#### INSTRUCTIONS

This Water Well Record form is designed to record the most essential data concerning a water well. We request that you be as accurate as possible in recording this information as it may be of great assistance in the planning and development of new water supplies.

An accurate location of the well is equally as important as an accurate well log.

As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted within thirty days after the completion of a well to the Division of Water Resources, Indiana Department of Conservation, 311 West Washington Street, Indianapolis, Indiana.

#### INSTRUCTIONS

This Water Well Record form is designed to record the most essential data concerning a water well. We request that you be as accurate as possible in recording this information as 't may be of great assistance in the planning and development of new water supplies.

An accurate location of the well is equally as important as an accurate well log. Please include all information possible in the space provided for well location.

As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted within thirty days after the completion of a well to the Division of Water Resources, Indiana Department of Conservation, 311 West Washington Street, Indianapolis, Indiana.

#### INSTRUCTIONS

This Water Well Record form is designed to record the most essential data concerning a water well. We request that you be as accurate as possible in recording this information as may be of great assistance in the planning and development of new water supplies.

An accurate location of the well is equally as important as an accurate well log. Please include all information possible in the space provided for well location.

As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted within thirty days after the completion of a well to the Division of Water Resources, Indiana Department of Conservation, 311 West Washington Street, Indianapolis, Indiana.

#### INSTRUCTIONS

This Water Well Record form is designed to record the most essential data concerning a water well. We request that you be as accurate as possible in recording this information as it may be of great assistance in the planning and development of new water supplies.

An accurate location of the well is equally as important as an accurate well log. 
-rlease include all information possible in the space provided for well location.

As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted within thirty days after the completion of a well to the Division of Water Resources, Indiana Department of Conservation.

This Water Well Record form is designed to record the most essential data concerning a water well. We request that you be as accurate as possible in recording this information as it may be of great assistance in the planning and development of new water supplies.

An accurate location of the well is equally as important as an accurate well log. — lease include all information possible in the space provided for well location.

As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted within thirty days after the completion of a well to the Division of Water Resources, Indiana Department of Conservation.

This Water Well Record form is designed to record the most essential data concerning a water well. We request that you be as accurate as possible in recording this information as it may be of great assistance in the planning and development of new water supplies.

An accurate location of the well is equally as important as an accurate well log.

Ylease include all information possible in the space provided for well location.

As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted

within thirty days after the completion of a well to the Division of Water Resources, Indiana

Department of Conservation.

This Water Well Record form is designed to record the most essential data concerning a water well. We request that you be as accurate as possible in recording this information as it may be of great assistance in the planning and development of new water supplies.

An accurate location of the well is equally as important as an accurate well log.

Please include all information possible in the space provided for well location.

As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted within thirty days after the completion of a well to the Division of Water Resources, Indiana Department of Conservation, 311 West Washington Street, Indianapolis, Indiana.

This Water Well Record form is designed to record the most essential data concerning a rater well. We request that you be as accurate as possible in recording this information as it may be of great assistance in the planning and development of new water supplies.

An accurate location of the well is equally as important as an accurate well log. Please include all information possible in the space provided for well location.

As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted within thirty days after the completion of a well to the Division of Water Resources, Indiana Department of Conservation, 311 West Washington Street, Indianapolis, Indiana.

This Water Well Record form is designed to record the most essential data concerning a water well. We request that you be as accurate as possible in recording this information as t may be of great assistance in the planning and development of new water supplies. An accurate location of the well is equally as important as an accurate well log. Please include all information possible in the space provided for well location. As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted

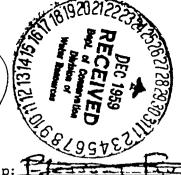

within thirty days after the completion of a well to the Division of Water Resources, Indiana

Department of Conservation.

#### DIVISION OF WATER RESOURCES INDIANA DEPARTMENT OF CONSERVATION 311 WEST WASHINGTON STREET

INDIANAPOLIS, INDIANA

#### WATER WELL RECORD

INFORMATION ON WELL LOCATION Civil Township: 1-County in which well was drilled: Number of section: Congressional township:\_ \_ Range: \_\_ (Fill in as completely as possible) Describe in your own words the well location with respect to nearby towns, roads, streets or distinctive landmarks:

Name of Well Drilling Contractor: Name of Drilling Equipment Operator:

This Water Well Record form is designed to record the most essential data concerning a water well. We request that you be as accurate as possible in recording this information as may be of great assistance in the planning and development of new water supplies.

An accurate location of the well is equally as important as an accurate well log.

Please include all information possible in the space provided for well location.

As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted within thirty days after the completion of a well to the Division of Water Resources, Indiana Department of Conservation, 311 West Washington Street, Indianapolis, Indiana.

Bedrock elevation Aquifer elevation

This Water Well Record form is designed to record the most essential data concerning a water well. We request that you be as accurate as possible in recording this information as it may be of great assistance in the planning and development of new water supplies.

An accurate location of the well is equally as important as an accurate well log. Please include all information possible in the space provided for well location.

REMARKS:

As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted within thirty days after the completion of a well to the Division of Water

### DIVISION OF WATER DEPARTMENT OF NATURAL RESOURCES, STATE OF INDIANA

is designed to record the most essential data concerning this information This Water Well Record form is designed to record the most essential data concerater well. We request that you be as accurate as possible in recording this informater well. We request that you be as accurate as possible in recording this informater well. It may be of great assistance in the planning and development of new water supplies.

INSTRUCTIONS

An accurate location of the well is equally as important as an accurate well log. Please include all information possible in the space provided for well location. As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submited space.

submitted within thirty days after the completion of a well to the Division of Water

This Water Well Record form is designed to record the most essential data concerning a water well. We request that you be as accurate as possible in recording this information as it may be of great assistance in the planning and development of new water supplies.

INSTRUCTIONS

An accurate location of the well is equally as important as an accurate well log. Please include all information possible in the space provided for well location.

As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted within thirty days after the completion of a well to the Division of Water

and the state of t

25 This Water Well Record form is designed to record the most essential data concerning a rater well. We request that you be as accurate as possible in recording this information as it may be of great assistance in the planning and development of new water supplies.

An accurate location of the well is equally as important as an accurate well log.
Please include all information possible in the space provided for well location.
As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted

within thirty days after the completion of a well to the Division of Water Resources, Indiana Department of Conservation, 311 West Washington Street, Indianapolis, Indiana.

This ater Tell Record form is designed to record the most essential data concerning a ster well. The request that you be as accurate as possible in recording this information as a curate location of the well is equally as important as an accurate kell log.

\*\*An accurate location of the well is equally as important as an accurate kell log.

\*\*Please include all information possible in the space provided for well location.

\*\*As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted as specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted feath thirty days after the completion of a well to the Division of Water Resources, Indiana.

\*\*Department of Conservation, 311 Fest Fashington Street, Indianapolis, Indiana.

This Water Well Record form is designed to record the most essential data concerning a water well. We request that you be as accurate as possible in recording this information as it may be of great assistance in the planning and development of new water supplies.

An accurate location of the well is equally as important as an accurate well log.

Please include all information possible in the space provided for well location.

As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted within thirty days after the completion of a well to the Division of Water Resources, Indiana Department of Conservation, 311 West Washington Street, Indianapolis, Indiana.

# INSTRUCTIONS

This Water Well Record form is designed to record the most essential data concerning a water well. We request that you be as accurate as possible in recording this information as it may be of great assistance in the planning and development of new water supplies.

An accurate location of the well is equally as important as an accurate well log.

Inease include all information possible in the space provided for well location.

As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted within thirty days after the completion of a well to the Division of Water Resources, Indiana Department of Conservation, 311 West Washington Street, Indianapolis, Indiana.

### INSTRUCTIONS

This Water Well Record form is designed to record the most essential data concerning a water well. We request that you be as accurate as possible in recording this information as may be of great assistance in the planning and development of new water supplies.

An accurate location of the well is equally as important as an accurate well log. Please include all information possible in the space provided for well location.

As specified in Chapter 6 of the Acts of 1959, a copy of this report must be submitted within thirty days after the completion of a well to the Division of Water Resources, Indiana Department of Conservation.

### APPENDIX C.2 2000 FISH CONSUMPTION ADVISORY

### Angling Indiana - 2000 FISH CONSUMPTION ADVISORY

Group 1 = Unrestricted consumption (at-risk population - limit consumption to 1 meal/week)\*

<sup>\*</sup>At-risk populations include children under 15, pregnant or nursing women, and those women planning to have children within 6 years

| County Name<br>River, Stream, Lake, or<br>Reservoir Name    | Fish Species       | Fish Length (inches)  | Contaminant ■ = PCBs O = Mercury | Group<br>(1-5) |

\*\* Fish tissue samples have not been taken from Walnut Fork. However, fish tissue samples taken from Little Sugar Creek (Montgomery Co.) and Sugar Creek (Montgomery Co., I-74 to SR-32) are at No Consumption advisory levels. These two bodies of water are connected by Walnut Fork in Montgomery Co., approximately one river mile in length. Based on these data, a No Consumption advisory will be placed on Walnut Fork to protect human health. Future sampling of Walnut Fork is planned for more comprehensive results.

| (tailwaters of Monroe Reservoir | Freshwater<br>Drum | 16+          | = | 5      |

<sup>\*\*</sup> This listing is based on limited data. It should be noted that fish migrate. Fish not sampled from these waters may migrate from the confluence of Clear Creek and Salt Creek, 1.3 miles south. Those water bodies have No Consumption advisories. Future sampling of the Salt Creek tailwaters below the Monroe Reservoir Dam is planned for more comprehensive results.

Sub: Soil and Foundation Investigation

Proposed Water Pollution Clarification

System, Bedford, Indiana

#### Gentlemen:

In accordance with your authorization, we have completed a soil and foundation investigation at the subject site and are pleased to submit the following report on the results of the investigation:

#### PURPOSE AND SCOPE

The purpose of this report is to present the results of our findings along with our interpretation of these, and recommendations to aid design and construction of foundations for the proposed Water Pollution Clarification System. These recommendations were developed on the basis of the specific information obtained at the boring locations during this investigation. The general stratification of the subsurface conditions other and poorer than those encountered may exist between boring locations and require some adjustments during construction.

#### PROJECT CHARACTERISTICS

The project site is located adjacent to and south of the main GMC Central Foundry Facility in the City of Bedford, Indiana. This clarification System will consist of a Control Room with attached Hydraulic Storage Pit, a north and a south Clarithickener, and a Reactor Clarifier. Some of the more important information about these units follows:

### Control Room With Attached Hydraulic Storage Pit

The Control Room is a one-story building covering an area 22 feet by 29 feet. Its finished floor elevation will reportedly be 696.00. Standard brick and block construction will be used. A basement is proposed with poured concrete walls. Maximum loads are expected to be relatively light.

A Hydraulic Storage Pit is to be located adjacent to the north wall of Control Room. It will cover an area ll feet by 22 feet. The Pit bottom will reportedly be at elevation 681.00.

### North and South Clarithickeners

Two clarithickeners are proposed for this facility. They will be 45 feet in diameter and 19'-6 3/4" deep. Their top elevation will be 696.5 and their bottom elevation will be 676.94.

# Reactor Clarifier

The Reactor Clarifier will be 44 feet in diameter and will be 16'- 8" deep. Its top elevation will be 693.5 and its bottom elevation is proposed at 673.83.

Three ponds currently exist at the site. The water elevations are 690.9, 689.2 and 686.8 in ponds Nos. 1, 2 and 3 respectively. The proposed facilities will be located at least partially in the area of pond No. 1, and in some cases completely. It is our understanding that a parking area is proposed in the area of pond No. 2.

### Field Investigation

Four (4) borings were put down at the subject site at locations shown on the Location of Boring drawing contained in the Appendix to this report. The borings were generally drilled to depths ranging between about 7.5 and 22 feet below existing ground.

Borings were advanced by using a truck-mounted rotary drilling rig equipped to secure both disturbed and undisturbed soil samples. To determine the relative density of cohesionless soils, the consistency of cohesive soils, and to secure samples for visual identification of the soil types encountered, standard penetration tests were made in accordance with A.S.T.M. D-1586, at about 2.5 to 5.0 foot intervals of depth in each boring. Typical samples of the soils encountered were sealed in glass jars and sent to the laboratory.

Standard penetration tests are made by driving a standard 1-3/8"

I.D. split barrel penetration spoon one-foot into undisturbed soil by

IND 2239 Page three

means of a 140 lb. drop weight free falling a distance of thirty inches.

A graphical representation of the logs of borings is given in the Appendix for reference. These sheets include:

- 1. The results of the standard penetration tests (N values).
- 2. Visual classifications of soils encountered at different depths.
- 3. Ground water level information where it was encountered.

#### FOUNDATION SUBSOIL CONDITIONS

The soil borings indicate that the foundation subsoil conditions at the site are somewhat variable. Surficial deposits in the area of borings 1 and 2 consist primarily of miscellaneous soil fill material. This material was extremely variable in both composition and condition. It generally extended to depths ranging between 7.5 and 20 feet below existing ground.

Below the miscellaneous fill at borings 1 and 2, and starting at the surface at borings 3 and 4 are various layers of medium stiff to very stiff clay or silty clay. These soils extended to the bottom of the borings. Auger refusal was encountered at depths of 22, 7.5 and 8 feet below existing ground at the location of borings 2, 3 and 4, respectively.

Free ground water level observations were made upon completion of the drilling. These observations indicate the water table was encountered at depths ranging between 5 and 10 feet below existing ground.

#### LABORATORY INVESTIGATION

All of the samples obtained in the field were brought to the laboratory for examination and testing. The field classifications were checked and modified if it was considered necessary.

Several unconfined compression tests were performed to assess the shear strength of the foundation soils. To obtain information about the soil index properties, natural moisture content and dry density determinations were performed. The results obtained from the various tests were tabulated and placed in the Appendix for reference.

#### ENGINEERING ANALYSES

Soil bearing capacity was computed as a function of depth below the lowest adjacent grade. The footings were considered to be at a minimum depth of 3 feet below final grade. The bearing capacity safety factor was on the order of 3 and was in some areas well above this limit. This safety factor was included in the recommended soil pressures.

The soil pressures recommended for use on this project were based on bearing capacity considerations and settlement evaluations of the foundation soils encountered. The settlements were estimated on the basis of the results of the field tests. The recommended soil pressure were adjusted so as to limit the estimated total settlements to about one (1) inch.

The evaluation was made on the basis of the least favorable soil conditions combined with the most severe loading conditions. It is therefore anticipated that the settlements in general will be less than the above limit, unless otherwise stated. Differential movements are expected to be on the order of three quarters of an inch maximum which is about 75 percent of the expected settlement. Most structures can readily tolerate such movements, however, it would be advisable to review the design of the proposed structure for this project considering the above mentioned settlement limits.

# CONCLUSIONS AND RECOMMENDATIONS GENERAL

- 1. The bottom of all excavations should be inspected at the time of construction by a representative of Pittsburgh Testing Laboratory to assure that all undesirable material has been removed, and the desired bearing material has been reached. The entire area should be proof-rolled with a heavy roller, in an attempt to locate soft surface areas. All soft soils, miscellaneous fill and organic soils should be removed and replaced with suitable fill material.
- 2. The materials used as backfill should be inspected by a soils engineer or his representative and approved prior to being used. A sufficient number of field density tests should be performed to assure that the specified compaction requirements are being fulfilled.
- 3. All soil placed under footings should be compacted to at least 100 percent of the maximum dry density as determined by A.S.T.M. Designation D-1557.
- 4. All soil placed around or above footings should be compacted to at least 93% of the maximum dry density as determined by A.S.T.M. Designation D-1657.

- 5. Rigid moisture control of soils should be maintained during construction of controlled backfills. The soils should be compacted at or near the optimum moisture content as determined by A.S.T.M. Designation D-1557.
- 6. If a compacted fill is used under footings at the site, it is recommended that the engineered compacted fill be constructed from a granular non-plastic, well-graded material. The fill should be compacted in layers not to exceed six to eight inches in compacted thickness. Pit rum or bank run granular soils, road base material and other similar soils are usually good materials for this type of compacted fill.

The width of the compacted fill under the footings should be equal to the width of the footing plus a dimension equal to two times the thickness dimension of the engineered compacted fill under the bottom of the footing.

- 7. Extreme care should be taken not to allow weakening of the foundation soils because of prolonged atmospheric exposure, disturbance or an increase in water content of the foundation soils. Should a delay in concrete placement be anticipated, footing excavations should be finished about 6 inches high and subsequently cut to grade immediately before placement.
- 8. It is recommended that the floor slabs be supported on at least 12 inches of base course of relatively clean granular material such as sand, sand and gravel or crushed stone. This granular base course will help distribute concentrated loads and equalize moisture conditions beneath the slabs.
- 9. The floor slab should be floating, that is not structurally connected to the walls or foundations. This is to minimize the possibility of undue cracking of the floor slab because of differential movement between the slab and the foundation. Such movements may be excessive for rigid connections between the foundations and a ground supported slab.
- 10. All continuous (wall type) footings should be a minimum of 18 inches in width for bearing capacity considerations.
- 11. Adequate drainage should be provided at the site. All final grades, pavements and parking areas should be sloped away from the structure.

# Specific

- 1. Due to the extremely variable nature and condition of the surficial fill material encountered at borings 1 and 2, it would be advisable to completely remove this material within the structure and any other paved areas, and replace it with an engineered compacted fill. Before backfilling, the area should be proof-rolled with a heavy roller and any soft areas disclosed by this operation should also be removed.
- 2. If proposed structures or paved areas are to be placed over existing ponds, the ponds should be drained, soft sediments should be removed down to stable soils, and backfilling should be accomplished with an engineered compacted fill. Proof rolling would be advisable in these areas also. These operations should be supervised by a representative of Pittsburgh Testing Laboratory.
- 3. If the above recommendations are followed, a net allowable bearing pressure of 2,000 psf can be used. When using net pressures, the weight of the footing and backfill over the footing need not be considered.
- 4. If the footings are designed as recommended above, the resulting settlements should be within tolerable limits.
- 5. Due to the depth of some proposed excavations, it is anticipated that dewatering problems will be encountered.
- 6. It is likely that bedrock will be encountered before reaching the anticipated bottom depth at the location of the south clarithickener and the Reactor Clarifier. The bedrock may also be encountered in some of the other deeper excavation locations, but additional borings would be needed to verify this.
- 7. The structures located below the water table will have to be designed to resist the uplift forces resulting from the high water rable in the area.

We appreciate this assignment and trust the above information will provide the data required for design purposes. If we can be of any further assistance, please advise.

Respectfully submitted,
PITTSBURGH\_TESTING LABORATORY

#### RELATIVE DENSITY (sand-silt)

Very Loose - Less than 4 blows per foot

Loose - 4 to 10 blows/ft

Medium -10 to 30 blows/ft.

Dense - 30 to 50 blows/ft

Very Dense - More than 50 blows/ft

### CONSISTENCY (clay)

Very Soft - Less than 2 blows per foot

Soft – 2 to 4 blows/ft

Medium - 4 to 8 blows/ft

Stiff - 8 to 15 blows/ft

Very Stiff - 15 to 30 blows/ft

Hard - More than 30 blows/ft

#### KEY TO BORING LOGS

Number of blows of a 140-lb weight falling 30 in in req'd to drive st'd. spoon one foot.
