Re: Ringwood Mines/Landfill Superfund Site
Annual Groundwater, Mine Water, and Surface Water Sampling - 2016

Dear Mr. Gowers:

Cornerstone Engineering Group, LLC, on behalf of Ford Motor Company (Ford), completed the 2016 Annual Sampling Event for groundwater, mine water, and surface water at the above referenced Site which includes sampling within all three land Areas of Concern (AC). In addition, in accordance with the Supplement to the Annual Sampling Program letter from Cornerstone to the USEPA dated August 1, 2016, during the Annual Sampling Event, samples were also collected for compound-specific isotope analysis for 1,4-dioxane. The sampling was performed during the period August 15 through August 30, 2016, with the synoptic measurement of water levels at accessible monitoring wells completed prior to sampling on August 12, 2016. This letter report presents the results of the 2016 Annual Sampling Event and includes a limited evaluation of compound-specific Isotope analysis for 1,4-dioxane.

Groundwater monitoring well, mine structure, and surface water sampling locations are illustrated on Figure 1 (see Attachment A, Figures). In addition, groundwater monitoring

well construction details are provided in Table 1 and water level measurements are provided in Table 2.

Sample Collection and Analyses

Groundwater samples were collected using the low-flow sampling methodology, consistent with previously approved and implemented practices, and field sampling data sheets are attached for reference (see Attachment B). As documented during previous sampling events, several of the bedrock wells exhibited poor recharge resulting in very low purge rates and, in some cases, inadequate volume for the collection of the full suite of parameters. To maximize sample volume, optimized purge rates established during prior sampling events were used. Also, per approval from USEPA, some locations required the collection of samples over a 24 hour period for collection of sufficient volume, and/or the volume collected was dedicated to a prioritized list of analytes. Details regarding purge rates, sampling times, and the locations at which inadequate sample volume prohibited the analysis for the full suite of parameters (and, in this event, which parameters were analyzed) are provided in Table 3. Field data sheets are provided in Attachment B.

Groundwater and surface water samples were sent under chain of custody to Test America Laboratories for analysis of Target Analyte List (TAL) inorganic compounds, Target Compound List (TCL) organic compounds (plus tentatively identified compounds (TICs)) and wet chemistry. Samples were also sent to Alpha Analytical (Alpha) for analysis of 1,4-dioxane. In addition, samples from four selected locations (RW-3DD, RW-11D, PMP-AS-180 and PMP-AS-230) were sent to Pace Analytical (Pace) for analysis of both 1,4-dioxane and 1,4-dioxane carbon isotopes as outlined in the Supplement to the Annual Sampling Program letter (August 1, 2016). Samples were not analyzed for pesticides based on prior approval from the USEPA dated April 2, 2007.

All samples were analyzed using the following methodology:

- Volatile Organics + 15 TICs – USEPA Method 8260B
- Semi-Volatile Organics + 15 TICs – USEPA Method 8270C
- 1,4-dioxane - USEPA Method 8270D SIM with Isotope Dilution(Alpha only)
- 1,4-dioxane - USEPA Method 522 (Pace only)
- 1,4-dioxane carbon isotope - AM24 (Pace Lab only)
- Metals (total and dissolved)– USEPA Methods 6010B/7470A
- PCBs – USEPA Methods 8082
- Alkalinity, total (as CaCO3) – USEPA Method SM20 2320B

- Chloride – USEPA Methods 300/9056
- Sulfate – USEPA Methods 300/9056

Samples were analyzed for the full suite of parameters above unless otherwise noted in Table 3, and as described above relating to inadequate sample volume.

Laboratory results for the sample delivery groups (SDGs) generated by Test America and Alpha during this sampling event were validated (level 4 validation) by Cadena Inc. Copies of the laboratory and data validation reports are provided in Attachments C and D, respectively.

Groundwater Elevation Data

A synoptic round of water levels at the groundwater monitoring wells was conducted on August 12, 2016, prior to sampling. Groundwater elevation data from this round of water level measurements are presented on Figures 2 through 6 (Attachment A, Figures). These figures present groundwater contours as follows:

- Figure 2 – Peters Mine Pit (PMP) Area overburden groundwater
- Figure 3 – PMP Area shallow bedrock groundwater
- Figure 4 – O'Connor Disposal Area (OCDA) overburden groundwater
- Figure 5 – Cannon Mine Pit (CMP) Area shallow bedrock groundwater
- Figure 6 – CMP Area deep bedrock groundwater

As shown in Figures 2 and 4, the groundwater flow gradient in the overburden is generally to the south-southeast from the PMP Area towards the OCDA. As shown in Figure 3, the groundwater flow gradient in the shallow bedrock in the PMP Area is generally to the southeast. The groundwater flow gradient in the shallow and deep bedrock in the CMP Area is primarily from the bedrock ridge towards the southeast with a component of flow to the southwest as shown in Figures 5 and 6. The flow gradients in each of the three land ACs is consistent with the findings of the Site-Related Groundwater Remedial Investigation (RI) as outlined in the RI Report dated January 2015.

Analytical Data

The results of the 2016 Annual Sampling Event are summarized in the tables identified below. Analytical data are organized by providing summary tables of detected parameters (i.e., only those locations and parameters for which there were detected constituents), followed by tabulation of the complete data sets (i.e., all locations and

parameters). Note that Tables 13A and 13B summarize the current and historic (2004-2016) benzene, 1,4-dioxance, chloroethane, arsenic, and lead concentrations in groundwater and the same data for the mine structures, respectively. These tables are provided for consistency with Table 13 from the Site-Related Groundwater RI Report dated January 2015 for ease of comparison of historical and current data for these parameters. Last, the data have been organized by Land Area of Concern (AOC) Peters Mine Pit (PMP), O'Connor Disposal Area (OCDA), Cannon Mine Pit (CMP), Sally's Pond area, surface water, mine structures, and quality control data. More specifically, the full suite of tables prepared to summarize the data and following this letter report include:

Results Summary

The results of the annual sampling event are summarized in the sections that follow organized by AOC, Sally's Pond area, surface water, mine structures, and quality control data.

Peters Mine Pit AOC - Groundwater

- The only volatile organic compound (VOC) detected above its respective New Jersey Groundwater Quality Standard (NJGWQS) is benzene and the only VOC detected above its New Jersey Interim Generic Groundwater Quality Criterion (NJIGGWQC) is chloroethane (See Table 5A). The detections of benzene and chloroethane were at generally low levels consistent with historical concentrations. VOC TICs were also reported at various well locations at low levels, mostly "J" qualified (i.e., estimated values), and similar to historical concentrations. To facilitate review of the VOC data, Figures 7 and 8 (see

Attachment A) present the benzene and 1,4-dioxane data (discussed below) superimposed on the overburden and shallow bedrock groundwater contour maps. As a point of reference for chloroethane, the USEPA Regional Screening Level for tap water for this compound is 21,000 micrograms per liter (ug/L) compared to the NJIGGWQC of 5 ug/L. The highest reported concentration for chloroethane during this sampling round was 61 ug/L at OB-27. Therefore, chloroethane concentrations were not added to the figures to help maintain clarity.

- With the exception of 1,4-dioxane, semi-volatile organic compounds (SVOCs) were detected only sporadically, at low levels, and none were detected above NJGWQS. SVOC TICs were also reported sporadically at low, "J" qualified levels, and similar to historical concentrations (See Table 5B). 1,4-dioxane was reported above its NJISGWQC of 0.4 ug/L in 17 samples as shown in Table 5B and as illustrated on Figures 7 and 8. Consistent with recent sampling results, the reported concentrations are generally low at less than 10 ug/L with a few exceptions as follows:

    - A higher concentration was reported at well RW-11D (73.4 ug/l), which is greater than previously reported concentrations of 26J and 17.9 ug/L but within the same order of magnitude.

    - At well RW-3DD a concentration of 152 ug/L was reported which is higher than the historically reported concentrations of 20 and 8.95 ug/L at this bedrock well location.

    - Note that samples from wells RW-11D and RW-3DD are locations for which samples were also submitted to Pace Analytical for 1,4-dioxane carbon isotope analysis, which is discussed further below. As a part of this analysis, Pace also analyzed for 1,4-dioxane via Method 522 and reported 1,4-dioxane concentrations for RW-11D and RW-3DD of 54.4 and 20.9 ug/L, respectively.

    - Given the discrepancy between the reported 1,4-dioxane concentrations for the RW-3DD sample, a decision was made to re-analyze an unopened second sample bottle from RW-3DD, provided it would be analyzed within no more than two times the specified holding time. Since it was within this range, Alpha analyzed the second sample bottle and the result was 29.2 ug/L. While no specific reason was found to invalidate the reported value of 152 ug/L, the collective data suggest that this value is not representative. However, all three of the reported concentrations are presented in the tables

and figures and groundwater quality at this well location will be verified as the Site-wide monitoring program continues.

- No PCBs were detected in any of the groundwater samples (see Table 5F).

- Analyses were performed for both total (unfiltered) and dissolved (filtered) metals. The only metals detected above their respective NJGWQS are aluminum, arsenic, iron, manganese, and sodium. The results for these metals are shown in Table 5C and summarized as follows:

    - Aluminum was detected above its NJGWQS in several bedrock and overburden wells and in total and filtered samples, with fewer detections in filtered samples. Aluminum is naturally occurring and an abundant secondary metal in the soil/groundwater system at the Site.
    - Total arsenic was reported above its NJGWQS in ten samples, while dissolved arsenic was reported in four samples at concentrations consistent with historical levels.
    - Iron and manganese were reported above their respective NJGWQS in a number of samples, in both the total and dissolved (filtered samples) forms. Iron and manganese are naturally occurring and prevalent in the aquifers at the Site (both overburden and bedrock).
    - Sodium was reported above its NJGWQS in both total and dissolved forms in six samples and in dissolved form in one additional sample. Sodium is a commonly occurring secondary metal.

- As shown in Table 5C, of the wet chemistry parameters, chloride and sulfate were reported above their NJGWQS and in only one sample each. Again, these are naturally occurring and common analytes.

O'Connor Disposal Area AOC - Groundwater

- There were no VOCs reported above their respective NJGWQS and VOC TICs were not detected (See Table 6A).

- As shown in Table 6A, and consistent with the historic database, no SVOCs were detected in any groundwater sample above NJGWQS and no SVOC TICs were detected during this sampling event. As also shown in Table 6A and Figure 9, 1,4-dioxane was reported above the NJISGWQC at one location, well OB-17, at a concentration that is consistent with the results of the 2015 annual sampling event.

The data indicates that this is a very localized occurrence based on the absence of 1,4-dioxane at similar concentrations elsewhere in the OCDA.

- A trace of 1,4-dioxane below the 0.4 ug/L NJISGWQC was also reported at well OB-14B which is also consistent with previous results.

- As shown in Table 6A, no PCBs were detected in any of the samples.

- Analyses were performed for both total (unfiltered) and dissolved (filtered) metals. The only metals reported above their respective NJGWQS are aluminum, arsenic, iron, and manganese (See Table 6B). The results for these metals are summarized as follows:

    - Total aluminum was reported above its NJGWQS in two samples; however, the dissolved aluminum results were all below the NJGWQS for this naturally occurring secondary metal.
    - Total arsenic was reported above its NJGWQS in one sample. Dissolved arsenic was not detected above its NJGWQS in any of the groundwater samples indicating that the total arsenic concentration is associated with particulates in the groundwater sample.
    - Iron and manganese were reported above their respective NJGWQS in a number of samples, both total and dissolved results. Iron and manganese are naturally occurring and prevalent in the aquifers (both overburden and bedrock) at this Site.

- As also shown in Table 6B, of the wet chemistry parameters, there were no detections above the NJGWQS.

Cannon Mine Pit AOC – Groundwater

- As shown in Table 7A and Figures 10 and 11, VOCs are reported sporadically, typically at low "J" qualified concentrations, with only benzene reported above its NJGWQS (1 ug/L) in one sample (RW-8(204-214)) at a concentration of 3.8 ug/L. A single VOC TIC was reported in one sample at a low, "J" qualified, concentration (See Table 7A).

  As shown in Table 7B, SVOCs were reported only sporadically, at low levels, with no compounds reported above NJGWQS. Two SVOC TICs were also reported at "J" qualified concentrations, similar to historical records. As also shown in Table 7B and Figures 10 and 11, 1,4-dioxane was reported above the interim NJISGWQC

of 0.4 ug/L in two samples collected at depth from wells RW-2(279-289) and RW-2(452-462).

- As also shown in Table 7B, PCBs were reported at one well location, well RW-2 (452-462) at a concentration of 0.77 ug/L which is slightly above the NJGWQS of 0.5 ug/L. PCBs have not been historically detected and these data are inconsistent with historical data.

- Analyses were performed for both total (unfiltered) and dissolved (filtered) metals. The only metals reported above their respective NJGWQS are arsenic, iron, manganese, and sodium (See Table 7C). The results for these metals are summarized as follows:

    - Arsenic was reported above its NJGWQS in five bedrock well locations in both the total and dissolved forms at concentrations consistent with historical results. Arsenic is naturally occurring and prevalent within the bedrock formations and mine tailings at the Site.

    - Iron and manganese were reported above their respective NJGWQS in a number of samples, both total and dissolved results. Iron and manganese are naturally occurring and prevalent in the aquifers (both overburden and bedrock) at the Site.
    - Sodium was reported above the NJGWQS in up to six groundwater samples, both in the total and dissolved forms.

- As shown in Table 7C, of the wet chemistry parameters, chloride was detected in one sample and sulfate was detected in three samples above their respective NJGWQS.

Sally's Pond Area – Groundwater

- As shown in Table 8A, there were no VOCs or SVOCs reported above their respective NJGWQS in any of the four groundwater sampling locations; wells OB-10, OB-29, RW-12 (55-65) and RW-12 (130-140). In addition, there were no VOC or SVOC TICs reported in any of the groundwater samples at these well locations. As also shown in Table 8A, 1,4-dioxane was not reported above the NJISGWQC of 0.4 ug/L in any of these four groundwater samples..

- As also shown in Table 8A, no PCBs were detected above NJGWQS in any of the samples.

- Analyses were performed for both total (unfiltered) and (filtered) dissolved metals. The only metals detected above their respective NJGWQS are aluminum, arsenic, iron, and sodium (See Table 8B). The results for these metals are summarized as follows:

    - Total aluminum was reported above its NJGWQS in one sample and in the total and dissolved forms in a second sample.

    - Arsenic was reported above its NJGWQS in groundwater at two well locations in both the total and filtered results. Arsenic is naturally occurring and prevalent within the bedrock formations and mine tailings at the Site.

    - Total iron was reported above its NJGWQS in groundwater at two well locations. Iron is naturally occurring and prevalent in the aquifers (both overburden and bedrock) at the Site.

    - Sodium was reported above its NJGWQS in groundwater at two well locations, in the total and filtered samples.

- As also shown in Table 8B, of the wet chemistry parameters, sulfate was reported in two samples above the NJGWQS.

Overall the analytical results for the collective August 2016 groundwater analytical results are consistent with historical data, and continue to demonstrate only sporadic, low-level, and localized site-related constituents and various inorganics in groundwater that are also naturally occurring in the aquifer systems at the Site. 1,4-dioxane was reported sporadically in overburden groundwater at generally low levels with some variability indicated at certain PMP Area bedrock well locations, with the distribution generally consistent with prior sampling results.

Mine Water

- Seven samples of mine water were collected for analyses; three different depth intervals in the PMP Air Shaft (50, 180, and 230 feet) and at four from different depth intervals in the CMP Mine Shaft (50, 100, 160, and 275 ft).

- As shown in Table 9A, the only VOC reported in mine water above its NJGWQS is benzene in the PMP Air Shaft at the 180' and 230' depth intervals. In addition, chloroethane was reported above its NJIGGWQC in the same two depth intervals.

The reported benzene and chloroethane concentrations are generally consistent with historical concentrations. VOC TICs were also reported within the 230′ depth interval in the PMP Air shaft at low levels, mostly "J" qualified, which is also similar to historical concentrations.

- 1,4-dioxane was reported above its NJISGWQC at the PMP Air Shaft 180′ and 230′ depth intervals at concentrations that are comparable with the 2015 annual sampling event. Also consistent with the 2015 annual sampling event, 1,4-dioxane was reported at trace concentrations below the 0.4 ug/L NJISGWQC in the CMP Shaft at the 160 and 275 ft. depth intervals. No other SVOCs were reported above NJGWQS in the PMP Air Shaft or CMP Shaft mine water. No SVOC TICs were reported in any of the mine water samples.

- As also shown in Table 9A, no PCBs were reported in any of the PMP Air Shaft or CMP Shaft mine water samples.

- Analyses were performed for both total (unfiltered) and dissolved (filtered) metals. The metals reported above their respective NJGWQS are cadmium, iron, manganese, lead, sodium and zinc (See Table 9B). The results for these metals are summarized as follows:

    - Total cadmium was reported above its NJGWQS in the 160′ and 275′ depth intervals in the CMP Shaft. Dissolved cadmium concentrations were all below NJGWQS indicating the total results are associated with particulates in the sample.

    - Total iron was reported above its NJGWQS in all the mine water samples except for the PMP Air Shaft 50′ interval. Dissolved iron was reported above its NJGWQS in samples collected from the CMP shaft 275′ interval and the PMP Air Shaft 180 and 230 foot intervals.

    - Manganese was reported above its NJGWQS in both total and dissolved forms in each sample except at the PMP Air Shaft 50′ depth interval. Iron and manganese are naturally occurring and prevalent in the aquifers (both overburden and bedrock) at the Site.

    - Lead was reported in the total form above its NJGWQS in two samples from the CMP Shaft and two samples from the PMP Air Shaft, and none of the dissolved lead concentrations were above the NJGWQS indicating lead is predominantly associated with particulates in the samples.

- Sodium was reported above its NJGWQS in each of the CMP Shaft mine water samples.

- Total zinc was reported above its NJGWQS in the 160′ and 275′ depth intervals in the CMP Shaft samples and at the 180′ depth interval in the PMP Air Shaft samples. No dissolved zinc concentrations were reported above the NJGWQS.

- As shown in Table 9B, there were no wet chemistry parameters above their respective NJGWQS.

Surface Water

- As shown in Figure 12, surface water samples were collected from Park Brook, Peters Mine Brook, North Brook, SR-3 seeps, SR3 Pond and the PMP Pond as part of the 2016 annual monitoring event.

  As shown in Table 10A and Figure 12, of the 22 surface water samples collected, the only VOC reported slightly above its New Jersey Surface Water Quality Standard (NJSWQS) was benzene in two samples (specifically, the SR-3 Seeps 1 and 2), and the values were both "J" qualified. Consistent with historic data, no VOC TICs were detected in any surface water sample.

- As shown in Table 10A and on Figure 12, low, single digit, concentrations of 1,4-dioxane were reported within 8 surface water samples with concentrations declining from the immediate vicinity of the PMP Area and no detections downstream of Sally's Pond. There is no New Jersey surface water quality standard established for 1,4-dioxane, however, for purposes of comparison, a surrogate screening value from Michigan (MDEQ Rule 57 Water Quality Values) that has been proposed for the Site is 22,000 ug/L.

- As shown in Table 10A, low concentrations of bis (2-ethylhexyl) phthalate and di-n-butyl phthalate were detected in up to 14 samples, with several of the reported bis (2-ethylhexyl) phthalate concentrations slightly above the NJSWQS. The reported concentrations are inconsistent with prior sampling results and di-n-butyl phthalate was also found in the sample blanks. Collectively, the data suggests that the detected concentrations are likely sampling and/or lab interferences and are not representative of actual surface water quality. No SVOC TICs were reported in surface water samples.

- As shown in Table 10A, no PCBs were detected in any of the surface water samples.

- As shown in Table 10B, total arsenic was reported above its NJSWQS in five samples. However no dissolved arsenic concentrations were reported above NJSWQS indicating that the reported total arsenic concentrations are attributable to particulates in the water samples.

- As also shown in Table 10B, total lead was reported above its NJSWQS at one location. Dissolved lead was not reported above NJSWQS again indicating that the reported total concentrations are attributable to particulates in the water sample.

- As shown in Table 10B, there were no wet chemistry parameters above their respective NJGWQS.

Overall, the collective surface water data are generally consistent with historic results.

Quality Control Samples

Field and trip blanks were collected in accordance with the established protocols for quality assurance purposes. Tables 11A – 11D summarize the Groundwater/Surface Water Quality Control Sample Data and Table 12 summarizes the Data Validation Qualifiers. As shown in Tables 11A-11D, acetone was detected in six out of eight trip blanks and methylene chloride was detected in four field blanks and two trip blanks. Both of these compounds are common laboratory contaminants. The field blanks did not indicate cross contamination and supported the adequate decontamination of sampling equipment between sampling locations.

The data validation prepared by Cadena further supports the quality of the data. None of the data were rejected.

1,4-dioxane carbon isotope analysis

As described in the Supplement to the Annual Sampling Program letter from Cornerstone submitted to the USEPA on August 1, 2016, during the annual sampling event samples were collected at the following locations for compound-specific isotope analysis (CSIA) for 1,4-dioxane:

- PMP Air Shaft, 230' interval;
- PMP Air Shaft, 180' interval;
- PMP Area Bedrock Monitoring Well RW-11; and.
- Downgradient Bedrock Monitoring Well RW-3DD.

As also described in the August 1 letter, the results of CSIA analysis can provide an indication of biotic or abiotic degradation through changes in isotope ratios. The lighter isotopes are degraded first with a concomitant accumulation of heavier isotopes as a result. For the 1,4-dioxane carbon isotope analysis, if biodegradation is contributing to concentration declines down gradient, there is an expectation that this degradation would be manifested as a change in the C13/C12 ratio. Biotic degradation is therefore indicated by increases in $\delta^{13}C$ and $\delta^{2}H$ (i.e., less negative values) from upgradient to downgradient locations. Abiotic degradation is indicated by an increase in $\delta^{2}H$ in the downgradient direction without a corresponding increase in $\delta^{13}C$. Although these data are not in and of themselves to be taken as an absolute determination of whether or not degradation is or is not occurring or will or will not occur, taken together with other empirical data, they are useful in evaluating whether or not there is evidence of actual or potential natural attenuation.

The tabulation below presents the results of the CSIA testing arranged in up-gradient to down-gradient locations.

Sample Location	$\delta^{13}C$(1)	$\delta^{2}H$(2)
PMP-AS-230	-29.86	-103.75
PMP-AS-180	-29.55	-110.61(3)
RW-11D (262-267)	-29.71	-97.31
RW-3DD (175-180)	-29.24	-105.04(3)

(1) Concentrations are ‰ VPBD (parts per thousand, Vienna Pee Dee Belemite (carbon isotope international standard))
(2) Concentrations are ‰ VSMOW (parts per thousand, Vienna Standard Mean Ocean Water (hydrogen isotope international standard))
(3) Low peak signal, result usable to ±20 ‰.
(4) Results not otherwise footnoted, ±0.5 ‰.

The above tabulation indicates the following:

- The $\delta^{13}C$ values from upgradient to down-gradient are essentially the same within the margin of error of the analyses. These data therefore suggest that there is no indication of biotic degradation in the down-gradient direction based on the selected sample locations.

- The δ^2H concentrations show no appreciable increases in δ^2H from the upgradient to downgradient sample locations. Therefore, these data are not indicative of abiotic degradation at the locations sampled.

- Concentration trends, will continue to be monitored and evaluated.

Table 12
CADENA Data Validation Qualifiers
August 2015

Validation Qualifiers	Description
<	Less than the reported concentration.
>	Greater than the reported concentration.
B	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was greater than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the reported concentration. For Inorganic methods the sample concentration was greater than the RDL and less than 10x the blank concentration and is considered non-detect at the reported concentration.
E	The analyte / Compound reported exceeds the calibration range and is considered estimated.
EMPC	Estimated Minimum Potential Contamination - Dioxin/Furan analyses only.
J	Indicates an estimated value. This flag is used either when estimating a concentration for a tentatively identified compound or when the data indicates the presence of an analyte / compound but the result is less than the sample Quantitation limit, but greater than zero. The flag is also used in data validation to indicate a reported value should be considered estimated due to associated quality assurance deficiencies.
J-	The result is an estimated quantity, but the result may be biased low.
JH	The sample result is considered estimated and is potentially biased high.
JL	The sample result is considered estimated and is potentially biased low.
NJ	Tentatively identified compound with approximated concentration.
R	Indicates the value is considered to be unusable. (Note: The analyte / compound may or may not be present.)
U	Indicates that the analyte / compound was analyzed for, but not detected.
UB	The analyte / compound was detected in the associated blank. For Organic methods the sample concentration was less than the RDL and less than 5x (or 10x for common lab contaminates) the blank concentration and is considered non-detect at the RDL. For Inorganic methods the sample concentration was less than the RDL and less than 10x the blank concentration and is considered non-detect at the RDL.
UJ	The analyte / compound was not detected above the reported sample Quantitation limit. However, the Quantitation limit is considered to be approximate due to associated quality assurance results and may or may not represent the actual limit of Quantitation to accurately and precisely report the analyte in the sample.

Notes:

Results for 1,4-dioxane, benzene, chloroethane, lead, and arsenic are presented in this table. See Summary tables for full results.

Results are presented in µg/L unless otherwise noted.

[1] NJGWQS, New Jersey Groundwater Quality Standard NJAC7:9C March 2014

[2] Results represent split samples between Test America (without isotope dilution) and Alpha Analytical (with isotope dilution), respectively.

1,4-dioxane analyzed by Method 8270 Sim with Isotope Dilution as of August 2016.

Notes:

Results for 1,4-dioxane, benzene, lead, and arsenic are presented in this table. See Summary tables for full results.

Results are presented in µg/L unless otherwise noted.

[1] NJGWQS, New Jersey Groundwater Quality Standard NJAC7:9C March 2014

[2] Results represent split samples between Test America (without isotope dilution) and Alpha Analytical (with isotope dilution), respectively.

1,4-dioxane analyzed by Method 8270 Sim with Isotope Dilution as of August 2016.

Shaded values exceed NJGWQS.

* First result by 8270 SIM-ID, second result via Method 522 from Pace Analytical as part of isotope study.

< = not detected

B (inorganic) = estimated result is between the detection limit and quantification limit

B (organic) = analyte found in associated method blank

Narrative

CASE NARRATIVE

Client: Cornerstone Environmental Group, LLC

Project: FORD Ringwood Mines E203361

Report Number: 460-118778-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 8/17/2016 3:10 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 5 coolers at receipt time were 0.2º C, 0.4º C, 0.8º C, 0.9º C and 3.0º C.

Receipt Exceptions

The container label for the following sample did not match the information listed on the Chain-of-Custody (COC): OB-13-081616 (460-118778-10). Quantity is 13 on COC, but 12 containers were received.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

Narrative

CASE NARRATIVE

Client: Cornerstone Environmental Group, LLC

Project: FORD Ringwood Mines E203361

Report Number: 460-118817-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 8/18/2016 11:20 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 5 coolers at receipt time were 0.1º C, 0.7º C, 0.9º C, 1.3º C and 1.8º C.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

The samples were analyzed on 08/23/2016.

The continuing calibration verification (CCV) analyzed in batch 460-386113 was outside the method criteria for the following analyte(s): 1,1,2-Trichloro-1,2,2-trifluoroethane (biased high) and Bromoform (biased low). A CCV standard at or below the reporting limit (RL) was analyzed with the affected samples and found to be acceptable. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

Six surrogates are used for this analysis. The laboratory's SOP allows one acid and one base of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: OB-27-081716 (460-118817-11). These results have been reported and qualified.

A full list spike was utilized for this method. Due to the large number of spiked analytes, there is a high probability that one or more analytes will recover outside acceptance limits. The laboratory's SOP allows for five analytes to recover outside criteria for this method when a full list spike is utilized. The LCS associated with batch 460-386082 had one analytes (2-Methylphenol) outside control limits; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified.

The continuing calibration verification (CCV) analyzed in 460-386667 was outside the method criteria for the following analyte(s): Phenol and Pentachlorophenol. As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

The continuing calibration verification (CCV) analyzed in 460-386897 was outside the method criteria for the following analyte(s): Phenol, Pentachlorophenol and 2-Fluorophenol (Surr). As indicated in the reference method, sample analysis may proceed; however, any detection for the affected analyte(s) is considered estimated.

GC/MS VOA TICs

Qualifier	Qualifier Description
J	Indicates an Estimated Value for TICs
N	This flag indicates the presumptive evidence of a compound.

GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
X	Surrogate is outside control limits
*	LCS or LCSD is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F1	MS and/or MSD Recovery is outside acceptance limits.

GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
F1	MS and/or MSD Recovery is outside acceptance limits.

HPLC/IC

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
D	Sample results are obtained from a dilution; the surrogate or matrix spike recoveries reported are calculated from diluted samples.
F1	MS and/or MSD Recovery is outside acceptance limits.
E	Result exceeded calibration range.

Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F1	MS and/or MSD Recovery is outside acceptance limits.
F5	Duplicate RPD exceeds limit, and one or both sample results are less than 5 times RL. The data are considered valid because the absolute difference is less than the RL.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.

General Chemistry

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Narrative

CASE NARRATIVE
REVISION I

Client: Cornerstone Environmental Group, LLC

Project: FORD Ringwood Mines E203361

Report Number: 460-118898-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 8/19/2016 11:10 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 6 coolers at receipt time were 0.0º C, 0.1º C, 0.2º C, 0.7º C, 0.7º C and 0.8º C.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

REVISION I

Bicarbonate was reported incorrectly in the original report for sample RW-5-081816 (460-118898-15). The attached revised repo includes the correct result of 22.1 mg/l.

Narrative

CASE NARRATIVE

Client: Cornerstone Environmental Group, LLC

Project: FORD Ringwood Mines E203361

Report Number: 460-118951-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 8/19/2016 6:00 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 7 coolers at receipt time were 1.0º C, 1.0º C, 1.2º C, 1.2º C, 1.3º C, 1.4º C and 1.5º C.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.
