performed a video survey of identified pipes to determine how far they extend from the canal and collect a variety of other information about the pipes.
Soil Sampling and Monitoring Well Installation	May 17 - June 30, 2010	USEPA ERT, National Grid, and New York City installed monitoring wells and collected soil samples during well installation activities. Each entity also completed a survey of the horizontal and verical information for the respective wells.
Groundwater Sampling	June 24- July 26, 2010	USEPA, National Grid, and New York City collected groundwater samples from the monitoring wells.
Groundwater / Surface Water Interaction	June 24- July 26, 2010	USEPA, National Grid, and New York City collected surface water and groundwater samples to evaluate groundwater surface water interactions.
Synoptic Water Level Survey	July 26 - December 20, 2010	USEPA, National Grid, and New York City collected synoptic water level measurements at monitoring wells and staff gauges along the entire canal to quantify hydraulic gradients and establish groundwater flow directions. Last survey scheduled for December 20, 2010 and those results will be included in final RI.
Tidal Survey	August 2, 2010 August 5, 2010	USEPA performed a survey to evaluate the influence of tidal fluctuations on groundwater levels.
Side Scan Sonar	November 12, 2010	USEPA performed survey to identify debris of potential historical significance at the bottom of the canal.

Notes:

CSO = Combined Sewer Overflow

ERT = Emergency Response Team

USEPA = United States Environmental Protection Agency

(1) Numbers do not include QA/QC samples.

(2) Analyses of samples collected by USEPA were performed and validated through the CLP (contract laboratory program) for TCL (target compound list), TAL (target analyte list), cyanide, PCB congeners, and lipids. Remaining analyses were through a subcontracted laboratory and validated by a contractor outside of the CLP. Analyses of samples collected by other entities were analyzed through subcontracted laboratories and independently validated.

(3) Geochemistry parameters include: alkalinity, ammonia, calcium, chlorides, iron – total, iron – dissolved, magnesium, manganese – total, manganese – dissolved, aluminum, nitrates, total Kjeldahl Nitrogen (TKN), organic carbon – total, organic carbon - dissolved, potassium, phosphate, total hardness, silica, sodium, sulfates, total dissolved solids (TDS), total suspended solids (TSS), and field test for ferrous (+II) iron.

TOC - Total Organic Carbon

AVS/SEM - acid volatile sulfide/simultaneously extracted metals

VOCs - volatile organic compounds

SVOCs - semi-volatile organic compounds

CSO - combined sewer overflow

NYC - New York City

USEPA - United States Environmental Protection Agency

ERT - Emergency Response Team

PCB - polychlorinated biphenyl

PAH - polycyclic aromatic hydrocarbons

TCLP - toxicity characteristic leaching procedure

RIC - reactivity, ignitibility, and corrosivity

Page Intentionally Left Blank

TABLE 2-3

Rationale for Selection of Sediment Coring Locations

Gowanus Canal Remedial Investigation

Brooklyn, New York

Location ID	Description	Rationale
Individual Locations		
ERT 4-3	East side of canal, south of Union Street bridge	National Grid Location SED-15A; sampled in January 2010 because location may not have been accessible once NYCDEP started Flushing Tunnel repair activities.
107	CSO (RH-034)	Head of canal; thick sediment mound from CSO discharges
108	Fulton former MGP site	Potential source
109	CSO (RH-036)	CSO; spatial coverage
110	National Grid location SED-24B	Potential source; NAPL observed at sediment surface by National Grid at location SED-24B
111	4th Street turning basin; National Grid location SED-86A	Verify previous results for National Grid SED-86A
112	CSO (OH-007)	CSO
113	CSO (RH-035)	CSO; upstream of CG/PP former MGP site
114	CG/PP former MGP site	NAPL adjacent to CG/PP former MGP site
115	CG/PP former MGP site	NAPL adjacent to CG/PP former MGP site
116	6th St. turning basin	Potential source
117	7th St. turning basin; National Grid location SED-92A	Verify National Grid SED-92A; potential source
118	Potential active source; storm water outfalls RH-601 and OH-607; former National Grid location GC-SED-58C	NAPL observed at sediment surface by National Grid at SED-58 and SED-59
119	11th St. turning basin, Metropolitan former MGP site	Potential source
120	Metropolitan former MGP site	Potential source
121	Metropolitan former MGP site	Potential source
122	Asphalt plant; National Grid location GC-SED-71C	Potential source
123	Gowanus Creek Channel	Spatial coverage of Gowanus Creek Channel
145	Center of channel, south of Carrol Street bridge	Potential source
149	Mouth of 11th Street turning basin	Potential source; added in field because core at location 119 did not penetrate into native sediment due to thick layer of accumulated sediment
150	West side of canal, near end of Halleck Street	Potential source
151	Near entrance to New York City incinerator facility	Potential source
152	East side of canal at end of DeGraw Street	CSO in upper reach of canal
153	Center of channel, north of Carrol Street bridge	Potential source
Transects		
ERT 1-1	Transect at head of canal	CSO near head of canal; sampled in January 2010 since location may not have been accessible once NYCDEP started Flushing Tunnel repair activities.
ERT 1-2		
ERT 1-3		
ERT 2-1	Between National Grid transects A and B	
ERT 2-2		
ERT 2-3		
ERT 3-1	Between National Grid transects C and D	
ERT 3-2		
ERT 3-3		
124	Between National Grid transects A and B	CSO near head of canal
125		
126		
127	North of 3rd St. bridge	Potential source
128		
129		
130	Under train bridge crossing (9th St.)	Potential source
131		
132		
133	Under Hamilton Ave./Gowanus Expressway	Potential source
134		
135		
136	Between National Grid transects X and Y	Channel deepens south of this point
137		
138		
139	South end Gowanus Creek Channel	Transect away from CSO
140		
141		
142	Hess oil tank	South end of study area
143		
144		
146	South of former 1st Street turning basin	Potential source
147		
148		

Notes:

CSO = combined sewer overflow

NAPL = non-aqueous phase liquid

NYCDEP = New York City Department of Environmental Protection

CG/PP = Carroll Gardens/Public Place

MGP = manufactured gas plant

Page Intentionally Left Blank

TABLE 2-4
Rationale for Selection of Surface Water and Sediment Sampling Locations
Gowanus Canal Remedial Investigation
Brooklyn, New York

Location	Description	Rationale
301 *	CSO (RH-034)	Active source, shallow water and / or exposed sediment during low tide, potential human health exposure point; note that area targeted for dredging by NYCDEP for CSO abatement
302 *	CSO (RH-038)	Active source, shallow water and / or exposed sediment during low tide, potential human health exposure point
303 *#	Fulton former MGP site	Active source, shallow water and / or exposed sediment during low tide, potential human health exposure point; high surface sediment PAH concentrations for evaluation in BERA
304	CSO (RH-037)	Active source
305 *	Union St. bridge	Potential human health exposure considered at bridge crossings
306	CSO (RH-036)	Active source, spatial coverage
307A *# 307B *#	CSO (OH-005) and Carroll St. bridge	Active source, potential human health exposure considered at bridge crossings
308A * 308B *	Canoe launch	Shallow water and / or exposed sediment during low tide, potential human health exposure point
309 *#	3rd St. bridge	Shallow water and / or exposed sediment during low tide, potential human health exposure point
310 *#	4th Street turning basin	Shallow water and / or exposed sediment during low tide, potential human health exposure point
311	CSO (OH-007)	Active source
312	CSO (RH-035)	Active source Upstream of CG/PP former MGP site
313 #	CG/PP former MGP site	Potential active source
314 *#	6th St. turning basin	Shallow water and / or exposed sediment during low tide, potential human health exposure point
315 #	CG/PP former MGP site	Potential active source
316 *	7th St. turning basin	Shallow water and / or exposed sediment during low tide, potential human health exposure point
317	Storm sewer outfalls (RH-601 and OH-607)[1]	Active source
318 *#	11th St. Basin, Metro. former MGP site	Metropolitan former MGP site Shallow water and / or exposed sediment during low tide, potential human health exposure point
319 *#	Metro. former MGP site	Metropolitan former MGP site Shallow water and / or exposed sediment during low tide, potential human health exposure point High surface sediment PAH concentrations for evaluation in BERA
320	CSO (RH-031) and Hamilton Avenue crossing	Active source
321 #	New York City incinerator location	Potential active source
322	Gowanus Creek Channel	Spatial coverage of Gowanus Creek Channel

TABLE 2-4
Rationale for Selection of Surface Water and Sediment Sampling Locations
Gowanus Canal Remedial Investigation
Brooklyn, New York

Location	Description	Rationale
323	CSO (OH-006)	Active source
324 #	Former Navy facility	Spatial coverage of Gowanus Creek Channel
325	Former Navy facility	Spatial coverage of Gowanus Creek Channel
326 #	Reference location	Ten locations in Gowanus Bay and Upper New York Bay were selected as reference sampling locations. These locations were positioned on an approximate grid with increased spacing with increasing distance from the mouth of the canal to characterize gradients in contaminant concentrations and biological effects, if present. Only surface water was collected from location 336, which near the Flushing Tunnel intake in the Buttermilk Channel.
327	Reference location	
328 #	Reference location	
329 #	Reference location	
330 #	Reference location	
331	Reference location	
332	Reference location	
333 #	Reference location	
334	Reference location	
335	Reference location	
336	Reference location – Surface water only	

* Denotes sample that will be used to support the human health risk assessment.
\# Denotes sample collected for toxicity testing.
_ Denotes sample collected for PCB congener analysis.
T – NYC has previously identified RH-601 as RH-032 and OH-607 as OH-008.
BERA – baseline ecological risk assessment
CG/PP – Carroll Gardens/Public Place former MGP site
CSO – combined sewer overflow
MGP – manufactured gas plant
NYCDEP – New York City Department of Environmental Protection
PAH- polycyclic aromatic hydrocarbon

TABLE 2-5

Tissue Sample Groupings for Chemical Analysis

Gowanus Canal Remedial Investigation

Brooklyn, New York

	Canal								Reference				
	Number of Samples Per Area[1]						Additional Samples (Multiple Area Groupings)	Total Canal Samples	Number of Samples Per Area[1]			Additional Samples (Multiple Area Groupings)	Total Reference Samples
	401	402	403	404	405	406			Reference (Inner)	Reference (Middle)	Reference (Outer)		
Small Prey Fish (Whole Body)													
Atlantic Tomcod[2]	1	0	1	0	1	1	0	4	1	0	0	0	1
Hake	0	0	0	0	0	0	0	0	0	0	1	0	1

Weakfish	0	0	0	0	0	0	0	0	0	0	1	0	1
White Perch	2	0	0	0	0	0	0	2	0	0	0	0	0
Carcass													
American Eel	0	2	3	0	0	1	0	6	1	0	0	0	1
Scup	0	0	0	0	0	0	0	0	0	0	3	0	3
Striped Bass	2	0	1	0	0	2	0	5	0	0	0	0	0
Weakfish	0	0	0	0	0	0	0	0	0	0	1	0	1
White Perch	2	0	0	0	0	0	0	2	0	0	0	0	0

1) Matrix spike / matrix spike duplicate samples included at a frequency of 5 percent.

2) Percent moisture and lipids were not analyzed on sample from reach 401 and reference (inner) due to limited Atlantic tomcod tissue mass collected from these sample reaches. Reduced weight tissue analysis was additionally conducted on the sample collected from the reference (inner) sample reach.

3) Percent moisture and lipids were not analyzed on sample from reach 402 due to limited mummichog tissue mass collected from this sample reach.

Page Intentionally Left Blank

TABLE 2-6
Locations of Combined Sewer Overflow Regulators
Gowanus Canal Remedial Investigation
Brooklyn, New York

CSO	Description
RH-031	Bond-Lorraine Sewer relief at Lorraine and Smith Streets
RH-034	Gowanus Pump Station
RH-033	Regulator R-25 at Nevins and Douglass Streets
RH-035	Bond-Lorraine Sewer relief at Bond and 4th Streets
RH-037	Regulator R-23 at Nevins and Sackett Streets
RH-036	Regulator R-22 at Nevins and President Streets
RH-038	Regulator R-24 at Nevins and Degraw Streets
OH-005	3rd Avenue sewer relief at 3rd Ave. and Carroll St.
OH-006	3rd Avenue sewer relief at 3rd Ave. and 19th St.
OH-007	2nd Avenue Pump Station at 3rd Ave. and 7th St.

Note:

CSOs designated with RH are part of the Red Hook Water Pollution Control Plant (WPCP) service area and CSOs designated as OH are part of the Owl's Head WPCP service area.

Page Intentionally Left Blank

TABLE 2-7
Locations of Selected Monitoring Locations at Combined Sewer Overflows
Gowanus Canal Remedial Investigation
Brooklyn, New York

CSO	Monitoring Location Description
RH-031	Manhole located in the traffic intersection of Lorraine St., Smith St., and Hamilton Blvd.
RH-034	Gowanus Pump Station influent screening chamber
RH-033	Manhole located approximately 75 ft southeast of the Nevins St. and Douglass St. intersection
RH-035	Manhole located approximately 25 ft northeast of the intersection of 4th St. and Bond St.
RH-037	Manhole located within the intersection of Nevins St. and Sackett St.
RH-036	Manhole located within the sidewalk southwest of the Nevins St. and President St. intersection
RH-038	Manhole located approximately 40 ft east of the Nevins St. and Degraw St. intersection
OH-005	Manhole located approximately 160 ft east of the intersection of 3rd Ave. and Carrroll St.
OH-006	Manhole located approximately 220 ft north of the 3rd Ave. and 19th St. intersection
OH-007	Dry weather sampling event: wet well located within the 2nd Avenue pump station Wet weather events: manhole located approximately 35 ft northeast of the 2nd Ave. and 5th St. intersection

Notes:

CSOs designated with RH are part of the Red Hook Water Pollution Control Plant (WPCP) service area and CSOs designated as OH are part of the Owls Head WPCP service area. Water and sediment samples were collected from the wet well located within the 2nd Avenue pump station during the dry weather sampling event due to a lack of water in the upstream manhole. Samples collected during the wet weather sampling events were collected from the upstream manhole located on 2nd Avenue.

Page Intentionally Left Blank

Notes:

[1] - Montitoring well MW-46I was originally labeled in the field as MW-46D. This well is screened in the intermediate zone and is discussed in the report as MW-46I.

[2] - Original Staff Gauge ID was "Stream Gauge - Gowanus Pump Station"

[3] - Original Staff Gauge ID was "Stream Gauge - Former Power Station"

[4] - Original Staff Gauge ID was "Stream Gauge - DOT"

[5] - Original Staff Gauge ID was "Canal-Gate Station"

[6] - Original Staff Gauge ID was "Canal-Degraw St"

[7] - Original Staff Gauge ID was "Canal-Union St"

[8] - Original Staff Gauge ID was "Canal-Mazzei"

All measurements are in US Survey Feet

Vertical Datum is NAVD 1988

bgs = below ground surface

ft = feet

NA = Not Applicable

NG = National Grid

NYSP = Horizontal Datum is the New York State Plane Coordinate System (East Zone) = NAD 1983 DATUM

NYC = New York City

USEPA = United States Environmental Protection Agency

Page Intentionally Left Blank

TABLE 3-1

Summary of Sediment Physical Characteristics

Gowanus Canal Remedial Investigation

Brooklyn, New York

Surface Sediment Data	***Canal Surface Sediment***			***Reference Area Surface Sediment***		
	Minimum	**Maxium**	**Average**	**Minimum**	**Maxium**	**Average**
Total Organic Carbon (mg/kg)	25,100	137,000	64,385	2,980	43,400	28,358
Percent Sand	10.2	58.5	39.0	9.7	43.6	28.1
Percent Silt	35.0	74.5	52.1	44.4	71.7	56.8
Percent Clay	4.9	15.4	8.9	12.1	20.7	15.2
Total Percent Fines	41.5	89.9	61.0	56.4	90.3	71.9
Percent Solids	25.7	77.9	35.5	27.3	69.5	40.9
Sulfide (mg/kg)	50.6	8,790.0	3,448.2	383.0	2,160.0	1,167.2
Sediment Core Data	***Soft Sediment***			***Native Sediment***		
	Minimum	**Maxium**	**Average**	**Minimum**	**Maxium**	**Average**
Total Organic Carbon (mg/kg)	730	490,000	119,650	550	168,000	18,677
Percent Sand	10.2	79.6	34.7	0.0	100.0	51.2
Percent Silt	18.4	69.6	54.4	0.0	81.2	38.4
Percent Clay	1.2	24.0	10.9	0.0	74.4	10.4
Total Percent Fines	20.4	89.8	65.3	0.5	100.0	49.3
Percent Solids	25.2	98.9	53.8	48.1	91.1	81.2
Sulfide (mg/kg)	184.0	8,330.0	3,908.6	7.6	7,300.0	144.7
Bulk Density (g/cm^3)	0.31	1.98	0.83	0.59	2.1	1.5

Notes:

Statistics were generated using 1/2 the detection limit for non-detected results

Statistics for surface sediment were generated using only USEPA 2010 data.

Total percent fines is the sum of percent silt and percent clay.

Total Organic Carbon and Percent Solids summary statistics for soft sediment from sediment cores were calculated using the USEPA 2010 and National Grid 2005 data sets. The summaries for native sediment were determined using only the USEPA 2010 data set.

Sulfide and Total Percent Fines summary statistics for soft and native sediment for sediment cores were determined using only the USEPA 2010 data set.

Bulk density for soft sediment was determined using only the National Grid 2005 data set. This parameter was not measured in the 2010 investigation. Bulk density values for native sediment were obtained from GEI (2007).

mg/kg = milligram per kilogram

g/cm^3 = grams per cubic centimeter

				Total	**1,546**	**354.6**	

Notes:
1) Outfalls RH-601, OH-602, and OH-607 are storm water outfalls. In addition to the above CSO and storm water outfalls, 14 highway drain outfalls discharge to the canal.

2) Baseline condition reflects collection system model calculations for a design precipitation record (annual rainfall recorded at JFK International Airport in 1988) and sanitary flows projected for year 2045 (Red Hook WPCP: 40 MGD; Owls Head WPCP: 117 MGD). An existing condition calculation is not available.

Source: NYCDEP 2008a

3) NYC has previously identified OH-601 as RH-032, OH-607 as OH-008, and OH-602 as OH-538.

TABLE 3-3
NYCDEP Shoreline Survey Outfalls Not Observed During Canal Reconnaissance
Gowanus Canal Remedial Investigation
Brooklyn, New York

Shoreline Survey Pipe Identification	Pipe Diameter (Inches)	Comments on Approximate Location[(1)]
OH-114	10	Lowe's Home Improvement store
OH-186	10	Northeast corner of 11th Street turning basin
OH-192	10	Alongside New York City asphalt plant
OH-514	6	End of 5th St.
OH-517	8	Corner of 4th Street Turning Basin
OH-522	8	Lowe's Home Improvement store
OH-602	18	South of Gowanus Expressway
OH-888	6	Lowe's Home Improvement store
RH-033	38W x 44H	End of Douglass St
RH-037	18	End of Sackett St.
RH-836	6	Approximately 50 feet south of Sackett St.
RH-837	3	Verizon property
RH-134	10	End of Bay St.
RH-154	12	3rd St. concrete facility
RH-575	4	End of Huntington St.
RH-587	4	3rd St. concrete facility
RH-588	4	3rd St. concrete facility
RH-601[2]	12	9th St., west side of canal

(1) Approximate location is based on the maps in the NYCDEP Shoreline Survey Reports and physical features / streets noted during the field survey in the general areas where these outfalls were expected to be situated.
(2) NYC has previously identified RH-601-as RH-032.

TABLE 4-1
Summary of Validation Qualifiers Applied to Remedial Investigation Data
Gowanus Canal Remedial Investigation
Brooklyn, New York

Validation Qualifier	Count	Percentage	Available for Use as Reported	Available for Use as Qualified	Not Available for Use	Definition	Effect on Data Quality
U	180,849	66.17%	X	X		Not detected. May also indicate "not detected at significantly greater concentration than that in an associated blank"	If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater concentration than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results. The data user should take caution when a U-qualified result is greater than a screening level.
[null]	35,173	12.87%	X			Detected	No effect on data quality. Detected. Available as reported. Note that "[null]" indicates that a data point is not accompanied by a qualifier.
J	31,068	11.37%	X	X		Concentration estimated	If applied by the laboratory, this indicates "below reporting limit" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "estimated". This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as detects at their reported concentration as long as the data user understands that the concentration is estimated.
UJ	18,531	6.78%		X		Not detected, quantitation limit is estimated	This indicates "nondetect, estimated quantitation limit". This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination. These results are usable as nondetects at their reported quantitation limit as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.
R	6,297	2.30%			X	Rejected	Significant negative effect. Not available for use. Note that any reported rejected data are accompanied by the R-qualifier.
NJ	1,395	0.51%		X		Qualitative identification questionable due to poor resolution. Presumptively present at approximate quantity.	This indicates "presumptively present at approximate quantity". This may indicate a QA/QC issue (most often precision exceedance between results from dual-columns) but not one severe enough to warrant rejection of data. These results are usable as detects at their reported concentration as long as the data user conservatively considers the analyte "present" and understands that the concentration is estimated.

Notes:
QA/QC = quality assurance/quality control
CRQL = contract-required quantitation limit

TABLE 4-2
List of Evaluation Criteria Used to Evaluate the Nature and Extent of Contamination
Gowanus Canal Remedial Investigation
Brooklyn, New York

Surface Sediment, Subsurface Sediment, CSO Sediment

The standards / criteria below are used to evaluate the degree of contamination found in the surface sediments in the Gowanus Canal. These standards / criteria are also used to provide a perspective on the concentrations in subsurface sediments and CSO sediments. The results for the surface sediment reference locations are also compared to the results for the surface sediment locations within the canal.

A. U.S. Environmental Protection Agency (USEPA). 2010. Residential soil RSL from EPA Regional Screening Table, May 2010. RSLs based on noncancer risk divided by 10 to account for exposure to more than one constituent that effects the same target organ.
http://www.epa.gov/reg3hwmd/risk/human/rb-concentration_table/Generic_Tables/index.htm

The standards / criteria listed below are used in the following order to create criteria R: 1) use criteria B1 first; 2) if no criteria available for a constituent under B1, go to C; 3) if no criteria available for a constituent under B1 and C, go to D; and 4) if no criteria available for a constituent under B1, C, and D, go to E and use in this order – E1, E2, E3.

B. New York State Department of Environmental Conservation (NYSDEC). 1999. Technical Guidance for Screening Contaminated Sediments. New York State Department of Environmental Conservation. (Benthic aquatic life chronic toxicity values for saltwater (designated SW)
B1 - NYSDEC 1999 Benthic Aquatic Life Chronic Toxicity (2% TOC)
B2 - NYSDEC 1999 Benthic Aquatic Life Chronic Toxicity (6.5% TOC) – included for informational purposes only

C. Jones, D.S., G.W. Suter II, and R.N. Hull. 1997. Toxicological benchmarks for screening contaminants of potential concern for effects on sediment-associated biota: 1997 revision. Environmental Restoration Division, ORNL Environmental Restoration Program. ES/ER/TM-95/R4. (Marine and estuarine benchmarks, lower of ER-L or TEL values)

D. Washington Department of Ecology (WDOE). 1995. Chapter 173-204 WAC, Sediment Management Standards. http://www.ecy.wa.gov/biblio/wac173204.html (Marine Sediment Quality Standards; presented in Table 1, under WAC 173-204-320)

E. Buchman, M.F., 2008. NOAA Screening Quick Reference Tables, NOAA OR&R Report 08-1, Seattle WA, Office of Response and Restoration Division, National Oceanic and Atmospheric Administration, 34 pages. (Marine surface water, chronic values)
E1 - SQuiRTs 2008 Mar SD TEL
E2 - SQuiRTs 2008 Mar SD ERL
E3 - SQuiRTs 2008 Mar SD PEL

Surface Water, CSO Water, Pipe Outfall Water

The standards / criteria below are used to evaluate the degree of contamination found in the surface water in the Gownus Canal. These standards / criteria are also used to provide a perspective on the concentrations in CSO water, and pipe outfall discharges. The results for the surface water reference locations are also compared to the results for the surface water locations within the canal.

The standards / criteria listed below are used in the following order to create criteria T and S:

Criteria T: Use the lesser of F or G2; use H if no F or G2 criteria available for a constituent.

Criteria S: 1) use criteria L1 first; 2) if no criteria available for a constituent under L1, go to I; and 3) if no criteria available for a constituent under L1 and I, go to K.

F. U.S. Environmental Protection Agency (USEPA). 2009. National Recommended Water Quality Criteria. Office of Water, Office of Science and Technology. Human Health for Consumption of Organism only.

G. New York State DEC, Chapter X, Division of Water, Part 703: Surface Water and Groundwater Quality Standards and Groundwater Effluent Limitations. Values correspond to classification of canal (SD) and classification of Bay (I) and are the standards for Health-fish consumption and recreation.
G1 - NYSDEC Chapter X for surface water (fish consumption) I H(FC) – included for informational purposes only, applies to Gowanus Bay
G2 - NYSDEC Chapter X for SW (fish consumption) SD H(FC)

TABLE 4-2
List of Evaluation Criteria Used to Evaluate the Nature and Extent of Contamination
Gowanus Canal Remedial Investigation
Brooklyn, New York

H. U.S. Environmental Protection Agency (USEPA). 2010. Tap Water RSL from EPA Regional Screening Table, May 2010.
RSLs based on noncancer divided by 10 to account for exposure to more than one constituent that effects the s ame target organ.

I. U.S. Environmental Protection Agency (USEPA). 2009. National Recommended Water Quality Criteria. Office of Water, Office of Science and Technology. 4303T. Saltwater chronic value (CCC) for the protection of aquatic life.

J. New York State Department of Environmental Conservation (NYSDEC). 1998. Water Quality Standards and Analytical Support. http://www.dec.ny.gov/chemical/23842.html. Chronic marine values for protection of aquatic life. (Note that these values have been incorporated into reference L and this reference is included here only to indicate that it was also reviewed).

K. Buchman, M.F., 2008. NOAA Screening Quick Reference Tables, NOAA OR&R Report 08-1, Seattle WA, Office of Response and Restoration Division, National Oceanic and Atmospheric Administration, 34 pages. Marine surface water, chronic values.

L. New York State DEC, Chapter X, Division of Water, Part 703: Surface Water and Groundwater Quality Standards and Groundwater Effluent Limitations . Values correspond to classification of canal (SD) and classification of Bay (I) and are the standards for Aquatic-Chronic toxicity.
L1 - NYSDEC Chapter X for surface water (aquatic chronic toxicity) I A(C) – included for informational purposes only, applies to Gowanus Bay

Groundwater

Groundwater was evaluated to assess groundwater interactions with the surface water in the canal. For completeness and to provide a perspective on the significance of detected concentrations at the locations where the monitoring wells were installed, the detected concentrations in groundwater are compared to the standards / criteria listed below.

The standards / criteria listed below are used in the following order to create criteria 1) use criteria N1 first; 2) if no criteria available for a constituent under N1, go to O1; and 3) if no criteria available for a constituent under N1 and O1, go to O2.

N. U.S. Environmental Protection Agency (USEPA). Maximum Contaminant Levels and MCLGs. http://www.epa.gov/safewater/contaminants/index.html (N1 is MCLs, N2 is MCLGs).

O. New York State DEC, Chapter X, Division of Water, Part 703: Surface Water and Groundwater Quality Standards and Groundwater Effluent Limitations. Values correspond to classification of groundwater along the canal (GA) and are the standards for Health-Water Source and Aesthetic -Water Source (includes O1 and O2).

Air

P. U.S. Environmental Protection Agency (USEPA). 2010. Residential air RSLs from EPA Regional Screening Table, May 2010. RSLs based on noncancer risk divided by 10 to account for exposure to more than one constituent that effects the same target organ.
http://www.epa.gov/reg3hwmd/risk/human/rb-concentration_table/Generic_Tables/index.htm

Soil

Soils were evaluated at the locations where monitoring wells were installed. For completeness and to provide a perspective on the significance of detected concentrations at the locations where the monitoring wells were installed, detected concentrations in soils are compared to the standards / criteria listed below.

Q. New York State DEC. 2009. Subpart 375-6: Remedial Program Soil Cleanup Objectives. December 14, 2006 and NYSDEC Draft CP/Soil Cleanup Guidance, November 4, 2009. Values used correspond to restricted use soil cleanup objectives; Protection of Groundwater.

TABLE 4-3
Summary of Evaluation Criteria Used to Evaluate Nature and Extent of Contamination
Gowanus Canal Remedial Investigation
Brooklyn, New York

Medium	Evaluation Criteria		
	Human Health Risk	**Ecological Risk**	**General**
Sediment - surface in canal	A	R (developed using this order:B1, C, D, E1, E2, and E3)	
Sediment – CSOs	A	R (developed using this order:B1, C, D, E1, E2, and E3)	
Sediment – subsurface soft	A	R (developed using this order:B1, C, D, E1, E2, and E3)	
Sediment – subsurface native	A	R (developed using this order:B1, C, D, E1, E2, and E3)	
Surface water in canal - dry and wet events	T (lesser of F or G2, H if no F or G2)	S (lesser of I or K)	
Surface water – CSOs	T (lesser of F or G2, H if no F or G2)	S (lesser of I or K)	
Surface water - pipe outfalls	T (lesser of F or G2, H if no F or G2)	S (lesser of I or K)	
Groundwater			N1, O1,O2
Soil			Q
Air	P		

Evaluation criteria for each letter are defined in Table 4-2.

Page Intentionally Left Blank

Notes for Statistical Summary Tables
Gowanus Canal Remedial Investigation
Brooklyn, New York

Columns included in all statistical summary tables are listed and defined below:

Parameter – This column lists detected constituents and is organized by parameter class (e.g., VOCs, SVOCs, etc). Constituents that were not detected within any sample for that matrix or data set are not included in the statistical summary tables.

Frequency of Detection - The frequency of detection represents the (total number of detections, excluding rejected and duplicate results) / (total number of samples analyzed, excluding rejected and duplicate results); value in parenthesis is the detection frequency presented as a percentage.

Number of Results - Total number of results includes all results (includes rejected results and excludes duplicate results). For field duplicate results, only best result is used (i.e., the highest detected value, or the detected value if one result is a detect and the other a non-detect).

Range of Non-Detect Values – This column presents the range of analytical detection levels observed for non-detected results. An entry of "--" for the range of non-detect values indicates that the parameter was detected in all samples.

Range of Detected Values – This column presents the range of detected analytical results.

Location of Maximum Detect- This column presents the location where the maximum detected concentration was found.

Parameters are listed twice when the maximum concentration is observed at two locations

Mean (1/2 RL for Non-Detects) – This column presents the mean concentrations calculated using a value of ½ the reporting limit (RL) for non-detected results.

Ecological Screening Value "designation letter" (# of Exceedances) – This column shows the ecological screening value followed in parenthesis by the number of results that exceeded the value. Note that multiple sources of screening values were available for each medium. Table 4-2 lists the sources of the screening values for each medium and assigns a letter to each as a reference. Because multiple sources of values were available for each medium, a prioritization order was developed to determine how the values were applied to each medium. Section 4-2 describes this prioritization order and Table 4-3 provides a summary of the prioritization scheme. The complete list of values is in Appendix C. Surface sediment and surface water samples collected from reference areas were not compared to screening values.

When a screening value was not available, the following designation was used: NA - Not available

Human Health Screening Value "designation letter" (# of Exceedances) - This column provides the same information as described above for the ecological screening values, but are related to human health.

Units:

mg/kg – milligrams/kilogram

µg/kg – micrograms/kilogram

ng/kg – nanograms/kilogram

mg/l – milligrams/liter

µg/l – micrograms/liter

$\mu g/m^3$ – micrograms/cubic meter

Calculation of total concentrations: Total PAH was calculated by summing the detected concentrations of the 16 priority pollutant PAHs. Total DDT was calculated by summing the detected concentrations of p,p'-DDD, p,p'-DDE, and p,p'-DDT. Total PCB was calculated by summing either detected concentrations of PCB Aroclors, or detected concentrations of PCB congeners. If any constituent had a rejected, or "R"-flagged, result, a total value was not calculated for the sample.

The following notes are specific to the table listed:

Table 4-6 – Soft Sediment:
The number of results varies for some parameters due to different target analyte lists used by GEI (2007) and USEPA.

Table 4-8a Surface Water – Canal – Dry Weather:
The number of results does not include an additional sample collected at the end of Sackett Street that was not part of the planned wet and dry weather sampling events.

Table 4-8b Surface Water – Reference – Dry Weather:
The total number of samples includes the location in Buttermilk Channel.

Table 4-9a Surface Water – Canal – Wet Weather:
The number of results does not include an additional sample collected at the end of Sackett Street that was not part of the planned wet and dry weather sampling events.
Location (325) could not be sampled during the wet event sampling.

Table 4-9b Surface Water – Reference – Wet Weather:
The total number of samples includes the location in Buttermilk Channel.

Table 4-19 Soil Samples:
Split samples from oversight sampling are not included in the statistical summary.

Tables 4-20a – Shallow Groundwater and 4-20b – Intermediate Groundwater:
Split samples from oversight sampling are not included in the statistical summary.
Filtered metals were not analyzed at New York City well locations.
Analytical results were not available for some constituents at some locations. "Number of Results" column indicates the number of samples included in statistical summary.

Tables 4-21a – Tissue – Summary of Results Used in Ecological Risk Assessment and 4-21b – Tissue – Summary of Results Used in Human Health Risk Assessment:
All tissue concentrations are reported in wet weight.
"PCB Dioxin" refer to "PCB Dioxin-like PCBs" and "PCB Nondioxin" refer to "PCB Nondioxin-like". Dioxin-like PCB congeners are listed below; all other congeners are non-dioxin like.

3,3',4,4'-Tetrachlorobiphenyl (77)
3,4,4',5-Tetrachlorobiphenyl (81)
2,3,3',4,4'-Pentachlorobiphenyl (105)
2,3,4,4',5-Pentachlorobiphenyl (114)
2,3',4,4',5-Pentachlorobiphenyl (118)
2,3',4,4',5'-Pentachlorobiphenyl (123)
3,3',4,4',5-Pentachlorobiphenyl (126)
Congeners (156/157)
2,3',4,4',5,5'-Hexachlorobiphenyl (167)
3,3',4,4',5,5'-Hexachlorobiphenyl (169)
2,3,3',4,4',5,5'-Heptachlorobiphenyl (189)

TABLE 4-4a
Surface Sediment - Canal - Statistical Summary
Gowanus Canal Remedial Investigation
Brooklyn, New York

Parameter	Frequency of Detection	Number of Results	Range of Non-Detect Values	Range of Detected Values	Location of Max Detect	Mean (1/2 RL for Non Detects)	Ecological Screening Value R (# of Exceedances)	Human Health Screening Value A (# of Exceedances)
Volatile Organic Compounds (ug/kg)

Notes:

1. The average of all soft sediment samples from the transect is listed first. The depth ranges below (0-2', 2-4', and 4-6') are average total PAH concentrations in native sediment for a given transect.
2. Transects T1 through T8 were sampled in 2010 by USEPA.
3. Transects A through BB, and those within the three turning basins were originally sampled by National Grid in 2005. These locations were resampled in 2010 and the averages presented utilize soft sediment data from both data sets. Native sediment data from only the 2010 USEPA sampling is included in this summary.
4. Field duplicates are not included (duplicates were omitted).

NR - Not Recovered

ug/kg - micrograms/kilogram

Comparison of Air Concentrations at Canoe Level and Street Level

Gowanus Canal Remedial Investigation

Brooklyn, New York

		Central Tendency Comparison	
Parameter	**Test**	**Probability that the Observed Differences Would Occur Purely by Chance**	**Statistical Decision with 0.05 Significance Level**
Round 1 - Volatile Organic Compounds (ug/m^3)			
Acetone	WRS	0.762	nsd
Benzene	WRS	0.791	nsd
Bromoform	Gehan	0.347	nsd
Carbon disulfide	Gehan	0.272	nsd
Chloroform	WRS	0.670	nsd
Chloromethane	WRS	0.111	nsd
Ethylbenzene	WRS	0.791	nsd
Methyl ethyl ketone (2-butanone)	WRS	0.287	nsd
Methylene chloride	Gehan	0.452	nsd
Toluene	WRS	0.762	nsd
Trichloroethylene (TCE)	Gehan	0.459	nsd
Xylene, total	WRS	0.256	nsd
Round 1 - Polynuclear Aromatic Hydrocarbons (PAHs) (ug/m^3)			
Acenaphthene	WRS	0.070	nsd
Acenaphthylene	WRS	0.104	nsd
Anthracene	WRS	0.026	Canoe > Street
Fluoranthene	WRS	0.140	nsd
Fluorene	WRS	0.140	nsd
Naphthalene	WRS	0.149	nsd
Phenanthrene	WRS	0.049	Canoe > Street
Pyrene	WRS	0.031	Canoe > Street
Round 2 - Volatile Organic Compounds (ug/m^3)			
Acetone	WRS	0.910	nsd
Benzene	WRS	0.272	nsd
Chloroform	WRS	0.368	nsd
Chloromethane	WRS	1.000	nsd
Ethylbenzene	WRS	0.364	nsd
Methyl ethyl ketone (2-butanone)	WRS	0.520	nsd
Methylene chloride	Gehan	0.500	nsd
Toluene	WRS	0.340	nsd
Trichloroethylene (TCE)	WRS	0.168	nsd
Xylene, total	WRS	0.264	nsd
Round 2 - Polynuclear Aromatic Hydrocarbons (PAHs) (ug/m^3)			
Acenaphthene	WRS	0.399	nsd
Acenaphthylene	WRS	0.374	nsd
Anthracene	WRS	0.142	nsd
Fluoranthene	WRS	0.230	nsd
Fluorene	WRS	0.450	nsd
Naphthalene	WRS	0.267	nsd
Phenanthrene	WRS	0.399	nsd
Pyrene	WRS	0.248	nsd

Notes:

Test was performed for detected constituents only.

WRS = Wilcoxson Rank Sum

- = test not performed

nsd = no significant difference

ug/m^3 = micrograms per cubic meter

Sediment Core Sample Locations
Lower Canal
Gowanus Canal Remedial Investigation
Brooklyn, New York

CH2MHILL

At individual coring stations, sediment samples were collected from the entire sediment profile to a target depth of 6 feet into the native sediment deposits. Samples were collected using a 2-foot composite interval.

At coring stations located on previously sampled transects, sediment samples were collected from the native sediment only. Three samples were collected using a 2-foot composite interval, to a target depth of 6 feet into the native sediment deposits.

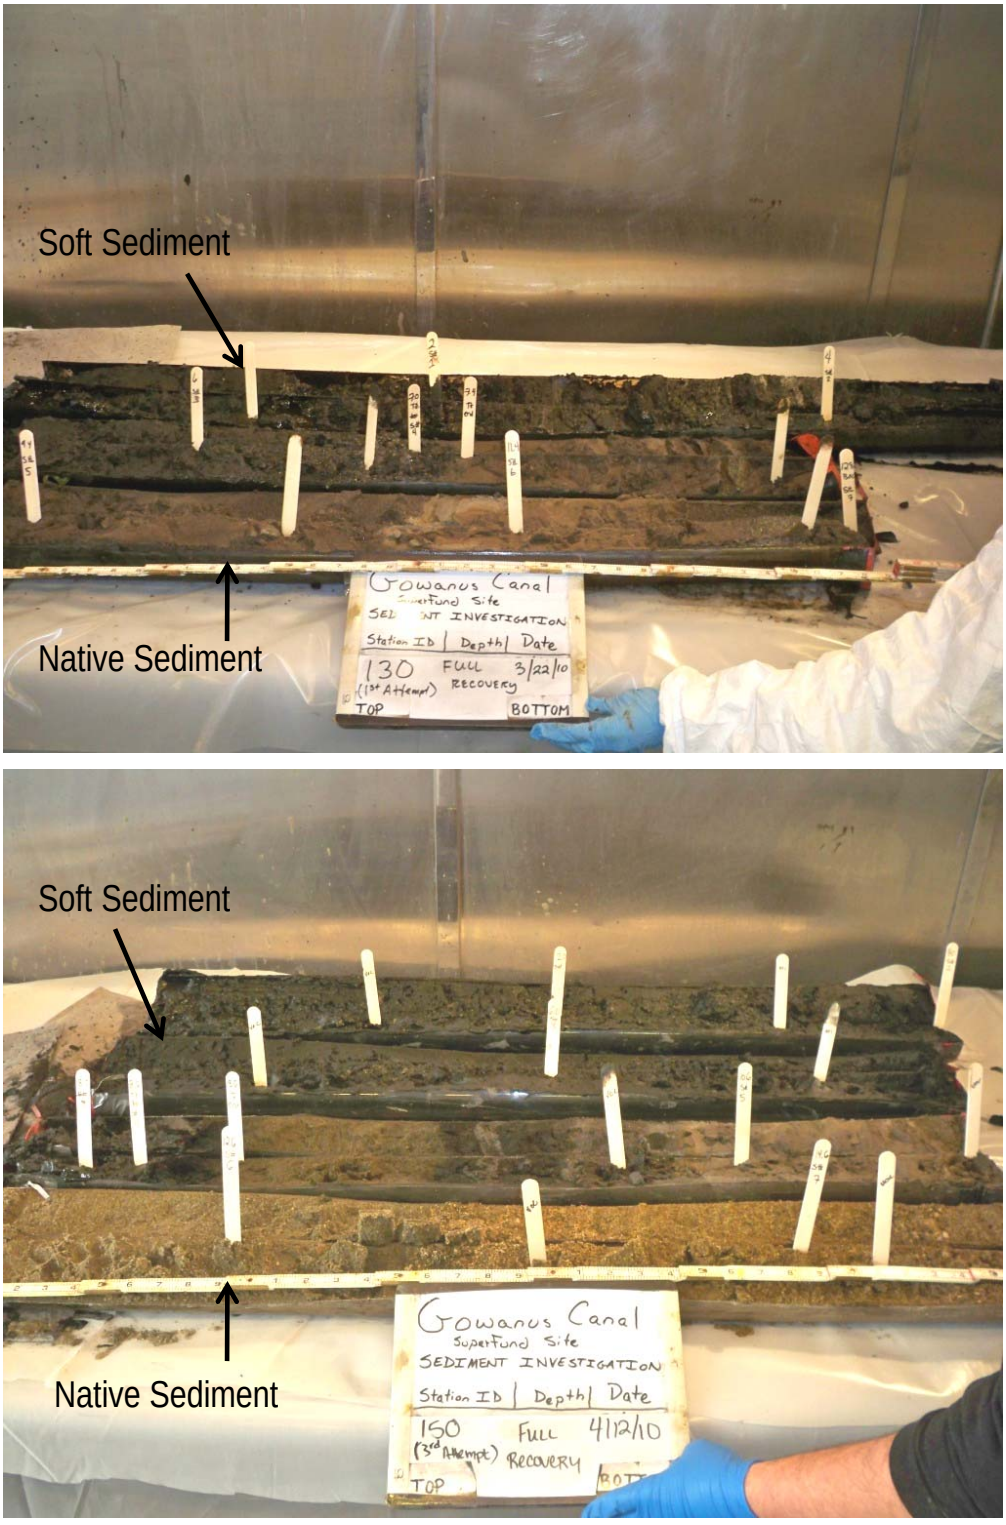
Sediment core from location SD-125 (Figure 2-1), near cross-section B-B' near the head of the canal (Figure 3-9). Lower photo illustrates NAPL saturated native sediment between -21.1 and -22.7 feet NAVD88.

FIGURE 4-4a
Representative Sediment Core Photos
Gowanus Canal Remedial Investigation
Brooklyn, New York



Transition zone observed in sediment core from location SD-29A (Figure 2-1), near cross-section C-C' near end of 2nd Avenue (Figure 3-9). Lower left photo illustrates staining observed on sampling equipment after sediment processing. Photo at lower right illustrates NAPL saturated native sediment between -23.6 and -25.6 feet NAVD88.

FIGURE 4-4b
Representative Sediment Core Photos
Gowanus Canal Remedial Investigation
Brooklyn, New York

Sediment core from location 111 (Figure 2-1), near cross-section C-C' near within the 4th Street turning basin (Figure 3-9). Lower photo illustrates NAPL saturated native sediment between -17.1 to -19.1 feet NAVD88.

FIGURE 4-4c
Representative Sediment Core Photos
Gowanus Canal Remedial Investigation
Brooklyn, New York

Sediment cores from locations SD-130 (top), near cross-section D-D' and the 9th Street bridge, and SD-150, near cross-section E-E'. (Figure 3-9). Location SD-150 is located on the western side of the channel, approximately 750 feet south of Hamilton Avenue. Sediment core locations are shown in Figure 2-1.

Legend

2010 Sediment Coring and
Monitoring Well / Soil Boring Locations

- NAPL-saturated
- NAPL Sheen, Coating, Staining, or Blebs
- No Observed NAPL Impacts
- No Soft Sediment was Recovered

Bathymetric Contours
(feet NAVD88, 1 foot contour interval)

Former MGP Site

Gowanus Canal

Notes:

1. NAPL impacts noted for -20 feet NAVD88 and above in monitoring well locations as observed during soil boring installation.
2. NAPL noted in multiple historical soil borings from the former MGP sites.
3. Locations for 133, 134 and 135 are approximate.
