Activity	Comment
Field Sampling	
Discuss sampling problems and field conditions that affect data useability.	There were no apparent problems reported that could affect data useability.
Are samples representative of receptor exposure for this medium (e.g. sample depth, grab vs composite, filtered vs unfiltered, low flow, etc.)?	Sample type (grab and/or composite), and analysis (lead) are representative of receptor exposure to indoor dust.
Assess the effect of field QC results on data useability.	There are no known field QC result issues that affect data useability.
Summarize the effect of field sampling issues on the risk assessment, if applicable.	There are no known field sampling issues that affect data useability.
Analytical Techniques	
Were the analytical methods appropriate for quantitative risk assessment?	The ICP methods are appropriate for risk assessment.
Were detection limits adequate?	In order for a detection limit to be considered adequate, either (1) the detection frequency had to be high (>80%), or (2) the detection limit had to be less than the concentration of potential concern to humans. The detection limits were adequate, with the exception of cobalt.
Summarize the effect of analytical technique issues on the risk assessment, if applicable.	Because the indoor dust results are not used in the risk calculations, but instead to derive a linear relationship between outdoor soil and indoor dust, inadequate cobalt detection limits do not affect the risk assessment. All ICP results were adequate and used in the risk assessment.
Data Quality Objectives	
Precision - How were duplicates handled?	The RPD of field duplicates and the MS/MSD duplicate pairs were evaluated. Results that exceeded QC acceptance criteria were qualified, as appropriate.

Discuss sampling problems and field conditions that affect data useability.	There were no apparent problems reported that could affect data useability.
Are samples representative of receptor exposure for this medium (e.g. sample depth, grab vs composite, filtered vs unfiltered, low flow, etc.)?	Sample depth (0-1 inches at residences), sample type (composites), and analysis (lead and other metals in soil) are representative of receptor exposure to soil.
Assess the effect of field QC results on data useability.	There are no known field QC result issues that affect data useability.
Summarize the effect of field sampling issues on the risk assessment, if applicable.	There are no known field sampling issues that affect data useability.
Analytical Techniques	
Were the analytical methods appropriate for quantitative risk assessment?	Two analytical methods were used for the analysis of soil samples: XRF and ICP. The ICP methods are appropriate for risk assessment. The XRF methods were evaluated (see Appendix C) and the results for lead and zinc were determined appropriate for use in risk assessment.
Were detection limits adequate?	In order for a detection limit to be considered adequate, either (1) the detection frequency had to be high (>80%), or (2) the detection limit had to be less than the concentration of potential concern to humans. The detection limits were adequate for all chemicals in soil, with the exception of thallium. (The detection limit for thallium in soil was about 7 mg/kg, which is slightly higher than the risk-based concentration of 5 mg/kg).
Summarize the effect of analytical technique issues on the risk assessment, if applicable.	All ICP results were adequate and used in the risk assessment. The XRF results for lead and zinc were determined adequate for use in the risk assessment.

Additional notes:	Two results were collected at property ID 29349 The first results collected at this property were considered unusual for two reasons: 1) the values were much higher than any other samples collected, and 2) the post-flush sample was much higher than the first-flush sample. Because the high concentrations of lead were not confirmed by the second set of tap water samples, the first tap water results collected at this residence are considered invalid and were excluded from the risk assessment, and only the results from the second round of sampling at this property were used.

What range of media concentrations were used for the model?	See Section 1. Lead Screening Questions (above) for the range of mean lead concentrations measured in residential soil.
What statistics were used to represent the exposure concentration terms and where are the data on concentrations in the risk assessment that support use of these statistics?	Average soil lead concentration at a residence. Data are Located in Appendix G.
Was soil sample taken from top 2 cm? If not, why?	Yes (0-1 inch or 0-2.5 cm).
Was soil sample sieved? What size screen was used? If not sieved, provide rationale.	Yes. Number 10 mesh sieve (2 mm) .
What was the point of exposure/location?	Residential yard.
Where are the output values located in the risk assessment report?	Located in Appendix H
Was the model run using default values only?	No. Default values were used in the absence of site-specific data.
Was the default soil bioavailability used?	No. Based on site-specific data, a value of 0.40 was used (see Section 4.4.2, Lead Bioavailability).
Was the default soil ingestion rate used?	Yes, default values for 7 age groups are 85, 135, 135, 100, 90, and 85 mg/day
If non-default values were used, where are the rationale for the values located in the risk assessment report?	Section 4.4.2 and Table 4-1.

3. Final Result

Medium	Result	Comment/PRG
SOIL	Input values of 12.5 - 5,711 mg/kg result in 32% of properties (9,033/28,478) with greater than a 5% probability of exceeding a blood lead level of 10 ：g/dL (referred to as P10). These results exceed OSWER's risk reduction goal that a typical child or group of similarly exposed children would have an estimated risk of no more than 5% exceeding a 10 ：g/dL blood lead level.	PRGs were not derived.

PBB & PRED are the observed and predicted blood Pb levels in ug/dL.

Percent exceedance was calculated using values of GSD and PbB Cutoff as follows:
GSD = 1.6
PbB Cutoff (C) = 10 ug/dL
