D-07 – CSO Sampling Field Forms

Page Intentionally Left Blank

CSO Sediment Sampling Form
Gowanus Canal Remedial Investigation
Brooklyn, Kings County, New York

Samplers/Inspectors: Michael Murphy, Graham Shirley, Casey Stoke (CHDR)
Station ID: OH-005
Time: 1310
Subcontractor/Crew: Traffic Safety
Water Depth: 12.3 - 12.85
Tide: not recorded
Weather: Sunny - 80° - low humid

CSO Sediment Sample ID: GC-SDOH005
Grab Penetration: 0.5 ft
Sample Time: H_2O - 1330, Sed - 1915
Number of Sampling Attempts: >10
Problems During Collection: None

QC SAMPLE DATA

QA/QC SampleIDs: (NONE) DUP _____, MS/MSD _____

SURFACE WATER DATA & CONDITIONS

DO (mg/L)	pH (SU)	Temp (C)	Salinity (ppt)	Sp Cond (mS/cm^3)	Turbidity (NTU)	ORP (mV)	Comments
3.76	6.09	24.77	0.3	0.661	Over Range	-96	dark brown/gray

Floating Debris (describe): Floating solids - brown color
Water Color: brown - very turbid
Clarity: Very turbid - brown
Turbidity: Very turbid - brown
Sheen: none detected

Sample Analytical Parameters: / **Bottleware/Preservation:**

CSO wastewater ID: GC-SWOH005-DW-1

TCL VOCs	✓	5 x 40 mL vials/TerraCore with stir bar, 1-40 mL vial,full; 4°C
TCL SVOCs	✓	8 oz Amber, wide mouth glass; protect from light, 4°C
TCL Pesticides	✓	8 oz wide mouth glass; 4°C
TCL PCBs	✓	8 oz wide mouth glass; 4°C
TAL Metals + Hg	✓	8 oz wide mouth glass; 4°C + filtered 0.45um
Cyanide	✓	8 oz wide mouth glass; 4°C
TOC	✓	4 oz wide mouth glass; 4°C
Grainsize		
AVS/SEM		4 oz wide mouth glass; no headspace; 4°C
Toxicity		3 x 1-gallon HDPE buckets; 4°C

- wastewater samples collected from the 0-0.5' interval using laboratory cleaned certified HDPE bottleware
- VOC sample collected + paired at a slow rate to prevent volatilization

SED SAMPLE DESCRIPTION

O_2=

COMMENTS/OBSERVATIONS

- Wastewater samples collected from 0.0' - 0.5' interval using certified laboratory cleaned HDPE bottleware (disposable)
- VOC sample collected & poured at slow rate to prevent volatilization

Biswas (mm)
Frank ~~Suriero~~ (NYCDEP) Matthew Feller + Brett Still (GGJ) Provide oversight

Sampler Signature/Date 7/13/10

- On Nevins at the end of Sackett St. (in front of private entrance)

Battery issue

Battery issue

1056 attempted to pull PAH pump but had to move due to traffic

(OB)

504C : When we checked 504C @ ~1300 we noticed that the 504C pump was running but it only showed 18 min run time (the other 2 in the cage were @ ~190 min)
I hit "Hold" button & it stopped, I hit "Start" & it ran for ~2 min before it stopped again (it was not showing Lo Batt or any problems ... possibly a "set-up configuration
Contacted CH2M & decided to replace pump
CH2M brought new pump (07770).
The Initial pump ran for 28 min before we switched it out

Notes:

MW-28I - Installed by USEPA

MW-30I - Installed by National Grid

MW-18I - Installed by NYC

Original Staff Gauge ID	Standardized EPA Staff Gauge ID
Stream Gauge - Gowanus Pump Station	SGMW-2
Stream Gauge - Former Power Station	SGMW-9
Stream Gauge - DOT	SGMW-18
Canal-Gate Station	SGMW-23
Canal-Degraw St	SGMW-31
Canal-Union St	SG-Union
Canal-Mazzei	SGMW-32

[1] - Montitoring well MW-46I was originally mislabled as MW-46D. This well is screened in the intermediate zone and is identified in the report as MW-26I.

[2] - MW-40S – Elevation not compensated for LNAPL thickness

NAPL observed in monitoring well

NP - No Product

NA - Not applicable

NR - Not recorded

All interface probes were calibrated to within 0.1 inch on 07/26/10

Page Intentionally Left Blank

Appendix D-9
Monthly Water Level Measurement Summary - August 2010
Gowanus Canal Remedial Investigation
Brooklyn, NY

August 23, 2010
Tide: Low @ 14:07pm

Notes:

MW-28I - Installed by USEPA

MW-30I - Installed by National Grid

MW-18I - Installed by NYC

Original Staff Gauge ID	Standardized EPA Staff Gauge ID
Stream Gauge - Gowanus Pump Station	SGMW-2
Stream Gauge - Former Power Station	SGMW-9
Stream Gauge - DOT	SGMW-18
Canal-Gate Station	SGMW-23
Canal-Degraw St	SGMW-31
Canal-Union St	SG-Union
Canal-Mazzei	SGMW-32

[1] - Montitoring well MW-46I was originally mislabled as MW-46D. This well is screened in the intermediate zone and is identified in the report as MW-26I.

[2] - MW-40S – Elevation not compensated for LNAPL thickness

NAPL observed in monitoring well

NP - No Product

NA - Not applicable

NR - Not recorded

All interface probes were calibrated to within 0.1 inch on 08/23/10

Page Intentionally Left Blank

Appendix D-9
Monthly Water Level Measurement Summary - September 2010
Gowanus Canal Remedial Investigation
Brooklyn, NY

September 29, 2010
Tide: High @ 12:01pm

Canal-Mazzei	SGMW-32

[1] - Montitoring well MW-46I was originally mislabled as MW-46D. This well is screened in the intermediate zone and is identified in the report as MW-26I.

[2] - MW-40S – Elevation not compensated for LNAPL thickness

NAPL observed in monitoring well

NP - No Product

NA - Not applicable

NR - Not recorded

All interface probes were calibrated to within 0.1 inch on 09/29/1(

Notes:

MW-28I - Installed by USEPA
MW-30I - Installed by National Grid
MW-18I - Installed by NYC

Original Staff Gauge ID	Standardized EPA Staff Gauge ID
Stream Gauge - Gowanus Pump Station	SGMW-2
Stream Gauge - Former Power Station	SGMW-9
Stream Gauge - DOT	SGMW-18
Canal-Gate Station	SGMW-23
Canal-Degraw St	SGMW-31
Canal-Union St	SG-Union
Canal-Mazzei	SGMW-32

[1] - Montitoring well MW-46I was originally mislabled as MW-46D. This well is screened in the intermediate zone and is identified in the report as MW-26I.

[2] - MW-40S – Elevation not compensated for LNAPL thickness

NAPL observed in monitoring well

NP - No Product
NA - Not applicable
NR - Not recorded
All interface probes were calibrated to within 0.1 inch on 12/20/1C

Daily Weather Tracking

Morning Report

Date: 6/17/2010
6:15

Actual Precipitation

Date of Last Significant Rainfall event (Field Office): (greater than 0.1")	**NA - Station not set up**
Date of Last Significant Rainfall event (La Guardia): (greater than 0.1")	**June 17th (0.32") (stopped at ~5am)**
Last 24 hours (Field Office):	**NA - Station not set up**
Last 24 hours (Central Park):	**0.45**
Last 24 hours (La Quardia):	**0.32**
Last 24 hours (Kennedy):	**0.08**

Owl Head and Red Hook Pump Stations

Owl Head pump station max flow rate during last 24 hours (MDG):	**95**
Owl Head - current flow rate (MGD)	**25**
Wet / Dry Flows during last 24 hours:	**WET (went to dry between 3 and 4am)**
Red Hook pump station max flow rate during last 24 hours (MGD):	**95**
Red Hook - current flow rate (MGD)	**25**
Wet / Dry Flows during last 24 hours:	**WET (went to dry at 3:10am)**
* Strong sewage odor near canal	

Tides

Low Tide 1	**12:08 AM**
High Tide 1	**6:53am**
Low Tide 2	**7:11am**
High Tide 2	**6:09pm**

Pump Station Updates (throughout the day as needed)

Afternoon Report

Precipication During Last 8 hours (Field Office):	**NA**

Owl Head and Red Hook Pump Station

Owl Head pump station average flow rate during last 8 hours (GPM):	
Wet / Dry Flows during last 8 hours:	
Red Hook pump station average flow rate during last 8 hours (GPM):	
Wet / Dry Flows during last 8 hours:

Evaluation of Results of Tidal Survey

Introduction

This technical memorandum describes the evaluation of a tidal survey conducted at the Gowanus Canal Superfund Site, in Brooklyn, New York between 1300 hours on August 2 and 1400 hours August 6, 2010 (97 hours total). The tidal survey was conducted to characterize the relationship between tidal fluctuations recorded in the Gowanus Canal, potentiometric water levels in shallow and intermediate-depth monitoring wells, and vertical hydraulic gradients in the subsurface adjacent to the canal. This survey evaluated the hydraulic connection with, and the contribution of local groundwater flow to the Gowanus Canal.

Groundwater (potentiometric) levels often exhibit wave-like (sinusoidal) patterns similar to tidal fluctuations in adjacent water bodies. In series, these patterns form oscillations similar to sound, seismic, and electrical cycles that travel in a wave-like forms. In a confined, homogeneous aquifer, sinusoidal oscillations can propagate into the aquifer as a function of tidal fluctuations at aquifer/surface water interface, and the diffusivity (transmissivity / storage coefficient) of the aquifer (Ferris, 1951). Fluctuations attributable to tidal fluctuations attenuate with distance from the surface water body as an exponential function (Erskine, 1991). Also, potentiometric levels respond to loading/unloading of tidal waters on the aquifer skeleton in a confined aquifer. Under these conditions, the compressibility of the aquifer controls the magnitude of the tidal response. Unconfined aquifers display a larger storage coefficient than confined units, dampening tidal fluctuations, and poorly transmitting the pressure signal from the surface water body into the aquifer.

The survey comprised recording tidal measurements at six stations distributed along the 8,000 foot length of the Gowanus Canal northeast from Gowanus Bay, a small tributary within Upper New York Bay. The distances between stations ranged from roughly 700 to 2,000 feet (Figure E-1). All tidal stations were situated adjacent to nested monitoring wells, containing shallow and intermediate wells, and located within 50 feet of the edge of the canal. Six additional nested monitoring wells lay between 150 to 270 feet inland of the canal.

InSitu Micro-Diver data logging systems recorded tidal and potentiometric measurements at 15 minute frequencies over the duration of the survey. Barometric pressure measurements were recorded at an identical frequency. Precipitation data was obtained from a United States National Weather Service Station located in the adjacent Park Slope neighborhood.

Tidal Effects in Canal

Surface water levels in the Gowanus Canal were recorded at six stations. Two tidal cycles (high and low tide) were apparent each day, with each cycle averaging 730 minutes (0.52 days; Table E-1) across the six stations. The maximum fluctuation defined by the difference in elevation between high and low tide defined the tidal range. A hydrograph of elevations in the canal (Figure E-2) featured asymmetric tidal ranges, with values ranging between 3.0 and 4.3 feet.

TABLE E-1
Summary of Amplitude at Tidal Stations in Gowanus Canal during Tidal Survey
1300hrs 08/02/10 to 1400hrs 08/06/2010
Gowanus Canal Remedial Investigation
Brooklyn, New York

Tidal Station	Maximum Tidal Range (feet)	Minimum Tidal Range (feet)
TSMW-3	4.3	3.1
TSMW-13	4.2	2.9
TSMW-15	4.3	2.9
TSMW-20	4.3	2.9
TSMW-25	4.3	3.1
TSMW-33	4.3	3.1

Tidal station data exhibited equivalent ranges along the total length of the canal, showing no attenuation with increasing distance from the Gowanus Bay (Figure E-2).

Tidal Effects in Monitoring Wells

Tidal effects on potentiometric levels were monitored in 24 wells, arrayed in 12 clusters, each containing wells screened across the water table (shallow), and up to 30 feet below the water table (intermediate). The upper screen elevation in the intermediate wells was positioned 5-feet below the bottom of the canal. The shallow wells exhibited maximum water level fluctuations ranging from 0.08 to 3.87 feet with an average fluctuation of 0.85 feet (Figure E-3). The intermediate wells exhibited fluctuations ranging from 0.27 to 2.96 feet, with an average of 1.10 feet.

All intermediate wells exhibited a sinusoidal, oscillatory pattern even when the pattern was not evident in the overlying shallow well (Figure E-4). Given the distance of half of the wells from the canal exceeded 100 feet, the response to tidal fluctuations appeared correspondent to loading of the tidal wedge on the overlying aquiclude, suggestive of confined or leaky confined conditions.

The nested monitoring well design allowed accurate estimation of vertical gradients adjacent to the canal, and vertical gradient hydrographs (Figure E-5). Six clusters displayed upward gradients, (Figure E-6, Table E-2), while five exhibited a downward gradient. One well exhibited a median vertical gradient around zero.

With one exception (MW-26), monitoring wells located greater than 150 feet away from the Gowanus Canal exhibited a mean downward gradient, indicative of vertical gradients in a recharge area. Vertical gradients at these locations ranged from 0.005 to 0.015 foot per foot (ft/ft). By comparison, clusters closer to the canal displayed upward gradients typical of discharge areas (Figure E- 7), with vertical gradients ranging from 0.005 to 0.06 ft/ft.

TABLE E-2
Summary of Vertical Gradients Calculated from Transducer Data
Gowanus Canal Remedial Investigation
Brooklyn, New York

Well Cluster	Minimum Vertical Gradient (ft/ft)	Maximum Vertical Gradient (ft/ft)	General Direction	Median Vertical Gradient (ft/ft)	Median Direction	Distance from Canal (ft)
MW-3S/I	0	0.12	Up	0.06	Up	14
MW-4S/I	-0.028	-0.01	Down	-0.009	Down	270
MW-13S/I	-0.018	0.018	Both	0	None	32
MW-14S/I	-0.033	0	Down	-0.0165	Down	139
MW-15S/I	-0.03	0.04	Both	0.005	Up	32
MW-16S/I	-0.04	0.005	Both	-0.0175	Down	254
MW-20S/I	0.035	0.065	Up	0.015	Up	48
MW-21S/I	-0.032	-0.002	Down	-0.015	Down	149
MW-25S/I	0.03	0.07	Up	0.02	Up	60
MW-26S/I	0.005	0.018	Up	0.0065	Up	210
MW-27S/I	0.08	0.28	Up	0.1	Up	150
MW-33S/I	-0.045	-0.035	Down	-0.005	Down	236

In several locations, canal elevations exceeded groundwater potentiometric elevations in the shallow monitoring wells consistently at high tide. Further, canal elevations exceeded potentiometric elevations in the intermediate wells at tide, but less frequently than in the shallow wells.

Tidal Efficiency

The tidal efficiency was evaluated for each monitor well to ascertain the magnitude of tidal range in potentiometric hydrograph data compared to the range in Gowanus Canal and Gowanus Bay. The peak ratio method was applied in determining values of tidal efficiency (Erskine, 2003). This method compares the amount of fluctuation between low and high

tide at comparable points between the station located within the canal and peak to trough fluctuations in potentiometric hydrographs at associated monitor wells.

Tidal efficiency values ranged from 1 percent to 89.6 percent, with high numbers indicating a very strong hydraulic, or loading response while low numbers suggesting negligible connection (Table E-3). Tidal efficiency in the shallow wells averaged 19.4 percent while intermediate wells averaged 28.2 percent. The average tidal efficiency in the shallow wells was positively skewed by a strong efficiency at MW-3S (89 percent). MW-3S located 13 feet from the edge of Gowanus Canal, represented the closest cluster to the canal.

TABLE E-3
Summary of Tidal Efficiency
Gowanus Canal Remedial Investigation
Brooklyn, New York

Well	Tidal Efficiency %
MW-3S	89.6
MW-3I	20.1
MW-13S	9.1
MW-13I	40.8
MW-15S	6.5
MW-15I	66.5
MW-20S	9.4
MW-20I	20.4
MW-25S	1
MW-25I	17.3
MW-33S	1
MW-33I	3.9

Extraneous influences on tidal survey data

As described previously, no measureable precipitation was recorded at the local National Weather Service Station in Park Slope. Thus, limited recharge entered the subsurface over the duration of the four day, tidal survey. Barometric pressure data collected at the location of MW-25, declined 0.6 feet of water (ft/H_2O) (Figure E-8) from 34.1 to 33.5 (ft H_2O) over the duration of the survey. The graphs of barometric pressure plotted in ft H_2O of water show a correlative reciprocal signature with potentiometric measurements at four shallow well locations including MW-14S (Figure E-9), MW-15S, MW-16S and MW-33S. Despite manipulation of the hydrograph data at other monitoring wells using statistical techniques developed by the United States Geological Survey, (Halford, 2006) designed to separate tidal fluctuations from hydrograph data, oscillatory potentiometric still obscured barometric influences.

A closer examination of barometric and potentiometric data series using Clark's (1967) linear regression method, indicates that the magnitude of potentiometric fluctuations ranges

lower than barometric fluctuations. Clark's method involves separating barometric and potentiometric fluctuations into line segments of equivalent time. By comparing the magnitude in fluctuations along the two line segments, a coefficient of barometric efficiency was established using the following equation:

$$\mathbf{BE = \Delta s / \Delta bp \times 100}$$

Where:

BE = barometric efficiency
Δs = magnitude of potentiometric fluctuation along line segment
Δ bp = magnitude of barometric pressure along line segment

Barometric efficiency values ranged only from 16 to 27 percent (Table E-4), relatively low values characteristic of unconfined or leaky confined conditions. Although weak, the data indicate potentiometric elevations still responded to changes in barometric pressure.

TABLE E-4
Summary of Barometric Efficiency
Gowanus Canal Remedial Investigation
Brooklyn, New York

Well	Barometric Efficiency %
MW-14S	27
MW-15S	18
MW-16S	17
MW-33S	18

Estimating Transmissivity from Tidal Data

Evaluation of tidal data in comparison to potentiometric shows that potentiometric oscillations remain sinusoidal with a time lag and an exponential decrease in tidal range with distance from the surface water body. Time lag appears as displacement in the position of a peak or trough between tidal and potentiometric oscillations plotted on an identical time scale. The time lag occurs as a function of the aquifer diffusivity; a coefficient defined by transmissivity divided by the storage coefficient. This relationship was further defined by Ferris (1963):

$$T/S = (x^2 * t_0)/(4\pi t_L^2) \text{ where:}$$

Where:

T = transmissivity (FT^2/DAY)
S = storativity (dimensionless)
x = distance from tidal boundary (FT)
t_0 = tidal period (DAYS)
t_L = time lag of given peak/trough after it occurs in the tidal body of water (DAYS)

Analysts can calculate transmissivity by multiplying the solution of the diffusivity equation by the expected storage coefficient of the aquifer. As this solution proves sensitive to estimates of storativity, calculating a range of transmissivity values by applying multiple storativity values in a single analysis provides a more conservative solution.

Examination of hydrograph data from the survey comparing tidal and potentiometric oscillations revealed ten shallow and six intermediate wells showing distinctive time lag relationships. The remaining shallow monitoring wells (2) exhibited no evidence of tidal fluctuations. By comparison, all intermediate monitoring wells showed oscillating potentiometric fluctuations. However, in the remaining six wells, no time lag appeared between the tidal and potentiometric oscillations.

Estimates of transmissivity ranged from 7 to 29,000 feet squared per day (ft^2/d) in the shallow monitoring wells, and from 27 to 47,000 ft^2/d in the intermediate wells (Table E-5). As an informal check, transmissivity estimates were compared against lithology across the screen interval of each well. Elevated transmissivity values correlated to coarser, well sorted sand and gravel, while lower values corresponded with wells screened against silty sands and clay. However, the method yielded less correlative results in finer sands, or sand mixtures.

TABLE E-4
Results of Ferris Method for Estimating Transmissivity
Gowanus Canal Remedial Investigation
Brooklyn, New York

Well	Transmissivity (ft^2/d)	Zone	Lithology in screen
MW-4S	560 to 5600	Shallow	Sandy FILL, (SW)
MW-4I	9300 to 47000	Intermediate	SAND with gravel, (SW)
MW-13S	400 to 1900	Shallow	SAND, (SP)
MW-14S	10 to 100	Shallow	sIlty SAND, (SM)
MW-14I	500 to 5000	Intermediate	SAND, (SP)
MW-15S	200 to 1100	Shallow	SAND with gravel, (SW)
MW-20S	5700 to 29000	Shallow	sIlty SAND, (SM)
MW-21S	1280 to 13000	Shallow	GRAVEL with sand (GW) over silty CLAY (CL)
MW-21I	1800 to 18100	Intermediate	silty Clay (CL) over SAND (SP)
MW-25S	10 to 90	Shallow	clayey SAND (SC)
MW-26S	70 to 700	Shallow	Cobbly fill (GW) over clayey SAND (SC)
MW-26I	100 to 1000	Intermediate	clayey SAND (SC)
MW-27S	200 to 2000	Shallow	cobbly fill (GW) over silty CLAY (CL)
MW-27I	50 to 500	Intermediate	silty SAND, (SM)
MW-33S	7 to 70	Shallow	silty CLAY (CL) , PEAT (PT), silty CLAY (CL)
MW-33I	27 to 300	Intermediate	SAND (SW), silty CLAY (CL), silty SAND (SM)

Despite the heterogeneity of materials underlying this urban area, most of the subsurface appears fairly transmissive. Of the 16 wells selected for time lag analysis, only three were screened across silt or clay beds. Consistent with the transmissivity of the study area only six of the minima values ranged less than 100 ft^2/d.

Estimates of Inland Tidal Oscillations

An important aspect of evaluating the tidal survey involved predicting the distances where potentiometric oscillations attenuate to less than measureable levels. These observations support evaluating potentiometric information in upland areas around Gowanus Canal. In general, oscillations in the shallow monitoring wells exhibited less tidal range than the intermediate wells, reflecting greater storage coefficients (orders of magnitude), inherent with unconfined conditions.

One exception appeared at MW-27S, where a tidal range of 3.75 feet occurred at a distance over 235 feet east of the canal. MW-27S screens construction debris including timbers, bricks, and cobble-size clasts of concrete. These materials exhibited an elevated coefficient of transmissivity (2,000 ft^2/d), but not the maximum values estimated from the survey data. The heterogeneity of the fill materials could induce locally confined conditions in thin, but highly permeable units of fill.

Fluctuations in the shallow monitoring wells were predicted to attenuate to less than 0.1 feet within 300 feet from the Gowanus Canal (Figure E-10). Furthermore, with the exception of MW-27S, fluctuations in the shallow monitoring wells ranged between 0 and 0.5 feet beyond 50 feet from the canal.

The pervasive nature of potentiometric oscillations in the intermediate wells suggests groundwater flow occurs under confined, or leaky conditions. Under confined conditions, potentiometric oscillations reflect the response of the aquifer skeleton and confined water to the weight of the tidal wedge loading onto an overlying aquiclude. Boring logs exhibit clay/silty beds over lying sand zones screened by the intermediate wells. Relative compressibilities of the skeletal mass and the confined water determine the ratio of stress, and the net response of the potentiometric surface to the surface force (Ferris, 1963).

Considering potential confined conditions, distances to both the Gowanus Canal, and to Gowanus Bay influenced potentiometric responses to tidal fluctuations in the intermediate wells. As defined from intermediate wells situated on either side of Gowanus Canal (Figure E- 11) predicted fluctuations attenuated to less than 0.1 feet approximately 500 east/west of the canal.

Gowanus Bay and surrounding Upper New York Bay envelopes the study area, posing a potential loading source to confined sediments. Plotting maximum fluctuations for intermediate monitoring wells situated along the length of the canal predicts that fluctuations attenuate to less than 0.1 feet 9,000 feet northeast of Gowanus Bay (Figure E-12).

Conclusions

The following conclusions were drawn from evaluation of the tidal survey:

- The maximum tidal range in Gowanus Canal ranged between 4.2 and 4.3 feet along its full length extending from Gowanus Bay 8,000 feet inland. Tidal fluctuations in Gowanus Canal exhibited no evidence of attenuation with distance from the bay.
- Potentiometric fluctuations attributable to tidal oscillations ranged up to 3.75 feet at MW-3S, located within 13 feet of the canal. However, hydrographs from several shallow monitoring wells, particularly at distances greater than 150 feet, displayed no tidal influence.
- Typical of unconfined conditions, sinusoidal potentiometric oscillations attenuated to less than 0.1 feet at distances greater than 300 feet from Gowanus Canal in the shallow monitoring wells.
- All of the intermediate monitoring wells exhibited sinusoidal oscillations typifying tidal influences. Potentiometric fluctuations ranged to greater than 3.0 feet in wells located adjacent to Gowanus Canal.
- Distance from Gowanus Bay also appeared to influence the magnitude of potentiometric fluctuations in the intermediate wells suggesting that loading/unloading of the tidal wedge affected potentiometric response.
- In the intermediate wells, sinusoidal potentiometric oscillations attenuated to less than 0.1 feet at distances greater than 500 feet from Gowanus Canal.
- The direction of vertical gradients displayed in monitoring well clusters located adjacent to Gowanus Canal appeared invariably upward, the expected direction of flow in a location where groundwater discharges to a surface water body.
- With only one exception, the direction of vertical gradients in monitoring well clusters located 150 feet from the canal were downward, typical of the direction of groundwater flow in an upland, recharge area.
- The strong sinusoidal, oscillating, potentiometric fluctuations in the shallow and intermediate monitoring wells indicate that the shallow water bearing zone maintains a strong hydraulic connection with the Gowanus Canal.
- The distribution of upward and downward vertical gradients in relation of Gowanus Canal indicates that local groundwater flows toward, and discharges to the canal.
- At high tide, canal elevations exceeded potentiometric elevations in adjacent shallow and intermediate monitoring wells indicating, water from the canal may intermittently flow into underlying sediments.

Appendix F
Evaluation of Groundwater/Surface Water Interaction

Introduction

Appendix F characterizes the interaction of surface water and groundwater adjacent to Gowanus Canal by examining water quality data collected from shallow monitoring wells, intermediate monitoring wells, and stations in Gowanus Canal. Comparison of geochemical signatures and specific constituents supports characterizing the contribution of groundwater to a surface water body. In addition to groundwater/ surface water interaction, these chemistry data characterize the aquifer and surface water environments in regard to enhancing or degrading migration of specific classes of contaminants.

Personnel from National Grid, New York City (NYC), and the United States Environmental Protection Agency (USEPA) collected groundwater samples from fourteen shallow and intermediate monitoring wells, along with surface water from eight adjacent stations in Gowanus Canal over the period from June 25 to July 26, 2010 (Figure F- 1, Table F- 1). Important field chemistry parameters (temperature, pH, Eh, specific conductivity, dissolved oxygen, turbidity, salinity and ferrous iron) were measured at the time of sample collection. Laboratories employed by National Grid, NYC and USEPA analyzed samples for a full list of metals and general water quality parameters, although several sample sets omitted specific constituents (Table F-2).

Water Chemistry

Surface Water

The pH of canal water ranged from mildly acidic (6.2) at SW-2 and SW-31 to mildly alkaline (7.9) at SW-18 (Figure F-2) while most samples exhibited a circumneutral pH. Acidic values suggest a location of groundwater contribution, or geochemical reactions in sediments lining the canal. Seawater exhibits relatively alkaline values from 7.9 to 8.2 (Hem, 1985). Thus, more alkaline pH values may reflect areas less influenced by inflow to the canal. Water temperatures in the canal ranged from 19.2 to 28.8 ^{o}C over the sampling period, several degrees higher than measured in adjacent shallow, or intermediate monitoring wells.

Dissolved oxygen (DO) concentrations in the canal fell in the oxic range (DO>2.0 mg/L; Stuyfzand, 1994), with most measurements ranging between 2 to 5 mg/L, relatively low concentrations for surface water. Only SW-37 and SW- 31 exhibited values closer to expected concentrations at 7.8 and 11.1 mg/L, respectively. Elevated concentrations of total organic carbon in sediments forming the canal bottom may consume oxygen in the canal water.

COPYRIGHT 2010 BY CH2M HILL, INC. • COMPANY CONFIDENTIAL

With the exception of SW-2, located at its northeastern end, concentrations of total dissolved solids (TDS) in Gowanus Canal ranged from 17,900 mg/L to 25,800 mg/L (Figure F-3) falling in the highly saline classification (Hem, 1985). These concentrations ranged around 10,000 mg/L less than sea water (at 3.5 percent salinity), implying some dilution with fresher water, consistent with eustarine conditions.

Trilinear diagrams helped characterize the bulk chemistry of water samples. By converting concentrations of calcium, sodium, potassium, magnesium, sulfate, chloride, and bicarbonate to equivalent weights, the basic components of water can be plotted on triangular diagrams to identify the most dominant cation and anionic components of a water sample. Water from the canal plotted as a sodium chloride type (Figure F-4), exhibiting almost no variability in major cations and anions between individual samples. Canal water composition closely matched representative samples of sea water.

Outside the relatively constrained range of TDS, SW-2 exhibited concentrations of 50,900 mg/L, roughly two times the concentrations in other samples, and exceeding the minimum threshold (50,000 mg/L) for brine.

Although collected over a period spanning one month, TDS concentrations in Gowanus Canal exhibited no systemic decline with distance from Gowanus Bay. The absence of a declining trend proceeding upgradient implies a minimal contribution of groundwater to the canal as baseflow.

Groundwater

Examination of boring logs and cross sections indicates that shallow monitoring wells selected for the water quality study screened saturated materials in the Fill and/or Alluvial/Marsh Deposits. Most intermediate wells screened the Glacial Deposits, although screens from several, including MW-9I and MW-21I spanned both the Alluvial and Glacial Deposits.

Water chemistry relationships discussed in the following two sections refer to specific, or groups of shallow and intermediate monitoring wells. However, this focus shifts in later sections to stratigraphic units and Gowanus Canal/ Bay when examining the interaction between these hydrologic units.

Shallow Monitoring Wells

With the exception of MW-31S, which exhibited a pH of 3.06, the pH of water from the shallow monitoring wells ranged nearly two units from 6.5 to 8.3, and averaged 6.7. The acidic pH at MW-31S fell outside the range of most natural waters, yet was not correlative with elevated contaminant concentrations. Furthermore, a sample from the canal at this location exhibited a mildly acidic pH.

TDS concentrations fell in the brackish (500 to 3,000 mg/L) and saline (3,000 to 50,000 mg/L) categories ranging from 506 mg/L to 23,400 mg/L (Figure F-5). Four of the seven wells situated adjacent to the canal exhibited TDS concentrations exceeding 3,000 mg/L, while two of the remaining three exceeded 1,000 mg/L. None of the samples exhibited TDS concentrations in the fresh water range (TDS< 500 mg/L).

In well pairs adjacent to the canal and in the uplands (MW- 15 and MW-16; MW-20 and MW-21; MW-37 and MW-39; MW-3 and MW-4) TDS concentrations consistently declined with distance from the canal. Although other factors like road de-icing and misting from the surrounding bays on the Brooklyn peninsula can increase shallow water salinity, the distribution of TDS concentrations suggests the Gowanus Canal controls water quality in the shallow monitoring wells.

Results of an evaluation of major cations and anions using the Piper method (Piper, 1944) displays several different water types in the shallow water bearing zone including sodium-chloride, sodium bicarbonate, and calcium bicarbonate types (Figure F-6). Sodium chloride water can originate from Gowanus Canal, or de-icing activities. Calcium and sodium bicarbonate waters suggest some mixing with fresh recharge. Samples displaying bicarbonate water types originated from wells situated in upland areas suggesting some contribution of recharge water from precipitation. This observation must be tempered against the brackish TDS concentrations.

DO concentrations averaged 1.0 mg/L, falling in the anoxic range (DO < 1.1 mg/L; Stuyfzand, 1993). A single oxic value (8.15 mg/L) was measured at MW-23S, but most wells exhibited concentrations below 1.0 mg/L. Anoxic conditions in the shallow groundwater coincide with reduced recharge through impervious cover, typical of an urban environment.

Average oxidation-reduction (Eh) potential values at 120 millivolts (m.v.) fell into the transitional range consistent with the absence of oxygen-laden recharge. The most reduced values were measured at MW-1S (-26 m.v.) and MW-3S (-56 m.v.) trending consistent with the relative absence of DO and nitrate-reducing conditions.

TOC concentrations at individual wells appeared consistent with dissolved organic carbon (DOC) indicating equilibrium with materials in the subsurface rather than interference from colloidal matter in samples. TOC concentrations ranged from less than laboratory method detection limits (MDL; 1.0 mg/L) to 18.6 mg/L. Elevated TOC concentrations coincided with elevated amounts of volatile organic compounds (VOC) and semi-volatile organic compounds at MW-9S, MW-16S, and MW-18S. Natural materials like plant debris, wood, and peat could also influence TOC concentrations in the shallow monitoring wells.

Occurrences of elevated TOC concentrations (5.6 to 60 mg/L) in shallow monitoring wells at MW-2, MW-3, MW-9, MW-18, MW-23, and MW-31 match closely with moderate concentrations of TOC (TOC< 5.1 mg/L) in Gowanus Canal. Conversely, at locations where TOC falls below MDL's (MW-15 and MW-37), no TOC appears in samples from the canal.

Total iron from the shallow monitoring wells approached concentrations exceeding 21 mg/L. However, 9 of the 14 samples exhibited a significant discrepancy between total and dissolved concentrations, suggesting interference by colloidal matter in the samples. With the exception of MW-3S at 3.6 mg/L, nitrate concentrations were less than MDL's. Nitrate concentrations also appeared in samples from the canal at the MW/SW-3 location.

Intermediate Monitoring Wells

In regard to most constituents, the intermediate monitoring wells as a group, exhibited more uniform water chemistry than the shallow wells. The pH of water sampled at the intermediate monitoring wells ranged from 6.3 to 8.0, and averaged 7.1. With the exception of MW-15I and MW-16I situated adjacent to Gowanus Bay, and MW-39I, all exhibiting saline concentrations, TDS concentrations at most wells fell in the brackish classification. TDS concentrations at MW-39I approached 12,000 mg/L (Figure F-7). Older land use maps suggest the adjoining tributary of the Gowanus Canal extended southeast through the location of MW-39I. Dissolution of materials in the anthropogenic fill used to reclaim the canal tributary may have influenced TDS concentrations in the groundwater sample collected at MW-39I.

With the exceptions MW-39I and MW-9I, TDS concentrations progressively declined with distance from Gowanus Bay. Similar to the shallow water bearing wells, TDS concentrations also decreased with distance from Gowanus Canal.

With the exception of two wells, all water samples displayed a sodium-chloride water type (Figure F-8). MW-2I and MW-31I, located at the northeastern end of the canal exhibited mixed cation –bicarbonate water types, along with lower TDS concentrations suggesting mixing with a freshened recharge source.

DO concentrations ranged up to 6.8 mg/L in MW-23I, but generally fell below 1.0 mg/L in the remaining wells. Average DO concentrations measured in the intermediate wells appeared equivalent to the shallow wells. Eh values in the intermediate wells exhibited less variability in values than the shallow wells. Although average Eh values ranged markedly lower in the intermediate wells, both zones fell into the transitional zone consistent with consumption of DO and nitrate-reducing conditions.

With the exception of MW-23I (14.5 mg/L), and MW-31I (59.8 mg/L), TOC concentrations in the intermediate wells were less than 3.0 mg/L. Conversely, elevated concentrations of VOC and SVOC constituents appeared more common in the intermediate than shallow monitoring wells. MW-31I displayed elevated concentrations of these constituents, but not MW-23I. In addition, total VOC/SVOC concentrations ranged significantly less than TOC, suggesting TOC were more influenced by naturally occurring conditions.

Interactions Between Zones Screened by Shallow and Intermediate Wells

With only one exception (MW-39I), TDS concentrations ranged significantly lower in the intermediate monitoring wells (Glacial Deposits) than in the shallow wells (Fill/Alluvium; Table F-3). Considering this relationship, along with the decline in TDS concentrations with distance from the canal, Gowanus Canal influences water quality in the Fill/Alluvium to a greater degree than the Glacial Deposits. Differences in water temperatures and TDS concentrations indicates the Fill/Alluvium and Glacial Deposits represent separate hydrologic systems at most locations.

Closer to Gowanus Bay (Figure F-9), TDS concentrations appear greater in the Glacial Deposits than the shallower Fill and Alluvium, consistent with a saltwater wedge propagating inland from the coast (Figure F-10). Within the study area, the shoreline of Gowanus Bay marks this conceptual hydrologic boundary.

Consistent with the elevated TDS, sodium-chloride water predominates in both the Alluvium and Glacial Deposits adjacent to the canal. Proceeding away from the canal, groundwater chemistry in the Alluvium beneath the uplands exhibits a calcium-bicarbonate chemistry, more typical of water mixing with freshened recharge. Although several distinct geochemical facies occur in the area, an interpretation involving freshened recharge must be tempered by the pervasive, brackish TDS and anoxic DO concentrations.

At the northeastern end of the canal, geochemical facies exhibit a differing pattern (Figure F-11) than proximal to Gowanus Bay. Again groundwater exhibits a sodium chloride type water in the Alluvium/Fill at wells adjacent to the canal. By comparison, groundwater in the Glacial Deposits consists of a mixed cation-bicarbonate type suggesting that a fresher, recharge water chemistry predominates with greater distance from Gowanus Bay.

Groundwater-Surface Water Interaction

Potentiometric levels measured during monthly synoptic water level surveys and the tidal study conducted in August 2010 showed that groundwater in the saturated Fill and Alluvium flows toward the Gowanus Canal. Vertical gradients between the Fill/Alluvium and Glacial Deposits adjacent to the canal generally trended upward suggesting flow toward the canal as a hydrologic discharge zone. Conversely, vertical gradients in uplands areas trended downward typical of recharge area.

Monitoring well/canal stations employed for both the tidal and water quality study included MW/SW-3, MW/SW-15, and MW/SW-20. In all three locations, canal elevations exceeded potentiometric elevations in the Fill/Alluvium at high tide (Figure F-12). Canal elevations exceeded potentiometric elevations in the Glacial Deposits intermittently during high tide at MW/SW-15, and MW/SW-20, but not at MW/SW-3.

TDS concentrations in the Fill/Alluvium appear anomalously elevated at all three locations. Water samples from the Fill/Alluvium at these three stations exhibit a sodium-chloride water chemistry. A similar relationship emerges in the Glacial Deposits, TDS concentrations appear elevated at MW/SW-15, and MW/SW-20M with samples exhibiting sodium-chloride water types. By comparison, TDS concentrations in the Glacial Deposits at the SW/MW-3 location appear similar to concentrations exhibited at local wells.

The uniformity of water chemistry along Gowanus Canal in regard to TDS and cation/anion type shows little evidence of dilution by significant inflow of groundwater.

In summary, the unique estuarine water quality in Gowanus Canal imposes a strong imprint on the water chemistry of the Fill/Alluvium, and at specific proximal locations in the Glacial Deposits.

Summary of Tidal Evaluation and Groundwater-Surface Water Interaction

Combined results of the synoptic, tidal and groundwater-surface water chemistry studies provide multiple lines of evidence to characterize the hydraulic relationships between local groundwater and the Gowanus Canal . Potentiometric surfaces developed from the synoptic events described in Section 3 suggest that, at the water table, groundwater flows toward Gowanus Canal. Potentiometric data from intermediate wells depicted a more complex pattern with groundwater generally flowing upward toward the canal typical of a discharge area.

Data from the 5-day tidal evaluation portrays a more temporally-controlled flow pattern than the synoptic study. At specific locations, canal elevations consistently exceeded groundwater elevations in the fill/ alluvium at high tide creating hydraulic conditions for surface water to flow into shallow aquifer sediments several times per day. These conditions appeared more intermittent over the tidal study period in wells screened in the glacial deposits.

Gowanus Canal exhibits a uniform chemical signature (TDS, temperature, cation/anions, etc.) along its entire length suggesting minimal influence by groundwater flow contribution. Furthermore, water chemistry in monitoring wells proximal to the canal exhibit chemical signatures similar to the canal, suggesting infiltration of surface water into the fill/alluvium.

Given its saline nature, the ionic strength of surface water from the Gowanus Canal ranges several orders of magnitude greater than most groundwater in the fill/alluvium and glacial deposits. Thus, a large contribution of groundwater is necessary to significantly influence the chemistry of water in the canal. Conversely, given its saline nature, even short periods of reversed flow from the canal into fill/alluvium and glacial deposits alters groundwater signatures.

Although evaluation of data from the synoptic and tidal studies produced lateral and vertical gradients supporting the flow of groundwater to the canal, temporal exceptions to this flow pattern emerged. Hydraulic data from these studies generally support the similarity in canal and groundwater chemistries proximal to Gowanus Canal. The three studies suggest that local groundwater from the fill/alluvium and glacial deposits, generally flow toward the Gowanus Canal, although the flow pattern appears to reverse locally, with daily regularity. Groundwater flow volumes into Gowanus Canal appear insufficient to alter its basic chemical signature. Conversely, because of its saline nature, infiltration of canal water even for brief periods influences groundwater chemistry in the fill/alluvium.

Appendix G
Survey of Outfall Features to the Gowanus Canal

Contents

Summary of Phase 1 and Phase 2 Feature Survey Results and Identified Active Permitted Discharges to Gowanus Canal

Table G-1 List of Features Observed Along the Gowanus Canal

Phase 2 Pipe Investigation Daily Summary Report

Page Intentionally Left Blank

Summary of Phase 1 and Phase 2 Feature Survey Results and Identified Active Permitted Discharges to Gowanus Canal

Table G-1 lists the features identified during Phase 1 and Phase 2 survey phases. A summary of the findings is presented below.

Phase 1

Number of features identified - 220

Number of features observed discharging – 25

Number of features identified as not being pipes - 5

Number of features where flow appears to be tidal drainage - 11 (no samples collected)

Number of features with flow that could not be clearly attributed to tidal drainage - 5 (5 samples collected)

Number of features with active flow not attributed to tidal drainage - 9 (7 features sampled)

The following 12 features were sampled:

GC-CF-E-027	GC-CF-W-001	GC-CF-W-048
GC-CF-E-029	GC-CF-W-037	GC-CF-W-077
GC-CF-E-033	GC-CF-W-044	GC-CF-T1-003
GC-CF-E-035	GC-CF-W-046	

GC-CF-E-063- possibly NYC storm drain OH-602 or unknown/other outfall OH-538

The following 2 features with active flow not attributed to tidal drainage were not sampled for the reasons below:

GC-CF-W-040 – This flow was obvious condensate from aeration system. Flow was only a drip and not enough to collect sample.

GC-CF-T2-003 – Flow was too slow to sample.

Observations on discharging pipes were made during dry weather.

Phase 2

Number of features investigated - 231

Newly identified features - 27

Capped or sealed with concrete features - 8

Features requiring further investigation - 71-87

Features observed discharging when no rain during inspection – 9

GC-CF-E-009A
GC-CF-E-033
GC-CF-T3-012A
GC-CF-T3-015
GC-CF-E-072 (CSO OH-006)
GC-CF-W-012A
GC-CF-W-044
GC-CF-W-048
GC-CF-W-051

Three of the discharging pipes (bolded and italicized above) were not found during Phase 1 (pipes newly identified during Phase 2).
E-033 and W-048 were discharging during both phases (samples collected during Phase 1).
T3-015 and W-044 were discharging during Phase 2 but not during Phase 1 (therefore not sampled).
W-051 was discharging during both phases but salinity was similar to the canal during Phase 1 and therefore, feature was not sampled.
The locations of newly identified features are approximate on Figures 3-8a-h.

Observations on discharging pipes were made during dry weather.

The presence of oil was noted at the following outfall features:

GC-CF-W-042	GC-CF-W-044	GC-CF-T3-013
GC-CF-W-002	GC-CF-W-045	GC-CF-E-007
GC-CF-W-002A	GC-CF-W-018	GC-CF-T3-012
GC-CF-W-015A	GC-CF-W-098	GC-CF-W-043

Permitted Discharges to Gowanus Canal as of December 2010

1. Bayside Fuel Depot – no active flow noted during Phase 1 and therefore, no sample collected
2. Hess Corp. – It is likely that this outfall was sampled during Phase 1 (sample GC-CF-W-077).
3. NYCDOT Asphalt Plant – outfall difficult to identify because of the number of features at location, based on observations made, it is believed that there was either no flow at this location or the outfall was submerged during Phase 1 and therefore, no sample was collected.
4. Red Hook Concrete Loading Corp. - no active flow noted during Phase 1 and therefore, no sample collected
5. FedEx FBTA Facility – no active flow noted during Phase 1 and therefore, no sample collected

APPENDIX G
TABLE G-1
List of Pipe Outfalls Observed Along the Gowanus Canal
Gowanus Canal Remedial Investigation
Brooklyn, New York

	Corresponding Feature #		Bulkhead Information								Feature Information					Pipe / Seep Discharge Description											
EPA Feature ID	GEI Survey ID	NYC Shoreline Survey ID	Type of Feature	Date	Time (24 hr)	General Location on Canal	Map No.	Feature Location in Canal	Bulkhead Construction Material	Bulkhead Condition	Relative Elevation	Horiz. Distance from Bulkhead	Offset Distance	Feature Construction Material	Feature Size	Fluid Actively Discharging? GC-CF-E-007	NA	NA	Pipe	9/1/2010	10:00	End of DeGraw St. close to South building	1	East Bank	Timber	Poor	Always Above Water	Flush	NA	Steel/Metal	4" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Wet with algae growth in tidal zone. Could be active ?
GC-CF-E-008	NA	NA	Pipe	9/1/2010	10:00	End of DeGraw St. close to South building	1	East Bank	Timber	Poor	Always Above Water	Inset	NA	Steel	9"	No	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Yes	Old deteriorated pipe, probably not in use. Half full of rust and sediment. Horiz. Distance from Bulkhead: Inset 9".
GC-CF-E-009	GC-OF-130	RH-835 or RH-037	Pipe	9/1/2010	10:12	Near Sackett	1	East Bank	Timber	Good	Tidal Transition Zone	Flush	NA	PVC/Plastic	12" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Old weathered PVC pipe, cracked, in tidal zone.
GC-CF-E-010	NA	~RH-512	Pipe	9/1/2010	NA	Between Sackett & Union Streets, closer to Union St.	1	East Bank	Timber	Poor	Tidal Transition Zone	Protruding	NA	Terra Cotta	10" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Some sediment and algae growth. Horiz. Distance from Bulkhead: Protruding ~4".
GC-CF-E-011	NA	OH-191	Pipe	9/1/2010	10:55	NYC DEP Asphalt Plant	7	East Bank	Concrete	Good	Tidal Transition Zone	Flush	NA	Steel	12" - 14" OD pipe submerged and looking from ~10' away	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Barge in the way, GPS coordinates collected ~10' north of pipe. Construction Material: Concrete w/steel supports and timber beams on top. Relative Elevation: Tidal Transition Zone, currently under water.
GC-CF-E-012	NA	OH-901	Pipe	9/1/2010	11:00	North end of NYC DEP Asphalt Plant	7	East Bank	Concrete	NA	Tidal Transition Zone	Flush	NA	Steel	~14" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Pipe submerged. Construction Material: Concrete w/steel supports and timber beams on top.
GC-CF-E-013	NA	OH-105	Pipe	9/1/2010	11:12	Middle of NYCDEP Asphalt Bulkhead	7	NA	Timber	NA	Tidal Transition Zone	Flush	NA	Steel	~14" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Pipe submerged. Construction Material: Timber w/steel supports and timber beams on top. Horiz. Distance from Bulkhead: Flush assumed.
GC-CF-E-014	NA	OH-104	Pipe	9/1/2010	11:15	Middle of NYCDEP Asphalt Plant	7	East Bank	Timber	NA	Tidal Transition Zone	Protruding	NA	Steel	~14" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Submerged Construction Material: Timber w/steel supports and timber beams on top. Horiz. Distance from Bulkhead: Protruding ~6".
GC-CF-E-015	NA	RH-460	Pipe	9/1/2010	12:08	North end of Union St. Bridge	1	East Bank	Concrete	Good	Always Above Water	Flush	NA	Terra Cotta	14" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Yes	Spider webs and old evidence of scouring present. Possible flows but more recently. Crack in pipe.
GC-CF-E-016	NA	OH-005	Pipe	9/1/2010	12:19	South side of Union St. Bridge, CSO-OH-005	1	East Bank	Concrete	Good	Tidal Transition Zone	Flush	NA	Brick	~42"	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	CSO OH-005, South of Union St. Bridge. Construction Material: Concrete, stone.
GC-CF-E-017	NA	NA	Pipe	9/1/2010	12:30	NA	NA	East Bank	No Bulkhead	Poor	Always Above Water	Flush	NA	Terra Cotta	7.5" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Sediment and spider webs present. Does not look active.
GC-CF-E-018	NA	NA	Pipe	9/1/2010	12:37	NA	2	East Bank	No Bulkhead	NA	Always Above Water	Flush	NA	Concrete	5" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	No	Yes	Does not appear active, contains sediment, may not extend far inland. Construction Material: Concrete? Could be Clay?
GC-CF-E-019	NA	NA	Pipe/Structure	9/1/2010	12:50	Near Africa Israel Property	2	East Bank	RipRap	Poor	Always Above Water	Offset on Land	~3'	Steel	12.5" OD and 20" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	No	Yes	Two pipes going vertical into ground filled with concrete with paint (survey paint) and number 27.
GC-CF-E-020	GC-OF-90	NA	Pipe/Structure	9/1/2010	13:05	Near Africa Israel Property	2	East Bank	RipRap	Poor	Always Above Water	Flush	NA	Concrete	12" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Yes	Small amount of sediment and algae, moist (tidal)?
GC-CF-E-021	GC-OF-89	NA	Pipe	9/1/2010	13:05	Near Africa Israel Property	2	East Bank	RipRap	Poor	Always Above Water	Flush	NA	Steel	12" OD -16" including flange	No	NA	NA	NA	NA	NA	NA	NA	NA	No	Yes	Pipe moist inside possibly due to standing water (tidal)?, 1/4 full of sediment.
GC-CF-E-022	GC-OF-087	OH-509	Pipe	9/1/2010	13:15	North side of 3rd St. Bridge	3	East Bank	Concrete	Fair	Always Above Water	Flush	NA	Unknown	~22" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Very slight drip on 9/8 at 11:13. Tidal from receiving high tide moist inside with little sediment and algae growth. Relative Elevation: Always Above Water and Tidal Transition Zone - very bottom observed to be in water at high tide. Construction Material: Unknown, Fiberglass like material.
GC-CF-E-023	NA	OH-509	Pipe	9/1/2010	13:34	North side of 3rd St. Bridge	3	East Bank	Concrete	NA	Always Above Water	Flush	NA	Steel	4" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Yes	Accuracy of GPS point poor due to overhead bridge structure. Bottom covered in rust, old pipe. Does not appear to be active.
GC-CF-E-024	NA	OH-126	Pipe	9/1/2010	13:29	North side of 3rd St.	3	East Bank	Concrete	NA	Always Above Water	Flush	NA	Concrete	2"	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Appears to be a 2" hole in concrete bulkhead. Cannot see how far it runs. Some debris inside.
GC-CF-E-025	NA	OH-510	Pipe	9/1/2010	13:24	North side of 3rd St.	3	East Bank	Concrete	NA	Tidal Transition Zone	Flush	NA	Terra Cotta	10"	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Pipe is under a portion of the bridge structure, GPS coordinates collected ~3 to the north of pipe. Minor amount of algae.
GC-CF-E-026	NA	NA	Pipe	9/1/2010	13:45	NA	3	East Bank	Concrete	Good	Tidal Transition Zone	Flush	NA	Terra Cotta	~10" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Wet from tides (no flow). Some algae growth. Located 3'5" North of South edge of bridge (3rd St.).

APPENDIX G
TABLE G-1
List of Pipe Outfalls Observed Along the Gowanus Canal
Gowanus Canal Remedial Investigation
Brooklyn, New York

	Corresponding Feature #		Bulkhead Information								Feature Information					Pipe / Seep Discharge Description										
GC-CF-E-027	NA	NA	Pipe	9/1/2010	13:49	NA	3	East Bank	Concrete	Good	Tidal Transition Zone	NA	NA	Unknown	~14"	Yes/No	Flowing	Clear	0.2	0	1.5'	Yes	Active	Yes	Inconclusive	Yes	Submerged. * On 9/2 at 10:50 returned to GC-CF-E-027 and saw an active discharge. Collected sample. No odor or color. Debris and algae present, some garbage in pipe. Located 8'8" South of South edge of 3rd St. Bridge. Construction material: Unknown, possible Concrete. Is fluid actively discharging from feature?: Yes 9/2/10; No 9/1/10 Was sediment observed in feature? Inconclusive, debris and refuse present in pipe.
GC-CF-E-028	NA	OH-512?	Pipe	9/1/2010	13:53	South of 3rd St. Bridge	3	East Bank	Concrete	Good	Always Above Water	Protruding	NA	Steel	4.5" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Steel pipe ~8' above high water mark. Possibly part of bridge control room. Located 16'13" South of 3rd St. Bridge Southern edge.
GC-CF-E-029	NA	OH-513?	Pipe	9/1/2010	13:57	NA	3	East Bank	Concrete	Good	Always Above Water	Protruding	NA	PVC	4.5" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Some algae and standing water in pipe. End of PVC pipe cracked and broken. Located 19'7" South of the 3rd St. Bridge Southern edge. Horiz. Distance from Bulkhead: Protruding ~ 8".
GC-CF-E-029	NA	OH-513?	Pipe	9/1/2010	13:57	NA	3	East Bank	Concrete	Good	Always Above Water	Protruding	NA	PVC	4.5" OD	Yes	Trickle	Clear	NA	0	~4'	Yes	Active	GC-CF-E-29-1	No	Yes	On 9/2/10 at 10:50, returned to this pipe and saw a trickle. ~2.5 hours from low tide and ~4 above water, believe this is an active discharge. Sample collected, trickle nearly stopped while sampling, only collected VOC and one amber jar.
GC-CF-E-030	NA	RH-512	Pipe	9/2/2010	8:07	North side of Union St. Bridge	1	East Bank	Concrete	Good	Always Above Water	Protruding	NA	Steel/Metal	6" OD, 4" ID	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	No signs of recent flows. Pipe is 7'4" South of the North end of the concrete bridge foundation. No GPS available since we are under the bridge structure. Pipe has 90° elbow at end of pipe, flow would go straight into canal.
GC-CF-E-031	NA	RH-460	Pipe	9/2/2010	8:11	North side of Union St. Bridge	1	East Bank	Concrete	Good	Always Above Water	Flush	NA	Unknown	12"	No	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Yes	Pipe is ~16' South of the North end of the concrete bridge foundation. No GPS available since we are under the bridge structure. Algae growth of sediment present (tidal zone). Construction Material: Unknown, too much organic growth on pipe to tell type.
GC-CF-E-032	NA	NA	Pipe	9/2/2010	8:15	North side of Carroll St. Bridge	2	East Bank	Concrete	Fair	Tidal Transition Zone	Flush	NA	Steel/Metal	5" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Yes	Series of 10+ 5" OD steel pipes. Approx. 4 of these pipes have old electrical cables inside them. Some (or all) of the pipes appear to have been sealed behind bricks which have later eroded away. Do not appear to have active discharges. Type of Feature: Pipe, Other, series of pipes, likely to be old utility conduits. Construction Material: Concrete and Stone
GC-CF-E-033	GC-OF-89	NA	Pipe	9/2/2010	8:50	Africa Israel Property directly East of Canoe Launch	2	East Bank	Timber/RipRap	Poor	Tidal Transition Zone	Inset	NA	Unknown	~18" OD	Yes	Flowing	Clear	0.28%	0	~4'	NA	Active	Yes	No	Yes	Pipe is heavily corroded, set behind a break in the wooden bulkhead timbers. Pipe is discharging, sample collected, no odor. Salinity (%): 0.28%, Salinity in canal = ~2.0%. Sample ID: GC-CF-E-033-1
GC-CF-E-034	NA	NA	Other	9/2/2010	8:55	Within Africa Israel Bulkhead	2	East Bank	Concrete	Good	Tidal Transition Zone	Flush	NA	Concrete	1.5" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Possible weep, 1.5" hole in concrete. Type of Feature: Other, small hole in bulkhead (weep?).
GC-CF-E-035	GC-OF-08D	OH-509?	Pipe	9/2/2010	9:05	Africa Israel Bulkhead	2	East Bank	Timber/Concrete	Good	Tidal Transition Zone	Flush	NA	Steel/Metal	9"	Yes	Flowing	Yellowish/Brown	0.37	0.2	~2'	No	Active	Yes	No	Yes	Organic like odor (sulfurish), color is slightly yellowish brown, gray, and green organic material on bottom of pipe. Sample ID: GC-CF-E-035-1
GC-CF-E-036	NA	NA	Pipe	9/2/2010	14:45	Just North of the 3rd Turning Basin	5	East Bank	Timber	Good	Always Above Water	NA	NA	Terra Cotta	10" heavily weathered	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	No sign of recent discharges.
GC-CF-E-037	NA	OH-529?	Pipe	9/2/2010	14:55	Just South of Turning Basin #3	5	East Bank	Concrete	Good	Always Above Water	NA	NA	Steel/Metal	4.5"	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Appears to be a roof or parking lot drain.
GC-CF-E-038	NA	OH-0036668-001	Pipe	9/2/2010	15:00	North of 9th St.	5	East Bank	Concrete	Good	Always Above Water	Flush	NA	Steel/Metal	4.5"	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Appears to be a roof or parking lot drain.
GC-CF-E-039	NA	OH-523?	Pipe	9/2/2010	15:04	North of 9th St.	5	East Bank	Concrete	Good	Always Below Water	Flush	NA	Steel/Metal	9"	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	
GC-CF-E-040	NA	NA	Pipe	9/2/2010	15:10	North of 9th St.	5	East Bank	Concrete	Good	Always Below Water	Flush	NA	Steel/Metal	4.5" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Appears to be a roof or parking lot drain.

Very slow trickle. Sample collected on 9/2/10 at 14:00.
GC-CF-T1-004	GC-OF-075	NA	Pipe	9/1/2010	15:23	Turn Around Basin #1, Southern Bank	3	Turn Around Basin #1	Timber	Fair	Always Above Water	Inset	NA	Terra Cotta	7: OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	No sediment, pipe cracked and worn. Construction Material: Terra Cotta, highly eroded with bacteria growth.
GC-CF-T1-005	NA	NA	Pipe	9/1/2010	11:20	Turn Around Basin #1	3	Turn Around Basin #1	Timber	Fair	NA	Flush	NA	Steel/Metal	~9" pipe deterioration	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	
GC-CF-T1-006	NA	NA	Pipe	9/3/2010	11:30	Turn Around Basin #1	3	Turn Around Basin #1	Timber	Fair	Tidal Transition Zone	NA	NA	Steel/Metal	7"	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Pipe moist inside, but no flow, likely from tidal drainage.
Turnaround Basin #2																										
GC-CF-T2-001	GC-OF-C3	OH-516	Pipe	9/2/2010	11:55	Turning Basin #2, South Wall	4	NA	RipRap/ No Bulkhead	Poor	Tidal Transition Zone	Flush	NA	Steel/Metal	~7" OD, heavily weathered	No	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Yes	Heavily weathered, sediment present in pipe.
GC-CF-T2-002	GC-OF-C4?	NA	Pipe	NA	NA	Turning Basin #2, South Side	NA	NA	RipRap/ No Bulkhead	Poor	Tidal Transition Zone	Flush	NA	Concrete	12"	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	12" hole in concrete, old and eroded and could be a piece of concrete RipRap in the bulkhead. No recent flow.
GC-CF-T2-003	GC-OF-64	OH-515	Pipe	9/2/2010	14:20	Turning Basin #2 South Side	4	NA	RipRap/ No Bulkhead	Poor	Always Above Water	Flush	NA	Steel/Metal	6" OD	Yes	Trickle	Clear	NA	0	1.5'	No	Active	No	No	Yes	Sample not collected. Trickle is <50 ml per minute. Flow to slow to sample.
GC-CF-T2-004	GC-OF-60	NA	Pipe	9/2/2010	14:26	Turning Basin #2 South Side	4	NA	RipRap/ No Bulkhead	NA	Always Above Water	Flush	NA	Terra Cotta	7" - 8"	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	
GC-CF-T2-005	NA	NA	Pipe	9/2/2010	14:30	Turning Basin #2 North Side	4	NA	Timber	Good	Always Above Water	Protruding	NA	Other	~10"	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	This feature is for 3 roof drains that drain into the canal. Construction material: Other, Aluminum roof drains.
GC-CF-T2-006	NA	NA	Pipe	9/7/2010	13:42	2nd Turning Basin	4	South Bank	Timber	Fair	Tidal Transition Zone	Flush	NA	Terra Cotta	~12"	No	NA	NA	NA	0.0	~1.5'	NA	NA	NA	Inconclusive	Yes	~12" Terra Cotta pipe - rock and debris noted, trace algae growth - mussel growth around pipe.
GC-CF-T2-007	NA	NA	Pipe	9/7/2010	13:54	2nd Turning Basin	4	South Bank	No Bulkhead	NA	Tidal Transition Zone	Protruding	NA	Concrete/Terra Cotta/Unknown	~4" black Terra Cotta/Concrete	No	NA	NA	NA	0.0	~4' - 5'	NA	NA	NA	Yes	Yes	Sediment noted in pipe.
GC-CF-T2-008	NA	NA	Sunken Barge	9/7/2010	NA	2nd Turning Basin	4	Within Canal	No Bulkhead	Poor	Always Above Water/Tidal Transition Zone	NA	~40' from North ~55' From South	Steel/Metal Other	40' x 80'	No	NA	NA	NA	0.0	NA	NA	NA	NA	NA	Yes	Sunken barge in canal. Construction material: Other, wood.
GC-CF-T2-009	NA	NA	Sunken Barge	9/7/2010	14:10	2nd Turning Basin	4	Within Canal	No Bulkhead	Poor	Tidal Transition Zone	Offset in Canal	~2'	Steel/Metal	40' x 100'	No	NA	NA	NA	0.0	NA	NA	NA	NA	NA	Yes	Sunken barge in canal.
GC-CF-T2-010	NA	NA	Pipe	9/8/2010	10:07	2nd Turning Basin	5	East Bank	Timber	Good	Always Above Water	Flush	NA	Terra Cotta	~4"	No	NA	NA	NA	0.0	~3'	NA	NA	NA	Inconclusive	Yes	~ 13' broken/smashed inside, spider webs, dust under building, no GPS. ~10 from Southern shoreline on Eastern wall
GC-CF-T2-011	NA	NA	Pipe	9/8/2010	10:25	2nd Turning Basin	4	North Bank	Timber	Fair	Always Above Water	Inset	NA	Unknown	~4"	No	NA	NA	NA	0.0	~2.5'	NA	NA	NA	Inconclusive	Yes	Pipe is above barge - inaccessible by foot - barge is in way. Pictures taken form far away.
Turnaround Basin #3																										
GC-CF-T3-001	NA	NA	Pipe	9/2/2010	14:20	6th Street	5	Turning Basin North Wall	Timber	Good	Tidal Transition Zone	Inset	NA	Steel/Metal	10"	No	NA	NA	NA	0.0	~1.0'	NA	NA	NA	NA	Yes	Steel pipe - has a cool "breeze" exiting from pipe.
GC-CF-T3-002	NA	NA	Pipe	9/2/2010	14:28	3rd Turning Basin	NA	Turning Basin East Wall	Steel	Good	Tidal Transition Zone	Protruding	NA	Steel/Metal	10"	No	NA	NA	NA	0.0	~1.5'	NA	NA	NA	NA	Yes	10" steel pipe - no rust observed - fresh steel, no algae growth.
GC-CF-T3-003	NA	NA	Pipe	9/2/2010	14:34	3rd Turning Basin	5	Turning Basin #3 South Wall	Concrete	Good	Always Above Water	Flush	NA	PVC/Plastic	~2.5'	No	NA	NA	NA	0.0	~3'	NA	NA	NA	NA	Yes	PVC pipe - filled with debris - brick fragments.
GC-CF-T3-004	NA	NA	Pipe	9/2/2010	14:38	3rd Turning Basin	5	Turning Basin South Wall	Concrete	Good	Tidal Transition Zone	Flush	NA	PVC/Plastic	4"	No	NA	NA	NA	0.0	~3'	NA	NA	NA	NA	Yes	Short 4" PVC pipe. See light from storm drain. Relative Elevation: Tidal Transition Zone, top of transition zone.
GC-CF-T3-005	NA	NA	Pipe	9/2/2010	14:47	3rd Turning Basin	5	3rd Turning Basin South Wall	Concrete	Good	Tidal Transition Zone	Flush	NA	PVC/Plastic	4"	No	NA	NA	NA	0.0	0.75'	NA	NA	NA	NA	Yes	PVC pipe 4" - see light in pipe from storm drain above.
GC-CF-T3-006	NA	NA	Pipe	9/2/2010	14:54	3rd Turning Basin	5	Turning Basin South Wall	Concrete	Good	Tidal Transition Zone	Flush	NA	PVC/Plastic	4"	No	NA	NA	NA	0.0	~0.75'	NA	NA	NA	NA	Yes	4" PVC pipe - directly below storm drain in parking lot.

APPENDIX G
TABLE G-1
List of Pipe Outfalls Observed Along the Gowanus Canal
Gowanus Canal Remedial Investigation
Brooklyn, New York

	Corresponding Feature #		Bulkhead Information								Feature Information					Pipe / Seep Discharge Description										
GC-CF-T3-007	NA	NA	Pipe	9/2/2010	14:58	3rd Turning Basin	5	3rd Turning Basin South Wall	Concrete	Good	Tidal Transition Zone	Flush	NA	PVC/Plastic	4"	No	NA	NA	NA	0.0	0.5'	NA	NA	NA	Yes	Yes	4" PVC pipe - filled with sand and capped with cement. Cement cap is falling off.
GC-CF-T3-008	NA	NA	Pipe	9/7/2010	10:22	NA	5	Turning Basin North Bank	Timber	Good	Tidal Transition Zone	Inset	NA	Terra Cotta	~6"	No	NA	NA	NA	0.0	0.0	NA	NA	NA	Yes	Yes	~6" terra Cotta pipe - badly damaged and broken - bottom of pipe has a little sand, shells, and pebbles inside pipe. Mussel growth around pipe. Is fluid actively discharging from feature?: No, in Tidal Transition Zone, water is in bottom of pipe at canal level.
GC-CF-T3-009	NA	NA	Pipe	9/7/2010	10:32	NA	5	3rd Turning Basin	Timber	Good	Tidal Transition Zone	Inset	NA	Terra Cotta	~6"	Yes	Trickle	Clear	2.1%, 2.2% background	0.0	~1.0'	No	Tide Drainage	No	Inconclusive	Yes	~6" Terra Cotta pipe - damaged and broken.
GC-CF-T3-010	NA	NA	Pipe	9/7/2010	10:43	3rd Turning Basin	5	3rd Turning Basin	Timber	Good	Tidal Transition Zone	Inset	NA	Terra Cotta	~12"	Yes	Trickle	Clear	1.6%, 2.2% background	0.0	~1.5'	Yes	Tide Drainage	No	No	Yes	~12" Terra Cotta pipe - end is badly broken.
GC-CF-T3-011	NA	NA	Pipe	9/7/2010	10:50	3rd Turning Basin	5	3rd Turning Basin North Wall	Timber	Good	Tidal Transition Zone	Flush	NA	Terra Cotta	~6	Yes	Drip	Clear	NA	0.0	~1.5'	Yes	Tide Drainage	No	Yes	Yes	~6" Terra Cotta pipe - lots of algae South and sedimentation on I.D. of pipe. Pipe is dripping H_2O, assumed tidal drainage based on nearby pipes also draining - tide has just gone down.
GC-CF-T3-012	NA	NA	Pipe	9/7/2010	10:56	3rd Turning Basin	5	3rd Turning Basin East Wall	Timber	Good	Tidal Transition Zone	Protruding	NA	Steel/Metal	~12"	Yes	Drip	Clear	NA	0.0	~1.0'	Yes	Tide Drainage	No	No	Yes	Tidal drainage - other pipes nearby also draining. Trace rust noted on bottom of pipe. Horiz. Distance from bulkhead: Protruding ~1'.
GC-CF-T3-013	NA	NA	Pipe	9/7/2010	11:00	3rd Turning Basin	5	3rd Turning Basin East Wall	Steel	Good	Tidal Transition Zone	Protruding	NA	Steel/Metal	~8"	Yes	Drip	Clear	NA	0.0	~2'	Yes	Tide Drainage	No	NA	Yes	Horiz. Distance from bulkhead: Protruding ~2'.
GC-CF-T3-014	NA	NA	Pipe	9/7/2010	11:08	3rd Turning Basin	5	South Bank	Timber/ Steel	Good	Always Above Water	Flush	NA	Terra Cotta	~4"	No	NA	NA	NA	0.0	~4.5'	Yes	NA	NA	NA	Yes	~4" Terra Cotta pipe - no algae growth or discoloration noted, collect on 9/9/10. Are other nearby features also discharging?: Yes, Tidal.
GC-CF-T3-015	NA	NA	Pipe	9/7/2010	11:19	3rd Turning Basin	NA	3rd Turning Basin South Wall	Timber/ RipRap	Fair	Tidal Transition Zone	Inset	NA	Terra Cotta	~6"	No	NA	NA	NA	0.0	NA	Yes	NA	NA	Yes	Yes	~6" Terra Cotta pipe - pipe is heavily sediment (1/2), 2 pictures. Are other nearby features also discharging?: Yes, Tidal.
GC-CF-T3-016	NA	NA	Pipe	9/7/2010	11:29	3rd Turning Basin	5	3rd Turning Basin	Timber/ RipRap	Fair/Poor	Tidal Transition Zone	Inset	NA	Steel/Metal	~8" with tide gate	Yes	Trickle	Clear	2.05%, 2.20%	0.0	~1.5'	Yes	Tide Drainage	No	Inconclusive	Yes	8" pipe with tide gate - leaking water (dripping) - red rusty spot under drip - appears that this dripping occurs often.
GC-CF-T3-017	NA	NA	Pipe	9/7/2010	11:35	3rd Turning Basin	5	East Wall	Steel	Good	Tidal Transition Zone	NA	NA	Terra Cotta	~12"	No	NA	Clear	2.0%, 2.21 % background	0.8	0.0"	Yes	Unsure	No	Inconclusive	Yes	Located directly under GC-CF-T3-013. Are other nearby features also discharging?: Yes, drainage.
GC-CF-T3-018	NA	NA	Pipe	9/7/2010	11:50	3rd Turning Basin	5	South Wall	Concrete	Good	Tidal Transition Zone	Flush	NA	PVC/Plastic	~4"	No	NA	NA	NA	0.0	~3.5'	No	NA	NA	NA	Yes	Along side GC-T3-004.
GC-CF-T3-019	NA	NA	Pipe	9/7/2010	11:57	3rd Turning Basin	5	South Wall	Concrete	Good	Tidal Transition Zone	Protruding	NA	Steel/Metal	~4"	No	NA	NA	NA	0.0	~3'	NA	NA	NA	NA	Yes	~4" metal pipe - appears to be plugged ~5" up pipe. Horiz. Distance from Bulkhead: Protruding ~4".
GC-CF-T3-020	NA	NA	Pipe	9/8/2010	12:36	3rd Turning Basin	4	West Bank	Timber/ Concrete/ RipRap/ No Bulkhead	Poor	Ground Level/ Tidal Transition Zone	Flush/Inset	NA	Terra Cotta	~4"	No	NA	NA	NA	0.0	~3'	NA	NA	NA	Inconclusive	Yes	~4" pipe - pipe is broken ~1.5', can see where pipe continues after break. Pipe is full of debris and ground; Horiz. Distance from Bulkhead: Flush, Inset broken.
Turnaround Basin #4																											
GC-CF-T4-01	NA	OH-887	Pipe	9/7/2010	10:10	Lowe's Turn Around Basin SE Corner	6	NA	Timber/ RipRap	Fair	Tidal Transition Zone	Flush	NA	Steel/ Metal	13" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Pipe could be active, coordinates for T4-01 through 05 collected together. These points and all <10 from each other at the very SE corner of the basin.
GC-CF-T4-02	NA	OH-889	Pipe	9/7/2010	10:12	Lowe's Turn Around Basin SE Corner	6	NA	Timber/ RipRap	Fair	Tidal Transition Zone	Flush	NA	Steel/ Metal	16" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Pipe could be active. Located below pipe GC-CF-T4-01.
GC-CF-T4-03	NA	OH-187	Pipe	9/7/2010	10:14	Lowe's Turn Around Basin SE Corner	6	NA	Timber/ RipRap	Fair	Always Above Water	Protruding	NA	NA	7"OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Located South shore, above Timber Bulkhead. Does not appear to be active.
GC-CF-T4-04	NA	NA	Pipe	9/7/2010	10:16	Lowe's Turn Around Basin SE	6	NA	Timber/ RipRap	Fair	Tidal Transition Zone	Protruding	NA	NA	7" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Pipe in line with GC-CF-T4-03 in tidal zone. Could be active
GC-CF-T4-05	NA	NA	Pipe	9/7/2010	10:20	NA	6	NA	Timber/ RipRap	Fair	Always Above Water	Protruding	NA	Steel/ Metal	11" OD	No	NA	NA	NA	NA	NA	NA	NA	NA	NA	Yes	Does not appear to be active. Located on South shore above Timber Bulkhead; contains sediment.

Notes:
NA - Not Applicable
Feature "Relative Elevation" = vertical location of feature along wall of bulkhead

Feature Horizontal Distance From Bulkhead:
Flush = Feature is even with the bulkhead wall
Inset = Feature is recessed behind bulkhead wall
Protruding = Feature extends out beyond bulkhead wall into canal
Offset = Feature is located separate from the bulkhead wall (see Offset Distance column)

OD = Outer Diameter
ID = Inner Diameter

Pipes highlighted in green correspond to pipes identified as being owned by New York City, not referred for further investigation
Pipes highlighted in grey correspond to pipes identified as POTENTIALLY being owned by New York City, referred for further investigation
Pipes with no highligting correspond with pipes of unidentified ownership, referred for further investigation

October 19, 2010

Pipe label: **W-001**
12"Ø Cast-Iron pipe.
Findings:
13' Catch-basin box. The push camera couldn't pass the first catch basin.
We can see another pipe connection at 3 o'clock.
Stop inspection.
We located the first catch basin from the ground, and saw a second one 11' away.
26' Second Catch basin.
Recommends:
Using the tractor camera in order to get 360° view of the pipe and the catch-basin box to search for other service connections in the system and evaluate there condition.

Pipe label: **W-005**
6"Ø Cast-Iron pipe.
46" above water level; 10:22 AM.
Findings:
Soap remains near the pipe.
60' Left 45°
89' can't push the camera any further. Stop inspection.

Pipe label: **W-004**
6"Ø Cast-Iron pipe.
43" above water level; 10:49 AM
Findings:
26'; 4" Y service connection at 3 o'clock.
50'; 4" Y service connection at 3 o'clock.
120' can't push the camera any further. Stop inspection.

Pipe label: **W-003**
6"Ø Clay pipe.

CITY SEWER SPECIALISTS Corp.

Gowanus Canal
Pipe investigation for contaminated pipes
Daily Summary Report

Attached with this report are video DVDs of the inspections.

Client:
Lockheed Martin Information & Technology Service
2339 Route 70 West Cherry Hill, NJ 08002-3315

Project description:
Pipe investigations at Gowanus Creek site, Brooklyn, NY.
In the REP Solicitation for SERAS program project #0-59 pipe investigation at Gowanus canal.

Dates:
December 6th to December 9th 2010

P.O. Box 670956, Flushing NY 11367 • Phone: 718-268-1647 • Fax: 718-268-0499 • info@SewerSp.com
www.SewerSp.com

Page Intentionally Left Blank

Table of content:

	Page
List of remaining pipes that need to be jetted, take oil samples, redo inspection	2
Dec 6: W-042, W-002, E-022A.	3
Dec 7: W-015A, W-044,	4
Dec 8: W-018, W-098, T3-013.	5
Dec 9: E-007, T3-012.	6

List of remaining pipes that need to be jetted, take oil samples, redo inspection:

E-007 4” Cast-Iron pipe.
T3-012 12” Cast-Iron pipe.
T3-013 10” Cast-Iron pipe.
W-015A 4” Cast-Iron pipe. (6' Downstream from W-015)
W-018 8” Cast-Iron pipe.
W-042 8” Clay pipe.
W-044 6” Clay pipe.
W-046 9' Clay pipe.
W-098 6” Cast-Iron pipe.

Please note:
This report indicates all the pipes that we found oil in them.
Oil samples were taken from these pipes during the water jetting.

- E-001 to E-006 36” Cast-Iron pipes: all six pipes connect to a large storm sewer under Douglass street.

Based on our observation, the first 30 feet, East of the canal into Douglass street, are a dumping ground for the local people to dispose of their liquid wastes.

- W-042, W-018, W-098, W-043. Those pipes come from 400 Carroll street lot.

All the pipes above were filled with oil. In all of them, when we took the camera out, it was covered with oil.
When we were in the process of jetting the pipes, the “owner” approached us, prevented us from docking our boat and didn't let us complete our job.

P.O. Box 670956, Flushing NY 11367 • Phone: 718-268-1647 • Fax: 718-268-0499 • info@SewerSp.com

Appendix H
Data Quality Evaluation

Page Intentionally Left Blank

Appendix H Data Quality Evaluation

1 Introduction: Data Quality Assessment

This data quality evaluation (DQE) assesses the effect of the overall analytical process on the "availability" of the analytical data. "Availability" in this context refers to whether results can be used by the project team based on their analytical soundness. If a result is analytically sound, it is available for use for evaluating the potential releases, nature and extent of contamination, and estimating potentially associated human health and ecological risks. However, a particular result or group of results may not be "usable" for these purposes if other conditions apply. For example, if there were a hypothetical site where a trichloroethylene (TCE) spill had occurred and the TCE data for many or all of the samples were rejected, the data may not be usable for making site-specific determinations even if all the non-TCE data were analytically sound and available for use by the project team. In order to avoid confusion of terms, this data quality evaluation differentiates the "availability" of results from "usability" of results. "Available" results are analytically sound and available for use by the project team to make decisions, even if they are not usable for a particular purpose.

The three major categories of data evaluation are laboratory performance, field collection performance (i.e. blank contamination), and matrix interferences. Evaluation of laboratory performance is a check for compliance with the method requirements; in other words, a check of whether the laboratory analyzed the samples within the limits of the analytical method. Depending on the type of data, an independent USEPA data validator may have also conducted a review of the laboratory data to assess whether the analytical methods were within required control limits at the time of analysis. An internal (i.e. non-USEPA) data validator may also perform this task. Evaluation of potential matrix interferences involves the review of several areas of results, including but not limited to surrogate spike recoveries, matrix spike recoveries, and duplicate sample results. Evaluation of field collection performance, such as blank contamination and field duplicates, involves the review of field quality control (QC) and the determination of their effect on the sample results.

The data evaluation and validation is a multi-tiered approach. The process begins with an internal laboratory review, continues with an independent review by an USEPA or internal data validator (if applicable), and ends with an overall review by the contractor project chemistry team. While only the data validator (USEPA or internal) is allowed to apply qualifiers to the data, the process allows for data quality to be thoroughly evaluated.

1.1 Laboratory Internal Quality Control Review

Prior to releasing the analytical data, the laboratory reviews both the sample and QC data to verify sample identity, instrument calibration, quantitation limits, dilution factors, numerical computations, accuracy of transcriptions, and chemical interpretations. In addition, the QC data are tabulated and the results reviewed to ascertain whether they were within the contract-required limits for accuracy and precision. Any non-conforming data

are discussed in the data package cover letter and case narrative. The case narrative is then reviewed by the data validator. If necessary, qualifiers are applied based on this information.

1.2 Levels of Data Validation

All data collected under UFP-QAPP, the project-specific quality assurance project plan, were verified and validated according to the procedures outlined in Worksheets 34, 35, and 36. In general, definitive data, which are typically "Full TCL/TAL" and generated through the CLP laboratory, are Level IV validated through the CLP program. Definitive data not generated through the CLP laboratory, such as air data, are Level III validated by an internal validator. Screening data, such as wet chemistry parameters associated with definitive data, are Level III validated by an internal validator. Screening data, such as GRAINSIZE and AVSSEM, are Level II validated by an internal validator. Investigation-derived waste (IDW) data, which are used only for determining disposal options, undergo a very low-level validation, which is typically a check for completeness and usability. Secondary data, which are that generated by another entity are validated by that entity according to that entity's QAPP. Therefore, the vast majority of data were subject to data validation by an independent USEPA data validator.

When applicable, an independent USEPA data validator reviewed all data packages using the validation criteria defined by USEPA Contract Laboratory Program (CLP) and specific to Region II. This guidance was applied to the data to help the validator create a thorough and systematic approach to the validation process. As stated above, the data validation process was independent and separate from the laboratory's internal review. The process was specifically focused on the effects of the laboratory's performance and sample matrix on the analytical results. Areas of review consisted of holding time compliance, surrogate recovery accuracy, matrix spiked sample precision and accuracy, blank contamination, initial and continuing calibration accuracy and precision, laboratory control sample accuracy, internal standard response and retention time accuracy, instrument tune criteria accuracy, and duplicate sample precision (laboratory and field duplicates). Additionally, the analytical spectrum and raw data output were reviewed and laboratory results selected by the validator were recalculated from the raw data to verify final laboratory quantitation.

1.3 Selection of Results

When multiple analyses are performed, it is usually due to dilution and reanalysis. It is sometimes due to multiple concentration ranges or repeating analytes across analysis groups. This often results in greater than one result per analyte per sample. More-specifically, there should be only one numerical result per CAS number per preparation (total, filtered, SEM, TCLP, SPLP, etc.) per sample ID. If duplicates occur, they must be systematically excluded. The data validator typically does this when it is due to analytical requirements such as dilution and reanalysis. This may leave duplicates due to concentration ranges such as when an analyte appears in both "Trace VOC" and "Trace VOC by SIM" or in both "Low SVOC" and "Low SVOC by SIM". It may also leave duplicates due to analysis groups such as when an analyte appears in both VOC and SVOC (not typical for CLP analysis) or when an analyte appears in both SVOC and Explosives (note that Explosives were not analyzed as part of this project). It is acceptable for these duplicates to occur because the results may be analytically sound and usable.

However, it is difficult to interpret results when there is more than one result per constituent per sample. Therefore, the "best result" is selected in order to prevent redundancy. Whether the data validator, an internal data validator, or a database manager is selecting a best result, a similar procedure is always used:

1. The non-rejected result is selected. If there are two or more results per analyte per sample, and one is rejected, then the rejected result is eliminated first in favor of non-rejected results. This is especially useful when the laboratory experiences a serious QA/QC deficiency and reanalyzes; the data user is forced to consider the result from the better analysis.

2. The result from the proper dilution factor is selected. If there are two or more results per analyte per sample due to multiple dilutions, then the result from the best dilution factor is selected. This is typically the lowest dilution factor (preferably 1X dilution). However, if a particular result exceeds the calibration range, then it is less accurate than a result from a greater dilution that is within the calibration range. Note that this may result in a lesser result being selected in favor of a greater result (when both results are analytically sound) when the lesser result is more accurate. Only a data validator does this. Sometimes a result does not fall into a proper dilution range (for example, over calibration range at 1X, less than CRQL or QL at 5X). In this case, the greater of detects is selected, but either result would be J-qualified to indicate the exceedance.

3. The detect is selected. If there are two or more results per analyte per sample and one or more is detected, then detected results are selected in favor of nondetected results. This results in a conservative data use.

4. The greater of detects is selected. If there are two or more results, all detected, and all are analytically sound (and not covered by one of the conditions above), then the greater of detects is selected. This results in a conservative data use.

5. The lesser of nondetects is selected. If there are two or more results, all nondetects, and all are analytically sound (and not covered by one of the conditions above), then the lesser of nondetects is selected. This prevents the data user from considering nondetect results (CRQLs or QLs) which are elevated due to various reasons when there are perfectly acceptable low CRQLs or QLs.

Selected results (those not excluded due to redundancy) should be used for reporting purposes. These may include rejected results. When rejected results are selected for reporting, they must be accompanied by the R-flag to indicate that they are not available for use or inclusion in statistics. The reporting of R-flagged results does not suggest the use of R-flagged results. They are reported in order to show that the constituent was collected and analyzed but the result is not acceptable (as opposed to not collected or not analyzed).

The exclusion of results because a "better" result exists does not affect completeness or count against data availability. That is because completeness is considered on the distinct set of results (one result per analyte per sample as described above). Completeness is negatively affected when a rejected result is included because a "better" result does not exist.

1.4 Qualification of Data

Qualification of data is not an unusual occurrence. To define a laboratory QC exceedance and when a laboratory QC exceedance occurs, the laboratory refers to its in-house Standard Operating Procedures (SOPs). The SOPs are based on program requirements, the requested USEPA CLP analytical method, and accumulated laboratory experience. When a laboratory QC exceedance occurs, the situation may be acceptable or it may require further action by the laboratory, such as application of a laboratory qualifier or reanalysis of the sample. The data validator uses a separate set of QC criteria, based on guidance from the USEPA region that applies to the samples. A laboratory QC exceedance may not constitute a data validation exceedance and a data validation exceedance may not constitute a laboratory QC exceedance. Data validation criteria exceedances may result in the qualification of or rejection of data, as deemed appropriate by the third-party data validator.

The data validator examines each data point and determines any effects that QC exceedances have had. Most often, these effects dictate that the result or quantitation limit should be considered estimated, but is still available for use. The J-qualification, UJ-qualification, NJ-qualification, and U-qualification of results are common occurrences and have no adverse effect on the availability of that result to the project team for making decisions. J-qualified and NJ-qualified results are available, at the reported result, for use as detects as long as they are considered "estimated" by the project team. Human health risk assessment guidance suggests that these qualifiers "indicate uncertainty in the reported concentration of the chemical, but not in its assigned identity. Therefore, these data can be used just as positive data with no qualifiers or codes." In addition, one should use "J-qualified concentrations the same way as positive data that do not have this qualifier" (Risk Assessment Guidance for Superfund: Volume I - Human Health Evaluation Manual. (Part A) EPA/540/1-89/002. Office of Emergency and Remedial Response, U.S. Environmental Protection Agency, Washington, D.C. 1989). U-qualified and UJ-qualified results are available, at the reported quantitation limit, for use as non-detects as long as they are considered "non-detect," "attributable to blank contamination," or "non-detect, estimated quantitation limit," as appropriate.

Electronic data for this project are accompanied by data qualifiers (U, J, etc.) but not reason codes (BL: due to blank contamination; BRL: below reporting limit; etc.). The reason for data qualification can be found in the data validation reports which accompany the laboratory data. Because the reason codes are not available electronically, they were not considered (for purposes of generating statistics and patterns) as part of this data quality evaluation. This is because, as above, most qualification results in data that are usable in the same way as unqualified data. Because rejection indicates a severe exceedance, the reason for rejection was investigated (in the data validation reports) when rejection occurred.

In extreme cases, a result is rejected and deemed to be unusable. "Unusable" in this instance is defined as a result that is not analytically sound and is not generally considered available for use by the project team. In some cases, the project team may still decide to use a rejected result. An example of such occurrence would be if a result is rejected because it is biased extremely high, yet it is still below the project action limits. A conservative decision may be made to consider this result a non-exceedance, even if its concentration was rejected. For that reason, it is important to examine why a result was rejected. For the most part,

however, rejected results are not usable, and the R-qualifier is the only qualifier that has an adverse effect on the availability of data.

In large data sets, rejected results are often inconsequential because there are sufficient non-rejected data available to the project team. If there are enough non-rejected data or the project team is able to infer results from adjacent sampling locations or there is other site-specific information that can provide additional lines of evidence, it may not be necessary to know the concentrations of some rejected constituents. It may also not be necessary to prove a constituent's absence if there are sufficient additional lines of evidence.

The following data validation qualifiers were applied to one or more analytical results:

- **U** - Not detected. The sample was analyzed for this parameter, but it was not detected at greater than the reported quantitation limit. The data validator may also apply this qualifier to indicate that a concentration is attributed to blank contamination. In this instance, the qualifier may indicate "not detected at significantly greater than that in an associated blank". The U-qualifier does not necessarily indicate a quality control problem.
- **UJ** – Not detected, quantitation limit is estimated. Sample was analyzed for this parameter, but it was not detected above the reported quantitation limit. The quantitation limit for this parameter is estimated due to a quality control issue.
- **J** - Concentration estimated. The parameter was positively identified and the associated numerical value is the approximate concentration of the parameter in the sample.
- **NJ** – Qualitative identification questionable due to poor resolution. Presumptively present at approximate quantity.
- **R** - Rejected. The result was rejected due to a quality control issue. The presence or absence of the parameter cannot be verified and the result generally is not usable as detected or not detected.
- **[null] -** Detected. Qualification was not warranted.

In some cases, the data validation qualifier is the same as the laboratory qualifier ([null], J, and U). When this occurs, the data are said to be acceptable as reported because the data validator did not need to apply additional qualification.

2 Impact of Data Quality on Project Data Quality Objectives and Data Usability

The laboratory or laboratories analyzed the samples in accordance with USEPA CLP methods, EPA methods, ASTM methods, Standard Methods, and SW-846 methods. The data packages were reviewed by an independent USEPA data validator or an internal validator using USEPA guidance.

The laboratory utilized various qualifiers to represent "below reporting limit," "non-detect," and "detected" among others that indicate a laboratory quality assurance / quality control (QA/QC) exceedance. The data validator utilized J-qualifiers, NJ-qualifiers, UJ-qualifiers, U-qualifiers, and R-qualifiers to represent "estimated," "presumptively present at approximate quantity," "non-detect, estimated quantitation limit," "non-detect" or "attributable to blank contamination," and "rejected," respectively.

The J- and UJ-qualifiers indicate that some results are estimated. These qualifiers indicate that data are available for use as detects and non-detects, respectively. These qualifiers do not necessarily indicate a problem that adversely affects the availability of data. For example, J-qualifiers are often applied simply because results are below the quantitation limit.

Region II data validation guidance mandates the use of J- and UJ-qualifiers when QA/QC exceedances dictate their necessity. If the direction of bias is known, it is not implied by the J- or UJ-qualifier. If a result is attributable to blank contamination, it is U-qualified and is no longer distinguishable from results that are simply non-detect. This supports the practice that J-qualified results, while estimated, are available for use as detects at their qualified concentration and U- and UJ-qualifiers are available for use as non-detects at their qualified quantitation limit. In general, J-, UJ-, and U-qualified results are available for use as qualified for evaluating potential releases, the nature and extent of contamination, and estimating potentially associated human health and ecological risks.

It is a common occurrence for achieved quantitation limits to be greater than project action limits or for quantitation limits to be elevated to greater than what was expected or requested at the time of planning activities. In many cases, project action limits (PAL) are simply very low or the laboratory was forced by the analytical method to raise the quantitation limit (QL) to a Contract Required QL (CRQL). These instances of QL v. PAL exceedance are acknowledged and detailed by Worksheet 15 of the project-specific Quality Assurance Project Plan (UFP-QAPP). In other cases, the laboratory is forced to modify the analytical method or select another analytical method in order to accommodate a difficult matrix or a free product. In these instances, the analytical data are often used to identify the matrix as opposed to determining whether or not a groundwater, soil, or sediment criterion is exceeded.

In the instance where non-detect quantitation limits are greater than project action limits, the results are available for use as non-detects, but their use adds uncertainty to the conclusions drawn. There are a variety of potentially unavoidable reasons why the quantitation limits of non-detect results may exceed project action limits:

- If a criterion (project action limit) is very low, current instrumentation technology may not be able to achieve a QL less than the project action limit.
- The quantitation limit may have been established at a time when the criterion (project action limit) was higher (less stringent), but the reporting is being done against new (more stringent) criteria. This can also occur when unanticipated project action limits emerge after the project-planning stage.
  - This is often the case when using older (perhaps historic) and secondary data.
- If the laboratory utilizes an analytical method with contract-required quantitation limits (CRQLs) or contract-required detection limits (CRDLs), the analytical method requirements may force the laboratory to report the quantitation limit at a level higher than the project action limit.
- If a target compound or analyte is present at an elevated level, the laboratory will dilute the entire sample in order to report that concentration within the instrument's linear calibration range. It may not be possible to analyze the sample at a lesser dilution if the target compound's high concentration is likely to damage the instrument or saturate the

detector. The high concentration of a non-target compound or analyte may also necessitate initial dilution for the same reason.
  - This is often the case for heavily-contaminated sites compared to risk-based screening levels. Although there are often multiple detected exceedances, there are often also multiple nondetected exceedances.
- If matrix effects mask low concentrations, the laboratory may be forced to elevate their quantitation limits to demonstrate the fact that low concentrations cannot be detected.
  - This is often the case for sites with difficult matrices such as NAPL and with mixed-matrices that contain NAPL.
- If matrix effects are particularly strong, the laboratory may be forced to analyze the sample at an initial dilution in an attempt to dilute the matrix effects.
  - This is often the case for sites with difficult matrices that include NAPL.
- If historical concentrations warrant, the laboratory detects an odor, or the field team designates a sample as "expected high concentration," the laboratory may pre-screen the sample and initially dilute it. Such dilutions raise the quantitation limit of nondetect compounds and may raise the quantitation limit to greater than the project action limit.
  - This is often the case for investigations that include both a contaminated area (or site) and also a surrounding area that is not expected to be contaminated.
- If the sample appearance indicates possible high concentrations, the laboratory may be forced to analyze the sample at a concentration range different from what is requested. For example, if a sample is designated as "groundwater," but is actually an emulsion or sludge, the laboratory may be forced to perform a waste dilution and analyze the sample using the "medium soil" instead of the "trace water" concentration range. Note that this may also result in units other than expected (solid-based units for liquid samples).
  - This occurs quite often. For planning purposes and simplicity, it is useful to compare CRQLs to action levels assuming that the laboratory can analyze all samples using the lowest concentration ranges. In this way, it can be shown that achievable concentration ranges are appropriate for nondetect results to support decision based on screening levels. In reality, however, contaminated samples would damage the instrumentation if analyzed at such low concentration ranges. Therefore, the lowest concentration ranges are requested and the appropriate (somewhat higher) concentration ranges are used. Although this increases the uncertainty surrounding nondetect results, it is appropriate given the actual levels of contamination that are observed in the samples compared to screening levels.
- If the field team cannot provide the full sample volume, the laboratory may be forced to dilute the sample by adding water until the minimum volume is achieved.
  - This does not occur very often. Most often, this occurs due to error or breakage. Sampling is usually designed to ensure full sample volume can be provided.
- If a sample is characterized by high percent moisture, the reporting limits will be raised such that the concentrations and quantitation limits are reported on a dry-weight basis.
  - This occurs quite often for sediment samples which are saturated with water.

Individual instances of quantitation limit v. screening level exceedances for this project may be the result of any or all of these factors. Please refer to Table 3. One row is provided for each combination of tracking table, matrix, analysis group, and analyte where at least one QL (U-value) exceeds its corresponding screening level. The applicable screening levels are provided. A summary of detects (count, minimum, and maximum), exceedances (count),

nondetects (count, minimum, and maximum), and U-Value exceedances (count) is provided. Detect information is useful to determine whether a particular constituent was detected in a given matrix during a given event, and whether none, some, or all detects exceeded a screening level. Nondetect information is useful to determine whether some or all nondetects exceeded a screening level. This helps demonstrate whether the requested concentration range was appropriate for the screening level or if the screening levels were too low given current instrumentation technology. The spread between the minimum and maximum nondetect helps demonstrate whether target or matrix effects caused elevated quantitation limits.

There is increased uncertainty in these instances (U-value exceeds screening level) because the laboratory may not be able to practically quantitate the concentration of a contaminant if it is present in the sample at or at greater than the screening level. Minimum detection limits (the level above which the laboratory is likely to detect and report the constituent, if present in the sample, are typically approximately 1/5 to 1/2 the quantitation limit, but must be less than the CRQL.

When a U-Value exceeds a screening level, it is useful to know if there other detected exceedances in the same sample and same analysis group. In that manner, the increased uncertainty (due to U-value exceedance of screening level) is not relevant because another constituent in the same class of analytes (for example, volatile organic compounds) suggests an exceedance. Instances where this does not occur (U-values that exceed screening levels but are not associated with a related detected exceedance defined as an exceedance in the same analysis group for the same sample) are shaded in yellow on Table 3. There is increased uncertainty in instances when the laboratory may not be able to practically quantitate the concentration of a contaminant if it is present in the sample at or at greater than the screening level and there are no sample results (for that analysis group) which suggest a screening level exceedance.

When this occurs, it is useful to know if there are other detected exceedances in the same matrix at the same station. This may take into account different samples (such as field duplicates and multiple depths) but would not consider different media (such as surface water collected from a sediment station). In this manner, the increased uncertainty (due to U-value exceedance of a screening level) is less relevant because the same or another sample result (in the same media at the same station) suggests an exceedance. This is because the data suggest some action (such as excavation) or understanding (such as calculation of risk) at a given location and it may no longer be necessary to demonstrate that all analytes are absent at less than their screening levels. Instances where this occurs (U-values that exceed screening levels but are not associated with a related detected exceedance defined as an exceedance in the same matrix at the same station) are shaded in pink on Table 3. The increased uncertainty in these instances is somewhat more severe than that shown via the yellow shading. It should be noted that this occurs only for VOCs (five results) in Phase I surface water (see section 4.1.4, below).

2.1 PARCC Considerations

2.1.1 Precision

Precision is defined as the agreement between duplicate results, and was assessed by comparing duplicate matrix spike recoveries, laboratory replicates, and field duplicate

sample results. When corresponding detects are sufficiently high, their relative percent difference (RPD) is calculated and compared to a goal or target RPD to demonstrate that precision is acceptable. For samples collected using a UFP-QAPP, the target RPD is provided in Worksheets 12 and 28. When both results are nondetect or when one result is detected and the other is nondetect, RPD is not calculated. However, the fact that one result is detected but not the other is discussed as it pertains to precision. Depending on the level of detect, this may or may not be an acceptable situation.

Precision is also considered as an additional indicator to ensure accuracy in split samples. Because split samples were not included in the UFP-QAPP for this project, "acceptable precision" was defined as 10% plus that which is acceptable for field duplicates (for similar matrix). This acknowledges that split samples are susceptible to RPD resulting from field compositing procedures and differences between laboratories.

2.1.2 Accuracy

Accuracy is a measure of the agreement between an experimental determination and the true value of the parameter being measured. For organic analyses, each sample was spiked with surrogate compounds; and for organic and inorganic analyses, an MS/MSD and LCS were spiked with a known parameter concentration before preparation. Surrogates and MS/MSD provide a measure of the matrix effects on the analytical accuracy. LCS demonstrates accuracy of the method and the laboratory's ability to meet the method criteria.

In some cases, split samples were collected and sent to a secondary laboratory in order to assess accuracy at the primary laboratory. Because it is unlikely that split samples will exhibit acceptable precision (refer to section 2.1.1, above) if one or both laboratories are inaccurate, precision between split samples was used to assess the accuracy of the primary laboratory.

2.1.3 Representativeness

Representativeness is a qualitative measure of the degree to which sample data accurately and precisely represent a characteristic environmental condition (in this case, nature and extent of contamination). Representativeness is a subjective parameter and is used to evaluate the efficacy of the sample planning design. In terms of data quality, representativeness was assured because the sampling team followed approved standard operating procedures for sample collection and handling, and the laboratory followed approved standard operating procedures for sample handling, preparation, and analysis.

In one instance, representativeness was affected for two samples due to equipment failure in the field during air sampling (refer to section 8.4.3, below).

2.1.4 Completeness

For purposes of this data quality evaluation, completeness will be defined as the percentage of measurements that are judged to be valid; validity being defined by the Data Quality Objectives (DQOs). Therefore, completeness will be calculated as the number of analytically-sound results that are available for use compared to the total number of measurements made. The following references designate all results except those R-qualified as "rejected" to be available for use as analytically-sound results:

Therefore, the R-qualifier is the only qualifier that negatively affects a data point's availability. Completeness is provided for each analysis group for each matrix. The completeness goal is defined in Worksheet 12 of the project-specific UFP-QAPP. For analyses undergoing data validation, the completeness goal is ">90% of results not rejected by data validator". For analyses that do not undergo CLP or internal data validation, the completeness goal is "Laboratory must report 100% of results requested". This is applicable to samples collected and analyzed as part of the UFP-QAPP.

For secondary (historic) data, there is one more factor that can affect completeness. When accepting large quantities of electronic data, a certain small percentage of data may be deemed "invalid" for various reasons. For example, the result may be zero, a negative value, or missing. Results deemed "invalid" for these reasons cannot be used and show up as data holes. This is acceptable considering the large quantity of electronic data that is available to support decisions at the site and the time that would be required to investigate "invalid" results. These results are treated as "not analyzed" and do not contribute to the total number of measurements made. Therefore, the presence of data holes does not decrease the percent completeness of secondary (historic) data, but this phenomenon is considered when discussing completeness.

2.1.5 Comparability

Comparability is a qualitative measure designed to express the confidence with which one data set may be compared to another. Factors that affect comparability are sample collection and handling techniques, sample matrix, and analytical methods. In this case, because approved standard operating procedures were used for sample collection and handling, common sample matrices were evaluated (groundwater, surface water, subsurface soil, sediment, surface soil, tissue, and air), and USEPA CLP methods, EPA methods, ASTM methods, Standard Methods, and SW-846 methods were utilized, the data user may express

confidence in the fact that this data set is comparable to others of acceptable data quality. In addition, comparability is controlled by the other PARCC parameters because data sets can be compared with confidence only when precision and accuracy are known. Except in the case of rejected data, precision and accuracy were demonstrated to be acceptable, and the data user may be confident that this data set is comparable to others of high data quality.

3. Data Groupings and Included Data

All relevant data underwent data quality evaluation. Please refer to Table 1 for the groupings of data included within this data quality evaluation. Data are grouped primarily by the tracking table on which the sample ID appears. This is because the tracking table considers the sample collection event (for example "Phase II"), the sample collection company, and the status of the data set (primary, secondary, historic, etc.). The groupings are further separated by matrix (sediment, surface water, etc.). Table 1 also specifies which screening level sets are used to compare to the results. For purposes of this data quality evaluation, this information is used in the nondetect U-value v. screening level comparison. A small amount of data will be evaluated as an addendum to this appendix:

- PCB Congener Data: At the time of preparation of this data quality evaluation, results had been received but there was insufficient time to complete the data quality evaluation.
- Tissue Data: At the time of preparation of this data quality evaluation, Tissue (i.e. fish and crab) sample results had not been received.

Please refer to Table 2 for groupings by tracking table, matrix, and analysis method. It should be noted that EPA three-digit methods (such as E608 for Pesticides and PCBs via GC) are provided instead of EPA CLP methods (such as EPA CLP SOM01.2) in order to imply the analysis group and concentration range within the analytical method in the electronic data.

4. Phase I Pipe Survey Surface Water Samples (A-1 WS)

The purpose of this data quality evaluation is to summarize the findings of the data validation and any effects it may have on the availability of the data from the Phase I Pipe Survey Surface Water Sampling event at Gowanus Canal as well as to provide an assessment of data usability. Samples were collected September 1, 2010 through September 7, 2010.

4.1 Volatile Organic Compounds

Volatiles were analyzed by USEPA CLP SOM01.2 "Trace Water" and "Trace Water by SIM". Excluding field quality control samples, 612 distinct data points were generated. Because there are no rejected results, the volatiles data set is 100 percent complete (612 of 612 volatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-1	WS	VOC	U	502	82.03%	4.1.1
A-1	WS	VOC	UJ	84	13.73%	4.1.2
A-1	WS	VOC		14	2.29%	
A-1	WS	VOC	J	12	1.96%	4.1.3

4.1.1 U-qualification

A total of 502 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

4.1.2 UJ-qualification

A total of 84 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 4.1.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

4.1.3 J-qualification

A total of 12 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

4.1.4 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set S or Set T. Of 586 U- or UJ-qualified results, 60 CRQLs exceeded Set T. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 60 CRQL v. SL exceedances, all 60 exceeded Set T and there were no detected SL exceedances for VOCs in the same sample. These instances are shown as yellow shading on Table 3. These instances are of interest because the data suggest that no VOCs were detected at greater than a screening level, but at the same time, one or more VOC CRQL was greater than its corresponding screening level in the same sample. However, of the 60 CRQL v. SL exceedances, only 5 CRQLs exceeded Set T without an exceedance (any analysis group) in the same matrix at the same station. These correspond to 1,2-dibromo-3-chloropropane; 1,2-dibromoethane; 2-hexanone; cis-1,3-dichloropropene; and trans-1,3-dichloropropene in GC-CF-W-044-1 at station W-44. It should be noted that this sample was analyzed only for VOCs and thus could not have had exceedances for analysis groups other than VOC. These instances are shown as pink shading on Table 3. This station is of interest because the data suggest that no compounds were detected at greater than a screening level, but at the same time, one or more VOC CRQLs was greater than its corresponding screening level.

4.2 Semivolatile Organic Compounds

Semivolatiles were analyzed by USEPA CLP SOM01.2 "Low Water" and "Low Water by SIM". Excluding field quality control samples, 748 distinct data points were generated. Because there are no rejected results, the semivolatiles data set is 100 percent complete (748 of 748 semivolatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the semivolatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-1	WS	SVOC	U	625	83.56%	4.2.1
A-1	WS	SVOC		54	7.22%	
A-1	WS	SVOC	UJ	40	5.35%	4.2.2
A-1	WS	SVOC	J	29	3.88%	4.2.3

4.2.1 U-qualification

A total of 625 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

4.2.2 UJ-qualification

A total of 40 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not

contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 4.2.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

4.2.3 J-qualification

A total of 12 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

4.2.4 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set S or Set T. Of 665 U- or UJ-qualified results, 278 CRQLs exceeded Set S or Set T. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 278 CRQL v. SL exceedances, only 28 exceeded Set S or Set T and there were no detected SL exceedances for SVOCs in the same sample. These instances are shown as yellow shading on Table 3. These instances are of interest because the data suggest that no SVOCs were detected at greater than a screening level, but at the same time, one or more SVOC CRQL was greater than its corresponding screening level in the same sample. However, it should be noted that all 278 of the SVOC CRQL v. SL exceedances were associated with an exceedance (any analysis group) in the same matrix at the same station.

4.3 Pesticides/PCBs

Pesticides and PCBs were analyzed by USEPA CLP SOM01.2 "Water". Excluding field quality control samples, 320 distinct data points were generated. When rejected results are considered, the PEST/PCB data set is 93.75 percent complete (300 of 320 PEST/PCB results are available for use). The validation process resulted in the following qualifiers for results in the pesticides fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-1	WS	PEST/PCB	U	262	81.88%	4.3.1
A-1	WS	PEST/PCB	UJ	28	8.75%	
A-1	WS	PEST/PCB	R	20	6.25%	4.3.2
A-1	WS	PEST/PCB		10	3.13%	4.3.3

4.3.1 U-qualification

A total of 262 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater

than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

4.3.2 UJ-qualification

A total of 28 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 4.3.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

4.3.3 R-qualification

A total of 20 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to 4,4'-DDT and Endosulfan I in 10 samples (GC-CF-E-027-1; GC-CF-E-033-1; GC-CF-E-035-1; GC-CF-E-063-1; GC-CF-T1-003-1; GC-CF-W-001-1; GC-CF-W-037-1; GC-CF-W-046-1; GC-CF-W-048-1; and GC-CF-W-077-1. Although these results are not usable for any purpose (and there are no usable 4,4'-DDT and Endosulfan I results for Phase I Surface Water samples), this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other PEST/PCB information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

4.3.4 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set S or Set T. Of 290 U- or UJ-qualified results, 250 CRQLs exceeded Set S or Set T. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 200 CRQL v. SL exceedances, all 200 exceeded Set S or Set T and there were no detected SL exceedances for PEST/PCBs in the same sample. These instances are shown as yellow shading on Table 3. These instances are of interest because the data suggest that no PEST/PCBs were detected at greater than a screening level, but at the same time, one or more PEST/PCB CRQL was greater than its corresponding screening level in the same sample. However, it should be noted that all 200 of the PEST/PCB CRQL v. SL exceedances were associated with an exceedance (any analysis group) in the same matrix at the same station.

4.4 Filtered Metals

Filtered metals, including mercury, were analyzed by USEPA CLP ILM05.4 using ICP-AES, ICP-MS, and CVAA. Excluding field quality control samples, 230 distinct data points were generated. When rejected results are considered, the filtered metals data set is 99.13 percent complete (228 of 230 filtered metals results are available for use). The validation process resulted in the following qualifiers for results in the filtered metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-1	WS	FMETAL		104	45.22%	
A-1	WS	FMETAL	U	99	43.04%	4.4.1
A-1	WS	FMETAL	J	25	10.87%	4.4.2
A-1	WS	FMETAL	R	2	0.87%	4.4.3

4.4.1 U-qualification

A total of 99 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

4.4.2 J-qualification

A total of 25 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

4.4.3 R-qualification

Two results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to filtered iron in GC-CF-E-033-1 and filtered sodium in GC-CF-T1-003-1. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other FMETAL information. There are filtered iron and sodium results for the remaining samples but it should be noted that corresponding total iron and sodium results in these samples are also rejected. Often, this is because of the filtered metals concentrations exceeding the total metals concentrations by some limit for relative percent difference.

Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

4.4.4 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U-values were compared to the lesser of Set S or Set T. Of 99 U-qualified results, 26 CRQLs exceeded Set S or Set T. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above. It should be noted that all of these CRQL v. PAL exceedances are associated with a detected exceedance for the same analysis group (FMETAL) in the same sample. Although uncertainty is increased when a CRQL exceeds a screening level, the increased uncertainty is less relevant because the CRQL v. SL exceedances are associated with other data that suggest detected SL exceedance in the same analysis group for the same sample.

4.5 Metals

Metals, including mercury and cyanide, were analyzed by USEPA CLP ILM05.4 using ICP-AES, ICP-MS, CVAA, and spectrophotometer. Excluding field quality control samples, 240 distinct data points were generated. When rejected results are considered, the metals data set is 99.17 percent complete (238 of 240 metals results are available for use). The validation process resulted in the following qualifiers for results in the metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-1	WS	METAL		115	47.92%	
A-1	WS	METAL	U	92	38.33%	4.5.1
A-1	WS	METAL	J	31	12.92%	4.5.2
A-1	WS	METAL	R	2	0.83%	4.5.3

4.5.1 U-qualification

A total of 92 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

4.5.2 J-qualification

A total of 31 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user

understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

4.5.3 R-qualification

Two results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to iron in GC-CF-E-033-1 and sodium in GC-CF-T1-003-1. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other METAL information. There are iron and sodium results for the remaining samples but it should be noted that corresponding filtered iron and sodium results in these samples are also rejected. Often, this is because of the filtered metals concentrations exceeding the total metals concentrations by some limit for relative percent difference. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

4.5.4 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U-values were compared to the lesser of Set S or Set T. Of 92 U-qualified results, 29 CRQLs exceeded Set S or Set T. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above. It should be noted that all of these CRQL v. PAL exceedances are associated with a detected exceedance for the same analysis group (METAL) in the same sample. Although uncertainty is increased when a CRQL exceeds a screening level, the increased uncertainty is less relevant because the CRQL v. SL exceedances are associated with other data that suggest detected SL exceedance in the same analysis group for the same sample.

4.6 Phase I Surface Water PARCC

4.6.1 Precision

Results may have been qualified due to precision-related QA/QC issues such as dual-column reproducibility, field duplicate reproducibility, laboratory replicate reproducibility, and MS/MSD precision. In some extreme cases, results may have been rejected due to precision issues. In the case of results rejected due to precision issues, the sample matrix or analytical process had a negative effect on precision. In the case of results qualified (but not rejected) due to precision issues, the sample matrix or analytical process had an effect on precision, but not severe enough to affect data usability (and hence completeness). In the case of unqualified (or U-qualified) results, which represent the majority of the data, there was no effect on precision.

4.6.2 Accuracy

Results may have been qualified due to accuracy-related QA/QC issues such as spiked surrogate recovery, internal standard recovery, laboratory control sample (or laboratory control sample duplicate) recovery, or matrix spike (or matrix spike duplicate) recovery. In some extreme cases, results may have been rejected due to accuracy issues. In the case of results rejected due to accuracy issues, the sample matrix or analytical process had a negative effect on accuracy. In the case of results qualified (but not rejected) due to accuracy issues, the sample matrix or analytical process had an effect on accuracy, but not severe

enough to affect data usability (and hence completeness). In the case of unqualified results, there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "nondetect"), there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "not detected at significantly greater than that in an associated blank"), there is no serious effect on accuracy (blank contamination affects the accuracy of a data point but not significantly unless the point is rejected) and the points are usable as U-qualified results.

4.6.3 Representativeness

There were no issues affecting representativeness in this data set.

4.6.4 Completeness

There were 24 R-qualified results in this dataset; therefore, the data validation process demonstrated that 98.88 percent of the results are available for use as qualified. For this data set, completeness exceeded a typical project goal of 90 percent. It should also be noted that only PEST/PCB, FMETAL, and METAL fractions contained rejected data, and these fractions, individually, also met the 90 percent project goal for completeness.

4.6.5 Comparability

There were no issues affecting comparability in this data set.

4.7 "Available as Reported" v. "Available as Qualified" v. Rejected

The data quality evaluation showed that the laboratory or data validator U-qualified 73.49 percent (1580 of 2150 results) of the data. These data may be available as reported (if U-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a U-qualifier). The data quality evaluation demonstrated that 13.81 percent (297 of 2150 results) of the data are acceptable without qualification. These results are available as reported. The data quality evaluation showed that the data validator UJ-qualified 7.07 percent (152 of 2150 results) of the data. These data are available as qualified. The data quality evaluation showed that the laboratory or data validator J-qualified 4.51 percent (97 of 2150 results) of the data. These data may be available as reported (if J-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a J-qualifier). The data quality evaluation showed that the data validator R-qualified 1.12 percent (24 of 2150 results) of the data and these data are not available for use. The results may be reported (as analyzed but rejected) as long as they are accompanied by the R-qualifier and are not used.

All results, with the exception of those R-qualified as "rejected" (24 of 2150 results, 1.12 percent of total results) are available for use as qualified.

5. Phase II Sediment Coring (A-2 SE)

The purpose of this data quality evaluation is to summarize the findings of the data validation and any effects it may have on the availability of the data from the Phase II Sediment Coring event at Gowanus Canal as well as to provide an assessment of data usability. Samples were collected March 3, 2010 through April 15, 2010.

5.1 Volatile Organic Compounds

Volatiles were analyzed by USEPA CLP SOM01.2 "Low Soil". Excluding field quality control samples, 29986 distinct data points were generated. When rejected data are considered, the volatiles data set is 97.91 percent complete (29358 of 29986 volatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-2	SE	VOC	U	24509	81.73%	5.1.1
A-2	SE	VOC		2249	7.50%	
A-2	SE	VOC	UJ	1748	5.83%	5.1.2
A-2	SE	VOC	J	852	2.84%	5.1.3
A-2	SE	VOC	R	628	2.09%	5.1.4

5.1.1 U-qualification

A total of 24509 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

5.1.2 UJ-qualification

A total of 1748 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 5.1.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

5.1.3 J-qualification

A total of 852 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user

understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

5.1.4 R-qualification

A total of 628 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These include 1,4-Dioxane in 569 samples. All nondetect 1,4-Dioxane results were rejected. Three 1,4-Dioxane detected results are available for use in GC-SD107-10.0-12.0, GC-SD153-08.2-08.8, and GC-SD081A-05.3-07.3. It should be noted that 1,4-Dioxane is not an analyte of interest for this project and it is often rejected due to its status as a poor purger. The remaining 59 rejected results consist of various volatile compounds (one or more of 1,1,1-Trichloroethane; 1,1,2,2-Tetrachloroethane; 1,1,2-Trichloroethane; 1,2,3-Trichlorobenzene; 1,2,4-Trichlorobenzene; 1,2-Dibromo-3-chloropropane; 1,2-Dibromoethane; 1,2-Dichlorobenzene; 1,2-Dichloropropane; 1,3-Dichlorobenzene; 1,4-Dichlorobenzene; 2-Hexanone; 4-Methyl-2-pentanone; Bromodichloromethane; Bromoform; Carbon tetrachloride; cis-1,3-Dichloropropene; Cyclohexane; Dibromochloromethane; Ethylbenzene; Styrene; Tetrachloroethene; trans-1,3-Dichloropropene; and Trichloroethene) in various samples (one or more of GC-SD108-06.0-08.0; GC-SD109-00.0-02.0; GC-SD109-02.0-04.0; GC-SD126-04.0-06.0; GC-SD126-06.0-06.6; GC-SD128-00.0-02.0; GC-SD141-00.0-02.0; GC-SD141-02.0-04.0; and GC-SD150-02.0-04.0). Although these results are not usable for any purpose (and there are only three 1,4-Dioxane results for Phase II Sediment), this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other VOC information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

5.1.5 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set A or Set R. Of 26257 U- or UJ-qualified results, 8218 CRQLs exceeded Set A or Set R. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 8218 CRQL v. SL exceedances, only 281 exceeded Set A or Set R and there were no detected SL exceedance for VOCs in the same sample. These instances are shown as yellow shading on Table 3. These instances are of interest because the data suggest that no VOCs were detected at greater than a screening level, but at the same time, one or more VOC CRQL was greater than its corresponding screening level in the same sample. However, of the 281 CRQL v. SL exceedances (without a "related detect"), no CRQLs exceeded Set A or Set R without an exceedance (any analysis group) in the same matrix at the same station.

5.2 Semivolatile Organic Compounds

Semivolatiles were analyzed by USEPA CLP SOM01.2 "Low Soil" and "Low Soil by SIM". Excluding field quality control samples, 39160 distinct data points were generated. When rejected results are considered, the semivolatiles data set is 99.36 percent complete (38911 of 39160 semivolatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-2	SE	SVOC	U	28084	71.72%	5.2.1
A-2	SE	SVOC	J	5182	13.23%	5.2.2
A-2	SE	SVOC		4805	12.27%	
A-2	SE	SVOC	UJ	840	2.15%	5.2.3
A-2	SE	SVOC	R	249	0.64%	5.2.4

5.2.1 U-qualification

A total of 28084 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

5.2.2 J-qualification

A total of 5182 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

5.2.3 UJ-qualification

A total of 840 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 5.2.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

5.2.4 R-qualification

A total of 249 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These include to 1,2,4,5-Tetrachlorobenzene in 94 samples. 1,2,4,5-Tetrachlorobenzene results are available in 478 other samples. The remaining 155 rejected results consist of various semivolatile compounds (one or more of 2,2'-Oxybis(1-

chloropropane); 2,3,4,6-Tetrachlorophenol; 2,4,5-Trichlorophenol; 2,4,6-Trichlorophenol; 2,4-Dichlorophenol; 2,4-Dimethylphenol; 2,4-Dinitrophenol; 2,4-Dinitrotoluene; 2,6-Dinitrotoluene; 2-Chloronaphthalene; 2-Chlorophenol; 2-Methylphenol; 2-Nitroaniline; 2-Nitrophenol; 3,3'-Dichlorobenzidine; 3-Nitroaniline; 4,6-Dinitro-2-methylphenol; 4-Bromophenyl-phenylether; 4-Chloro-3-methylphenol; 4-Chloroaniline; 4-Chlorophenyl-phenylether; 4-Methylphenol; 4-Nitroaniline; 4-Nitrophenol; Acetophenone; Atrazine; Benzaldehyde; Benzo(b)fluoranthene; Benzo(g,h,i)perylene; bis(2-Chloroethoxy)methane; bis(2-Chloroethyl)ether; bis(2-Ethylhexyl)phthalate; Butylbenzylphthalate; Caprolactam; Carbazole; Dibenz(a,h)anthracene; Diethylphthalate; Dimethyl phthalate; Di-n-butylphthalate; Di-n-octylphthalate; Hexachlorobenzene; Hexachlorobutadiene; Hexachlorocyclopentadiene; Hexachloroethane; Indeno(1,2,3-cd)pyrene; Isophorone; Nitrobenzene; n-Nitroso-di-n-propylamine; n-Nitrosodiphenylamine; Pentachlorophenol; and Phenol) in various samples (one or more of GC-SD017A-02.0-04.0; GC-SD031A-11.3-13.3; GC-SD121-03.5-05.5; GC-SD127-10.0-12.0; GC-SD127-14.0-15.8; and GC-SD129-06.6-08.6). Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other SVOC information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

5.2.5 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set A or Set R. Of 28924 U- or UJ-qualified results, 17457 CRQLs exceeded Set A or Set R. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 17457 CRQL v. SL exceedances, only 883 exceeded Set A or Set R and there were no detected SL exceedances for SVOCs in the same sample. These instances are shown as yellow shading on Table 3. These instances are of interest because the data suggest that no SVOCs were detected at greater than a screening level, but at the same time, one or more SVOC CRQL was greater than its corresponding screening level in the same sample. However, it should be noted that all 883 of the SVOC CRQL v. SL exceedances were associated with an exceedance (any analysis group) in the same matrix at the same station.

5.3 Pesticides/PCBs

Pesticides and PCBs were analyzed by USEPA CLP SOM01.2 “Soil”. Excluding field quality control samples, 18524 distinct data points were generated. When rejected results are considered, the PEST/PCB data set is 87.62 percent complete (16230 of 18524 PEST/PCB results are available for use). The validation process resulted in the following qualifiers for results in the PEST/PCB fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-2	SE	PEST/PCB	U	12261	66.19%	5.3.1
A-2	SE	PEST/PCB	R	2294	12.38%	5.3.2
A-2	SE	PEST/PCB	J	1563	8.44%	5.3.3
A-2	SE	PEST/PCB	UJ	1134	6.12%	5.3.4
A-2	SE	PEST/PCB	NJ	856	4.62%	5.3.5
A-2	SE	PEST/PCB		416	2.25%	

5.3.1 U-qualification

A total of 12261 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

5.3.2 R-qualification

A total of 2294 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to one or more PEST/PCB analytes in each of 502 samples. A spot-check was performed to determine the reason for rejection of these results. Results were rejected due to poor dual-column reproducibility. Region II SOPs for data validation require the rejection of detected results for which the percent difference (between results from both columns) is greater than 200%. Detected results are rejected when percent difference is greater than 100% if no peak interferences are noted. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other PEST/PCB information. As above, Phase II Sediment Coring PEST/PCB data are 87.62 percent complete. It should be noted that the Phase II Sediment PEST/PCB results did not meet the 90% completeness goal specified in the UFP-QAPP.

5.3.3 J-qualification

A total of 1563 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

5.3.4 UJ-qualification

A total of 1134 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 5.3.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

5.3.5 NJ-qualification

A total of 856 results were NJ-qualified as "presumptively present at approximate quantity" by the validator. The QA/QC issue was not severe enough to warrant rejection of data. This issue likely originates from precision exceedances (between results from dual-columns). The NJ-qualification of data by the data validator does not affect the availability of data because these results are available for use as detects at the reported concentration. The data user must consider the results "presumptively present at approximate quantity".

5.3.6 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set A or Set R. Of 13395 U- or UJ-qualified results, 8795 CRQLs exceeded Set A or Set R. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 8795 CRQL v. SL exceedances, only 2961 exceeded Set A or Set R and there were no detected SL exceedances for PEST/PCBs in the same sample. These instances are shown as yellow shading on Table 3. These instances are of interest because the data suggest that no PEST/PCBs were detected at greater than a screening level, but at the same time, one or more PEST/PCB CRQL was greater than its corresponding screening level in the same sample. However, it should be noted that all 2961 of the PEST/PCB CRQL v. SL exceedances (without corresponding related detects) were associated with an exceedance (any analysis group) in the same matrix at the same station.

5.4 Metals

Metals, including mercury and cyanide, were analyzed by USEPA CLP ILM05.4 using ICP-AES, ICP-MS, CVAA, and spectrophotometer. Excluding field quality control samples, 13688 distinct data points were generated. When rejected results are considered, the metals data set is 99.88 percent complete (13671 of 13688 metals results are available for use). The validation process resulted in the following qualifiers for results in the metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-2	SE	METAL		6334	46.27%	
A-2	SE	METAL	J	3495	25.53%	5.4.1
A-2	SE	METAL	U	3102	22.66%	5.4.2
A-2	SE	METAL	UJ	740	5.41%	5.4.3
A-2	SE	METAL	R	17	0.12%	5.4.4

5.4.1 J-qualification

A total of 3495 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

5.4.2 U-qualification

A total of 3102 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

5.4.3 UJ-qualification

A total of 740 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 5.4.2, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

5.4.4 R-qualification

Seventeen results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to Lead in D-03162010-01; GC-SD031A-09.3-11.3; GC-SD031A-11.3-13.3; GC-SD031A-13.3-13.9; GC-SD087A-08.3-10.3; GC-SD087A-10.3-12.3; GC-SD087A-12.3-14.3; GC-SD090B-05.4-07.4; GC-SD090B-07.4-09.4; GC-SD090B-09.4-11.4; GC-SD090B-

11.4-13.4; GC-SD111-08.3-10.3; GC-SD111-10.3-12.3; and GC-SD111-12.3-14.3, Mercury in D-04082010-02, Antimony in GC-SD125-04.0-06.0, and Zinc in GC-SD146-11.0-13.0. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other METAL information. There are Lead, Mercury, Antimony, and Selenium results for all of the remaining samples. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

5.4.5 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set A or Set R. Of 3842 U- or UJ-qualified results, 975 CRQLs exceeded Set A or Set R. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above. It should be noted that all of these CRQL v. PAL exceedances are associated with a detected exceedance for the same analysis group (METAL) in the same sample. Although uncertainty is increased when a CRQL exceeds a screening level, the increased uncertainty is less relevant because the CRQL v. SL exceedances are associated with other data that suggest detected SL exceedance in the same analysis group for the same sample.

5.5 Wet Chemistry

Wet Chemistry, including Sulfide, pH (or corrosivity), percent solids, and Total Organic Carbon (TOC) were analyzed by SW-846 9034, 9045C, ASTM D2216, and Lloyd Kahn, respectively. Excluding field quality control samples, 101 distinct data points were generated. Because there were no rejected results, the WCHEM data set is 100 percent complete (101 of 101 WCHEM results are available for use). The validation process resulted in the following qualifiers for results in the WCHEM fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-2	SE	WCHEM		71	70.30%	
A-2	SE	WCHEM	U	25	24.75%	5.5.1
A-2	SE	WCHEM	J	5	4.95%	5.5.2

5.5.1 U-qualification

Twenty-five results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

5.5.2 J-qualification

Five results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

5.6 Grain Size

Grain Size was analyzed by ASTM D4464. Excluding field quality control samples, 57 distinct data points were generated. Because there were no rejected results, the GRAINSIZE data set is 100 percent complete (57 of 57 GRAINSIZE results are available for use). It was not necessary to apply any qualifiers to the GRAINSIZE fraction.

5.7 Ignitability

Flash Point was analyzed by Pensky Martens. Excluding field quality control samples, 21 distinct data points were generated. Because there were no rejected results, the IGN data set is 100 percent complete (21 of 21 IGN results are available for use). It was not necessary to apply any qualifiers to the IGN fraction.

5.8 Reactivity

Reactive Cyanide was analyzed by SW-846 9014. Excluding field quality control samples, 21 distinct data points were generated. Because there were no rejected results, the REACT data set is 100 percent complete (21 of 21 REACT results are available for use). The REACT data set was 100 percent U-qualified to indicate that all data were nondetect.

5.9 Phase II Sediment Coring PARCC

5.9.1 Precision

Results may have been qualified due to precision-related QA/QC issues such as dual-column reproducibility, field duplicate reproducibility, laboratory replicate reproducibility, and MS/MSD precision. In some extreme cases, results may have been rejected due to precision issues. In the case of results rejected due to precision issues, the sample matrix or analytical process had a negative effect on precision. In the case of results qualified (but not rejected) due to precision issues, the sample matrix or analytical process had an effect on precision, but not severe enough to affect data usability (and hence completeness). In the case of unqualified (or U-qualified) results, which represent the majority of the data, there was no effect on precision.

Because a significant portion of the PEST/PCB results were rejected due to poor dual-column reproducibility (preventing the PEST/PCB fraction from meeting the completeness goal), the sample matrix or analytical process had a significant impact on precision in this instance.

5.9.2 Accuracy

Results may have been qualified due to accuracy-related QA/QC issues such as spiked surrogate recovery, internal standard recovery, laboratory control sample (or laboratory control sample duplicate) recovery, or matrix spike (or matrix spike duplicate) recovery. In some extreme cases, results may have been rejected due to accuracy issues. In the case of results rejected due to accuracy issues, the sample matrix or analytical process had a negative effect on accuracy. In the case of results qualified (but not rejected) due to accuracy issues, the sample matrix or analytical process had an effect on accuracy, but not severe enough to affect data usability (and hence completeness). In the case of unqualified results, there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "nondetect"), there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "not detected at significantly greater than that in an associated blank"), there is no serious effect on accuracy (blank contamination affects the accuracy of a data point but not significantly unless the point is rejected) and the points are usable as U-qualified results.

5.9.3 Representativeness

There were no issues affecting representativeness in this data set.

5.9.4 Completeness

There were 3188 R-qualified results in this dataset; therefore, the data validation process demonstrated that 96.86 percent of the results are available for use as qualified. For this data set, completeness exceeded the Phase II UFP-QAPP completeness goal of 90%. It should also be noted that VOC, SVOC, PEST/PCB, and METAL fractions contained rejected data. VOC, SVOC, and METAL, considered individually, also met the 90 percent completeness goal. However, PEST/PCB, considered individually, did not meet the 90 percent completeness goal because it is only 87.62 percent complete (see section 5.3.2, above).

5.9.5 Comparability

There were no issues affecting comparability in this data set.

5.10 "Available as Reported" v. "Available as Qualified" v. Rejected

The data quality evaluation showed that the laboratory or data validator U-qualified 66.96 percent (68002 of 101558 results) of the data. These data may be available as reported (if U-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a U-qualifier). The data quality evaluation demonstrated that 13.74 percent (13953 of 101558 results) of the data are acceptable without qualification. These results are available as reported. The data quality evaluation showed that the laboratory or data validator J-qualified 10.93 percent (11097 of 101558 results) of the data. These data may be available as reported (if J-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a J-qualifier). The data quality evaluation showed that the data validator UJ-qualified 4.39 percent (4462 of 101558 results) of the data. These data are available as qualified. The data quality evaluation showed that the data validator R-qualified 3.14 percent (3188 of 101558 results) of the data and these data are not available for use. The results may be reported (as analyzed but rejected) as long as they are accompanied by the R-qualifier and are not used. The data quality evaluation showed that the data

validator NJ-qualified 0.84 percent (856 of 101558 results) of the data. These data are available as qualified.

All results, with the exception of those R-qualified as "rejected" (3188 of 101558 results, 3.14 percent of total results) are available for use as qualified.

6. Phase II Sediment Coring (ERT) (A-3 SE)

The purpose of this data quality evaluation is to summarize the findings of the data validation and any effects it may have on the availability of the data from the Phase II Sediment Coring event conducted by ERT at Gowanus Canal as well as to provide an assessment of data usability. Samples were collected by ERT January 27, 2010 through January 29, 2010.

6.1 Volatile Organic Compounds

Volatiles were analyzed by GC/MS. Excluding field quality control samples, 5460 distinct data points were generated. When rejected data are considered, the volatiles data set is 96.01 percent complete (5242 of 5460 volatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-3	SE	VOC	U	3215	58.88%	6.1.1
A-3	SE	VOC	UJ	885	16.21%	6.1.2
A-3	SE	VOC	J	699	12.80%	6.1.3
A-3	SE	VOC		443	8.11%	
A-3	SE	VOC	R	218	3.99%	6.1.4

6.1.1 U-qualification

A total of 3215 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

6.1.2 UJ-qualification

A total of 885 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 6.1.1, above). These results are usable as nondetects as

long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

6.1.3 J-qualification

A total of 699 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

6.1.4 R-qualification

A total of 218 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

6.1.5 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set A or Set R. Of 4100 U- or UJ-qualified results, 386 CRQLs exceeded Set A or Set R. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 386 CRQL v. SL exceedances, only 56 exceeded Set A or Set R and there were no detected SL exceedance for VOCs in the same sample. These instances are shown as yellow shading on Table 3. These instances are of interest because the data suggest that no VOCs were detected at greater than a screening level, but at the same time, one or more VOC CRQL was greater than its corresponding screening level in the same sample. However, of the 56 CRQL v. SL exceedances (without a "related detect"), no CRQLs exceeded Set A or Set R without an exceedance (any analysis group) in the same matrix at the same station.

6.2 Semivolatile Organic Compounds

Semivolatiles were analyzed by GC/MS. Excluding field quality control samples, 7208 distinct data points were generated. When rejected results are considered, the semivolatiles data set is 98.72 percent complete (7116 of 7208 semivolatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-3	SE	SVOC	UJ	2877	39.91%	6.2.1
A-3	SE	SVOC	U	2071	28.73%	6.2.2
A-3	SE	SVOC	J	1469	20.38%	6.2.3
A-3	SE	SVOC		699	9.70%	
A-3	SE	SVOC	R	92	1.28%	6.2.4

6.2.1 UJ-qualification

A total of 2877 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 6.2.2, below). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

6.2.2 U-qualification

A total of 2071 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

6.2.3 J-qualification

A total of 1469 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

6.2.4 R-qualification

A total of 92 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

6.2.5 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set A or Set R. Of 4948 U- or UJ-qualified results, 2409 CRQLs exceeded Set A or Set R. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 2409 CRQL v. SL exceedances, none exceeded Set A or Set R without a related detected SL exceedances for SVOCs in the same sample.

6.3 Pesticides/PCBs

Pesticides and PCBs were analyzed by GC. Excluding field quality control samples, 3392 distinct data points were generated. When rejected results are considered, the PEST/PCB data set is 87.38 percent complete (2964 of 3392 PEST/PCB results are available for use). The validation process resulted in the following qualifiers for results in the PEST/PCB fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-3	SE	PEST/PCB	U	1718	50.65%	6.3.1
A-3	SE	PEST/PCB	J	487	14.36%	6.3.2
A-3	SE	PEST/PCB	R	428	12.62%	6.3.3
A-3	SE	PEST/PCB	UJ	300	8.84%	6.3.4
A-3	SE	PEST/PCB		255	7.52%	
A-3	SE	PEST/PCB	NJ	204	6.01%	6.3.5

6.3.1 U-qualification

A total of 1718 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

6.3.2 J-qualification

A total of 487 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

6.3.3 R-qualification

A total of 428 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. As above, the Phase II Sediment Coring (ERT) data set is 87.38 percent complete. It should be noted that the Phase II Sediment (ERT) PEST/PCB results did not meet a typical project completeness goal of 90%. Please refer to section 5.3.2, above, for additional insight on this issue.

6.3.4 UJ-qualification

A total of 300 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 6.3.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

6.3.5 NJ-qualification

A total of 204 results were NJ-qualified as "presumptively present at approximate quantity" by the validator. The QA/QC issue was not severe enough to warrant rejection of data. This issue likely originates from precision exceedances (between results from dual-columns). The NJ-qualification of data by the data validator does not affect the availability of data because these results are available for use as detects at the reported concentration. The data user must consider the results "presumptively present at approximate quantity".

6.3.6 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set A or Set R. Of 2018 U- or UJ-qualified results, 1464 CRQLs exceeded Set A or Set R. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 1464 CRQL v. SL exceedances, only 41 exceeded Set A or Set R and there were no detected SL exceedances for PEST/PCBs in the same sample. These instances are shown as yellow shading on Table 3. These instances are of interest because the data suggest that no PEST/PCBs were detected at greater than a screening level, but at the same time, one or more PEST/PCB CRQL was greater than its corresponding screening level in the same sample. However, it should be noted that all 41 of the PEST/PCB CRQL v. SL exceedances (without corresponding related detects) were associated with an exceedance (any analysis group) in the same matrix at the same station.

6.4 Metals

Metals, including mercury and cyanide, were analyzed by ICP-AES, CVAA, and spectrophotometer. Excluding field quality control samples, 2544 distinct data points were generated. Because there were no rejected results, the metals data set is 100 percent

complete (2544 of 2544 metals results are available for use). The validation process resulted in the following qualifiers for results in the metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-3	SE	METAL	J	1241	48.78%	6.4.1
A-3	SE	METAL		817	32.11%	
A-3	SE	METAL	U	277	10.89%	6.4.2
A-3	SE	METAL	UJ	209	8.22%	6.4.3

6.4.1 J-qualification

A total of 1241 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

6.4.2 U-qualification

A total of 277 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

6.4.3 UJ-qualification

A total of 209 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 6.4.2, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

6.4.4 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U-values were compared to the lesser of Set A or Set R. Of 486 U-qualified results, 112 CRQLs exceeded Set A or Set R. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v.

PAL exceedances are discussed in Section 2, above. It should be noted that all of these CRQL v. PAL exceedances are associated with a detected exceedance for the same analysis group (METAL) in the same sample. Although uncertainty is increased when a CRQL exceeds a screening level, the increased uncertainty is less relevant because the CRQL v. SL exceedances are associated with other data that suggest detected SL exceedance in the same analysis group for the same sample.

6.5 Wet Chemistry

Wet Chemistry, including sulfide, was analyzed by SW-846 9030. Excluding field quality control samples, 105 distinct data points were generated. Because there were no rejected results, the WCHEM data set is 100 percent complete (105 of 105 WCHEM results are available for use). The validation process resulted in the following qualifiers for results in the WCHEM fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-3	SE	WCHEM		90	85.71%	
A-3	SE	WCHEM	U	12	11.43%	6.5.1
A-3	SE	WCHEM	J	3	2.86%	6.5.2

6.5.1 U-qualification

Twelve results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

6.5.2 J-qualification

Three results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

6.6 Phase II Sediment Coring (ERT) PARCC

6.6.1 Precision

Results may have been qualified due to precision-related QA/QC issues such as dual-column reproducibility, field duplicate reproducibility, laboratory replicate reproducibility,

and MS/MSD precision. In some extreme cases, results may have been rejected due to precision issues. In the case of results rejected due to precision issues, the sample matrix or analytical process had a negative effect on precision. In the case of results qualified (but not rejected) due to precision issues, the sample matrix or analytical process had an effect on precision, but not severe enough to affect data usability (and hence completeness). In the case of unqualified (or U-qualified) results, which represent the majority of the data, there was no effect on precision.

Because the pattern of rejection for Phase II Sediment (ERT) and PEST/PCB is similar to that above for Phase II Sediment above and PEST/PCB, it is assumed that the reason for rejection is similar or identical. It is likely that R-qualified PEST/PCB results in this dataset were rejected due to poor dual-column reproducibility (> 100% difference between detected results from both columns when no peak interference is noted).

6.6.2 Accuracy

Results may have been qualified due to accuracy-related QA/QC issues such as spiked surrogate recovery, internal standard recovery, laboratory control sample (or laboratory control sample duplicate) recovery, or matrix spike (or matrix spike duplicate) recovery. In some extreme cases, results may have been rejected due to accuracy issues. In the case of results rejected due to accuracy issues, the sample matrix or analytical process had a negative effect on accuracy. In the case of results qualified (but not rejected) due to accuracy issues, the sample matrix or analytical process had an effect on accuracy, but not severe enough to affect data usability (and hence completeness). In the case of unqualified results, there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "nondetect"), there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "not detected at significantly greater than that in an associated blank"), there is no serious effect on accuracy (blank contamination affects the accuracy of a data point but not significantly unless the point is rejected) and the points are usable as U-qualified results.

6.6.3 Representativeness

There were no issues affecting representativeness in this data set.

6.6.4 Completeness

There were 738 R-qualified results in this dataset; therefore, the data validation process demonstrated that 96.06 percent of the results are available for use as qualified. For this data set, completeness exceeded a typical project completeness goal of 90%. It should also be noted that VOC, SVOC, and PEST/PCB fractions contained rejected data. VOC and SVOC, considered individually, also met the 90 percent completeness goal. However, PEST/PCB, considered individually, did not meet the 90 percent completeness goal because it is only 87.38 percent complete (see section 5.3.2, above). This pattern is similar to PEST/PCB in Phase II Sediment Coring above. Refer to section 5.9.4, above, for further detail.

6.6.5 Comparability

There were no issues affecting comparability in this data set.

6.7 "Available as Reported" v. "Available as Qualified" v. Rejected

The data quality evaluation showed that the laboratory or data validator U-qualified 38.98 percent (7293 of 18709 results) of the data. These data may be available as reported (if U-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a U-qualifier). The data quality evaluation showed that the data validator UJ-qualified 22.83 percent (4271 of 18709 results) of the data. These data are available as qualified. The data quality evaluation showed that the laboratory or data validator J-qualified 20.84 percent (3899 of 18709 results) of the data. These data may be available as reported (if J-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a J-qualifier). The data quality evaluation demonstrated that 12.31 percent (2304 of 18709 results) of the data are acceptable without qualification. These results are available as reported. The data quality evaluation showed that the data validator R-qualified 3.94 percent (738 of 18709 results) of the data and these data are not available for use. The results may be reported (as analyzed but rejected) as long as they are accompanied by the R-qualifier and are not used. The data quality evaluation showed that the data validator NJ-qualified 1.09 percent (204 of 18709 results) of the data. These data are available as qualified.

All results, with the exception of those R-qualified as "rejected" (738 of 18709 results, 3.94 percent of total results) are available for use as qualified.

7. 2005 Soft Sediment (NG) (A-4 SE)

The purpose of this data quality evaluation is to summarize the findings of the data validation and any effects it may have on the availability of the data from the 2005 Soft Sediment Sampling event conducted by National Grid at Gowanus Canal as well as to provide an assessment of data usability. Samples were collected by National Grid December 14, 2005 through January 30, 2006.

7.1 Volatile Organic Compounds

Volatiles were analyzed by GC/MS. Excluding field quality control samples, 5328 distinct data points were generated. When rejected data are considered, the volatiles data set is 99.70 percent complete (5312 of 5328 volatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-4	SE	VOC	U	4367	81.96%	7.1.1
A-4	SE	VOC	UJ	418	7.85%	7.1.2
A-4	SE	VOC	J	324	6.08%	7.1.3
A-4	SE	VOC		203	3.81%	
A-4	SE	VOC	R	16	0.30%	7.1.4

7.1.1 U-qualification

A total of 4367 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC

problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

7.1.2 UJ-qualification

A total of 418 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 7.1.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

7.1.3 J-qualification

A total of 324 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

7.1.4 R-qualification

Sixteen results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

7.1.5 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set A or Set R. Of 4367 U- or UJ-qualified results, 1213 CRQLs exceeded Set A or Set R. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 1213 CRQL v. SL exceedances, only two exceeded Set A or Set R and there were no detected SL exceedance for VOCs in the same sample (affects vinyl chloride only). These instances are shown as yellow shading on Table 3. These instances are of interest because the data suggest that no VOCs were detected at greater than a screening level, but at the same time, one or more VOC CRQL was greater than its corresponding screening level in

the same sample. However, of the two CRQL v. SL exceedances (without a "related detect"), no CRQLs exceeded Set A or Set R without an exceedance (any analysis group) in the same matrix at the same station.

7.2 Semivolatile Organic Compounds

Semivolatiles were analyzed by GC/MS. Excluding field quality control samples, 9216 distinct data points were generated. When rejected results are considered, the semivolatiles data set is 99.82 percent complete (9199 of 9216 semivolatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the semivolatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-4	SE	SVOC	U	6210	67.38%	7.2.1
A-4	SE	SVOC		1543	16.74%	
A-4	SE	SVOC	J	1192	12.93%	7.2.2
A-4	SE	SVOC	UJ	254	2.76%	7.2.3
A-4	SE	SVOC	R	17	0.18%	7.2.4

7.2.1 U-qualification

A total of 6210 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

7.2.2 J-qualification

A total of 1192 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

7.2.3 UJ-qualification

A total of 254 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not

contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 7.2.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

7.2.4 R-qualification

Seventeen results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

7.2.5 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set A or Set R. Of 6464 U- or UJ-qualified results, 4543 CRQLs exceeded Set A or Set R. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 4543 CRQL v. SL exceedances, only 25 exceeded Set A or Set R and there were no detected SL exceedance for SVOCs in the same sample. These instances are shown as yellow shading on Table 3. These instances are of interest because the data suggest that no SVOCs were detected at greater than a screening level, but at the same time, one or more SVOC CRQL was greater than its corresponding screening level in the same sample. However, of the 25 CRQL v. SL exceedances (without a "related detect"), no CRQLs exceeded Set A or Set R without an exceedance (any analysis group) in the same matrix at the same station.

7.3 Pesticides/PCBs

Pesticides and PCBs were analyzed by GC. Excluding field quality control samples, 4320 distinct data points were generated. When rejected results are considered, the PEST/PCB data set is 97.57 percent complete (4215 of 4320 PEST/PCB results are available for use). The validation process resulted in the following qualifiers for results in the PEST/PCB fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-4	SE	PEST/PCB	U	2476	57.31%	7.3.1
A-4	SE	PEST/PCB	J	561	12.99%	7.3.2
A-4	SE	PEST/PCB		489	11.32%	
A-4	SE	PEST/PCB	UJ	461	10.67%	7.3.3
A-4	SE	PEST/PCB	NJ	228	5.28%	7.3.4
A-4	SE	PEST/PCB	R	105	2.43%	7.3.5

7.3.1 U-qualification

A total of 2476 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation

elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

7.3.2 J-qualification

A total of 561 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

7.3.3 UJ-qualification

A total of 461 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 7.3.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

7.3.4 NJ-qualification

A total of 228 results were NJ-qualified as "presumptively present at approximate quantity" by the validator. The QA/QC issue was not severe enough to warrant rejection of data. This issue likely originates from precision exceedances (between results from dual-columns). The NJ-qualification of data by the data validator does not affect the availability of data because these results are available for use as detects at the reported concentration. The data user must consider the results "presumptively present at approximate quantity".

7.3.5 R-qualification

A total of 105 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset.

7.3.6 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set A or Set R. Of 2937 U- or UJ-qualified results, 2149 CRQLs exceeded Set A or Set R. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 2149 CRQL v. SL exceedances, only 102 exceeded Set A or Set R and there were no detected SL exceedances for PEST/PCBs in the same sample. These instances are shown as yellow shading on Table 3. These instances are of interest because the data suggest that no PEST/PCBs were detected at greater than a screening level, but at the same time, one or more PEST/PCB CRQL was greater than its corresponding screening level in the same sample. However, it should be noted that all 102 of the PEST/PCB CRQL v. SL exceedances (without corresponding related detects) were associated with an exceedance (any analysis group) in the same matrix at the same station.

7.4 Metals

Metals, including mercury and cyanide, were analyzed by ICP-AES, CVAA, and spectrophotometer. Excluding field quality control samples, 3456 distinct data points were generated. When rejected results are considered, the metals data set is 99.62 percent complete (3443 of 3456 metals results are available for use). The validation process resulted in the following qualifiers for results in the metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-4	SE	METAL	J	1493	43.20%	7.4.1
A-4	SE	METAL		1232	35.65%	
A-4	SE	METAL	U	374	10.82%	7.4.2
A-4	SE	METAL	UJ	344	9.95%	7.4.3
A-4	SE	METAL	R	13	0.38%	7.4.4

7.4.1 J-qualification

A total of 14*6 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

7.4.2 U-qualification

A total of 374 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

7.4.3 UJ-qualification

A total of 344 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 7.4.2, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

7.4.4 R-qualification

Thirteen results, consisting of cyanide in 13 samples, were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. There are 131 other cyanide results available for use in this data set.

7.4.5 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U-values were compared to the lesser of Set A or Set R. Of 718 U-qualified results, 235 CRQLs exceeded Set A or Set R. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above. It should be noted that all of these CRQL v. PAL exceedances are associated with a detected exceedance for the same analysis group (METAL) in the same sample. Although uncertainty is increased when a CRQL exceeds a screening level, the increased uncertainty is less relevant because the CRQL v. SL exceedances are associated with other data that suggest detected SL exceedance in the same analysis group for the same sample.

7.5 Wet Chemistry

Wet Chemistry, including nitrate, nitrite, and sulfate, was analyzed by EPA 300.0. Excluding field quality control samples, 432 distinct data points were generated. Because there were no rejected results, the WCHEM data set is 100 percent complete (105 of 105 WCHEM results are available for use). The validation process resulted in the following qualifiers for results in the WCHEM fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-4	SE	WCHEM	U	278	64.35%	7.5.1
A-4	SE	WCHEM		91	21.06%	
A-4	SE	WCHEM	J	57	13.19%	7.5.2
A-4	SE	WCHEM	UJ	6	1.39%	7.5.3

7.5.1 U-qualification

A total of 278 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation

elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

7.5.2 J-qualification

A total of 57 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

7.5.3 UJ-qualification

Six results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 7.5.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

7.6 2005 Soft Sediment (NG) PARCC

7.6.1 Precision

Results may have been qualified due to precision-related QA/QC issues such as dual-column reproducibility, field duplicate reproducibility, laboratory replicate reproducibility, and MS/MSD precision. In some extreme cases, results may have been rejected due to precision issues. In the case of results rejected due to precision issues, the sample matrix or analytical process had a negative effect on precision. In the case of results qualified (but not rejected) due to precision issues, the sample matrix or analytical process had an effect on precision, but not severe enough to affect data usability (and hence completeness). In the case of unqualified (or U-qualified) results, which represent the majority of the data, there was no effect on precision.

7.6.2 Accuracy

Results may have been qualified due to accuracy-related QA/QC issues such as spiked surrogate recovery, internal standard recovery, laboratory control sample (or laboratory control sample duplicate) recovery, or matrix spike (or matrix spike duplicate) recovery. In some extreme cases, results may have been rejected due to accuracy issues. In the case of results rejected due to accuracy issues, the sample matrix or analytical process had a

negative effect on accuracy. In the case of results qualified (but not rejected) due to accuracy issues, the sample matrix or analytical process had an effect on accuracy, but not severe enough to affect data usability (and hence completeness). In the case of unqualified results, there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "nondetect"), there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "not detected at significantly greater than that in an associated blank"), there is no serious effect on accuracy (blank contamination affects the accuracy of a data point but not significantly unless the point is rejected) and the points are usable as U-qualified results.

7.6.3 Representativeness

There were no issues affecting representativeness in this data set.

7.6.4 Completeness

There were 151 R-qualified results in this dataset; therefore, the data validation process demonstrated that 99.34 percent of the results are available for use as qualified. For this data set, completeness exceeded a typical project completeness goal of 90%. It should also be noted that VOC, SVOC, PEST/PCB, and METAL fractions contained rejected data. These fractions, considered individually, also met the 90 percent completeness goal.

7.6.5 Comparability

There were no issues affecting comparability in this data set.

7.7 "Available as Reported" v. "Available as Qualified" v. Rejected

The data quality evaluation showed that the laboratory or data validator U-qualified 60.24 percent (13705 of 22752 results) of the data. These data may be available as reported (if U-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a U-qualifier). The data quality evaluation showed that the laboratory or data validator J-qualified 15.94 percent (3627 of 22752 results) of the data. These data may be available as reported (if J-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a J-qualifier). The data quality evaluation demonstrated that 15.64 percent (3558 of 22752 results) of the data are acceptable without qualification. These results are available as reported. The data quality evaluation showed that the data validator UJ-qualified 6.52 percent (1483 of 22752 results) of the data. These data are available as qualified. The data quality evaluation showed that the data validator NJ-qualified 1.00 percent (228 of 22752 results) of the data. These data are available as qualified. The data quality evaluation showed that the data validator R-qualified 0.66 percent (151 of 22752 results) of the data and these data are not available for use. The results may be reported (as analyzed but rejected) as long as they are accompanied by the R-qualifier and are not used.

All results, with the exception of those R-qualified as "rejected" (151 of 22752 results, 0.66 percent of total results) are available for use as qualified.

8. Phase III Ambient Air Samples (A-5 AA)

The purpose of this data quality evaluation is to summarize the findings of the data validation and any effects it may have on the availability of the data from the Phase III

Ambient Air Sampling Event at Gowanus Canal as well as to provide an assessment of data usability. Samples were collected on July 8, 2010 and July 29, 2010.

8.1 Volatile Organic Compounds

Volatiles were analyzed by EPA TO-15 (low-level and SIM concentration ranges). Excluding field quality control samples, 799 distinct data points were generated. Because there are no rejected results, the volatiles data set is 100 percent complete (799 of 799 volatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	AA	VOC		392	49.06%	
A-5	AA	VOC	U	390	48.81%	8.1.1
A-5	AA	VOC	J	17	2.13%	8.1.2

8.1.1 U-qualification

A total of 390 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator (Toluene was U-qualified by the data validator in GC-AS501-S-2; GC-AS503-S-2; GC-AS508-S-2; and GC-AS509-S-2), this indicates "not detected at significantly greater than that in an associated blank". In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

8.1.2 J-qualification

Seventeen results were J-qualified as "estimated" by the data validator. These consist of methylene chloride in D-07082010-02-VOC; D-07292010-01; D-07292010-02-VOC; GC-AS501-C-1; GC-AS501-S-1; GC-AS502-C-1; GC-AS502-S-1; GC-AS503-S-1; GC-AS506-C-2; GC-AS506-S-2; GC-AS507-C-1; GC-AS507-S-1; GC-AS508-C-1; GC-AS509-C-1; GC-AS509-S-1; GC-AS512-S-1; and GC-AS513-S-1. This does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results were qualified as such due to initial calibration exceedances. They are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

8.1.3 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the Set P. Of 390 U-qualified results, 78 CRQLs exceeded Set P. These instances are shown as rows on Table 3.

It should be noted that benzene was detected in each sample at greater than the screening level.

Every sample was nondetect for bromodichloromethane and the quantitation limit exceeded the screening level in each case. This was expected as evidenced by shading in Worksheet

15-22 in the Phase III UFP-QAPP. Set P for bromodichloromethane is 0.0658ug/m^3. By far the most quantitation limits were 0.067ug/m^3 (29 samples). This is slightly greater than the screening level. It should be noted that all of these 29 samples contained a detected exceedance for benzene and chloroform and six also exceeded for ethylbenzene. Some quantitation limits were 0.13ug/m^3 (five samples). These samples all contained a detected exceedance for benzene and most (four) also exceeded for chloroform. Of those five, two also contained a detected exceedance for ethylbenzene. One quantitation limit (for bromodichloromethane) was 0.2ug/m^3. This sample contained a detected exceedance for benzene and chloroform. Some quantitation limits for bromodichloromethane were 0.22ug/m^3 (five samples). These samples all contained detected exceedances for benzene and one also exceeded for chlorine and methylene chloride. One of those five samples exceeded for ethylbenzene. The remaining seven quantitation limits were 0.34ug/m^3. These samples all contained a detected exceedance for benzene and one also exceeded for chloroform and ethylbenzene and another exceeded for ethylbenzene only. Elevated quantitation limits are due to dilution factor needed for low sample volume or high concentrations of other (target and/or non-target) analytes. It is important to note that the laboratory is not reporting results detected at less than the QL. This was not an option and is due to the extremely low-level concentration range; the laboratory would not be able to assure canister certification for results at less than the QL. Therefore, there is a very narrow range (between 0.0658ug/m^3 and 0.067ug/m^3) where the laboratory cannot detect and quantitate bromodichloromethane at greater than the screening level. This has no effect on the usability of the data since all samples contained a detected exceedance for benzene and many contained detected exceedances for other compounds.

Chloroform was detected in most samples. Any chloroform detections exceeded Set P. Most (but not all) nondetects quantitation limits were greater than the screening level and this is due to dilutions necessitated by low sample volume or high concentrations of other (target and/or non-target) analytes. The laboratory has demonstrated that it is capable of reporting nondetects at less than the screening level as evidenced by GC-AS510-C-2.

For dibromochloromethane, quantitation limit v. screening level exceedances were expected as evidenced shading in Worksheet 15-22 of the Phase III UFP-QAPP. However, for the majority (29) of samples, the laboratory was able to achieve quantitation limits less than expected and less than the screening level. For the remaining samples where the QL is greater than the screening level, the elevated quantitation limits are due to dilutions necessitated by low sample volume or high concentrations of other (target and/or non-target) analytes. These samples also all exceeded for benzene and nine of them exceeded for one or more of chloroform, ethylbenzene, and methylene chloride.

Methylene chloride was detected in one sample and exceeded the screening level in that one sample. This compound was nondetect in three samples at greater than the screening level. These three instances were among those where the data validator applied a U-qualifier. Therefore, the data user must acknowledge that methylene chloride was detected in GC-AS507-S-2; GCAS509-C-2; and GC-AS509-S-2 at greater than the screening level. Then, the data validator subsequently marked the points "not detected at significantly greater than that in an associated blank". This is not an uncommon situation. The data user can treat these as nondetects as long as they acknowledge that they were detected and subsequently U-qualified due to blank contamination.

Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

8.2 Semivolatile Organic Compounds

Semivolatiles were analyzed by EPA TO-13A using a SIM concentration range. Excluding field quality control samples, 799 distinct data points were generated. Because there are no rejected results, the semivolatiles data set is 100 percent complete (799 of 799 semivolatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the semivolatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	AA	SVOC	U	313	39.17%	8.2.1
A-5	AA	SVOC	J	229	28.66%	8.2.2
A-5	AA	SVOC		196	24.53%	
A-5	AA	SVOC	UJ	61	7.63%	8.2.3

8.2.1 U-qualification

A total of 313 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

8.2.2 J-qualification

A total of 229 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

8.2.3 UJ-qualification

A total of 61 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 8.2.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher.

This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

8.2.4 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to Set P. Of 374 U- or UJ-qualified results, 266 QLs exceeded Set P. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

It should be noted that all of these QL v. PAL exceedances are associated with a detected exceedance for the same analysis group (SVOC) in the same sample. Although uncertainty is increased when a QL exceeds a screening level, the increased uncertainty is less relevant because the QL v. SL exceedances are associated with other data that suggest detected SL exceedance in the same analysis group for the same sample.

8.3 Pesticides/PCBs

PCBs (Aroclors) were analyzed by EPA TO-4A. Excluding field quality control samples, 16 distinct data points were generated. Because there were no rejected results, the PEST/PCB data set is 100 percent complete (16 of 16 PEST/PCB results are available for use). All 16 results were U-qualified by the laboratory to indicate "nondetect" and this does not affect the availability of results. It does not indicate a QA/QC problem. For all (U-qualified) results, the quantitation limit was less than the screening level.

8.4 Phase III Ambient Air PARCC

8.4.1 Precision

Results may have been qualified due to precision-related QA/QC issues such as dual-column reproducibility, field duplicate reproducibility, and laboratory replicate reproducibility. Because no results were rejected due to precision issues, the sample matrix and analytical process did not have any serious negative effects on precision. In the case of results qualified (but not rejected) due to precision issues, the sample matrix or analytical process had an effect on precision, but not severe enough to affect data usability (and hence completeness). In the case of unqualified (or U-qualified) results, which represent the majority of the data, there was no effect on precision.

8.4.2 Accuracy

Results may have been qualified due to accuracy-related QA/QC issues such as spiked surrogate recovery, internal standard recovery, or laboratory control sample (or laboratory control sample duplicate) recovery. Because no results were rejected due to accuracy issues, the sample matrix and analytical process did not have any serious negative effects on accuracy. In the case of results qualified (but not rejected) due to accuracy issues, the sample matrix or analytical process had an effect on accuracy, but not severe enough to affect data usability (and hence completeness). In the case of unqualified results, there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "nondetect"), there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "not detected at significantly greater than that in an associated blank"), there is no serious effect on accuracy (blank contamination affects the accuracy of a data

point but not significantly unless the point is rejected) and the points are usable as U-qualified results.

8.4.3 Representativeness

For VOCs and PEST/PCBs, there were no issues affecting representativeness in this data set. For SVOCs, there was one significant issue affecting representativeness. Samples GC-AS504-C-2 and GC-AS507-C-2 were characterized by equipment failure and it is not known how much sample air passed through the cartridge. Therefore, results for these samples are reported on a "per cartridge basis" as opposed to a "per air volume basis". These results are analytically sound and usable at their reported amounts. However, the sample results cannot be expressed as concentrations and thus cannot be compared to screening levels. Furthermore, it should be noted that:

- Nondetects for these two samples are suspect. It cannot be verified that sufficient air passed through the cartridge.
- Nondetect quantitation limits for these two samples are of unknown concentration.
- Detects for these two samples can be used to demonstrate that the contaminant is present at the sample location.
- Detects for these two samples are of unknown concentration because it is not known what volume of air the sample represents.

Therefore, these sample results are usable as reported (numerical value and units) and so this does not affect the dataset completeness. The ambient air SVOC dataset is of sufficient size that decisions can be made without concentrations at these two locations during this sample event.

8.4.4 Completeness

There were no R-qualified results in this dataset; therefore, the data validation process demonstrated that 100 percent of the results are available for use as qualified. For this data set, completeness exceeded the project goal of 90 percent from the Phase III UFP-QAPP.

8.4.5 Comparability

There were no issues affecting comparability in this data set.

8.5 "Available as Reported" v. "Available as Qualified" v. Rejected

The data quality evaluation showed that the laboratory or data validator U-qualified 44.55 percent (719 of 1614 results) of the data. These data may be available as reported (if U-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a U-qualifier). The data quality evaluation demonstrated that 36.43 percent (588 of 1614 results) of the data are acceptable without qualification. These results are available as reported. The data quality evaluation showed that the laboratory or data validator J-qualified 15.24 percent (246 of 1614 results) of the data. These data may be available as reported (if J-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a J-qualifier). The data quality evaluation showed that the data validator UJ-qualified 3.78 percent (61 of 1614 results) of the data. These data are available as qualified.

All results are available for use as qualified.

9. Phase III Groundwater (A-5 WG)

The purpose of this data quality evaluation is to summarize the findings of the data validation and any effects it may have on the availability of the data from the Phase III Groundwater event at Gowanus Canal as well as to provide an assessment of data usability. Samples were collected June 24, 2010, July 8, 2010, and July 12, 2010 through July 26, 2010.

9.1 Volatile Organic Compounds

Volatiles were analyzed by USEPA CLP SOM01.2 "Trace Water" and "Trace Water by SIM". This data set also contains volatiles analyzed via SW-846 8260B following TCLP extraction via SW-846 1311 (waste characterization). Excluding field quality control samples, 3776 distinct data points were generated. When rejected data are considered, the volatiles data set is 99.10 percent complete (3742 of 3776 volatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	WG	VOC	U	2875	76.14%	9.1.1
A-5	WG	VOC	UJ	385	10.20%	9.1.2
A-5	WG	VOC		279	7.39%	
A-5	WG	VOC	J	203	5.38%	9.1.3
A-5	WG	VOC	R	34	0.90%	9.1.4

9.1.1 U-qualification

A total of 2875 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

9.1.2 UJ-qualification

A total of 385 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 9.1.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

9.1.3 J-qualification

A total of 203 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

9.1.4 R-qualification

A total of 34 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These include Bromomethane in 32 samples and 1,4-Dioxane and methyl acetate in GC-MWXX. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other VOC information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

9.2 Semivolatile Organic Compounds

Semivolatiles were analyzed by USEPA CLP SOM01.2 "Low Water" and "Low Water by SIM". This data set also contains semivolatiles analyzed via SW-846 8270C following TCLP extraction via SW-846 1311 (waste characterization). Excluding field quality control samples, 5028 distinct data points were generated. Because there were no rejected results, the semivolatiles data set is 100 percent complete (5028 of 5028 semivolatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	WG	SVOC	U	3908	77.72%	9.2.1
A-5	WG	SVOC		489	9.73%	
A-5	WG	SVOC	J	441	8.77%	9.2.2
A-5	WG	SVOC	UJ	190	3.78%	9.2.3

9.2.1 U-qualification

A total of 3908 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

9.2.2 J-qualification

A total of 441 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

9.2.3 UJ-qualification

A total of 190 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 9.2.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

9.3 Pesticides/PCBs

Pesticides and PCBs were analyzed by USEPA CLP SOM01.2 "Water". This data set also contains pesticides analyzed via SW-846 8081A following TCLP extraction via SW-846 1311 (waste characterization). Excluding field quality control samples, 2368 distinct data points were generated. When rejected results are considered, the PEST/PCB data set is 96.49 percent complete (2285 of 2368 PEST/PCB results are available for use). The validation process resulted in the following qualifiers for results in the PEST/PCB fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	WG	PEST/PCB	U	1944	82.09%	9.3.1
A-5	WG	PEST/PCB	UJ	341	14.40%	9.3.2
A-5	WG	PEST/PCB	R	83	3.51%	9.3.3

9.3.1 U-qualification

A total of 1944 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

9.3.2 UJ-qualification

A total of 341 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 9.3.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

9.3.3 R-qualification

A total of 83 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to 4,4'-DDD and Endosulfan I nondetects in various samples. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other PEST/PCB information.

9.4 Metals

Metals, including mercury and cyanide, were analyzed by USEPA CLP ILM05.4 using ICP-AES, ICP-MS, CVAA, and spectrophotometer. This data set also contains metals and mercury analyzed via SW-846 6010B/7470A following TCLP extraction via SW-846 1311 (waste characterization). Excluding field quality control samples, 1775 distinct data points were generated. When rejected results are considered, the metals data set is 96.51 percent complete (1713 of 1775 metals results are available for use). The validation process resulted in the following qualifiers for results in the metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	WG	METAL		580	32.68%	
A-5	WG	METAL	U	560	31.55%	9.4.1
A-5	WG	METAL	J	499	28.11%	9.4.2
A-5	WG	METAL	UJ	74	4.17%	9.4.3
A-5	WG	METAL	R	62	3.49%	9.4.4

9.4.1 U-qualification

A total of 560 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the

availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

9.4.2 J-qualification

A total of 499 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

9.4.3 UJ-qualification

A total of 74 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 9.4.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

9.4.4 R-qualification

A total of 62 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Rejected results correspond to various detects and nondetects in various samples. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other METAL information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

9.5 Filtered Metals

Filtered metals, including mercury were analyzed by USEPA CLP ILM05.4 using ICP-AES, ICP-MS, and CVAA. Excluding field quality control samples, 1681 distinct data points were generated. When rejected results are considered, the filtered metals data set is 96.97 percent complete (1630 of 1681filtered metals results are available for use). The validation process resulted in the following qualifiers for results in the filtered metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	WG	FMETAL	U	671	39.92%	9.5.1
A-5	WG	FMETAL		548	32.60%	
A-5	WG	FMETAL	J	346	20.58%	9.5.2
A-5	WG	FMETAL	UJ	65	3.87%	9.5.3
A-5	WG	FMETAL	R	51	3.03%	9.5.4

9.5.1 U-qualification

A total of 671 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

9.5.2 J-qualification

A total of 346 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

9.5.3 UJ-qualification

A total of 65 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 9.5.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

9.5.4 R-qualification

A total of 51 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Rejected results correspond to various detects and nondetects in various samples. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data

using the other FMETAL information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

9.6 Wet Chemistry

Wet Chemistry including Total Organic Carbon (TOC) and Dissolved Organic Carbon (DOC) via SW-846 9060 or SM5310B, Chloride, Nitrate, Nitrite, Sulfate, and/or Phosphate via EPA 300.0, Alkalinity and Hardness via EPA 310.1, SM2320B, and/or SM2320C, Total Kjeldahl Nitrogen (TKN) via EPA 351.2 or SM4500C-NOrg, Nitrate/Nitrite via EPA 353.2, Total Dissolved Solids (TDS) via SM2540C, Total Suspended Solids (TSS) via SM2540D, Silica via SM4500, and/or Ammonia via SM4500C-NH3 was analyzed on one or more groundwater sample. Excluding field quality control samples, 233 distinct data points were generated. Because there were no rejected results, the WCHEM data set is 100 percent complete (233 of 233 WCHEM results are available for use). The validation process resulted in the following qualifiers for results in the WCHEM fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	WG	WCHEM		155	66.52%	
A-5	WG	WCHEM	U	49	21.03%	9.6.1
A-5	WG	WCHEM	J	23	9.87%	9.6.2
A-5	WG	WCHEM	UJ	6	2.58%	9.6.3

9.6.1 U-qualification

Forty nine results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

9.6.2 J-qualification

Twenty three results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

9.6.3 UJ-qualification

Six results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status,

but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 9.6.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

9.7 Phase III Groundwater PARCC

9.7.1 Precision
