Project Name	San Jacinto River Waste Pits SF - N		
Subject	Water Levels and Waves on Site		

1. Introduction

An engineered cofferdam using the best management practices (BMP) will encircle the Northern Impoundment of the San Jacinto River Waste Pits Superfund (Site) as shown in Figure 1. The BMP walls are designed for exposure to wind and varying water levels in the San Jacinto River in addition to other loads described in Section 3 (Appendix I). The top of the walls will be at elevation +10 ft (NAVD88). This memorandum evaluates the water levels in the river and wind-waves generated over the fetch area around the Site.

Figure 1 *Northern Impoundment Vicinity Map*

2. Water Levels

The Site is subject to tidal fluctuations, as well as increases in river level from rainfall and tropical storms. To evaluate these influences, the history of the water levels was hindcasted from an upriver USGS[1] gage near Sheldon, Texas. The details of the hindcast model and the determination of maximum water levels during the year are provided in the 100% Remedial Design (RD) report. The month-wise daily maximum water elevation from the hindcast model is reproduced in Figure 2. The maximum typical water levels on Site are lower than 3.75 ft and there are five (5) instances of water level higher than 10-ft that are outside the planned excavation period.

The sheet pile walls surrounding the excavation area at the Site are designed for different loading scenarios –

Usual: Service level loading experience frequently such as static earth pressures, hydrostatic pressures after installation of the BMP and during excavation.

Unusual: Loads larger than those considered Usual and experienced less frequently such as 100-year probability storm events and atypical water levels in the river.

Extreme: Worst case scenario loads, rarely experienced during the design life of the structure, such as hurricane level winds, flood levels in the river and barge impacts.

With an added factor of safety, the Usual loading scenarios are evaluated at water level of +5 ft (NAVD88) and the Unusual and Extreme loading scenarios are evaluated at water level of +10 ft (NAVD88) on Site. The interior side of the BMP is assumed to be dry i.e., free of standing water for all loading scenarios. As noted in Attachment 3.3 (Appendix I), it will take less than 2 hours to fill the excavation area in any of the excavation season. The water inside the excavation area will reduce the effective loading on the BMP walls as it will oppose the forces from the water in the river.

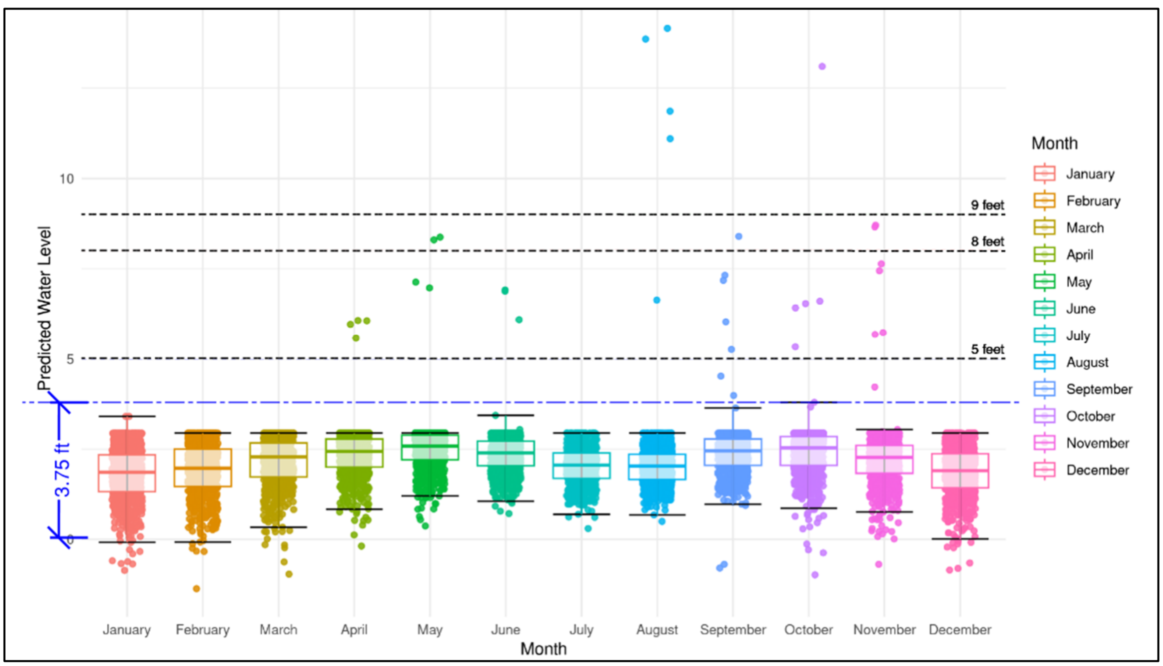

Figure 2 Month-wise Box Plots for Daily Maximum Elevations from Hindcast Model

This Technical Memorandum is provided as an interim output under our agreement with IPC and MIMC. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way other than the stated purpose.

3. Waves

Waves are generated by sustained winds over unobstructed open waters i.e., fetch area. The Site is sheltered by land on all sides within the 0.2 miles except the north and northwest directions as shown in Figure 3. There are barges moored on the north side within 0.3 miles interrupting the open waters and beyond that, the nearest land is 0.5 miles away. The unobstructed fetch distance to the northwest is less than 1.5 mile. For the waves to impact the sheet pile walls, winds have to blow toward the Site from approximately 300° to 60° direction relative to North).

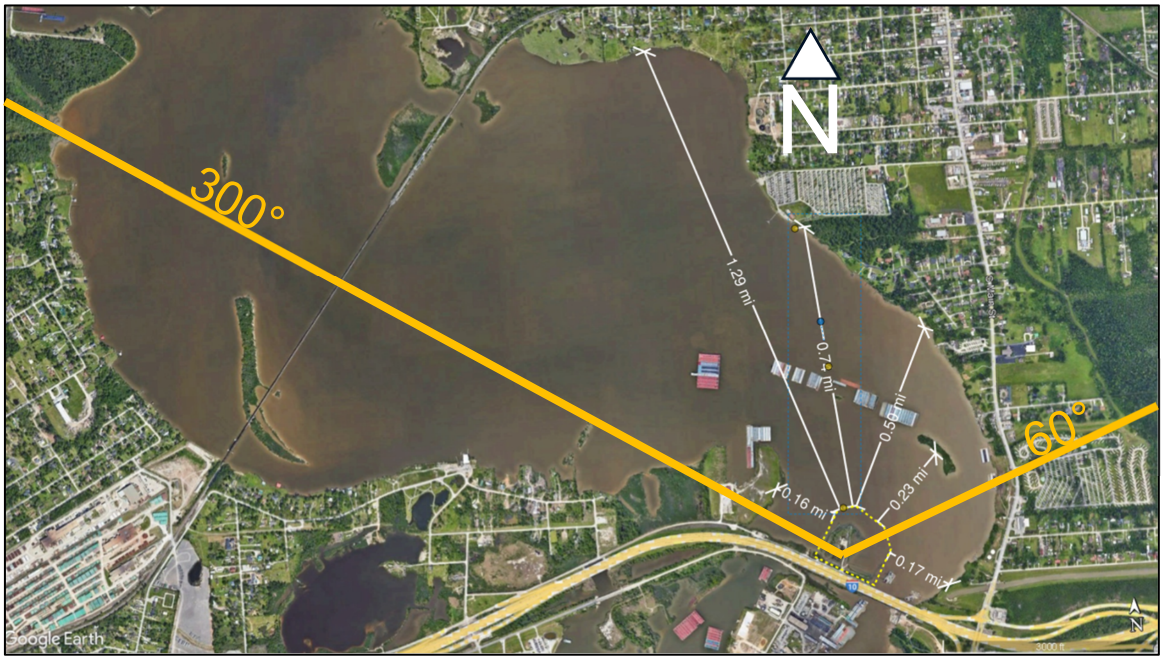

Figure 3 Fetch Distance near Northern Impoundment

The wind data (3 sec gust) was obtained from Morgans Point, Texas (Station Number 8770613), located approximately 9 miles to southeast of the Site (Figure 4). The instrumentation on site is owned and operated by the Texas Coastal Ocean Observing Network. The anemometer is located approximately 25 feet above the mean sea level. Although wind data may be sensitive to local obstructions, the location provides the longest record of wind speed, direction, and water levels near the Site. Data record is available from January 1, 2001, to June 30, 2023, at 6-minute intervals. There are some interruptions in data continuity likely to due to routine maintenance.

The distribution of the available wind speed and direction data is presented in the wind-rose diagram (Figure 5As shown in Figure 5 and Figure 6, there are only a few occurrences of significant wind speed events approaching from the north side of the Site.). It shows that high winds typically approach the site from the south and southeast as expected for the tropical storm events. Less than 5% of the winds approach from the 300° to 60° direction.

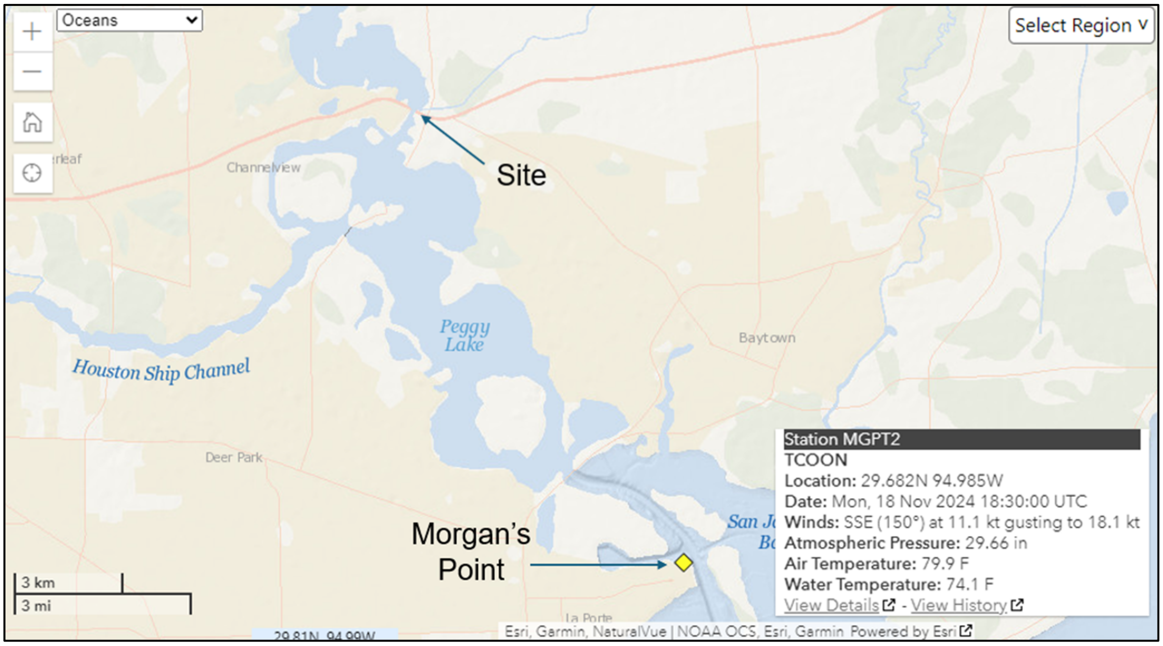

Figure 4 *Location of Morgans Point, Texas (Station Number 8770613)*

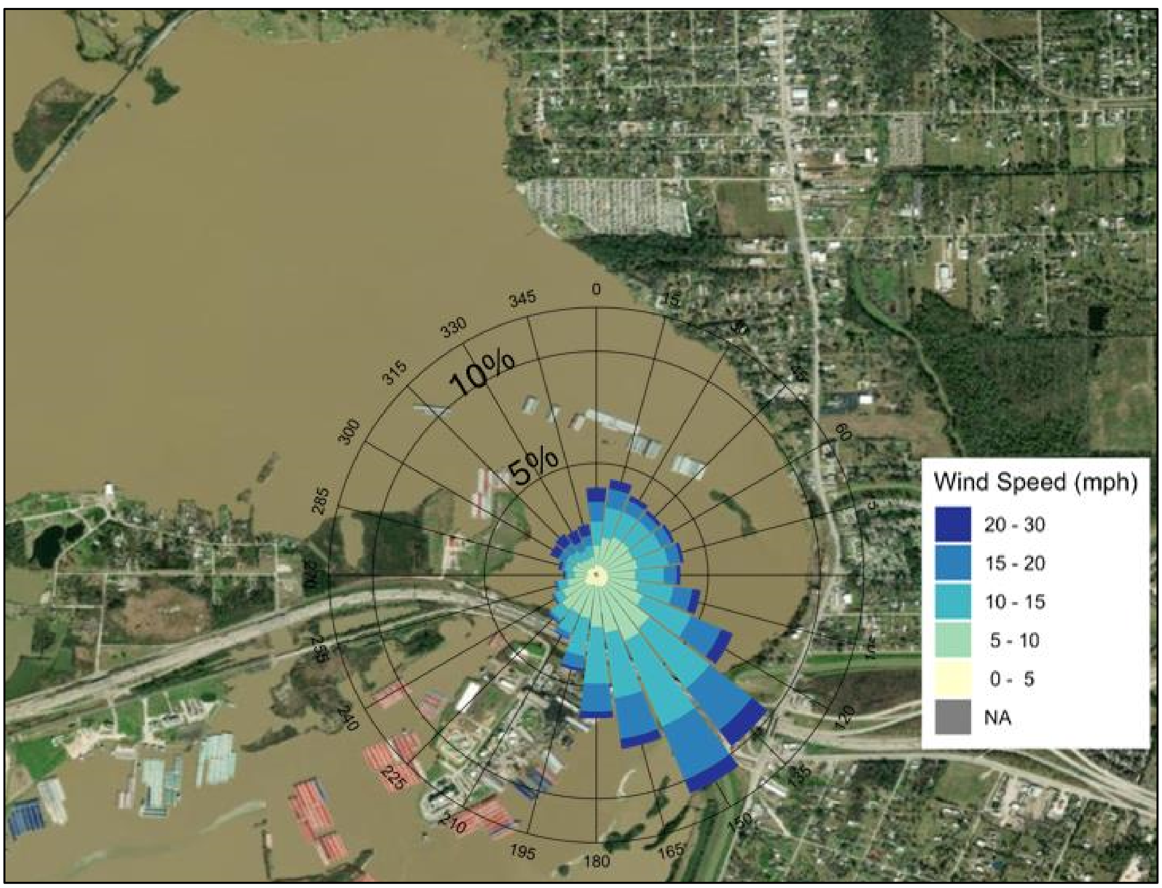

Figure 5 *Morgan's Point Wind Rose overlaid on Northern Impoundment*

This Technical Memorandum is provided as an interim output under our agreement with IPC and MIMC. It is provided to foster discussion in relation to technical matters associated with the project and should not be relied upon in any way other than the stated purpose.

The data from Morgan's Point was filtered to include all instances where wind direction was recorded from 300° to 60° relative to North as shown in Figure 6. The maximum wind speed (3 sec gust) is approximately 79 mph with typical winds in the range of 25 to 35 mph. Although the station reported wind coming from the North, this instance coincided with Hurricane Ike, a category II event that made landfall to the South near Galveston, Texas on September 13, 2008. As the anemometer went offline after this date, it is inferred that the winds were a result of the hurricane passing through the site.

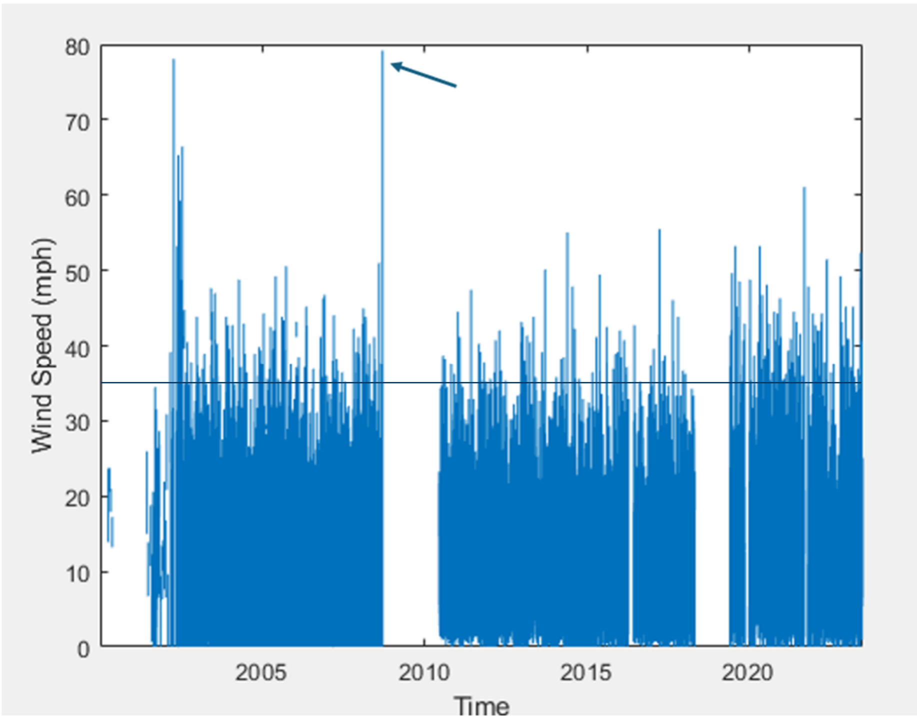

Figure 6 Morgan's Point Record for Wind (3 sec Gust) from 300° to 60°

The NOAA[2] navigation chart tool was used to estimate the average depth to mudline along the fetch. Approximately 50% of the length along the maximum fetch distance has depth less than 1 ft at normal river flow, with a narrow passage of deeper waters in the navigational channel as shown in Figure 7. The representative water depth is estimated as 10 ft at normal water levels (+2 ft) in the river for the purpose of the wave height calculation.

An estimate for wind wave heights was generated using the equations for fetch limited wave growth detailed in the CEM[3] assuming the winds are sustained for at least 1 hour over the fetch distance. The 3 sec gust of 79 mph equates to a 1-hour duration wind of 52.5 mph wind. Table 1 includes the wave heights calculated using the maximum wind speed in the direction of the maximum fetch distance of 1.3 miles. The wave heights were calculated for the normal water levels (+2 ft to +5 ft) in the river.

[2] National Oceanic and Atmospheric Administration
[3] Coastal Engineering Manual

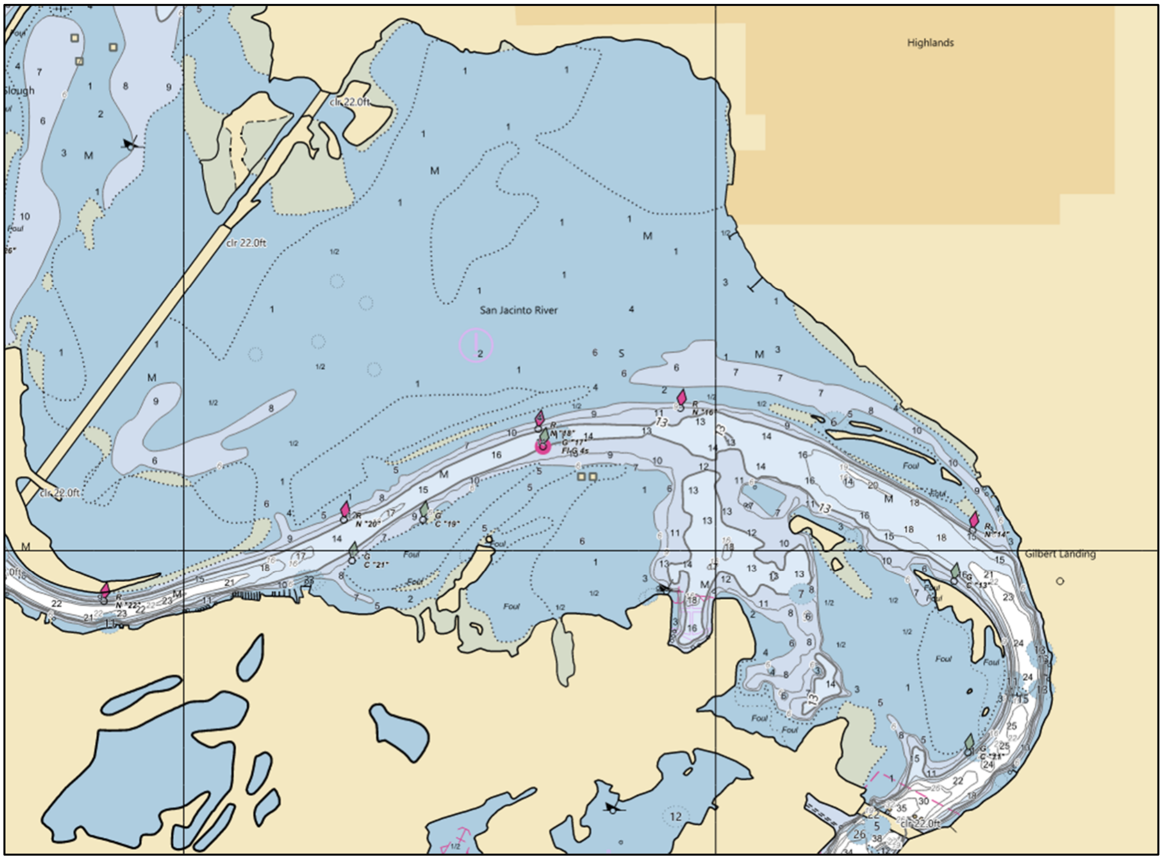

Figure 7 *San Jacinto Riverbed Elevation – NOAA Navigation Chart*

Table 1 *Wave Height for Maximum Winds (1 hour) from North*

Water Level (ft NAVD88)	Average Water Depth (ft)	Wind Wave Height (ft)	Peak Period (s)	Effective Water Surface Elevation (ft NAVD88)
2	10	0.85	2.63	2.85
3	11	0.85	2.64	3.85
4	12	0.85	2.65	4.85
5	13	0.86	2.65	5.85

The CEM also provides a threshold for breaking waves as the ratio between the water depth and the wave height. The waves break if this ratio is less than 1.28. This ratio is greater than 1.28 in each of the scenarios (water level and river depth) modeled therefore breaking waves are not expected near Site. As the nonbreaking waves do not trap an air pocket against the wall, the pressure at the wall has a gentle variation in time and is almost in phase with the wave elevation. Consequently, the wave load can be treated as a static load i.e., the effective water surface elevation can be considered as the sum of river water level and wave height for BMP wall design.

4. Wind and Water Levels

The time series for the maximum wind event used to calculate the wave heights is shown in Figure 8. The maximum value observed was a peak of 79 mph before the recording stopped on September 13th, 2008, as shown in the first plot. The corresponding water levels and wind directions are shown in the second and third plot respectively. There is some lag between the measured wind speed and the increase in the water levels at Morgan's Point. As the wind speed increased from 30 mph to 60 mph, between 2100 hrs (September 12) to 0300 (September 13), no increase in water level was measured at Morgan's Point for six (6) hours. The winds continued to increase and reached the peak measured value of 79 mph in the next 3 hours and the water levels increased the most in this duration (3 ft).

It should be noted that these wind and water levels are specific to Morgan's Point station. The water levels are affected by the width of the channel, proximity to the ocean or tidal waters pushed upstream by the storm, and the surface runoff captured in the channel. The Northern Impoundment is likely more influenced by the surface runoff than the tidal waters influenced by the storm events. Also, as Lake Houston fills from the watershed, it can be expected that the increase in water levels near the Northern Impoundment will be related to the release of excess water from Lake Houston Dam.

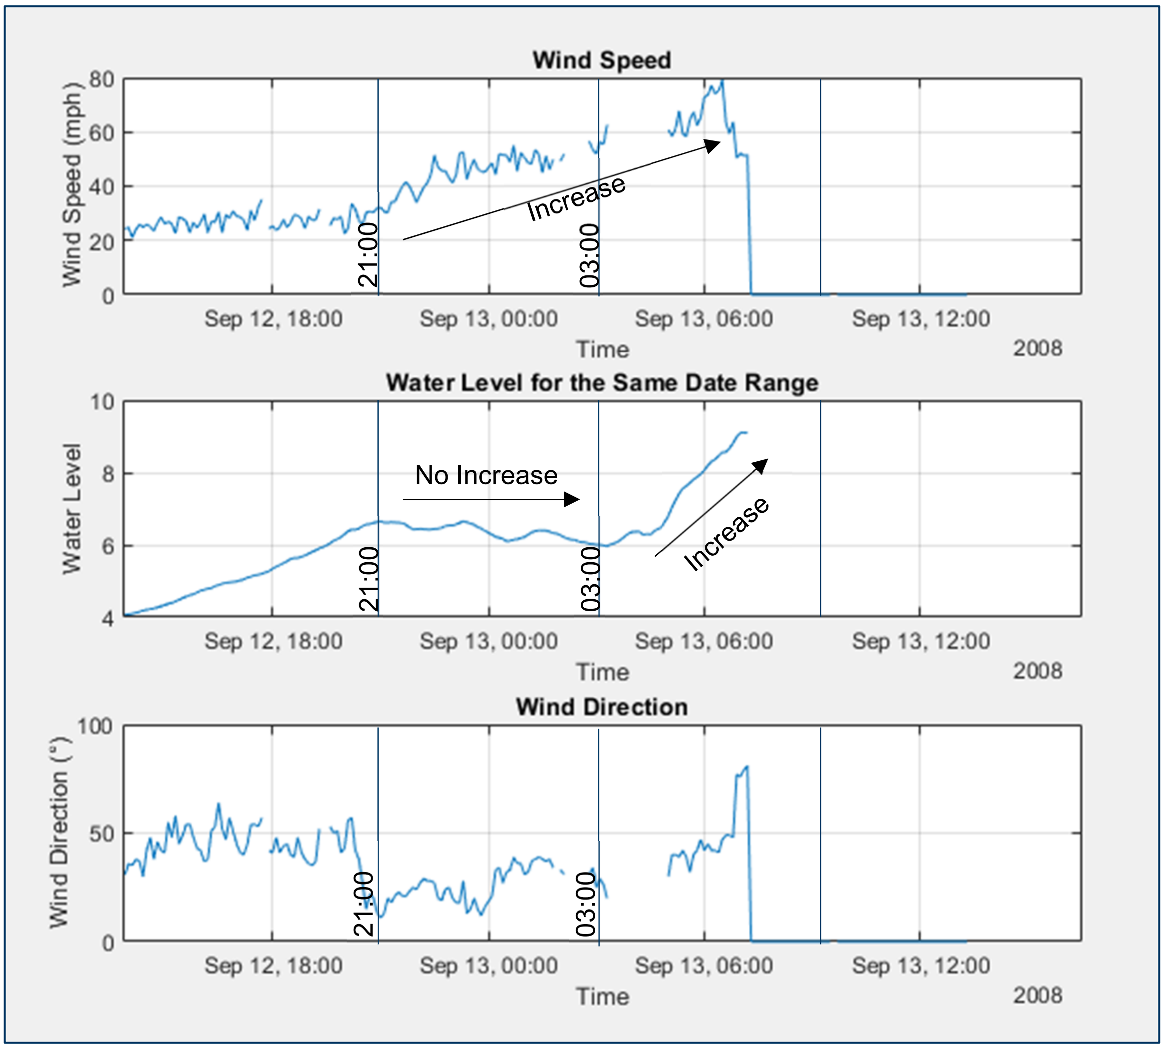

Figure 8 ***Time Series of Wind and Water on September 12-13, 2008.***

5. Summary

As shown in Figure 5 and Figure 6, there are only a few occurrences of significant wind speed events approaching from the north side of the Site.

The maximum water surface elevation is +5.85 ft when significant winds approach over the maximum fetch distance near Site. The wave heights presented in Table 1 are calculated using a conservative approach by assuming the hurricane level wind (Extreme condition) is sustained over the maximum fetch available in a specific direction approaching the Site. Thus, it is noted that the waves will not affect the design or require a reevaluation for Usual load conditions.

For Unusual or Extreme load conditions, the BMP is designed with water level at top of the walls. Thus, a separate evaluation of wave loads on the BMP is not required.

The BMP walls are adequately designed to accommodate the effects of wind generated waves in the vicinity of the Northern Impoundment.

Attachment 4

Slope Stability - Excavation

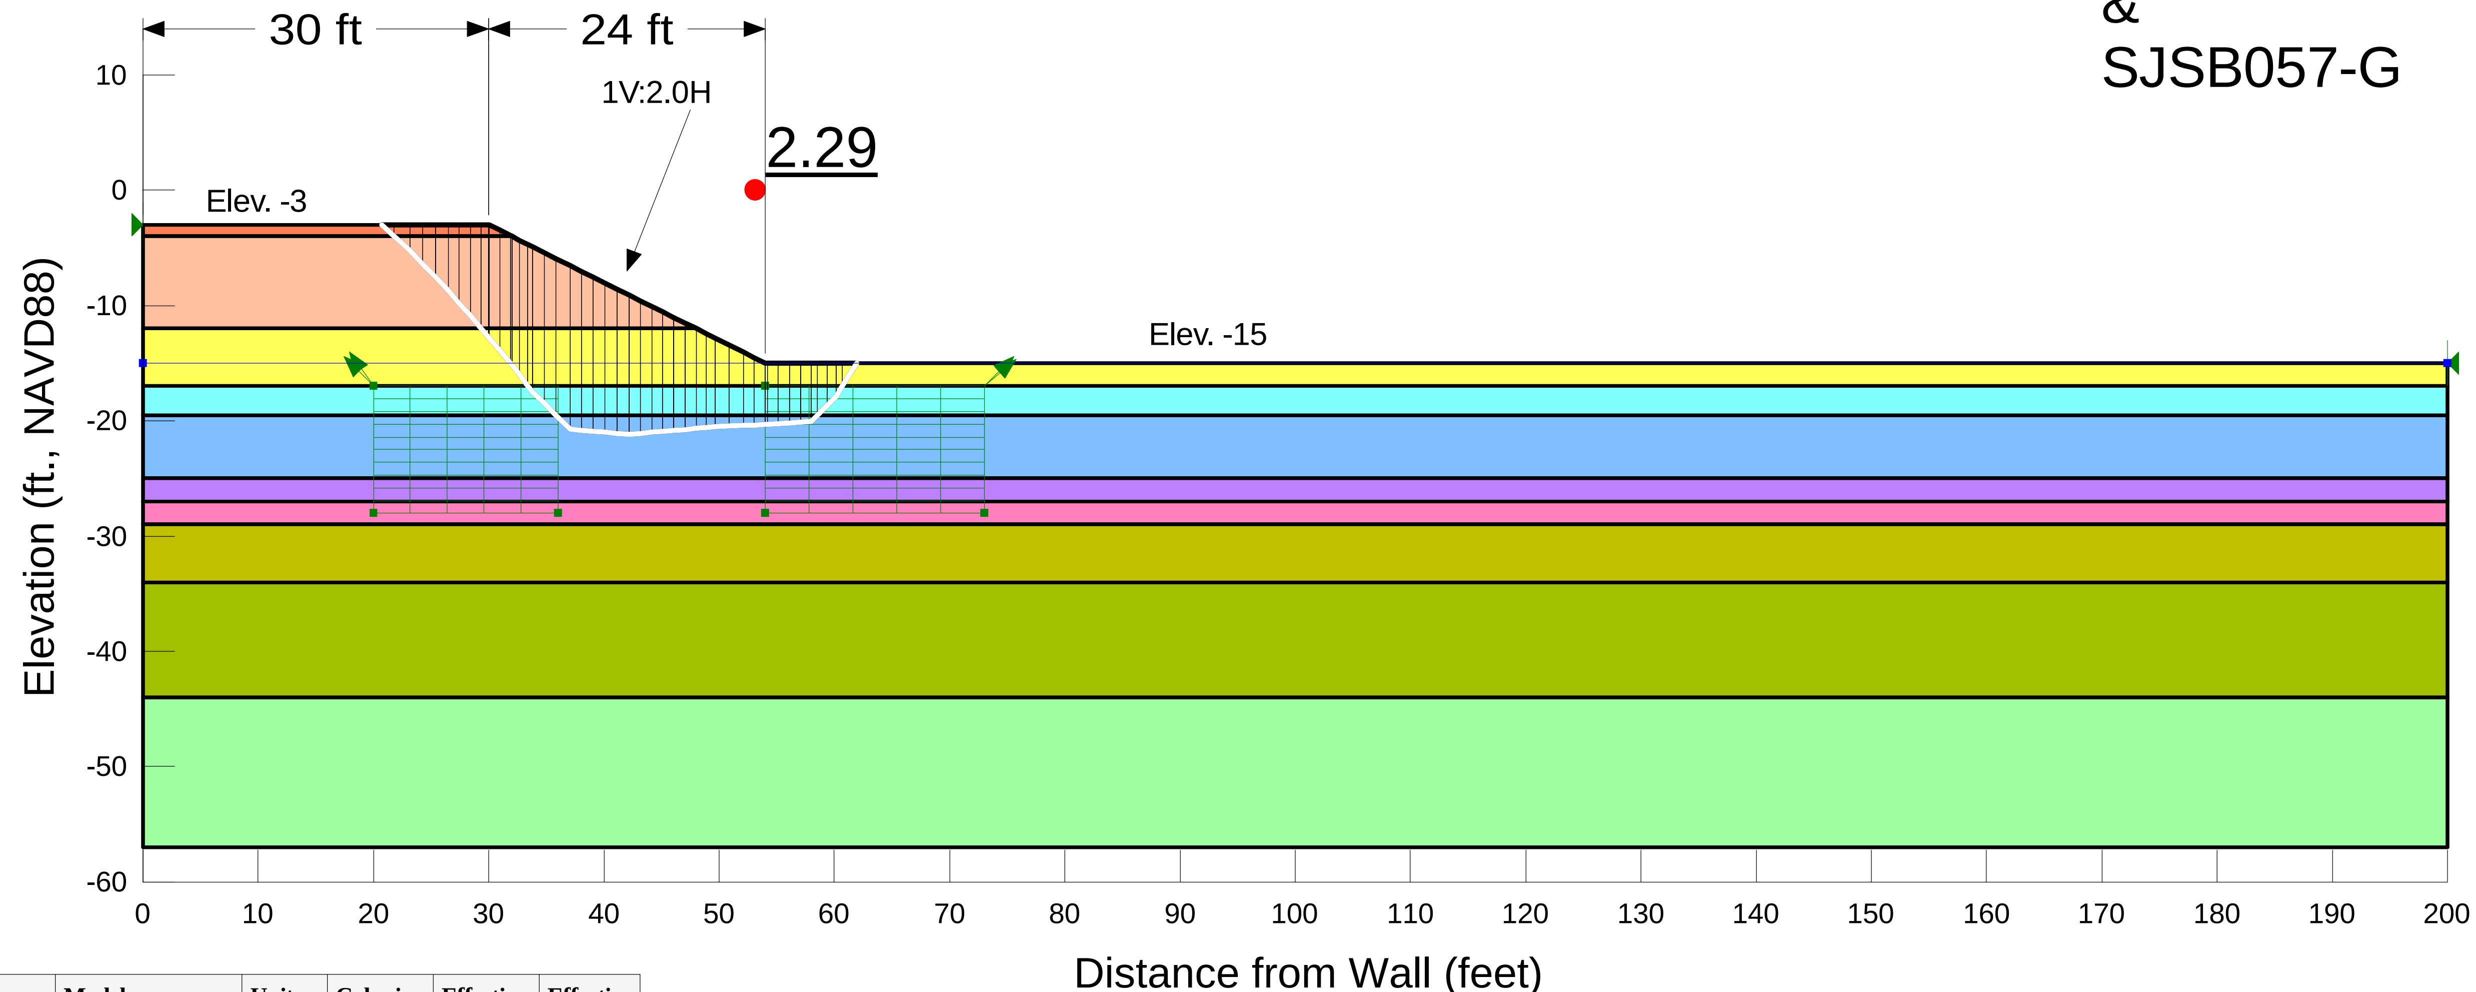
Client	IPC and MIMC	Job Number	11215702	Sheet	
Project	San Jacinto River Waste Pits Site	Sheets By	S.Chilka	Date	07-17-2024
Subject	BMP Design - Geotechnical Parameters	Checked By		Date	

APPENDIX I - BMP STRUCTURAL DESIGN REPORT

ATTACHMENT 4
SLOPE STABILITY - EXCAVATION

Method: Spencer
Slip Surface Option: Block
Factor of Safety: 2.29

SJSB058-G & SJSB057-G



Color	Name	Model	Unit Weight (pcf)	Cohesion (psf)	Effective Cohesion (psf)	Effective Friction Angle (°)
	SJSB057-G 06 - SC (-19.5 to -25)	Mohr-Coulomb	122		0	30
	SJSB057-G 07 - SC (-25 to -27)	Mohr-Coulomb	122		0	30
	SJSB057-G 08 - SC (-27 to -29)	Mohr-Coulomb	122		0	30
	SJSB057-G 09 - CH (-29 to -34)	Undrained (Phi=0)	130	2,250		
	SJSB057-G 10 - CLS (-34 to -44)	Undrained (Phi=0)	135	2,250		
	SJSB057-G 11 - CH (-44 to -57)	Undrained (Phi=0)	125	2,300		
	SJSB058-G 02 - CLS (-2 to -4)	Undrained (Phi=0)	110	200		
	SJSB058-G 03 - CL (-4 to -12)	Undrained (Phi=0)	115	950		
	SJSB058-G 04 - SM (-12 to -17)	Mohr-Coulomb	120		0	30
	SJSB058-G 05 - SM (-17 to -19.5)	Mohr-Coulomb	122		0	30

Notes:
- Piezometric line maintained at bottom of excavation
- Soil properties taken from individual soil boring
