Re: Ringwood Mines/Landfill Superfund Site
Annual Groundwater and Surface Water Sampling

Dear Mr. Gowers:

Cornerstone Engineering Group, LLC, on behalf of Ford Motor Company (Ford), completed the annual sampling event for groundwater, mine water, and surface water at the above referenced Site. The sampling was performed during the period from August 4 through August 25, 2015, with the measurement of water levels at available monitoring wells completed prior to sampling on August 3, 2015. This letter report presents the results of the annual sampling program.

Sample Collection and Analyses

Groundwater samples were collected using the low-flow sampling methodology, consistent with previously approved and implemented practices, and field sampling data sheets are attached for reference (Attachment B). As documented during previous

sampling events, several of the bedrock wells exhibit poor recharge rates resulting in very low purge rates and in some cases, inadequate volume for the collection of the full suite of parameters. To maximize sample volume, optimized purge rates established during prior sampling events were used. Also, per approval from USEPA, some locations required the collection of samples over a 24 hour period for collection of sufficient volume, and/or the volume collected was dedicated to a prioritized list of analytes. Details regarding purge rates, sampling times and the locations at which inadequate sample volume prohibited the analysis for the full suite of parameters, and which parameters were analyzed, are provided in Table 3. Field data sheets are in Attachment B.

Groundwater and surface water samples were sent under chain of custody to Test America Laboratories for analysis of Target Analyte List (TAL) inorganic compounds, Target Compound List (TCL) organic compounds (plus tentatively identified compounds (TICs)) and wet chemistry. Samples were not analyzed for pesticides based on prior approval from the USEPA dated April 2, 2007. The samples were analyzed at the laboratory using the following SW-846 methodology:

- Volatile Organics + 15 TICs – USEPA Method 8260B
- Semi-Volatile Organics + 15 TICs – USEPA Method 8270C
- Metals (total and dissolved)– USEPA Methods 6010B/7470A
- PCBs – USEPA Methods 8082
- Alkalinity, total (as CaCO3) – USEPA Method SM20 2320B
- Chloride – USEPA Methods 300/9056
- Sulfate – USEPA Methods 300/9056

Samples were analyzed for the full suite of parameters above unless otherwise noted in Table 3, and as described above relating to inadequate sample volume.

Laboratory results for the sample delivery groups (SDGs) generated during this sampling event were validated (level 4 validation) by Cadena Inc. Copies of the laboratory and data validation reports are provided in Attachments C and D, respectively.

Additionally, USEPA split samples collected from monitoring well locations OB-19, OB-20A, OB-06, RW-06, RW-6A and SC-01 for analysis of the same parameters referenced above and the USEPA data report is provided in Attachment E, for reference. USEPA field sample ID SC-11 is a blind duplicate of sample ID SC-01, as verified with the USEPA.

Groundwater Elevation Data

As noted previously, a synoptic round of water levels at the groundwater monitoring wells was conducted on August 3, 2015, prior to sampling. Groundwater elevation data from this round of water level measurements are presented on Figures 2 through 6 (Attachment A, Figures). These figures present groundwater contours as follows:

- Figure 2 – Peters Mine Pit area overburden groundwater
- Figure 3 – Peters Mine Pit area shallow bedrock groundwater
- Figure 4 – O'Connor Disposal Area overburden groundwater
- Figure 5 – Cannon Mine Pit area shallow bedrock groundwater
- Figure 6 – Cannon Mine Pit area deep bedrock groundwater

This groundwater mapping is consistent with the findings of the Site-Related Groundwater Remedial Investigation (RI) as outlined in the RI Report dated January 2015.

Analytical Data

Results of the annual sampling event are summarized in the tables identified below. Analytical data are organized by providing summary tables of detected parameters (i.e., only those locations and parameters for which there were detected constituents), followed by tabulation of the complete data sets (i.e., all locations and parameters). A table of historic and current benzene, arsenic and lead concentrations is also provided for consistency with Table 13 from the Site-Related Groundwater RI Report, prepared by Arcadis, dated January 2015 for ease of comparison of historical and current data for these parameters. Last, the data have been organized by Land Area of Concern (Peters Mine Pit PMP), O'Connor Disposal Area (OCDA), Cannon Mine Pit (CMP)), Sally's Pond area, surface water, mine structures, and quality control data. More specifically, the full suite of tables prepared to summarize the data and following this letter report include:

Results Summary

The results of the annual sampling event are summarized in the sections that follow organized by Land Area of Concern (AOC), Sally's Pond area, surface water, mine structures, and quality control data. As a consequence of changes/updates to the Target Compound List (TCL) of analytes, this annual sampling event is the first comprehensive monitoring event at the Site in which 1,4-dioxane is reported as a volatile organic compound (VOC), reported concentrations of which, are also discussed below.

Peters Mine Pit AOC - Groundwater

- The only volatile organic compounds (VOCs) detected above their respective New Jersey Groundwater Quality Standards (NJGWQS) are benzene, 1,4-dioxane (interim specific standard), and chloroethane (See Table 5A). The detections of benzene and chloroethane were at generally low levels consistent with historical concentrations. As noted above, this is the first comprehensive monitoring event for which 1,4-dioxane was reported as a volatile organic compound, as a consequence of changes/updates to the Target Compound List (TCL) of analytes. Therefore, there is not an historical data set for 1,4-dioxane for comparison. VOC TICs were also reported at various well locations at low levels, mostly "J" qualified (i.e., estimated values), and similar to historical concentrations. To facilitate review of the VOC data, Figures 7 and 8 (see Attachment A) present the benzene and 1,4-dioxane data superimposed on the overburden and shallow bedrock groundwater contour maps.

- Semi-volatile organic compounds (SVOCs) were detected only sporadically, at low levels, and none were detected above NJGWQS. SVOC TICs were also reported at various well locations at low levels, mostly "J" qualified, and similar to historical concentrations (See Table 5B).

- Total PCBs were originally reported in groundwater at two well locations (RW-4A and RW-5A). Given that PCBs have never been detected as part of previous groundwater sampling events, the reported concentrations were suspected errors and the samples were reanalyzed within holding times. The reanalysis did not

detect PCBs, which is consistent with historical data and confirms that the original results are not representative (see Table 5F).

- Analyses were performed for both total (unfiltered) and dissolved (filtered) metals. The only metals detected above their respective NJGWQS are aluminum, arsenic, iron, manganese, nickel, lead, and sodium. The results for these metals are shown in Table 5C and summarized as follows:

    - Aluminum was detected above its NJGWQS in several bedrock and overburden wells and in total and filtered samples, with fewer detections in filtered samples. Aluminum is naturally occurring and an abundant secondary metal in the soil/groundwater system at the Site.
    - Total arsenic was reported above its NJGWQS in only four samples out of 28. For six additional samples, total arsenic was reported above the NJGWQS, but was qualified as also detected in the associated method blank and therefore considered non detect at the reported concentration (see data validation report, Attachment D). Dissolved arsenic was reported above its NJGWQS in only two samples out of 28, and not otherwise qualified as detected in the associated blank.
    - Iron and manganese were reported above their respective NJGWQS in a number of samples, in both the total and dissolved (filtered samples) forms. Iron and manganese are naturally occurring and prevalent in the aquifers at the Site (both overburden and bedrock).
    - Total lead was reported in two samples above its NJGWQS, and none of the dissolved (filtered) lead concentrations were above the NJGWQS. This indicates that lead, where reported, was primarily associated with particulates in the groundwater samples.
    - Sodium was reported above its NJGWQS in seven of the total of 28 samples and is a commonly occurring secondary metal.

- As shown in Table 5C, of the wet chemistry parameters, only chloride and sulfate were reported above their NJGWQS and in only one sample each out of the total of 28 samples. Again, these are naturally occurring and common analytes.

O'Connor Disposal Area AOC - Groundwater

- The only VOC reported above its respective NJGWQS is 1,4-dioxane (interim specific standard) in only one sample (overburden well OB-17) out of a total of seven. The reported concentration was only slightly above the 10 ug/L interim

specific NJGWQS. VOC TICs were not detected (See Table 6A). Figure 9 presents the 1,4-dioxane data superimposed on the overburden groundwater contour map for this area. Consistent with the historic database, benzene was not detected at any of the OCDA well locations as also shown on Figure 9.

- As shown in Table 6A, consistent with the historic database, no SVOCs were detected in any groundwater sample and only two SVOC TICs were detected at low levels.

- As shown in Table 6A, no PCBs were detected in any of the samples.

- Analyses were performed for both total (unfiltered) and dissolved (filtered) metals. The only metals reported above their respective NJGWQS are aluminum, arsenic, iron, and manganese (See Table 6B). The results for these metals are summarized as follows:

    - Total aluminum was reported above its NJGWQS in two samples out of the total of seven; however, the dissolved aluminum results were all below the NJGWQS for this naturally occurring secondary metal.
    - Total arsenic was reported above its NJGWQS in three of the seven groundwater samples. Dissolved arsenic was not detected above its NJGWQS in any of the groundwater samples.
    - Iron and manganese were reported above their respective NJGWQS in a number of samples, both total and dissolved results. Iron and manganese are naturally occurring and prevalent in the aquifers (both overburden and bedrock) at this Site.

- As shown in Table 6B, of the wet chemistry parameters, there were no detections above the NJGWQS.

Cannon Mine Pit AOC – Groundwater

- VOCs were not detected above their respective NJGWQS in any of the 12 groundwater samples. VOC TICs were reported at various well locations at low levels, mostly "J" qualified, and similar to historical concentrations (See Table 7A). Only trace levels of benzene and 1,4-dioxane were reported sporadically at very low levels that are "J" qualified and below the interim specific NJGWQS as shown on Table 7A and in Figures 10 and 11.

- As shown in Table 7B, SVOCs were reported only sporadically, at low levels, and only bis(2-ethylhexyl)phthalate was detected above its respective NJGWQS, but was also qualified as detected in the associated method blank and therefore considered non detect at the reported concentration (see data validation report, Attachment D). SVOC TICs were also reported at various well locations at low levels, all were "J" qualified, and similar to historical concentrations.

- As shown in Table 7B, no PCBs were detected in any of the groundwater samples.

- Analyses were performed for both total (unfiltered) and dissolved (filtered) metals. The only metals reported above their respective NJGWQS are aluminum, arsenic, iron, manganese, and sodium (See Table 7C). The results for these metals are summarized as follows:

    - Aluminum was reported nominally above the NJGWQS in only one sample of the total of 12, both for the total and filtered samples, for this common, naturally occurring secondary metal.
    - Arsenic was reported nominally above its NJGWQS in groundwater at five of the 12 bedrock well locations in both the total and dissolved forms and the results at several sample locations were also qualified as detected in the associated method blank and therefore considered non-detect at the reported concentration (see data validation report, Attachment D).
    - Iron and manganese were reported above their respective NJGWQS in a number of samples, both total and dissolved results. Iron and manganese are naturally occurring and prevalent in the aquifers (both overburden and bedrock) at the Site.
    - Sodium was reported above the NJGWQS in up to seven of the 12 groundwater samples, both in the total and dissolved forms.

- As shown in Table 7C, of the wet chemistry parameters, only chloride was detected in one sample above the NJGWQS out of the total of 12 samples.

Sally's Pond Area – Groundwater

- VOCs were not detected above their respective NJGWQS in any of the four samples tested. VOC TICs were reported at two well locations at low levels, and the results were both "J" qualified (See Table 8A).

- As shown in Table 8A, the only SVOC detected is phenol at a low, "J" qualified level, and below its NJGWQS. SVOC TICs were reported at three well locations at low levels, and all results were "J" qualified.

- As shown in Table 8A, no PCBs were detected in any of the samples.

- Analyses were performed for both total (unfiltered) and (filtered) dissolved metals. The only metals detected above their respective NJGWQS are aluminum, arsenic, iron, manganese, and sodium (See Table 8B). The results for these metals are summarized as follows:

    - Aluminum was reported slightly above its NJGWQS in three samples of the total of four, both in the total and dissolved forms. Two of the total aluminum results were qualified as also detected in the associated method blank and therefore considered non-detect at the reported concentration (see data validation report, Attachment D).

    - Arsenic was reported slightly above its NJGWQS in groundwater at three well locations in both the total and filtered results. One of the samples was qualified as detected in the associated method blank and therefore considered non-detect at the reported concentration (see data validation report, Attachment D).

    - Iron was reported above its NJGWQS in groundwater at two well locations, one total and one dissolved result. Iron is naturally occurring and prevalent in the aquifers (both overburden and bedrock) at the Site.

    - Sodium was reported above its NJGWQS in groundwater at three well locations, in the total and filtered samples.

- As shown in Table 8B, of the wet chemistry parameters, only sulfate was reported in one sample nominally above the NJGWQS.

Overall the analytical results for the collective August 2015 groundwater analytical results are consistent with historical data, and continue to demonstrate only sporadic, low-level, and localized site-related constituents and various naturally occurring inorganics in groundwater at the Site. As noted above, this annual sampling event is the first comprehensive event in which 1,4-dioxane is reported as a VOC constituent. 1,4-dioxane was reported sporadically in groundwater and surface water generally at low levels and primarily in the area surrounding PMP. Since this is the first comprehensive

data set for 1,4-dioxane, additional monitoring will be conducted as necessary to evaluate the data and prior to making any conclusions.

As previously discussed, additional groundwater, mine water, and surface water monitoring, which will include 1,4-dioxane, will be conducted in the PMP Area and will be included in the proposed work plan for installation of additional monitoring wells in the PMP Area.

Mine Water

- Seven samples of mine water were collected for analyses; three different depth intervals in the PMP Air Shaft (50, 180, and 230 feet) and at four from different depth intervals in the CM Mine Shaft (50, 100, 160, and 275 ft).

- As shown in Table 9A and Figure 8, the only VOCs reported in mine water above their respective NJGWQS were in the Peters Mine shaft at the 180' and 230' depth intervals, and the compounds detected (above NJGWQS) include benzene, 1,4-dioxane (above the interim specific standard), and chloroethane. The reported benzene and chloroethane concentrations were generally low and consistent with historical concentrations. As previously noted, there is not an historical database for 1,4-dioxane. VOC TICs were also reported within the 180' and 230' depth intervals in the PMP Air shaft at low levels, mostly "J" qualified, which is similar to historical concentrations.

- As shown in Table 9A and on Figure 11, the only VOC reported at trace concentrations below the NJGWQS (interim specific) in the CMP Shaft is 1,4-dioxane at "J" qualified levels of 0.47J and 0.54J at the 100 and 160 ft. depth interval. Benzene was not detected in any of the four samples.

- As shown in Table 9A, no SVOCs were detected above NJGWQS in the PMP Air Shaft or CMP Shaft mine water. SVOC TICs were also sporadically reported in both mine shafts, and at low, "J" qualified levels.

- As shown in Table 9A, no PCBs were detected in any of the PMP Air Shaft or CMP Shaft mine water samples.

- Analyses were performed for both total (unfiltered) and dissolved (filtered) metals. The metals reported above their respective NJGWQS are arsenic, cadmium, iron, manganese, lead, sodium and zinc (See Table 9B). The results for these metals are summarized as follows:

- Dissolved arsenic was reported nominally above its NJGWQS in one sample from the 275′ depth interval in the CMP Shaft, and was also qualified as detected in the associated method blank and therefore considered non-detect at the reported concentration (see data validation report, Attachment D).

- Cadmium was reported slightly above its NJGWQS in the 275′ depth interval in the CMP Shaft.

- Total iron was reported above its NJGWQS in all the mine water samples, but only one sample (CMP Shaft 50′ depth interval) for dissolved iron was reported above its NJGWQS indicating that, in the majority of samples, iron is predominantly associated with particulates in the samples.

- Manganese was reported above its NJGWQS in both total and dissolved forms in each sample except at the PMP Air Shaft 50′ depth interval. Iron and manganese are naturally occurring and prevalent in the aquifers (both overburden and bedrock) at the Site.

- Lead was reported in the total form above its NJGWQS in two mine water samples from the CMP Shaft and two samples from the PMP Air Shaft, and none of the dissolved lead concentrations were above the NJGWQS indicating lead is predominantly associated with particulates in the samples.

- Sodium was reported above its NJGWQS in each of the CMP Shaft mine water samples.

- Zinc was reported above its NJGWQS in the 160′ and 275′ depth intervals in the CMP Shaft mine water samples and at the 180′ and 230′ depth intervals in the PMP Air Shaft, for both the total (four samples) and dissolved (three samples) forms.

- As shown in Table 9B, there were no wet chemistry parameters above their respective NJGWQS.

Surface Water

- As shown in Figure 1, surface water samples were collected from Park Brook, Peters Mine Brook, North Brook and the SR-3 seeps as part of the 2015 annual monitoring event.
- As shown in Table 10A, of the 18 surface water samples collected, the only VOC reported slightly above its New Jersey Surface Water Quality Standard (NJSWQS) was benzene in two samples (specifically, the SR-3 Seeps 1 and 2), and the values were both "J" qualified. Several other VOCs, including a trace of 1,4-dioxane at Park Brook locations SW-PAB-01A and SW-PAB-02, were reported at low, "J" qualified levels, and are constituents for which there is no quantitative NJSWQS. Consistent with historic data, no VOC TICs were detected in any of the samples. The benzene and 1,4-dioxane data for the surface water samples are shown on Figures 7, 9 and 10, respectively.

- As shown in Table 10A, no SVOCs were detected above the NJSWQS. SVOC TICs were sporadically reported in various surface water sampling locations but at low, "J" qualified levels.

- As shown in Table 10A, no PCBs were detected in any of the surface water samples.

- As shown in Table 10B, arsenic was reported in both the total and dissolved forms above its NJSWQS; however, these results were all low level and "J" qualified values and, in some instances, were further qualified as also detected in the associated method blank and therefore considered non-detect at the reported concentration (see data validation report, Attachment D).

- As also shown in Table 10B, thallium was reported above its NJSWQS at low, "J" qualified levels in both the total and dissolved forms, at three locations along the Park Brook.

- As also shown in Table 10B, chloride was reported in one surface water sample above its NJSWQS.

Overall, the collective surface water data do not indicate any significant impacts from the Site.

Quality Control Samples

Field and trip blanks were collected in accordance with the established protocols for quality assurance purposes. Tables 11A – 11D summarize the Groundwater/Surface Water Quality Control Sample Data and Table 12 summarizes the Data Validation Qualifiers. As shown in Tables 11A-11D, the trip blanks did not indicate any cross contamination of VOCs. Only acetone was detected in the trip blanks at low levels and this is a common laboratory contaminant. The field blanks similarly did not indicate cross contamination and supported the adequate decontamination of sampling equipment between sampling locations.

The data validation prepared by Cadena further supports the quality of the data. None of the data were rejected.

Table 12
CADENA Data Validation Qualifiers
August 2015

Validation Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
J-	The result is an estimated quantity, but the result may be biased low.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Narrative

CASE NARRATIVE

Client: Cornerstone Environmental Group, LLC

Project: FORD Ringwood Mines E203361

Report Number: 490-84420-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Nashville attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 8/6/2015 8:50 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 0.8º C and 1.3º C.

Narrative

CASE NARRATIVE

Client: Cornerstone Environmental Group, LLC

Project: FORD Ringwood Mines E203361

Report Number: 490-84595-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Nashville attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Narrative

CASE NARRATIVE

Client: Cornerstone Environmental Group, LLC

Project: FORD Ringwood Mines E203361

Report Number: 490-84924-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Nashville attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

Narrative

CASE NARRATIVE

Client: Cornerstone Environmental Group, LLC

Project: FORD Ringwood Mines E203361

Report Number: 490-85153-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Nashville attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

Narrative

CASE NARRATIVE

Client: Cornerstone Environmental Group, LLC

Project: FORD Ringwood Mines E203361

Report Number: 490-85229-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica Nashville attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were analyzed on 08/26/2015.

Toluene was detected in method blank MB 490-276265/7 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.
