Results may have been qualified due to precision-related QA/QC issues such as dual-column reproducibility, field duplicate reproducibility, laboratory replicate reproducibility, and MS/MSD precision. In some extreme cases, results may have been rejected due to precision issues. In the case of results rejected due to precision issues, the sample matrix or analytical process had a negative effect on precision. In the case of results qualified (but not rejected) due to precision issues, the sample matrix or analytical process had an effect on precision, but not severe enough to affect data usability (and hence completeness). In the case of unqualified (or U-qualified) results, which represent the majority of the data, there was no effect on precision.

9.7.2 Accuracy

Results may have been qualified due to accuracy-related QA/QC issues such as spiked surrogate recovery, internal standard recovery, laboratory control sample (or laboratory control sample duplicate) recovery, or matrix spike (or matrix spike duplicate) recovery. In some extreme cases, results may have been rejected due to accuracy issues. In the case of results rejected due to accuracy issues, the sample matrix or analytical process had a negative effect on accuracy. In the case of results qualified (but not rejected) due to accuracy issues, the sample matrix or analytical process had an effect on accuracy, but not severe enough to affect data usability (and hence completeness). In the case of unqualified results, there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "nondetect"), there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "not detected at significantly greater than that in an associated blank"), there is no serious effect on accuracy (blank contamination affects the accuracy of a data point but not significantly unless the point is rejected) and the points are usable as U-qualified results.

9.7.3 Representativeness

There were no issues affecting representativeness in this data set.

9.7.4 Completeness

There were 230 R-qualified results in this dataset; therefore, the data validation process demonstrated that 98.45 percent of the results are available for use as qualified. For this data set, completeness exceeded the Phase III UFP-QAPP completeness goal of 90%. It should also be noted that VOC, PEST/PCB, METAL, and FMETAL fractions contained rejected data. Each of these fractions, considered individually, also met the 90 percent completeness goal.

9.7.5 Comparability

There were no issues affecting comparability in this data set.

9.8 "Available as Reported" v. "Available as Qualified" v. Rejected

The data quality evaluation showed that the laboratory or data validator U-qualified 67.34 percent (10007 of 14861 results) of the data. These data may be available as reported (if U-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a U-qualifier). The data quality evaluation demonstrated that 13.80 percent (2051 of 14861 results) of the data are acceptable without qualification. These results are available as reported. The data quality evaluation showed that the laboratory or data validator J-qualified 10.17 percent (1512 of 14861 results) of the data. These data may be available as reported (if J-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a J-qualifier). The data quality evaluation showed that the data validator UJ-qualified 7.14 percent (1061 of 14861 results) of the data. These data are available as qualified. The data quality evaluation showed that the data validator R-qualified 1.55 percent (230 of 14861 results) of the data and these data are not available for use. The results may be reported (as analyzed but rejected) as long as they are accompanied by the R-qualifier and are not used.

All results, with the exception of those R-qualified as "rejected" (230 of 14861 results, 1.55 percent of total results) are available for use as qualified.

10. Phase III Sediment Sampling (A-5 SE)

The purpose of this data quality evaluation is to summarize the findings of the data validation and any effects it may have on the availability of the data from the Phase III Sediment Sampling event at Gowanus Canal as well as to provide an assessment of data usability. Samples were collected June 17, 2010 through July 1, 2010.

10.1 Volatile Organic Compounds

Volatiles were analyzed by USEPA CLP SOM01.2 "Low Soil". Excluding field quality control samples, 2548 distinct data points were generated. When rejected data are considered, the volatiles data set is 97.17 percent complete (2476 of 2548 volatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	SE	VOC	U	1759	69.03%	10.1.1
A-5	SE	VOC	UJ	593	23.27%	10.1.2
A-5	SE	VOC	J	87	3.41%	10.1.3
A-5	SE	VOC	R	72	2.83%	10.1.4
A-5	SE	VOC		37	1.45%	

10.1.1 U-qualification

A total of 1759 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

10.1.2 UJ-qualification

A total of 593 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 10.1.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

10.1.3 J-qualification

A total of 87 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

10.1.4 R-qualification

A total of 72 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These include all VOC results for D-062310-01, which is a field duplicate (there are available results for the parent sample), seven VOCs for GC-SD306-0.0-0.5, six VOCs for GC-SD314-0.0-0.5, and seven VOCs for GC-SDRH037-DW-1. Although these

results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other VOC information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

10.1.5 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set A or Set R. Of 1176 U- or UJ-qualified results, only 51 CRQLs exceeded Set A or Set R. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 51 CRQL v. SL exceedances, only 40 exceeded Set A or Set R and there were no detected SL exceedance for VOCs in the same sample. These instances are shown as yellow shading on Table 3 and consist mostly of 1,2-dibromo-3-chloropane results. The laboratory did demonstrate the capability to report nondetect 1,2-dibromo-3-chloropropane results at less than Set A. Elevated CRQLs are likely due to high percent moisture content in sediment samples. These instances are of interest because the data suggest that no VOCs were detected at greater than a screening level, but at the same time, one or more VOC CRQL was greater than its corresponding screening level in the same sample. However, of the 40 CRQL v. SL exceedances (without a "related detect"), no CRQLs exceeded Set A or Set R without an exceedance (any analysis group) in the same matrix at the same station.

10.2 Semivolatile Organic Compounds

Semivolatiles were analyzed by USEPA CLP SOM01.2 "Low Soil" and "Low Soil by SIM". Excluding field quality control samples, 3332 distinct data points were generated. Because there were no rejected results, the semivolatiles data set is 100 percent complete (3332 of 3332 semivolatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	SE	SVOC	U	2251	67.56%	10.2.1
A-5	SE	SVOC		367	11.01%	
A-5	SE	SVOC	J	361	10.83%	10.2.2
A-5	SE	SVOC	UJ	353	10.59%	10.2.3

10.2.1 U-qualification

A total of 2251 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

10.2.2 J-qualification

A total of 361 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

10.2.3 UJ-qualification

A total of 353 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 10.2.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

10.2.4 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set A or Set R. Of 2604 U- or UJ-qualified results, 1585 CRQLs exceeded Set A or Set R. This is not surprising considering the heavy dilutions that were necessary to quantify the high PAH detects. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above. It should be noted that all of these CRQL v. PAL exceedances are associated with a detected exceedance for the same analysis group (SVOC) in the same sample. Although uncertainty is increased when a CRQL exceeds a screening level, the increased uncertainty is less relevant because the CRQL v. SL exceedances are associated with other data that suggest detected SL exceedance in the same analysis group for the same sample.

10.3 Pesticides/PCBs

Pesticides and PCBs were analyzed by USEPA CLP SOM01.2 "Soil". Excluding field quality control samples, 1568 distinct data points were generated. When rejected results are considered, the PEST/PCB data set is 94.13 percent complete (1476 of 1568 PEST/PCB results are available for use). The validation process resulted in the following qualifiers for results in the PEST/PCB fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	SE	PEST/PCB	U	979	62.44%	10.3.1
A-5	SE	PEST/PCB	UJ	437	27.87%	10.3.2
A-5	SE	PEST/PCB	R	92	5.87%	10.3.3
A-5	SE	PEST/PCB		30	1.91%	
A-5	SE	PEST/PCB	J	20	1.28%	10.3.4
A-5	SE	PEST/PCB	NJ	10	0.64%	10.3.5

10.3.1 U-qualification

A total of 979 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

10.3.2 UJ-qualification

A total of 437 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 10.3.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

10.3.3 R-qualification

A total of 92 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to 4,4'-DDD in 43 samples, 4,4'-DDE in one sample, Dieldrin in 1 sample, and Endosulfan I in four samples. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other PEST/PCB information.

10.3.4 J-qualification

A total of 20 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this

does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

10.3.5 NJ-qualification

Ten results were NJ-qualified as "presumptively present at approximate quantity" by the validator. The QA/QC issue was not severe enough to warrant rejection of data. This issue likely originates from precision exceedances (between results from dual-columns). The NJ-qualification of data by the data validator does not affect the availability of data because these results are available for use as detects at the reported concentration. The data user must consider the results "presumptively present at approximate quantity".

10.3.6 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set A or Set R. Of 1416 U- or UJ-qualified results, 987 CRQLs exceeded Set A or Set R. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 987 CRQL v. SL exceedances, only 610 exceeded Set A or Set R and there were no detected SL exceedances for PEST/PCBs in the same sample. These instances are shown as yellow shading on Table 3. These instances are of interest because the data suggest that no PEST/PCBs were detected at greater than a screening level, but at the same time, one or more PEST/PCB CRQL was greater than its corresponding screening level in the same sample. However, it should be noted that all 610 of the PEST/PCB CRQL v. SL exceedances (without corresponding related detects) were associated with an exceedance (any analysis group) in the same matrix at the same station.

10.4 Metals

Metals, including mercury and cyanide, were analyzed by USEPA CLP ILM05.4 using ICP-AES, ICP-MS, CVAA, and spectrophotometer. Excluding field quality control samples, 1176 distinct data points were generated. When rejected results are considered, the metals data set is 97.79 percent complete (1150 of 1173 metals results are available for use). The validation process resulted in the following qualifiers for results in the metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	SE	METAL	J	716	60.88%	10.4.1
A-5	SE	METAL		224	19.05%	
A-5	SE	METAL	UJ	140	11.90%	10.4.2
A-5	SE	METAL	U	70	5.95%	10.4.3
A-5	SE	METAL	R	26	2.21%	10.4.4

10.4.1 J-qualification

A total of 716 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this

does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

10.4.2 UJ-qualification

A total of 140 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 10.4.3, below). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

10.4.3 U-qualification

A total of 70 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

10.4.4 R-qualification

A total of 26 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to Zinc in 16 samples and arsenic and iron in five samples. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other METAL information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

10.4.5 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set A or Set R. Of 210 U- or UJ-qualified results, 81 CRQLs exceeded Set A or Set R. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above. It should be noted that all of these CRQL v. PAL exceedances are associated with a detected exceedance for the same analysis group (METAL) in the same sample. Although uncertainty is increased when a CRQL exceeds a screening level, the increased uncertainty is less relevant because the CRQL v. SL exceedances are associated with other data that suggest detected SL exceedance in the same analysis group for the same sample.

10.5 AVS/SEM

Acid Volatile Sulfide/Simultaneously Extractable Metals (AVS/SEM) was analyzed via EPA 821_R-91-100. Excluding field quality control samples, 259 distinct data points were generated. When rejected results are considered, the AVSSEM analysis group is 98.46 percent complete (255 of 259 AVSSEM results are available for use). The validation process resulted in the following qualifiers for results in the AVSSEM fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	SE	AVSSEM	J	102	39.38%	10.5.1
A-5	SE	AVSSEM		73	28.19%	
A-5	SE	AVSSEM	U	66	25.48%	10.5.2
A-5	SE	AVSSEM	UJ	14	5.41%	10.5.3
A-5	SE	AVSSEM	R	4	1.54%	10.5.4

10.5.1 J-qualification

A total of 102 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

10.5.2 U-qualification

A total of 66 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

10.5.3 UJ-qualification

A total of 14 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 10.5.2, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher.

This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

10.5.4 R-qualification

Four results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to SEM mercury and SEM silver in GC-SD315-0.0-0.5 and GC-SD324-0.0-0.5 . Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other AVSSEM information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

10.6 Phase III Sediment Sampling PARCC

10.6.1 Precision

Results may have been qualified due to precision-related QA/QC issues such as dual-column reproducibility, field duplicate reproducibility, laboratory replicate reproducibility, and MS/MSD precision. In some extreme cases, results may have been rejected due to precision issues. In the case of results rejected due to precision issues, the sample matrix or analytical process had a negative effect on precision. In the case of results qualified (but not rejected) due to precision issues, the sample matrix or analytical process had an effect on precision, but not severe enough to affect data usability (and hence completeness). In the case of unqualified (or U-qualified) results, which represent the majority of the data, there was no effect on precision.

10.6.2 Accuracy

Results may have been qualified due to accuracy-related QA/QC issues such as spiked surrogate recovery, internal standard recovery, laboratory control sample (or laboratory control sample duplicate) recovery, or matrix spike (or matrix spike duplicate) recovery. In some extreme cases, results may have been rejected due to accuracy issues. In the case of results rejected due to accuracy issues, the sample matrix or analytical process had a negative effect on accuracy. In the case of results qualified (but not rejected) due to accuracy issues, the sample matrix or analytical process had an effect on accuracy, but not severe enough to affect data usability (and hence completeness). In the case of unqualified results, there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "nondetect"), there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "not detected at significantly greater than that in an associated blank"), there is no serious effect on accuracy (blank contamination affects the accuracy of a data point but not significantly unless the point is rejected) and the points are usable as U-qualified results.

10.6.3 Representativeness

There were no issues affecting representativeness in this data set.

10.6.4 Completeness

There were 194 R-qualified results in this dataset; therefore, the data validation process demonstrated that 97.82 percent of the results are available for use as qualified. For this data set, completeness exceeded the Phase III UFP-QAPP completeness goal of 90%. It should

also be noted that VOC, PEST/PCB, METAL and AVSSEM fractions contained rejected data. Each fraction, considered individually, also met the 90 percent completeness goal.

10.6.5 Comparability

There were no issues affecting comparability in this data set.

10.7 "Available as Reported" v. "Available as Qualified" v. Rejected

The data quality evaluation showed that the laboratory or data validator U-qualified 57.69 percent (5125 of 8883 results) of the data. These data may be available as reported (if U-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a U-qualifier). The data quality evaluation showed that the data validator UJ-qualified 17.30 percent (1537 of 8883 results) of the data. These data are available as qualified. The data quality evaluation showed that the laboratory or data validator J-qualified 14.48 percent (1286 of 8883 results) of the data. These data may be available as reported (if J-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a J-qualifier). The data quality evaluation demonstrated that 8.23 percent (730 of 8883 results) of the data are acceptable without qualification. These results are available as reported. The data quality evaluation showed that the data validator R-qualified 2.18 percent (194 of 8883 results) of the data and these data are not available for use. The results may be reported (as analyzed but rejected) as long as they are accompanied by the R-qualifier and are not used. The data quality evaluation showed that the data validator NJ-qualified 0.11 percent (10 of 8883 results) of the data. These data are available as qualified.

All results, with the exception of those R-qualified as "rejected" (194 of 8883 results, 2.18 percent of total results) are available for use as qualified.

11. Phase III Surface Water Samples (A-5 WS)

The purpose of this data quality evaluation is to summarize the findings of the data validation and any effects it may have on the availability of the data from the Phase III Surface Water Sampling Event at Gowanus Canal as well as to provide an assessment of data usability. Samples were collected June 19, 2010 through July 1, 2010; July 12, 2010 through July 27, 2010, September 28, 2010, and October 1, 2010.

11.1 Volatile Organic Compounds

Volatiles were analyzed by USEPA CLP SOM01.2 "Trace Water" and "Trace Water by SIM". Excluding field quality control samples, 5865 distinct data points were generated. When rejected results are considered, the volatiles data set is 99.13 percent complete (5814 of 5865 volatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	WS	VOC	U	4775	81.42%	11.1.1
A-5	WS	VOC		388	6.62%	
A-5	WS	VOC	J	333	5.68%	11.1.2
A-5	WS	VOC	UJ	318	5.42%	11.1.3
A-5	WS	VOC	R	51	0.87%	11.1.4

11.1.1 U-qualification

A total of 4775 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

11.1.2 J-qualification

A total of 333 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

11.1.3 UJ-qualification

A total of 318 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 11.1.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

11.1.4 R-qualification

A total of 51 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to 50 results in D-06192010-04, a field duplicate, and Bromomethane in GC-SWMW3-2. Although these results are not usable for any purpose (and there are usable results for the parent of D-06192010-04) this does not affect the other

non-rejected results in the same dataset. Conclusions can still be made from the data using the other VOC information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

11.1.5 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set S or Set T. Of 5093 U- or UJ-qualified results, 558 CRQLs exceeded Set T. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 558 CRQL v. SL exceedances, only 339 exceeded Set T and there were no detected SL exceedances for VOCs in the same sample. These instances are shown as yellow shading on Table 3. These instances are of interest because the data suggest that no VOCs were detected at greater than a screening level, but at the same time, one or more VOC CRQL was greater than its corresponding screening level in the same sample. However, it should be noted that all 339 of the VOC CRQL v. SL exceedances (without corresponding related detects) were associated with an exceedance (any analysis group) in the same matrix at the same station.

11.2 Semivolatile Organic Compounds

Semivolatiles were analyzed by USEPA CLP SOM01.2 "Low Water" and "Low Water by SIM". Excluding field quality control samples, 7888 distinct data points were generated. Because there are no rejected results, the semivolatiles data set is 100 percent complete (788 of 788 semivolatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the semivolatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	WS	SVOC	U	6741	85.46%	11.2.1
A-5	WS	SVOC		619	7.85%	
A-5	WS	SVOC	J	274	3.47%	11.2.2
A-5	WS	SVOC	UJ	254	3.22%	11.2.3

11.2.1 U-qualification

A total of 6741 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

11.2.3 J-qualification

A total of 274 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

11.2.3 UJ-qualification

A total of 254 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 11.2.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

11.2.4 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set S or Set T. Of 6995 U- or UJ-qualified results, 3116 CRQLs exceeded Set S or Set T. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 3116 CRQL v. SL exceedances, only 701 exceeded Set S or Set T and there were no detected SL exceedances for SVOCs in the same sample. These instances are shown as yellow shading on Table 3. These instances are of interest because the data suggest that no SVOCs were detected at greater than a screening level, but at the same time, one or more SVOC CRQL was greater than its corresponding screening level in the same sample. However, it should be noted that all 701 of the SVOC CRQL v. SL exceedances (without corresponding related detects) were associated with an exceedance (any analysis group) in the same matrix at the same station.

11.3 Pesticides/PCBs

Pesticides and PCBs were analyzed by USEPA CLP SOM01.2 "Water". Excluding field quality control samples, 3680 distinct data points were generated. When rejected results are considered, the PEST/PCB data set is 93.45 percent complete (3439 of 3680 PEST/PCB results are available for use). The validation process resulted in the following qualifiers for results in the PEST/PCB fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	WS	PEST/PCB	U	3416	92.83%	11.3.1
A-5	WS	PEST/PCB	R	241	6.55%	11.3.2
A-5	WS	PEST/PCB	UJ	20	0.54%	11.3.3
A-5	WS	PEST/PCB	J	2	0.05%	11.3.4
A-5	WS	PEST/PCB		1	0.03%	

11.3.1 U-qualification

A total of 3416 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

11.3.2 R-qualification

A total of 241 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to 4,4'-DDD in 96 samples and Endosulfan I in 52 samples. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other PEST/PCB information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

11.3.3 UJ-qualification

A total of 20 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 11.3.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

11.3.4 J-qualification

Two results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user

understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

11.3.5 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U- or UJ-values were compared to the lesser of Set S or Set T. Of 3436 U- or UJ-qualified results, 2956 CRQLs exceeded Set S or Set T. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above.

Of the 2956 CRQL v. SL exceedances, most of them (2906) exceeded Set S or Set T and there were no detected SL exceedances for PEST/PCBs in the same sample. These instances are shown as yellow shading on Table 3. These instances are of interest because the data suggest that no PEST/PCBs were detected at greater than a screening level, but at the same time, one or more PEST/PCB CRQL was greater than its corresponding screening level in the same sample. However, it should be noted that all 2906 of the PEST/PCB CRQL v. SL exceedances (without corresponding related detects) were associated with an exceedance (any analysis group) in the same matrix at the same station.

11.4 Filtered Metals

Filtered metals, including mercury, were analyzed by USEPA CLP ILM05.4 using ICP-AES, ICP-MS, and CVAA. Excluding field quality control samples, 2352 distinct data points were generated. When rejected results are considered, the filtered metals data set is 95.96 percent complete (2257 of 2352 filtered metals results are available for use). The validation process resulted in the following qualifiers for results in the filtered metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	WS	FMETAL	U	1049	44.60%	11.4.1
A-5	WS	FMETAL	J	551	23.43%	11.4.2
A-5	WS	FMETAL		499	21.22%	
A-5	WS	FMETAL	UJ	158	6.72%	11.4.3
A-5	WS	FMETAL	R	95	4.04%	11.4.4

11.4.1 U-qualification

A total of 1049 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

11.4.2 J-qualification

A total of 551 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

11.4.3 UJ-qualification

A total of 158 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 11.4.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

11.4.4 R-qualification

A total of 95 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to various filtered metals in various samples (no apparent pattern). Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other FMETAL information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

11.4.5 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U-values were compared to the lesser of Set S or Set T. Of 1207 U- or UJ-qualified results, 793 CRQLs exceeded Set S or Set T. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above. It should be noted that all of these CRQL v. PAL exceedances are associated with a detected exceedance for the same analysis group (FMETAL) in the same sample. Although uncertainty is increased when a CRQL exceeds a screening level, the increased uncertainty is less relevant because the CRQL v. SL exceedances are associated with other data that suggest detected SL exceedance in the same analysis group for the same sample. Refer to section 11.5.6, below, for additional considerations with respect to copper.

11.5 Metals

Metals, including mercury and cyanide, were analyzed by USEPA CLP ILM05.4 using ICP-AES, ICP-MS, CVAA, and spectrophotometer. Excluding field quality control samples, 2455 distinct data points were generated. When rejected results are considered, the metals data set is 97.35 percent complete (2390 of 2455 metals results are available for use). The validation process resulted in the following qualifiers for results in the metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	WS	METAL	U	1117	45.50%	11.5.1
A-5	WS	METAL		662	26.97%	
A-5	WS	METAL	J	576	23.46%	11.5.2
A-5	WS	METAL	R	65	2.65%	11.5.3
A-5	WS	METAL	UJ	35	1.43%	11.5.4

11.5.1 U-qualification

A total of 1117 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

11.5.2 J-qualification

A total of 576 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

11.5.3 R-qualification

A total of 65 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to various metals in various samples (no apparent pattern). Conclusions can still be made from the data using the other METAL information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

11.5.4 UJ-qualification

A total of 35 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 11.5.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher.

This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

11.5.5 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U-values were compared to the lesser of Set S or Set T. Of 1152 U- or UJ-qualified results, 764 CRQLs exceeded Set S or Set T. These instances are shown as rows on Table 3. Typical reasons for elevated quantitation limits and reasons for QL v. PAL exceedances are discussed in Section 2, above. It should be noted that all of these CRQL v. PAL exceedances are associated with a detected exceedance for the same analysis group (METAL) in the same sample. Although uncertainty is increased when a CRQL exceeds a screening level, the increased uncertainty is less relevant because the CRQL v. SL exceedances are associated with other data that suggest detected SL exceedance in the same analysis group for the same sample. Refer to section 11.5.6, below, for additional considerations with respect to copper.

11.5.6 Copper

Because of an interesting data trend between the wet and dry surface water sampling events for the ecological risk assessment, copper was examined with further detail. Copper was detected in several samples in the dry event but was not detected during the wet event. The Set S (ecological screening level) for copper is 3.1ug/L and the undiluted ICP-MS CRQL via EPA CLP ILM05.4 is 2ug/L. The undiluted ICP-AES CRQL via EPA CLP ILM05.4 is 25ug/L.

For the sake of simplicity, the following data grouping was considered: Phase III surface water, METAL and FMETAL, copper only, wet and dry event only, no field duplicates.

Analysis of copper via ICP-MS was requested. During the first event (dry event), the laboratory noted analytical issues with copper and other metals. At a 1X dilution, exceedances were noted for internal standards. In addition, when compared to ICP-AES results, false detects were noted for copper via ICP-MS. The laboratory was forced to analyze some samples for copper via ICP-AES to reduce or eliminate these issues.

During the dry (first) event, samples were analyzed for copper via ICP-MS and ICP-AES. Some samples (analyzed via ICP-MS) had detects for copper. Detections ranged between 122ug/L and 282ug/L. The remainder of the samples (analyzed via ICP-AES) were nondetect for copper. Nondetect ICP-AES CRQLs were 25 U ug/L (30 analyses) and 375 U ug/L (16 analyses).

During the wet (second) event, samples were analyzed for copper via ICP-AES only. All samples were nondetect for copper. CRQLs were 375 U ug/L (71 analyses) and 1880 U ug/L (three analyses).

Analysis and diluted analysis via ICP-AES was necessary to reduce interference from high metals concentrations (other target analytes). This has no effect on the availability of results for use. All results are usable at their reported concentration (for detected results) or quantitation limit (for nondetect results). All detected copper results during the dry event are less than the nondetect copper CRQLs during the wet event. As described in section 11.4.5 and 11.5.5, above, all instances of nondetect copper or filtered copper CRQLs exceeding screening limits are associated with a METAL or FMETAL detected exceedance in the same sample and same analysis group.

11.6 Wet Chemistry

Wet Chemistry including Total Organic Carbon (TOC) and Dissolved Organic Carbon (DOC) via SW-846 9060, Chloride, Nitrate, Nitrate, Sulfate, and/or Phosphate via EPA 300.0, Total Kjeldahl Nitrogen (TKN) via EPA 351.2, Nitrate/Nitrite via EPA 353.2, Alkalinity or Hardness via SM2320, SM2320B, and/or SM2320C, Total Dissolved Solids (TDS) via SM2540C, Total Suspended Solids (TSS) via SM2540D, and/or Silica via SM4500 was analyzed in one or more surface water sample. Excluding field quality control samples, 244 distinct data points were generated. Because there were no rejected results, the WCHEM data set is 100 percent complete (244 of 244 WCHEM results are available for use). The validation process resulted in the following qualifiers for results in the WCHEM fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	WS	WCHEM		209	85.66%	
A-5	WS	WCHEM	U	23	9.43%	11.6.1
A-5	WS	WCHEM	J	10	4.10%	11.6.2
A-5	WS	WCHEM	UJ	2	0.82%	11.6.3

11.6.1 U-qualification

Twenty three results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

11.6.2 J-qualification

Ten results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

11.6.3 UJ-qualification

Two results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank

contamination (see section 11.6.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

11.7 Phase III Surface Water PARCC

11.7.1 Precision

Results may have been qualified due to precision-related QA/QC issues such as dual-column reproducibility, field duplicate reproducibility, laboratory replicate reproducibility, and MS/MSD precision. In some extreme cases, results may have been rejected due to precision issues. In the case of results rejected due to precision issues, the sample matrix or analytical process had a negative effect on precision. In the case of results qualified (but not rejected) due to precision issues, the sample matrix or analytical process had an effect on precision, but not severe enough to affect data usability (and hence completeness). In the case of unqualified (or U-qualified) results, which represent the majority of the data, there was no effect on precision.

11.7.2 Accuracy

Results may have been qualified due to accuracy-related QA/QC issues such as spiked surrogate recovery, internal standard recovery, laboratory control sample (or laboratory control sample duplicate) recovery, or matrix spike (or matrix spike duplicate) recovery. In some extreme cases, results may have been rejected due to accuracy issues. In the case of results rejected due to accuracy issues, the sample matrix or analytical process had a negative effect on accuracy. In the case of results qualified (but not rejected) due to accuracy issues, the sample matrix or analytical process had an effect on accuracy, but not severe enough to affect data usability (and hence completeness). In the case of unqualified results, there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "nondetect"), there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "not detected at significantly greater than that in an associated blank"), there is no serious effect on accuracy (blank contamination affects the accuracy of a data point but not significantly unless the point is rejected) and the points are usable as U-qualified results.

11.7.3 Representativeness

There were no issues affecting representativeness in this data set.

11.7.4 Completeness

There were 452 R-qualified results in this dataset; therefore, the data validation process demonstrated that 97.99 percent of the results are available for use as qualified. For this data set, completeness exceeded the project goal of 90 percent from the Phase III UFP-QAPP. It should also be noted that only VOC, PEST/PCB, FMETAL, and METAL fractions contained rejected data, and these fractions, individually, also met the 90 percent project goal for completeness.

11.7.5 Comparability

There were no issues affecting comparability in this data set.

11.8 "Available as Reported" v. "Available as Qualified" v. Rejected

The data quality evaluation showed that the laboratory or data validator U-qualified 76.15 percent (17121 of 22484 results) of the data. These data may be available as reported (if U-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a U-qualifier). The data quality evaluation demonstrated that 10.58 percent (2378 of 22484 results) of the data are acceptable without qualification. These results are available as reported. The data quality evaluation showed that the laboratory or data validator J-qualified 7.77 percent (1746 of 22484 results) of the data. These data may be available as reported (if J-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a J-qualifier). The data quality evaluation showed that the data validator UJ-qualified 3.50 percent (787 of 22484 results) of the data. These data are available as qualified. The data quality evaluation showed that the data validator R-qualified 2.01 percent (452 of 22484 results) of the data and these data are not available for use. The results may be reported (as analyzed but rejected) as long as they are accompanied by the R-qualifier and are not used.

All results, with the exception of those R-qualified as "rejected" (452 of 22484 results, 2.01 percent of total results) are available for use as qualified.

12. Phase III Upland Soil (ERT) (A-8 SO)

The purpose of this data quality evaluation is to summarize the findings of the data validation and any effects it may have on the availability of the data from the Phase III Upland Soil Sampling event conducted by ERT at Gowanus Canal as well as to provide an assessment of data usability. Samples were collected by ERT May 17, 2010 through June 29, 2010.

12.1 Volatile Organic Compounds

Volatiles were analyzed by GC/MS. Excluding field quality control samples, 13186 distinct data points were generated. When rejected data are considered, the volatiles data set is 94.96 percent complete (12521 of 13186 volatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-8	SO	VOC	U	10399	78.86%	12.1.1
A-8	SO	VOC	UJ	906	6.87%	12.1.2
A-8	SO	VOC	J	837	6.35%	12.1.3
A-8	SO	VOC	R	665	5.04%	12.1.4
A-8	SO	VOC		379	2.87%	

12.1.1 U-qualification

A total of 10399 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater

than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

12.1.2 UJ-qualification

A total of 906 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 12.1.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

12.1.3 J-qualification

A total of 837 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

12.1.4 R-qualification

A total of 665 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

12.2 Semivolatile Organic Compounds

Semivolatiles were analyzed by GC/MS. Excluding field quality control samples, 17260 distinct data points were generated. Because there were no rejected results, the semivolatiles data set is 100 percent complete (17260 of 17260 semivolatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-8	SO	SVOC	U	13264	76.85%	12.2.1
A-8	SO	SVOC	J	2611	15.13%	12.2.2
A-8	SO	SVOC		1035	6.00%	
A-8	SO	SVOC	UJ	344	1.99%	12.2.3
A-8	SO	SVOC	NJ	6	0.03%	12.2.4

12.2.1 U-qualification

A total of 13264 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

12.2.2 J-qualification

A total of 2611 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

12.2.3 UJ-qualification

A total of 2877 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 12.2.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

12.2.4 NJ-qualification

Six results consisting of 4-methyl-2-pentanone in 059-2188, 059-2193, 059-2194, 059-2195, 059-2196, and 059-2200 were NJ-qualified as "presumptively present at approximate quantity" by the validator. The QA/QC issue was not severe enough to warrant rejection of data. The NJ-qualification of data by the data validator does not affect the availability of

data because these results are available for use as detects at the reported concentration. The data user must consider the results "presumptively present at approximate quantity".

12.3 Pesticides/PCBs

Pesticides and PCBs were analyzed by GC. Excluding field quality control samples, 8127 distinct data points were generated. When rejected results are considered, the PEST/PCB data set is 97.45 percent complete (7920 of 8127 PEST/PCB results are available for use). The validation process resulted in the following qualifiers for results in the PEST/PCB fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-8	SO	PEST/PCB	U	6189	76.15%	12.3.1
A-8	SO	PEST/PCB	UJ	1347	16.57%	12.3.2
A-8	SO	PEST/PCB	J	229	2.82%	12.3.3
A-8	SO	PEST/PCB	R	207	2.55%	12.3.4
A-8	SO	PEST/PCB		104	1.28%	
A-8	SO	PEST/PCB	NJ	51	0.63%	12.3.5

12.3.1 U-qualification

A total of 6189 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

12.3.2 UJ-qualification

A total of 1347 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 12.3.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

12.3.3 J-qualification

A total of 229 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this

does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

12.3.4 R-qualification

A total of 207 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset.

12.3.5 NJ-qualification

A total of 51 results were NJ-qualified as "presumptively present at approximate quantity" by the validator. The QA/QC issue was not severe enough to warrant rejection of data. This issue likely originates from precision exceedances (between results from dual-columns). The NJ-qualification of data by the data validator does not affect the availability of data because these results are available for use as detects at the reported concentration. The data user must consider the results "presumptively present at approximate quantity".

12.4 Metals

Metals, including mercury and cyanide, were analyzed by ICP-AES, CVAA, and spectrophotometer. Excluding field quality control samples, 6096 distinct data points were generated. When rejected results are considered, the metals data set is 99.98 percent complete (6095 of 6096 metals results are available for use). The validation process resulted in the following qualifiers for results in the metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-8	SO	METAL		2852	46.78%	
A-8	SO	METAL	U	1692	27.76%	12.4.1
A-8	SO	METAL	J	1362	22.34%	12.4.2
A-8	SO	METAL	UJ	189	3.10%	12.4.3
A-8	SO	METAL	R	1	0.02%	12.4.4

12.4.1 U-qualification

A total of 1692 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

12.4.2 J-qualification

A total of 1362 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

12.4.3 UJ-qualification

A total of 189 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 12.4.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

12.4.4 R-qualification

One result (nickel in 059-2105) was R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset.

12.5 Wet Chemistry

Wet Chemistry (percent moisture) data was generated for these samples. Excluding field quality control samples, nine distinct data points were generated. Because there were no rejected results, the WCHEM data set is 100 percent complete (nine of nine WCHEM results are available for use). No qualifiers were applied to the WCHEM data.

12.6 Phase III Upland Soil (ERT) PARCC

12.6.1 Precision

Results may have been qualified due to precision-related QA/QC issues such as dual-column reproducibility, field duplicate reproducibility, laboratory replicate reproducibility, and MS/MSD precision. In some extreme cases, results may have been rejected due to precision issues. In the case of results rejected due to precision issues, the sample matrix or analytical process had a negative effect on precision. In the case of results qualified (but not rejected) due to precision issues, the sample matrix or analytical process had an effect on precision, but not severe enough to affect data usability (and hence completeness). In the case of unqualified (or U-qualified) results, which represent the majority of the data, there was no effect on precision.

12.6.2 Accuracy

Results may have been qualified due to accuracy-related QA/QC issues such as spiked surrogate recovery, internal standard recovery, laboratory control sample (or laboratory control sample duplicate) recovery, or matrix spike (or matrix spike duplicate) recovery. In some extreme cases, results may have been rejected due to accuracy issues. In the case of results rejected due to accuracy issues, the sample matrix or analytical process had a negative effect on accuracy. In the case of results qualified (but not rejected) due to accuracy issues, the sample matrix or analytical process had an effect on accuracy, but not severe enough to affect data usability (and hence completeness). In the case of unqualified results, there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "nondetect"), there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "not detected at significantly greater than that in an associated blank"), there is no serious effect on accuracy (blank contamination affects the accuracy of a data point but not significantly unless the point is rejected) and the points are usable as U-qualified results.

12.6.3 Representativeness

There were no issues affecting representativeness in this data set.

12.6.4 Completeness

There were 873 R-qualified results in this dataset; therefore, the data validation process demonstrated that 98.05 percent of the results are available for use as qualified. For this data set, completeness exceeded a typical project completeness goal of 90%. It should also be noted that VOC, PEST/PCB, and METAL fractions contained rejected data. These fractions, when considered individually, also met the 90 percent completeness goal.

12.6.5 Comparability

There were no issues affecting comparability in this data set.

12.7 "Available as Reported" v. "Available as Qualified" v. Rejected

The data quality evaluation showed that the laboratory or data validator U-qualified 70.60 percent (31544 of 44678 results) of the data. These data may be available as reported (if U-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a U-qualifier). The data quality evaluation showed that the laboratory or data validator J-qualified 11.28 percent (5039 of 44678 results) of the data. These data may be available as reported (if J-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a J-qualifier). The data quality evaluation demonstrated that 9.80 percent (4379 of 44678 results) of the data are acceptable without qualification. These results are available as reported. The data quality evaluation showed that the data validator UJ-qualified 6.24 percent (2786 of 44678 results) of the data. These data are available as qualified. The data quality evaluation showed that the data validator R-qualified 1.95 percent (873 of 44678 results) of the data and these data are not available for use. The results may be reported (as analyzed but rejected) as long as they are accompanied by the R-qualifier and are not used. The data quality evaluation showed that the data validator NJ-qualified 0.13 percent (57 of 44678 results) of the data. These data are available as qualified.

All results, with the exception of those R-qualified as "rejected" (873 of 44678 results, 1.95 percent of total results) are available for use as qualified.

13. Phase III Groundwater (NYC/NG) (A-9 WG)

The purpose of this data quality evaluation is to summarize the findings of the data validation and any effects it may have on the availability of the data from the Phase III Groundwater (New York City/National Grid) event at Gowanus Canal as well as to provide an assessment of data usability. Samples were collected by New York City/National Grid June 24, 2010 through July 22, 2010.

13.1 Volatile Organic Compounds

Volatiles were analyzed by GC/MS. 1,2-Dibromoethane and 1,2-dibromo-3-chloropropane included a micro-extraction technique. Excluding field quality control samples, 1296 distinct data points were generated. When rejected data are considered, the volatiles data set is 96.99 percent complete (1257 of 1296 volatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-9	WG	VOC	U	1118	86.27%	13.1.1
A-9	WG	VOC		87	6.71%	
A-9	WG	VOC	J	43	3.32%	13.1.2
A-9	WG	VOC	R	39	3.01%	13.1.3
A-9	WG	VOC	UJ	9	0.69%	13.1.4

13.1.1 U-qualification

A total of 1118 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

13.1.2 J-qualification

A total of 43 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user

understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

13.1.3 R-qualification

A total of 39 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other VOC information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

13.1.4 UJ-qualification

Nine results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 13.1.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

13.2 Semivolatile Organic Compounds

Semivolatiles were analyzed by GC/MS and selective ion monitoring. Excluding field quality control samples, 1650 distinct data points were generated. Because there were no rejected results, the semivolatiles data set is 100 percent complete (1650 of 1650 semivolatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-9	WG	SVOC	U	1380	83.64%	13.2.1
A-9	WG	SVOC		175	10.61%	
A-9	WG	SVOC	J	82	4.97%	13.2.2
A-9	WG	SVOC	UJ	13	0.79%	13.2.3

13.2.1 U-qualification

A total of 1380 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

13.2.2 J-qualification

A total of 82 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

13.2.3 UJ-qualification

A total of 13 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 13.2.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

13.3 Pesticides/PCBs

Pesticides and PCBs were analyzed by GC. Excluding field quality control samples, 800 distinct data points were generated. Because there were no rejected results, the PEST/PCB data set is 100 percent complete (800 of 800 PEST/PCB results are available for use). The validation process resulted in the following qualifiers for results in the PEST/PCB fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-9	WG	PEST/PCB	U	634	79.25%	13.3.1
A-9	WG	PEST/PCB	UJ	163	20.38%	13.3.2
A-9	WG	PEST/PCB	J	2	0.25%	13.3.3
A-9	WG	PEST/PCB		1	0.13%	

13.3.1 U-qualification

A total of 634 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

13.3.2 UJ-qualification

A total of 163 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 13.3.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

13.3.3 J-qualification

Two results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

13.4 Filtered Metals

Filtered metals, including mercury were analyzed by ICP-AES, ICP-MS, and CVAA. Excluding field quality control samples, 265 distinct data points were generated. Because there were no rejected results, the filtered metals data set is 100 percent complete (265 of 265 filtered metals results are available for use). The validation process resulted in the following qualifiers for results in the filtered metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-9	WG	FMETAL	UJ	133	50.19%	13.4.1
A-9	WG	FMETAL		72	27.17%	
A-9	WG	FMETAL	U	32	12.08%	13.4.2
A-9	WG	FMETAL	J	28	10.57%	13.4.3

13.4.1 UJ-qualification

A total of 133 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 13.4.2, below). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

13.4.2 U-qualification

A total of 32 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

13.4.3 J-qualification

A total of 28 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

13.5 Metals

Metals, including mercury and cyanide, were analyzed by ICP-AES, ICP-MS, CVAA, and spectrophotometer. Excluding field quality control samples, 600 distinct data points were generated. Because there were no rejected results, the metals data set is 100 percent complete (600 of 600 metals results are available for use). The validation process resulted in the following qualifiers for results in the metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-9	WG	METAL		237	39.50%	
A-9	WG	METAL	U	207	34.50%	13.5.1
A-9	WG	METAL	UJ	115	19.17%	13.5.2
A-9	WG	METAL	J	41	6.83%	13.5.3

13.5.1 U-qualification

A total of 207 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the

availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

13.5.2 UJ-qualification

A total of 115 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 13.5.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

13.5.3 J-qualification

A total of 41 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

13.6 Wet Chemistry

Wet Chemistry including Chloride and Sulfate via EPA 300.0, Nitrate and Nitrate/Nitrite via EPA 353.2 and SM4500, Phosphorous via EPA 365.3, Alkalinity via EPA 310.1 and SM2320B, Hardness via SM2340B and SM2340C, Total Kjeldahl Nitrogen (TKN) via EPA 351.2 and SM4500C-NOrg, TDS via SM2540C, TSS via SM2540D, Silica via SM4500, Ammonia via SM4500C-NH3, and Total Organic Carbon (TOC) and Dissolved Organic Carbon (DOC) via SM5310B were analyzed on one or more groundwater sample. Excluding field quality control samples, 128 distinct data points were generated. Because there were no rejected results, the WCHEM data set is 100 percent complete (128 of 128 WCHEM results are available for use). The validation process resulted in the following qualifiers for results in the WCHEM fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-9	WG	WCHEM		105	82.03%	
A-9	WG	WCHEM	U	17	13.28%	13.6.1
A-9	WG	WCHEM	J	6	4.69%	13.6.2

13.6.1 U-qualification

Seventeen results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status

from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

13.6.2 J-qualification

Six results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

13.7 Phase III Groundwater (NYC/NG) PARCC

13.7.1 Precision

Results may have been qualified due to precision-related QA/QC issues such as dual-column reproducibility, field duplicate reproducibility, laboratory replicate reproducibility, and MS/MSD precision. In some extreme cases, results may have been rejected due to precision issues. In the case of results rejected due to precision issues, the sample matrix or analytical process had a negative effect on precision. In the case of results qualified (but not rejected) due to precision issues, the sample matrix or analytical process had an effect on precision, but not severe enough to affect data usability (and hence completeness). In the case of unqualified (or U-qualified) results, which represent the majority of the data, there was no effect on precision.

13.7.2 Accuracy

Results may have been qualified due to accuracy-related QA/QC issues such as spiked surrogate recovery, internal standard recovery, laboratory control sample (or laboratory control sample duplicate) recovery, or matrix spike (or matrix spike duplicate) recovery. In some extreme cases, results may have been rejected due to accuracy issues. In the case of results rejected due to accuracy issues, the sample matrix or analytical process had a negative effect on accuracy. In the case of results qualified (but not rejected) due to accuracy issues, the sample matrix or analytical process had an effect on accuracy, but not severe enough to affect data usability (and hence completeness). In the case of unqualified results, there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "nondetect"), there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "not detected at significantly greater than that in an associated blank"), there is no serious effect on accuracy (blank contamination affects the accuracy of a data point but not significantly unless the point is rejected) and the points are usable as U-qualified results.

13.7.3 Representativeness

There were no issues affecting representativeness in this data set.

13.7.4 Completeness

There were 39 R-qualified results in this dataset; therefore, the data validation process demonstrated that 99.18 percent of the results are available for use as qualified. For this data set, completeness exceeded a typical project completeness goal of 90%. It should also be noted that only the VOC fraction contained rejected data. This fraction, considered individually, also met the 90 percent completeness goal.

13.7.5 Comparability

There were no issues affecting comparability in this data set.

13.8 "Available as Reported" v. "Available as Qualified" v. Rejected

The data quality evaluation showed that the laboratory or data validator U-qualified 71.49 percent (3388 of 4739 results) of the data. These data may be available as reported (if U-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a U-qualifier). The data quality evaluation demonstrated that 14.29 percent (677 of 4739 results) of the data are acceptable without qualification. These results are available as reported. The data quality evaluation showed that the data validator UJ-qualified 9.14 percent (433 of 4739 results) of the data. These data are available as qualified. The data quality evaluation showed that the laboratory or data validator J-qualified 4.26 percent (202 of 4739 results) of the data. These data may be available as reported (if J-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a J-qualifier). The data quality evaluation showed that the data validator R-qualified 0.82 percent (39 of 4739 results) of the data and these data are not available for use. The results may be reported (as analyzed but rejected) as long as they are accompanied by the R-qualifier and are not used.

All results, with the exception of those R-qualified as "rejected" (39 of 4730 results, 0.28 percent of total results) are available for use as qualified.

14. Phase III Soil (NYC/NG) (A-9 SO)

The purpose of this data quality evaluation is to summarize the findings of the data validation and any effects it may have on the availability of the data from the Phase III Soil Sampling event conducted by New York City/National Grid at Gowanus Canal as well as to provide an assessment of data usability. Samples were collected by New York City/National Grid June 2, 2010 through June 30, 1010.

14.1 Volatile Organic Compounds

Volatiles were analyzed by GC/MS. Excluding field quality control samples, 6342 distinct data points were generated. When rejected data are considered, the volatiles data set is 97.52 percent complete (6185 of 6342 volatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-9	SO	VOC	U	5282	83.29%	14.1.1
A-9	SO	VOC	UJ	425	6.70%	14.1.2
A-9	SO	VOC	J	279	4.40%	14.1.3
A-9	SO	VOC		199	3.14%	
A-9	SO	VOC	R	157	2.48%	14.1.4

14.1.1 U-qualification

A total of 5282 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

14.1.2 UJ-qualification

A total of 425 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 14.1.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

14.1.3 J-qualification

A total of 279 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

14.1.4 R-qualification

A total of 157 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

14.2 Semivolatile Organic Compounds

Semivolatiles were analyzed by GC/MS. Excluding field quality control samples, 8052 distinct data points were generated. When rejected results are considered, the semivolatiles data set is 99.99 percent complete (8051 of 8052 semivolatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-9	SO	SVOC	U	6065	75.32%	14.2.1
A-9	SO	SVOC		949	11.79%	
A-9	SO	SVOC	J	740	9.19%	14.2.2
A-9	SO	SVOC	UJ	297	3.69%	14.2.3
A-9	SO	SVOC	R	1	0.01%	14.2.4

14.2.1 U-qualification

A total of 6065 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

14.2.2 J-qualification

A total of 740 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

14.2.3 UJ-qualification

A total of 297 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 14.2.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher.

This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

14.2.4 R-qualification

One result (2,4-Dinitrophenol in GC-MW23I(30-35)) was R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

14.3 Pesticides/PCBs

Pesticides and PCBs were analyzed by GC. Excluding field quality control samples, 3904 distinct data points were generated. When rejected results are considered, the PEST/PCB data set is 99.49 percent complete (73884 of 3904 PEST/PCB results are available for use). The validation process resulted in the following qualifiers for results in the PEST/PCB fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-9	SO	PEST/PCB	U	3618	92.67%	14.3.1
A-9	SO	PEST/PCB	UJ	137	3.51%	14.3.2
A-9	SO	PEST/PCB	J	57	1.46%	14.3.3
A-9	SO	PEST/PCB		49	1.26%	
A-9	SO	PEST/PCB	NJ	23	0.59%	14.3.4
A-9	SO	PEST/PCB	R	20	0.51%	14.3.5

14.3.1 U-qualification

A total of 3618 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

14.3.2 UJ-qualification

A total of 137 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 14.3.1, above). These results are usable as nondetects as

long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

14.3.3 J-qualification

A total of 57 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

14.3.4 NJ-qualification

A total of 23 results were NJ-qualified as "presumptively present at approximate quantity" by the validator. The QA/QC issue was not severe enough to warrant rejection of data. This issue likely originates from precision exceedances (between results from dual-columns). The NJ-qualification of data by the data validator does not affect the availability of data because these results are available for use as detects at the reported concentration. The data user must consider the results "presumptively present at approximate quantity".

14.3.5 R-qualification

Twenty results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset.

14.4 Metals

Metals, including mercury and cyanide, were analyzed by ICP-AES, CVAA, and spectrophotometer. Excluding field quality control samples, 2928 distinct data points were generated. Because there were no rejected results, the metals data set is 100 percent complete (2928 of 2928 metals results are available for use). The validation process resulted in the following qualifiers for results in the metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-9	SO	METAL		1567	53.52%	
A-9	SO	METAL	U	839	28.65%	14.4.1
A-9	SO	METAL	J	345	11.78%	14.4.2
A-9	SO	METAL	UJ	177	6.05%	14.4.3

14.4.1 U-qualification

A total of 839 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed

the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

14.4.2 J-qualification

A total of 345 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

14.4.3 UJ-qualification

A total of 177 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 14.4.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

14.5 Wet Chemistry

Wet Chemistry (percent moisture) data was generated for these samples. Excluding field quality control samples, 121 distinct data points were generated. Because there were no rejected results, the WCHEM data set is 100 percent complete (121 of 121 WCHEM results are available for use). No qualifiers were applied to the WCHEM data.

14.6 Phase III Soil (NYC/NG) PARCC

14.6.1 Precision

Results may have been qualified due to precision-related QA/QC issues such as dual-column reproducibility, field duplicate reproducibility, laboratory replicate reproducibility, and MS/MSD precision. In some extreme cases, results may have been rejected due to precision issues. In the case of results rejected due to precision issues, the sample matrix or analytical process had a negative effect on precision. In the case of results qualified (but not rejected) due to precision issues, the sample matrix or analytical process had an effect on precision, but not severe enough to affect data usability (and hence completeness). In the case of unqualified (or U-qualified) results, which represent the majority of the data, there was no effect on precision.

14.6.2 Accuracy

Results may have been qualified due to accuracy-related QA/QC issues such as spiked surrogate recovery, internal standard recovery, laboratory control sample (or laboratory control sample duplicate) recovery, or matrix spike (or matrix spike duplicate) recovery. In some extreme cases, results may have been rejected due to accuracy issues. In the case of results rejected due to accuracy issues, the sample matrix or analytical process had a negative effect on accuracy. In the case of results qualified (but not rejected) due to accuracy issues, the sample matrix or analytical process had an effect on accuracy, but not severe enough to affect data usability (and hence completeness). In the case of unqualified results, there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "nondetect"), there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "not detected at significantly greater than that in an associated blank"), there is no serious effect on accuracy (blank contamination affects the accuracy of a data point but not significantly unless the point is rejected) and the points are usable as U-qualified results.

14.6.3 Representativeness

There were no issues affecting representativeness in this data set.

14.6.4 Completeness

There were 178 R-qualified results in this dataset; therefore, the data validation process demonstrated that 99.17 percent of the results are available for use as qualified. For this data set, completeness exceeded a typical project completeness goal of 90%. It should also be noted that VOC, SVOC, and PEST/PCB fractions contained rejected data. These fractions, when considered individually, also met the 90 percent completeness goal.

14.6.5 Comparability

There were no issues affecting comparability in this data set.

14.7 "Available as Reported" v. "Available as Qualified" v. Rejected

The data quality evaluation showed that the laboratory or data validator U-qualified 74.03 percent (15804 of 21347 results) of the data. These data may be available as reported (if U-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a U-qualifier). The data quality evaluation demonstrated that 13.51 percent (2885 of 21347 results) of the data are acceptable without qualification. These results are available as reported. The data quality evaluation showed that the laboratory or data validator J-qualified 6.66 percent (1421 of 21347 results) of the data. These data may be available as reported (if J-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a J-qualifier). The data quality evaluation showed that the data validator UJ-qualified 4.85 percent (1306 of 21347 results) of the data. These data are available as qualified. The data quality evaluation showed that the data validator R-qualified 0.83 percent (178 of 21347 results) of the data and these data are not available for use. The results may be reported (as analyzed but rejected) as long as they are accompanied by the R-qualifier and are not used. The data quality evaluation showed that the data validator NJ-qualified 0.11 percent (23 of 21347 results) of the data. These data are available as qualified.

All results, with the exception of those R-qualified as "rejected" (178 of 21347 results, 0.83 percent of total results) are available for use as qualified.

15. Phase III Surface Water (NYC/NG) (A-9 WS)

The purpose of this data quality evaluation is to summarize the findings of the data validation and any effects it may have on the availability of the data from the Phase III Surface Water Sampling Event (New York City/National Grid) at Gowanus Canal as well as to provide an assessment of data usability. Two surface water samples were collected by New York City/National Grid on July 21, 2010.

15.1 Filtered Metals

Select filtered metals were analyzed by ICP-AES and ICP-MS. Excluding field quality control samples, 14 distinct data points were generated. Because there were no rejected results, the filtered metals data set is 100 percent complete (14 of 14 filtered metals results are available for use). The validation process resulted in the following qualifiers for results in the filtered metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-9	WS	FMETAL		11	78.57%	
A-9	WS	FMETAL	J	2	14.29%	15.1.1
A-9	WS	FMETAL	UJ	1	7.14%	15.1.2

15.1.1 J-qualification

Two results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

15.1.2 UJ-qualification

One result was UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination. These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

15.1.3 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U-values were compared to the lesser of Set S or Set T. There were no instances of nondetect U-values exceeding screening levels.

15.2 Metals

Select metals were analyzed using ICP-AES. Excluding field quality control samples, 14 distinct data points were generated. Because there were no rejected results, the metals data set is 100 percent complete (14 of 14 metals results are available for use). The validation process resulted in the following qualifiers for results in the metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-9	WS	METAL		12	85.71%	
A-9	WS	METAL	J	2	14.29%	15.2.1

15.2.1 J-qualification

Two results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

15.2.2 CRQL v. SL Exceedances

Please refer to Table 3. Nondetect U-values were compared to the lesser of Set S or Set T. All data were detect.

15.3 Wet Chemistry

Wet Chemistry including Chloride and Sulfate via EPA 300.0, Phosphorous via EPA 365.3, Alkalinity via EPA 310.1, Hardness via SM2340B, Nitrate/Nitrate via EPA 353.2, Ammonia via SM4500C-NH3, Total Kjeldahl Nitrogen (TKN) via SM4500C-NOrg, Ferrous Iron via SM3500D-Fe, Silica via SM4500, and Total Organic Carbon (TOC) and Dissolved Organic Carbon (DOC) via SM5310B were analyzed in one or more surface water sample. Excluding field quality control samples, 23 distinct data points were generated. Because there were no rejected results, the WCHEM data set is 100 percent complete (23 of 23 WCHEM results are available for use). The validation process resulted in the following qualifiers for results in the WCHEM fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-9	WS	WCHEM		18	78.26%	
A-9	WS	WCHEM	J	5	21.74%	15.3.1

15.3.1 J-qualification

Five results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These

results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

15.4 Phase III Surface Water (NYC/NG) PARCC

15.4.1 Precision

Results may have been qualified due to precision-related QA/QC issues such as field duplicate reproducibility, laboratory replicate reproducibility, and MS/MSD precision. In the case of results qualified (but not rejected) due to precision issues, the sample matrix or analytical process had an effect on precision, but not severe enough to affect data usability (and hence completeness).

15.4.2 Accuracy

Results may have been qualified due to accuracy-related QA/QC issues such as laboratory control sample (or laboratory control sample duplicate) recovery or matrix spike (or matrix spike duplicate) recovery. In the case of results qualified (but not rejected) due to accuracy issues, the sample matrix or analytical process had an effect on accuracy, but not severe enough to affect data usability (and hence completeness). In the case of unqualified results, there was no effect on accuracy.

15.4.3 Representativeness

There were no issues affecting representativeness in this data set.

15.4.4 Completeness

There were no R-qualified results in this dataset; therefore, the data validation process demonstrated that 100 percent of the results are available for use as qualified. For this data set, completeness exceeded a typical project goal of 90 percent.

15.4.5 Comparability

There were no issues affecting comparability in this data set.

15.5 “Available as Reported” v. “Available as Qualified” v. Rejected

The data quality evaluation demonstrated that 80.39 percent (41 of 51 results) of the data are acceptable without qualification. These results are available as reported. The data quality evaluation showed that the laboratory or data validator J-qualified 17.65 percent (9 of 51results) of the data. These data may be available as reported (if J-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a J-qualifier). The data quality evaluation showed that the data validator UJ-qualified 1.96 percent (one of 51 results) of the data. These data are available as qualified.

All results are available for use as qualified.

16. Phase III PRP Split Groundwater (A-10 WG)

The purpose of this data quality evaluation is to summarize the findings of the data validation and any effects it may have on the availability of the data from the Phase III PRP

Split Groundwater event at Gowanus Canal as well as to provide an assessment of data usability. Samples were collected June 24, 2010, July 8, 2010 through July 22, 2010.

16.1 Volatile Organic Compounds

Volatiles were analyzed by USEPA CLP SOM01.2 "Trace Water" and "Trace Water by SIM". Excluding field quality control samples, 1173 distinct data points were generated. Because there were no rejected data, the volatiles data set is 100 percent complete (1173 of 1173 volatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-10	WG	VOC	U	1012	86.27%	16.1.1
A-10	WG	VOC	J	95	8.10%	16.1.2
A-10	WG	VOC		66	5.63%	

16.1.1 U-qualification

A total of 1012 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

16.1.2 J-qualification

A total of 95 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

16.2 Semivolatile Organic Compounds

Semivolatiles were analyzed by USEPA CLP SOM01.2 "Low Water" and "Low Water by SIM". Excluding field quality control samples, 1496 distinct data points were generated. When rejected results are considered, the semivolatiles data set is 99.47 percent complete (1488 of 1496 semivolatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the semivolatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-10	WG	SVOC	U	1192	79.68%	16.2.1
A-10	WG	SVOC	J	176	11.76%	16.2.2
A-10	WG	SVOC		105	7.02%	
A-10	WG	SVOC	UJ	15	1.00%	16.2.3
A-10	WG	SVOC	R	8	0.53%	16.2.4

16.2.1 U-qualification

A total of 1192 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

16.2.2 J-qualification

A total of 176 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

16.2.3 UJ-qualification

A total of 115 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 16.2.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

16.3.3 R-qualification

Eight results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to Pentachlorophenol in GC-MW23I-S-NG; GC-MW23S-S-NG; GC-MW30S-S-NG; GC-MW31I-S-NG; GC-MW31S-S-NG; GC-MW32S-S-NG; GC-MW41I-S-NG; and GC-MW41S-S-NG. Although these results are not usable for any purpose, this

does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other SVOC information.

16.3 Pesticides/PCBs

Pesticides and PCBs were analyzed by USEPA CLP SOM01.2 "Water". Excluding field quality control samples, 704 distinct data points were generated. When rejected results are considered, the PEST/PCB data set is 99.86 percent complete (703 of 704 PEST/PCB results are available for use). The validation process resulted in the following qualifiers for results in the PEST/PCB fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-10	WG	PEST/PCB	U	427	60.65%	16.3.1
A-10	WG	PEST/PCB	UJ	273	38.78%	16.3.2
A-10	WG	PEST/PCB	J	3	0.43%	16.3.3
A-10	WG	PEST/PCB	R	1	0.14%	16.3.4

16.3.1 U-qualification

A total of 427 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

16.3.2 UJ-qualification

A total of 273 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 16.3.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

16.3.3 J-qualification

Three results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user

understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

16.3.4 R-qualification

One result was R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. This corresponds to beta-BHC in GC-MW09I-S-NYC. Although this result is not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other PEST/PCB information.

16.4 Filtered Metals

Filtered metals, including mercury were analyzed by USEPA CLP ILM05.4 using ICP-AES, ICP-MS, and CVAA. Excluding field quality control samples, 506 distinct data points were generated. When rejected results are considered, the filtered metals data set is 96.44 percent complete (488 of 506filtered metals results are available for use). The validation process resulted in the following qualifiers for results in the filtered metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-10	WG	FMETAL		204	40.32%	
A-10	WG	FMETAL	U	201	39.72%	16.4.1
A-10	WG	FMETAL	J	60	11.86%	16.4.2
A-10	WG	FMETAL	UJ	23	4.55%	16.4.3
A-10	WG	FMETAL	R	18	3.56%	16.4.4

16.4.1 U-qualification

A total of 201 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

16.4.2 J-qualification

A total of 60 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user

understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

16.4.3 UJ-qualification

A total of 23 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 16.4.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

16.4.4 R-qualification

A total of 18 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Rejected results correspond to various detects and nondetects in various samples (no discernable pattern). Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other FMETAL information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

16.5 Metals

Metals, including mercury and cyanide, were analyzed by USEPA CLP ILM05.4 using ICP-AES, ICP-MS, CVAA, and spectrophotometer. Excluding field quality control samples, 528 distinct data points were generated. When rejected results are considered, the metals data set is 94.51 percent complete (499 of 528 metals results are available for use). The validation process resulted in the following qualifiers for results in the metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-10	WG	METAL		267	50.57%	
A-10	WG	METAL	U	158	29.92%	16.5.1
A-10	WG	METAL	J	65	12.31%	16.5.2
A-10	WG	METAL	R	29	5.49%	16.5.3
A-10	WG	METAL	UJ	9	1.70%	16.5.4

16.5.1 U-qualification

A total of 158 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as

the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

16.5.2 J-qualification

A total of 65 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

16.5.3 R-qualification

A total of 29 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. Rejected results correspond to various detects and nondetects in various samples (no discernable pattern). Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other METAL information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

16.5.4 UJ-qualification

Nine results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 16.5.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

16.6 Phase III PRP Split Groundwater PARCC

16.6.1 Precision

Results may have been qualified due to precision-related QA/QC issues such as dual-column reproducibility, field duplicate reproducibility, laboratory replicate reproducibility, and MS/MSD precision. In some extreme cases, results may have been rejected due to precision issues. In the case of results rejected due to precision issues, the sample matrix or analytical process had a negative effect on precision. In the case of results qualified (but not rejected) due to precision issues, the sample matrix or analytical process had an effect on precision, but not severe enough to affect data usability (and hence completeness). In the case of unqualified (or U-qualified) results, which represent the majority of the data, there was no effect on precision.

16.6.2 Accuracy

Results may have been qualified due to accuracy-related QA/QC issues such as spiked surrogate recovery, internal standard recovery, laboratory control sample (or laboratory control sample duplicate) recovery, or matrix spike (or matrix spike duplicate) recovery. In some extreme cases, results may have been rejected due to accuracy issues. In the case of results rejected due to accuracy issues, the sample matrix or analytical process had a negative effect on accuracy. In the case of results qualified (but not rejected) due to accuracy issues, the sample matrix or analytical process had an effect on accuracy, but not severe enough to affect data usability (and hence completeness). In the case of unqualified results, there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "nondetect"), there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "not detected at significantly greater than that in an associated blank"), there is no serious effect on accuracy (blank contamination affects the accuracy of a data point but not significantly unless the point is rejected) and the points are usable as U-qualified results.

16.6.3 Representativeness

There were no issues affecting representativeness in this data set.

16.6.4 Completeness

There were 56 R-qualified results in this dataset; therefore, the data validation process demonstrated that 98.73 percent of the results are available for use as qualified. For this data set, completeness exceeded the Phase III UFP-QAPP completeness goal of 90%. It should also be noted that SVOC, PEST/PCB, METAL, and FMETAL fractions contained rejected data. Each of these fractions, considered individually, also met the 90 percent completeness goal.

16.6.5 Comparability

There were no issues affecting comparability in this data set.

16.7 "Available as Reported" v. "Available as Qualified" v. Rejected

The data quality evaluation showed that the laboratory or data validator U-qualified 67.85 percent (2990 of 4407 results) of the data. These data may be available as reported (if U-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a U-qualifier). The data quality evaluation demonstrated that 14.57 percent (642 of 4407 results) of the data are acceptable without qualification. These results are available as reported. The data quality evaluation showed that the laboratory or data validator J-qualified 9.05 percent (399 of 4407 results) of the data. These data may be available as reported (if J-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a J-qualifier). The data quality evaluation showed that the data validator UJ-qualified 7.26 percent (320 of 4407 results) of the data. These data are available as qualified. The data quality evaluation showed that the data validator R-qualified 1.27 percent (56 of 4407 results) of the data and these data are not available for use. The results may be reported (as analyzed but rejected) as long as they are accompanied by the R-qualifier and are not used.

All results, with the exception of those R-qualified as "rejected" (56 of 4407 results, 1.27 percent of total results) are available for use as qualified.

17. Phase III PRP Split Soil Sampling (A-10 SO)

The purpose of this data quality evaluation is to summarize the findings of the data validation and any effects it may have on the availability of the data from the Phase III PRP Split Soil Sampling event at Gowanus Canal as well as to provide an assessment of data usability. Samples were collected June 2, 2010 through June 30, 2010.

17.1 Volatile Organic Compounds

Volatiles were analyzed by USEPA CLP SOM01.2 "Low Soil". Excluding field quality control samples, 1508 distinct data points were generated. When rejected data are considered, the volatiles data set is 93.44 percent complete (1409 of 1508 volatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-10	SO	VOC	U	1254	83.16%	17.1.1
A-10	SO	VOC	R	99	6.56%	17.1.2
A-10	SO	VOC	J	62	4.11%	17.1.3
A-10	SO	VOC		55	3.65%	
A-10	SO	VOC	UJ	38	2.52%	17.1.4

17.1.1 U-qualification

A total of 1254 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

17.1.2 R-qualification

A total of 99 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These include 1,4-Dioxane in 29 samples (1,4-Dioxane is not an analyte of interest for this project) and various VOCs in SB02C-S-NYC, SB17I-S-NYC, SB19C-S-NYC, SB23IC-S-NG, SB31IB-S-NG, and SB32ID-S-NG. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other VOC information. Because R-

qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

17.1.3 J-qualification

A total of 62 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

17.1.4 UJ-qualification

A total of 38 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 17.1.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

17.2 Semivolatile Organic Compounds

Semivolatiles were analyzed by USEPA CLP SOM01.2 "Low Soil" and "Low Soil by SIM". Excluding field quality control samples, 1972 distinct data points were generated. Because there were no rejected results, the semivolatiles data set is 100 percent complete (1972 of 1972 semivolatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-10	SO	SVOC	U	1371	69.52%	17.2.1
A-10	SO	SVOC	J	290	14.71%	17.2.2
A-10	SO	SVOC		283	14.35%	
A-10	SO	SVOC	UJ	28	1.42%	17.2.3

17.2.1 U-qualification

A total of 1371 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the

availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

17.2.2 J-qualification

A total of 290 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

17.2.3 UJ-qualification

A total of 28 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 17.2.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

17.3 Pesticides/PCBs

Pesticides and PCBs were analyzed by USEPA CLP SOM01.2 "Soil". Excluding field quality control samples, 928 distinct data points were generated. When rejected results are considered, the PEST/PCB data set is 93.53 percent complete (868 of 928 PEST/PCB results are available for use). The validation process resulted in the following qualifiers for results in the PEST/PCB fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-10	SO	PEST/PCB	U	757	81.57%	17.3.1
A-10	SO	PEST/PCB	R	60	6.47%	17.3.2
A-10	SO	PEST/PCB	UJ	52	5.60%	17.3.3
A-10	SO	PEST/PCB	J	22	2.37%	17.3.4
A-10	SO	PEST/PCB		20	2.16%	
A-10	SO	PEST/PCB	NJ	17	1.83%	17.3.5

17.3.1 U-qualification

A total of 757 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one

severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

17.3.2 R-qualification

A total of 60 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to all aroclors in SB40IB-S-NG and various pesticides in SB01D-S-NYC (three compounds), SB23IC-S-NG (beta-BHC), SB23IH-S-NG (six compounds), SB31IG-S-NG (eight compounds), SB32ID-S-NG (11 compounds), SB32II-S-NG-R (three compounds), SB40IB-S-NG (seven compounds), and SB41IB-S-NG (five compounds). For the rejected pesticide results, all laboratory qualifier contained "P" and thus this is likely a precision issue between dual-columns. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other PEST/PCB information.

17.3.3 UJ-qualification

A total of 52 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 17.3.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

17.3.4 J-qualification

A total of 22 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

17.3.5 NJ-qualification

Seventeen results were NJ-qualified as "presumptively present at approximate quantity" by the validator. The QA/QC issue was not severe enough to warrant rejection of data. This issue likely originates from precision exceedances (between results from dual-columns). The NJ-qualification of data by the data validator does not affect the availability of data because these results are available for use as detects at the reported concentration. The data user must consider the results "presumptively present at approximate quantity".

17.4 Metals

Metals, including mercury and cyanide, were analyzed by USEPA CLP ILM05.4 using ICP-AES, ICP-MS, CVAA, and spectrophotometer. Excluding field quality control samples, 672 distinct data points were generated. When rejected results are considered, the metals data set is 97.77 percent complete (657 of 672 metals results are available for use). The validation process resulted in the following qualifiers for results in the metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-10	SO	METAL		331	49.26%	
A-10	SO	METAL	U	189	28.13%	17.4.1
A-10	SO	METAL	J	114	16.96%	17.4.2
A-10	SO	METAL	UJ	23	3.42%	17.4.3
A-10	SO	METAL	R	15	2.23%	17.4.4

17.4.1 U-qualification

A total of 189 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

17.4.2 J-qualification

A total of 114 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

17.4.3 UJ-qualification

A total of 23 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 17.4.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher.

This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

17.4.4 R-qualification

A total of 15 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to copper in D-06072010-S-NYC; D-06082010-S-NYC; SB01D-S-NYC; SB01H-S-NYC; SB02G-S-NYC; SB09C-S-NYC; SB09H-S-NYC; SB10C-S-NYC; SB10I-S-NYC; SB17C-S-NYC; SB17I-S-NYC; SB18D-S-NYC; SB18K-S-NYC; SB19C-S-NYC; and SB19L-S-NYC. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other METAL information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

17.5 Phase III PRP Split Soil Sampling PARCC

17.5.1 Precision

Results may have been qualified due to precision-related QA/QC issues such as dual-column reproducibility, field duplicate reproducibility, laboratory replicate reproducibility, and MS/MSD precision. In some extreme cases, results may have been rejected due to precision issues. In the case of results rejected due to precision issues, the sample matrix or analytical process had a negative effect on precision. In the case of results qualified (but not rejected) due to precision issues, the sample matrix or analytical process had an effect on precision, but not severe enough to affect data usability (and hence completeness). In the case of unqualified (or U-qualified) results, which represent the majority of the data, there was no effect on precision.

17.5.2 Accuracy

Results may have been qualified due to accuracy-related QA/QC issues such as spiked surrogate recovery, internal standard recovery, laboratory control sample (or laboratory control sample duplicate) recovery, or matrix spike (or matrix spike duplicate) recovery. In some extreme cases, results may have been rejected due to accuracy issues. In the case of results rejected due to accuracy issues, the sample matrix or analytical process had a negative effect on accuracy. In the case of results qualified (but not rejected) due to accuracy issues, the sample matrix or analytical process had an effect on accuracy, but not severe enough to affect data usability (and hence completeness). In the case of unqualified results, there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "nondetect"), there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "not detected at significantly greater than that in an associated blank"), there is no serious effect on accuracy (blank contamination affects the accuracy of a data point but not significantly unless the point is rejected) and the points are usable as U-qualified results.

17.5.3 Representativeness

There were no issues affecting representativeness in this data set.

17.5.4 Completeness

There were 174 R-qualified results in this dataset; therefore, the data validation process demonstrated that 96.57 percent of the results are available for use as qualified. For this data set, completeness exceeded the Phase III UFP-QAPP completeness goal of 90%. It should also be noted that VOC, PEST/PCB, and METAL fractions contained rejected data. Each fraction, considered individually, also met the 90 percent completeness goal.

17.5.5 Comparability

There were no issues affecting comparability in this data set.

17.6 "Available as Reported" v. "Available as Qualified" v. Rejected

The data quality evaluation showed that the laboratory or data validator U-qualified 70.30 percent (3571 of 5080 results) of the data. These data may be available as reported (if U-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a U-qualifier). The data quality evaluation demonstrated that 13.56 percent (689 of 5080 results) of the data are acceptable without qualification. These results are available as reported. The data quality evaluation showed that the laboratory or data validator J-qualified 9.61 percent (488 of 5080 results) of the data. These data may be available as reported (if J-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a J-qualifier). The data quality evaluation showed that the data validator R-qualified 3.43 percent (174 of 5080 results) of the data and these data are not available for use. The results may be reported (as analyzed but rejected) as long as they are accompanied by the R-qualifier and are not used. The data quality evaluation showed that the data validator UJ-qualified 2.78 percent (141 of 5080 results) of the data. These data are available as qualified. The data quality evaluation showed that the data validator NJ-qualified 0.33 percent (17 of 5080 results) of the data. These data are available as qualified.

All results, with the exception of those R-qualified as "rejected" (174 of 5080 results, 3.43 percent of total results) are available for use as qualified.

Supplement 1 to Appendix H (Data Quality Evaluation)

19 Introduction

This supplement provides the data quality evaluation (DQE) for data that became available after the main section of Appendix H was completed. The data included in this Supplement 1 are the Polychlorinated Biphenyl Congeners results for surface sediments and the results for the analyses performed on the tissue samples. The statements made in Appendix H apply to the data included in Supplement 1 unless a contrary statement is made and unless additional statistics are provided. When additional statistics are provided, they apply to data included in Supplement 1 and not to data included in Appendix H. Table 4 is similar to (a continuation of) Table 1 in Appendix H. Table 5 is similar to (a continuation of) Table 2 in Appendix H.

20. Phase III Sediment (A-5 SE)

The purpose of this data quality evaluation is to summarize the findings of the data validation and any effects it may have on the availability of the data from the Phase III Sediment sampling event at Gowanus Canal as well as to provide an assessment of data usability. Samples were collected June 17, 2010 through June 24, 2010.

20.1 Polychlorinated Biphenyl Congeners

Polychlorinated Biphenyl (PCB) Congeners were analyzed by USEPA CLP CBC01.2 . Excluding field quality control samples, 4394 distinct data points were generated. When rejected results are considered, the PCB congeners data set is 99.50 percent complete (4372 of 4394 PCB congeners results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the PCB congeners fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-5	SE	PCBCONG		3868	88.03%	
A-5	SE	PCBCONG	U	469	10.67%	20.1.1
A-5	SE	PCBCONG	J	35	0.80%	20.1.2
A-5	SE	PCBCONG	R	22	0.50%	20.1.3

20.1.1 U-qualification

A total of 469 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed

the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

20.1.2 J-qualification

A total of 35 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

20.1.3 R-qualification

A total of 22 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to various individual congeners and coelutions within D-062310-01; GC-SD308A-0.0-0.5; GC-SD309-0.0-0.5; GC-SD313-0.0-0.5; GC-SD315-0.0-0.5; GC-SD318-0.0-0.5; and GC-SD325-0.0-0.5. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other PCBCONG information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

20.1.4 CRQL v. SL Exceedances

Individual congener detections were not compared to SLs. For total PCBs (calculation), there were no nondetect results and thus comparison to SLs is not relevant. Therefore, there was no effect on data quality resulting from the proximity of contract required quantitation limits (CRQLs) to SLs.

20.2 Phase III Sediment PARCC

20.2.1 Precision

Results may have been qualified due to precision-related QA/QC issues such as dual-column reproducibility, field duplicate reproducibility, laboratory replicate reproducibility, and MS/MSD precision. In some extreme cases, results may have been rejected due to precision issues. In the case of results rejected due to precision issues, the sample matrix or analytical process had a negative effect on precision. In the case of results qualified (but not rejected) due to precision issues, the sample matrix or analytical process had an effect on precision, but not severe enough to affect data usability (and hence completeness). In the case of unqualified (or U-qualified) results, which represent the majority of the data, there was no effect on precision.

20.2.2 Accuracy

Results may have been qualified due to accuracy-related QA/QC issues such as spiked surrogate recovery, laboratory control sample (or laboratory control sample duplicate) recovery, or matrix spike (or matrix spike duplicate) recovery. In some extreme cases, results may have been rejected due to accuracy issues. In the case of results rejected due to accuracy issues, the sample matrix or analytical process had a negative effect on accuracy. In the case of results qualified (but not rejected) due to accuracy issues, the sample matrix or analytical process had an effect on accuracy, but not severe enough to affect data usability (and hence completeness). In the case of unqualified results, there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "nondetect"), there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "not detected at significantly greater than that in an associated blank"), there is no serious effect on accuracy (blank contamination affects the accuracy of a data point but not significantly unless the point is rejected) and the points are usable as U-qualified results.

20.2.3 Representativeness

There were no issues affecting representativeness in this data set.

20.2.4 Completeness

There were 22 R-qualified results in this dataset; therefore, the data validation process demonstrated that 99.50 percent of the results are available for use as qualified. For this data set, completeness exceeded the UFP-QAPP goal of 90 percent.

20.2.5 Comparability

There were no issues affecting comparability in this data set.

20.3 "Available as Reported" v. "Available as Qualified" v. Rejected

The data quality evaluation demonstrated that 88.03 percent (3868 of 4394 results) of the data are acceptable without qualification. These results are available as reported. The data quality evaluation showed that the laboratory or data validator U-qualified 10.67 percent (469 of 4394 results) of the data. These data may be available as reported (if U-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a U-qualifier). The data quality evaluation showed that the laboratory or data validator J-qualified 0.80 percent (35 of 4394 results) of the data. These data may be available as reported (if J-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a J-qualifier). The data quality evaluation showed that the data validator R-qualified 0.50 percent (22 of 4394 results) of the data and these data are not available for use. The results may be reported (as analyzed but rejected) as long as they are accompanied by the R-qualifier and are not used.

All results, with the exception of those R-qualified as "rejected" (22 of 4394 results, 0.80 percent of total results) are available for use as qualified.

21. Phase III Tissue (A-7 TA)

The purpose of this data quality evaluation is to summarize the findings of the data validation and any effects it may have on the availability of the data from the Phase III

tissue sampling event at Gowanus Canal as well as to provide an assessment of data usability.

21.1 Metals

Metals, including mercury and cyanide, were analyzed by USEPA CLP ILM05.4 using ICP-AES, CVAA, and spectrophotometer. Excluding field quality control samples, 2568 distinct data points were generated. Because there were no rejected results, the metals data set is 100 percent complete (2568 of 2568 metals results are available for use). The validation process resulted in the following qualifiers for results in the metals fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-7	TA	METAL	U	1467	57.13%	21.1.1
A-7	TA	METAL		836	32.55%	
A-7	TA	METAL	J	255	9.93%	21.1.2
A-7	TA	METAL	UJ	10	0.39%	21.1.3

21.1.1 U-qualification

A total of 1467 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

21.1.2 J-qualification

A total of 255 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

21.1.3 UJ-qualification

Ten results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank

contamination (see section 21.1.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

21.2 Polychlorinated Biphenyl Congeners

Polychlorinated Biphenyl (PCB) Congeners were analyzed by USEPA CLP CBC01.2 . Excluding field quality control samples, 18059 distinct data points were generated. When rejected results are considered, the PCB congeners data set is 99.00 percent complete (17879 of 18059 PCB congeners results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the PCB congeners fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-7	TA	PCBCONG		15064	83.42%	
A-7	TA	PCBCONG	U	2650	14.67%	21.2.1
A-7	TA	PCBCONG	R	180	1.00%	21.2.2
A-7	TA	PCBCONG	J	165	0.91%	21.2.3

21.2.1 U-qualification

A total of 2650 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

21.2.2 R-qualification

A total of 180 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to various individual congeners and coelutions within various samples (a pattern is not evident). Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other PCBCONG information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

21.2.3 J-qualification

A total of 165 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is

not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

21.3 Pesticides/PCBs

Pesticides (no Aroclors; PCBs were assessed via PCBCONG) were analyzed by USEPA CLP SOM01.2 "Soil". Excluding field quality control samples, 2226 distinct data points were generated. When rejected results are considered, the PEST/PCB data set is 93.94 percent complete (2091 of 2226 PEST/PCB results are available for use). The validation process resulted in the following qualifiers for results in the PEST/PCB fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-7	TA	PEST/PCB	U	1729	77.67%	21.3.1
A-7	TA	PEST/PCB	UJ	198	8.89%	21.3.2
A-7	TA	PEST/PCB	R	135	6.06%	21.3.3
A-7	TA	PEST/PCB		76	3.41%	
A-7	TA	PEST/PCB	NJ	48	2.16%	21.3.4
A-7	TA	PEST/PCB	J	40	1.80%	21.3.5

21.3.1 U-qualification

A total of 1729 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

21.3.2 UJ-qualification

A total of 198 results were UJ-qualified as "nondetect, estimated quantitation limit" by the validator. If the laboratory qualifier contained "U", the data validator did not change the detect status, but the UJ-qualifier may be indicative of a QA/QC problem. The QA/QC issue was not severe enough to warrant rejection of data. If the laboratory qualifier did not contain "U" then the data validator changed the detect status and this is usually due to blank contamination (see section 21.3.1, above). These results are usable as nondetects as long as the data user understands that the quantitation limit is estimated and may be higher. This does not affect the usability of results but the data user should take caution when a UJ-qualified result is greater than an action limit.

21.3.3 R-qualification

A total of 135 results were R-qualified as "rejected" by the data validator. This is indicative of a serious QA/QC exceedance and these results are not usable as detects or nondetects for any purpose. These correspond to DDD, DDE, and/or DDT (and thus "total DDTs") in 47 samples and alpha-Chlordane, gamma-Chlordane, Endrin, and/or Dieldrin in 15 samples. Although these results are not usable for any purpose, this does not affect the other non-rejected results in the same dataset. Conclusions can still be made from the data using the other PEST/PCB information. Because R-qualified results are not available for use as detects or nondetects, this reduces the percent completeness of the data set.

21.3.4 NJ-qualification

A total of 48 results were NJ-qualified as "presumptively present at approximate quantity" by the validator. The QA/QC issue was not severe enough to warrant rejection of data. This issue likely originates from precision exceedances (between results from dual-columns). The NJ-qualification of data by the data validator does not affect the availability of data because these results are available for use as detects at the reported concentration. The data user must consider the results "presumptively present at approximate quantity".

21.3.5 J-qualification

A total of 40 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

21.4 Semivolatile Organic Compounds

Semivolatiles were analyzed by USEPA CLP SOM01.2 "Low Soil by SIM". Only "Low Soil by SIM" compounds were reported. Excluding field quality control samples, 688 distinct data points were generated. Because there were no rejected results, the semivolatiles data set is 100 percent complete (688 of 688 semivolatiles results are available for use, qualified as applicable). The validation process resulted in the following qualifiers for results in the volatiles fraction:

Tracking Table	Matrix	Analysis Group	Final Qualifier	Count	Percentage	Section
A-7	TA	SVOC		453	65.84%	
A-7	TA	SVOC	U	212	30.81%	21.4.1
A-7	TA	SVOC	J	23	3.34%	21.4.2

21.4.1 U-qualification

A total of 212 results were U-qualified. If applied by the laboratory, this indicates "nondetect" and does not affect the availability of results. It does not indicate a QA/QC problem. If applied by the validator, this indicates "not detected at significantly greater than that in an associated blank". If detected at less than the CRQL, the data validation

elevated the (U-qualified) result to the CRQL. In this instance, the data validator changed the detect status from detect to nondetect. This may indicate a QA/QC issue but not one severe enough to warrant rejection of data. These results are usable as nondetects as long as the data user understands that the compound was detected in the sample and was subsequently attributed to blank contamination. Therefore, this does not affect the availability of results but the data user should take caution when a U-qualified result is greater than a screening level.

21.4.2 J-qualification

A total of 23 results were J-qualified as "estimated" by the laboratory (to indicate "below reporting limit") or by the validator (to indicate "estimated"). If the laboratory qualifier was also "J" then the laboratory qualifier was simply carried over to the final qualifier and this is not indicative of a QA/QC problem. If the laboratory qualifier did not contain "J" then this does indicate a QA/QC problem, but not one severe enough to warrant rejection. These results are usable as detects at the reported concentration as long as the data user understands that the result is estimated. This does not change the detect status and does not affect the usability of results.

21.5 Wet Chemistry

Wet Chemistry, including percent lipids, was analyzed by laboratory SOP. Excluding field quality control samples, 107 distinct data points were generated. Because there were no rejected results, the WCHEM data set is 100 percent complete (107 of 107 WCHEM results are available for use). The validation process resulted in no qualification.

21.6 Phase III Tissue PARCC

21.6.1 Precision

Results may have been qualified due to precision-related QA/QC issues such as dual-column reproducibility, field duplicate reproducibility, laboratory replicate reproducibility, and MS/MSD precision. In some extreme cases, results may have been rejected due to precision issues. In the case of results rejected due to precision issues, the sample matrix or analytical process had a negative effect on precision. In the case of results qualified (but not rejected) due to precision issues, the sample matrix or analytical process had an effect on precision, but not severe enough to affect data usability (and hence completeness). In the case of unqualified (or U-qualified) results, which represent the majority of the data, there was no effect on precision.

21.6.2 Accuracy

Results may have been qualified due to accuracy-related QA/QC issues such as spiked surrogate recovery, internal standard recovery, laboratory control sample (or laboratory control sample duplicate) recovery, or matrix spike (or matrix spike duplicate) recovery. In some extreme cases, results may have been rejected due to accuracy issues. In the case of results rejected due to accuracy issues, the sample matrix or analytical process had a negative effect on accuracy. In the case of results qualified (but not rejected) due to accuracy issues, the sample matrix or analytical process had an effect on accuracy, but not severe enough to affect data usability (and hence completeness). In the case of unqualified results, there was no effect on accuracy. In the case of U-qualified results (where the U-qualifier indicates "nondetect"), there was no effect on accuracy. In the case of U-qualified results

(where the U-qualifier indicates "not detected at significantly greater than that in an associated blank"), there is no serious effect on accuracy (blank contamination affects the accuracy of a data point but not significantly unless the point is rejected) and the points are usable as U-qualified results.

21.6.3 Representativeness

There were no issues affecting representativeness in this data set.

21.6.4 Completeness

There were 315 R-qualified results in this dataset; therefore, the data validation process demonstrated that 98.67 percent of the results are available for use as qualified. For this data set, completeness exceeded the Phase III UFP-QAPP completeness goal of 90%. It should also be noted that PCBCONG and PEST/PCB fractions contained rejected data. These fractions, considered individually, also met the 90 percent completeness goal.

21.6.5 Comparability

There were no issues affecting comparability in this data set.

21.7 "Available as Reported" v. "Available as Qualified" v. Rejected

The data quality evaluation demonstrated that 69.93 percent (16536 of 23648 results) of the data are acceptable without qualification. These results are available as reported. The data quality evaluation showed that the laboratory or data validator U-qualified 25.62 percent (6058 of 23648 results) of the data. These data may be available as reported (if U-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a U-qualifier). The data quality evaluation showed that the laboratory or data validator J-qualified 2.04 percent (483 of 23648 results) of the data. These data may be available as reported (if J-qualified by the laboratory and the data validator did not further qualify the data) or available as qualified (if the data validator applied a J-qualifier). The data quality evaluation showed that the data validator R-qualified 1.33 percent (315 of 23648 results) of the data and these data are not available for use. The results may be reported (as analyzed but rejected) as long as they are accompanied by the R-qualifier and are not used. The data quality evaluation showed that the data validator UJ-qualified 0.88 percent (208 of 23648 results) of the data. These data are available as qualified. The data quality evaluation showed that the data validator NJ-qualified 0.20 percent (408 of 23648 results) of the data. These data are available as qualified.

All results, with the exception of those R-qualified as "rejected" (315 of 23648 results, 1.33 percent of total results) are available for use as qualified.

Notes on Appendix I Tables

Note that the letters designating the screening values that are exceeded are marked in parenthesis after the results. The list of screening values and the prioritization scheme can be found in Tables 4-2 and 4-3, respectively. Appendix C contains the detailed list of values.

The letters designating the screening values for each media are also presented below for ease of reference:

Medium	Evaluation Criteria		
	Human Health Risk	Ecological Risk	General
Sediment - surface in canal	A	R	
Sediment – CSOs	A	R	
Sediment – subsurface soft	A	R	
Sediment – subsurface native	A	R	
Surface water in canal - dry and wet events	T	S	
Surface water – CSOs	T	S	
Surface water - pipe outfalls	T	S	
Tissue	M	U, V, W, X, Y, Z	
Groundwater			N1, O1,O2
Soil			Q
Air	P		

1. For surface sediment, surface water, soft and native sediment, and air, the samples are listed based on their distance from the head of the canal. For the remaining media, the samples are listed in chronological order based on their number.
2. The list of analytes is based on the target list identified in the QAPPs developed for the project.
3. Two sets of tables are provided – first set includes all results. Second set only lists detected concentrations and highlights the concentrations that exceed standards / criteria.
4. Exceedance of one standard / criteria is bolded. Exceedance of two standards / criteria is enclosed in a rectangle. The criteria that are exceeded are noted in parenthesis after the result.
5. Blank means that the compound was not detected.
6. "- -" in the results means that a result was not available.
7. "- -" in the total concentrations means that a total value was not calculated. Total concentrations were not calculated for locations where one of the results that needed to be included in the total is rejected.
8. "*" Asterisk denotes that compound does not have a screening value.
9. For soil sampling locations where multiple samples were collected at the same interval, the VOC sample depth is shown to differentiate between the two samples.
10. The following results were not available at the time of preparation of this draft RI report:
    a. Surface water dry weather sampling – the cyanide results for eight locations, seven of which are reference locations (322, 326, 327, 328, 329, 330, 333, and 336).
11. The following abbreviations appear in the Appendix I data tables:
    a. N-Normal sample
    b. FD-Field duplicate
    c. S-Split
    d. ND – not detected, generally used to populate fields for summed values where constituent compounds were all below detection limit
    e. mg/kg – milligrams/kilogram

f. µg/kg – micrograms/kilogram
g. mg/l – milligrams/liter
h. µg/l – micrograms/liter
i. µg/m3 – micrograms/cubic meter

12. Data qualifiers used include:
    a. J – Concentration estimated.
    b. NJ - Qualitative identification questionable due to poor resolution. Presumptively present at approximate quantity.
    c. R – Rejected.
    d. U – detected. May also indicate "not detected at significantly greater than that in an associated blank".
    e. UJ - Not detected, quantitation limit is estimated.
    f. [null] – Detected.
