The proposed MSWLF must (1) be within 6 miles of the airport, as measured from airport property line to MSWLF property line, and (2) have started construction or establishment on or after April 5, 2001. Public Law 106-181 only limits the construction or establishment of some new MSWLF. It does not limit the expansion, either vertical or horizontal, of existing landfills.

NOTE: Consult the most recent version of AC 150/5200-34, *Construction or Establishment of Landfills Near Public Airports,* for a more detailed discussion of these restrictions.

b. Siting for new MSWLF not subject to AIR 21. If an airport and MSWLF do not meet the restrictions of Public Law 106-181, the FAA recommends against locating MSWLF within the separation distances identified in Sections 1-2 through 1-4. The separation distances should be measured from the closest point of the airport's AOA to the closest planned MSWLF cell.

c. Considerations for existing waste disposal facilities within the limits of separation criteria. The FAA recommends against airport development projects that would increase the number of aircraft operations or accommodate larger or faster aircraft near MSWLF operations located within the separations identified in Sections 1-2 through 1-4. In addition, in accordance with 40 CFR 258.10, owners or operators of existing MSWLF units that are located within the separations listed in Sections 1-2 through 1-4 must demonstrate that the unit is designed and operated so it does not pose a bird hazard to aircraft. (See Section 4-2(b) of this AC for a discussion of this demonstration requirement.)

d. Enclosed trash transfer stations. Enclosed waste-handling facilities that receive garbage behind closed doors; process it via compaction, incineration, or similar manner; and remove all residue by enclosed vehicles generally are compatible with safe airport operations, provided they are not located on airport property or within the Runway Protection Zone (RPZ). These facilities should not handle or store putrescible waste outside or in a partially enclosed structure accessible to hazardous wildlife. Trash transfer facilities that are open on one or more sides; that store uncovered quantities of municipal solid waste outside, even if only for a short time; that use semi-trailers that leak or have trash clinging to the outside; or that do not control odors by ventilation and filtration systems (odor masking is not acceptable) do not meet the FAA's definition of fully enclosed trash transfer stations. The FAA considers these facilities incompatible with safe airport operations if they are located closer than the separation distances specified in Sections 1-2 through 1-4.

e. Composting operations on or near airport property. Composting operations that accept only yard waste (e.g., leaves, lawn clippings, or branches) generally do not attract hazardous wildlife. Sewage sludge, woodchips, and similar material are not municipal solid wastes and may be used as compost bulking agents. The compost, however, must never include food or other municipal solid waste. Composting operations should not be located on airport property. Off-airport property composting operations should be located no closer than the greater of the following distances: 1,200 feet from any AOA or the distance called for by airport design requirements (see AC 150/5300-13, *Airport Design*). This spacing should prevent material, personnel, or equipment from penetrating any Object Free Area (OFA), Obstacle Free Zone (OFZ), Threshold Siting Surface (TSS), or Clearway. Airport operators should monitor composting operations located in proximity to the airport to ensure that steam or thermal rise does not adversely affect air traffic. On-airport disposal of compost by-products should not be conducted for the reasons stated in 2-3f.

f. Underwater waste discharges. The FAA recommends against the underwater discharge of any food waste (e.g., fish processing offal) within the separations identified in Sections 1-2 through 1-4 because it could attract scavenging hazardous wildlife.

g. Recycling centers. Recycling centers that accept previously sorted non-food items, such as glass, newspaper, cardboard, or aluminum, are, in most cases, not attractive to hazardous wildlife and are acceptable.

h. Construction and demolition (C&D) debris facilities. C&D landfills do not generally attract hazardous wildlife and are acceptable if maintained in an orderly manner, admit no putrescible waste, and are not co-located with other waste disposal operations. However, C&D landfills have similar visual and operational characteristics to putrescible waste disposal sites. When co-located with putrescible waste disposal operations, C&D landfills are more likely to attract hazardous wildlife because of the similarities between these disposal facilities. Therefore, a C&D landfill co-located with another waste disposal operation should be located outside of the separations identified in Sections 1-2 through 1-4.

i. Fly ash disposal. The incinerated residue from resource recovery power/heat-generating facilities that are fired by municipal solid waste, coal, or wood is generally not a wildlife attractant because it no longer contains putrescible matter. Landfills accepting only fly ash are generally not considered to be wildlife attractants and are acceptable as long as they are maintained in an orderly manner, admit no putrescible waste of any kind, and are not co-located with other disposal operations that attract hazardous wildlife.

Since varying degrees of waste consumption are associated with general incineration (not resource recovery power/heat-generating facilities), the FAA considers the ash from general incinerators a regular waste disposal by-product and, therefore, a hazardous wildlife attractant if disposed of within the separation criteria outlined in Sections 1-2 through 1-4.

2-3. WATER MANAGEMENT FACILITIES. Drinking water intake and treatment facilities, storm water and wastewater treatment facilities, associated retention and settling ponds, ponds built for recreational use, and ponds that result from mining activities often attract large numbers of potentially hazardous wildlife. To prevent wildlife hazards, land-use developers and airport operators may need to develop management plans, in compliance with local and state regulations, to support the operation of storm water management facilities on or near all public-use airports to ensure a safe airport environment.

a. Existing storm water management facilities. On-airport storm water management facilities allow the quick removal of surface water, including discharges related to aircraft deicing, from impervious surfaces, such as pavement and terminal/hangar building roofs. Existing on-airport detention ponds collect storm water, protect water quality, and control runoff. Because they slowly release water after storms, they create standing bodies of water that can attract hazardous wildlife. Where the airport has developed a Wildlife Hazard Management Plan (WHMP) in accordance with Part 139, the FAA requires immediate correction of any wildlife hazards arising from existing storm water facilities located on or near airports, using appropriate wildlife hazard mitigation techniques. Airport operators should develop measures to minimize hazardous wildlife attraction in consultation with a wildlife damage management biologist.

Where possible, airport operators should modify storm water detention ponds to allow a maximum 48-hour detention period for the design storm. The FAA recommends that airport operators avoid or remove retention ponds and detention ponds featuring dead storage to eliminate standing water. Detention basins should remain totally dry between rainfalls. Where constant flow of water is anticipated through the basin, or where any portion of the basin bottom may remain wet, the detention facility should include a concrete or paved pad and/or ditch/swale in the bottom to prevent vegetation that may provide nesting habitat.

When it is not possible to drain a large detention pond completely, airport operators may use physical barriers, such as bird balls, wires grids, pillows, or netting, to deter birds and other hazardous wildlife. When physical barriers are used, airport operators must evaluate their use and ensure they will not adversely affect water rescue. Before installing any physical barriers over detention ponds on Part 139 airports, airport operators must get approval from the appropriate FAA Regional Airports Division Office.

The FAA recommends that airport operators encourage off-airport storm water treatment facility operators to incorporate appropriate wildlife hazard mitigation techniques into storm water treatment facility operating practices when their facility is located within the separation criteria specified in Sections 1-2 through 1-4.

b. New storm water management facilities. The FAA strongly recommends that off-airport storm water management systems located within the separations identified in Sections 1-2 through 1-4 be designed and operated so as not to create above-ground standing water. Stormwater detention ponds should be designed, engineered, constructed, and maintained for a maximum 48–hour detention period after the design storm and remain completely dry between storms. To facilitate the control of hazardous wildlife, the FAA recommends the use of steep-sided, rip-rap lined, narrow, linearly shaped water detention basins. When it is not possible to place these ponds away from an airport's AOA, airport operators should use physical barriers, such as bird balls, wires grids, pillows, or netting, to prevent access of hazardous wildlife to open water and minimize aircraft-wildlife interactions. When physical barriers are used, airport operators must evaluate their use and ensure they will not adversely affect water rescue. Before installing any physical barriers over detention ponds on Part 139 airports, airport operators must get approval from the appropriate FAA Regional Airports Division Office. All vegetation in or around detention basins that provide food or cover for hazardous wildlife should be eliminated. If soil conditions and other requirements allow, the FAA encourages the use of underground storm water infiltration systems, such as French drains or buried rock fields, because they are less attractive to wildlife.

c. Existing wastewater treatment facilities. The FAA strongly recommends that airport operators immediately correct any wildlife hazards arising from existing wastewater treatment facilities located on or near the airport. Where required, a WHMP developed in accordance with Part 139 will outline appropriate wildlife hazard mitigation techniques. Accordingly, airport operators should encourage wastewater treatment facility operators to incorporate measures, developed in consultation with a wildlife damage management biologist, to minimize hazardous wildlife attractants. Airport operators should also encourage those wastewater treatment facility operators to incorporate these mitigation techniques into their standard operating practices. In addition, airport operators should consider the existence of wastewater treatment facilities when evaluating proposed sites for new airport development projects and avoid such sites when practicable.

d. New wastewater treatment facilities. The FAA strongly recommends against the construction of new wastewater treatment facilities or associated settling ponds within the separations identified in Sections 1-2 through 1-4. Appendix 1 defines wastewater treatment facility as “any devices and/or systems used to store, treat, recycle, or reclaim municipal sewage or liquid industrial wastes.” The definition includes any pretreatment involving the reduction of the amount of pollutants or the elimination of pollutants prior to introducing such pollutants into a publicly owned treatment works (wastewater treatment facility). During the site-location analysis for wastewater treatment facilities, developers should consider the potential to attract hazardous wildlife if an airport is in the vicinity of the proposed site, and airport operators should voice their opposition to such facilities if they are in proximity to the airport.

e. Artificial marshes. In warmer climates, wastewater treatment facilities sometimes employ artificial marshes and use submergent and emergent aquatic vegetation as natural filters. These artificial marshes may be used by some species of flocking birds, such as blackbirds and waterfowl, for breeding or roosting activities. The FAA strongly recommends against establishing artificial marshes within the separations identified in Sections 1-2 through 1-4.

f. Wastewater discharge and sludge disposal. The FAA recommends against the discharge of wastewater or sludge on airport property because it may improve soil moisture and quality on unpaved areas and lead to improved turf growth that can be an attractive food source for many species of animals. Also, the turf requires more frequent mowing, which in turn may mutilate or flush insects or small animals and produce straw, both of which can attract hazardous wildlife. In addition, the improved turf may attract grazing wildlife, such as deer and geese. Problems may also occur when discharges saturate unpaved airport areas. The resultant soft, muddy conditions can severely restrict or prevent emergency vehicles from reaching accident sites in a timely manner.

2-4. WETLANDS. Wetlands provide a variety of functions and can be regulated by local, state, and Federal laws. Normally, wetlands are attractive to many types of wildlife, including many which rank high on the list of hazardous wildlife species (Table 1).

NOTE: If questions exist as to whether an area qualifies as a wetland, contact the local division of the U.S. Army Corps of Engineers, the Natural Resources Conservation Service, or a wetland consultant qualified to delineate wetlands.

a. Existing wetlands on or near airport property. If wetlands are located on or near airport property, airport operators should be alert to any wildlife use or habitat changes in these areas that could affect safe aircraft operations. At public-use airports, the FAA recommends immediately correcting, in cooperation with local, state, and Federal regulatory agencies, any wildlife hazards arising from existing wetlands located on or near airports. Where required, a WHMP will outline appropriate wildlife hazard mitigation techniques. Accordingly, airport operators should develop measures to minimize hazardous wildlife attraction in consultation with a wildlife damage management biologist.

b. New airport development. Whenever possible, the FAA recommends locating new airports using the separations from wetlands identified in Sections 1-2 through 1-4. Where alternative sites are not practicable, or when airport operators are expanding an existing airport into or near wetlands, a wildlife damage management biologist, in consultation with the U.S. Fish and Wildlife Service, the U.S. Army Corps of Engineers, and the state wildlife management agency should evaluate the wildlife hazards and prepare a WHMP that indicates methods of minimizing the hazards.

c. Mitigation for wetland impacts from airport projects. Wetland mitigation may be necessary when unavoidable wetland disturbances result from new airport development projects or projects required to correct wildlife hazards from wetlands. Wetland mitigation must be designed so it does not create a wildlife hazard. The FAA recommends that wetland mitigation projects that may attract hazardous wildlife be sited outside of the separations identified in Sections 1-2 through 1-4.

(1) Onsite mitigation of wetland functions. The FAA may consider exceptions to locating mitigation activities outside the separations identified in Sections 1-2 through 1-4 if the affected wetlands provide unique ecological functions, such as critical habitat for threatened or endangered species or ground water recharge, which cannot be replicated when moved to a different location. Using existing airport property is sometimes the only feasible way to achieve the mitigation ratios mandated in regulatory orders and/or settlement agreements with the resource agencies. Conservation easements are an additional means of providing mitigation for project impacts. Typically the airport operator continues to own the property, and an easement is created stipulating that the property will be maintained as habitat for state or Federally listed species.

Mitigation must not inhibit the airport operator's ability to effectively control hazardous wildlife on or near the mitigation site or effectively maintain other aspects of safe airport operations. Enhancing such mitigation areas to attract hazardous wildlife must be avoided. The FAA will review any onsite mitigation proposals to determine compatibility with safe airport operations. A wildlife damage management biologist should evaluate any wetland mitigation projects that are needed to protect unique wetland functions and that must be located in the separation criteria in Sections 1-2 through 1-4 before the mitigation is implemented. A WHMP should be developed to reduce the wildlife hazards.

(2) Offsite mitigation of wetland functions. The FAA recommends that wetland mitigation projects that may attract hazardous wildlife be sited outside of the separations identified in Sections 1-2 through 1-4 unless they provide unique functions that must remain onsite (see 2-4c(1)). Agencies that regulate impacts to or around wetlands recognize that it may be necessary to split wetland functions in mitigation schemes. Therefore, regulatory agencies may, under certain circumstances, allow portions of mitigation to take place in different locations.

(3) Mitigation banking. Wetland mitigation banking is the creation or restoration of wetlands in order to provide mitigation credits that can be used to offset permitted wetland losses. Mitigation banking benefits wetland resources by providing advance replacement for permitted wetland losses; consolidating small projects into larger, better-designed and managed units; and encouraging integration of wetland mitigation projects with watershed planning. This last benefit is most helpful for airport projects, as wetland impacts mitigated outside of the separations identified in Sections 1-2 through 1-4 can still be located within the same watershed. Wetland mitigation banks meeting the separation criteria offer an ecologically sound approach to mitigation in these situations. Airport operators should work with local watershed management agencies or organizations to develop mitigation banking for wetland impacts on airport property.

2-5. DREDGE SPOIL CONTAINMENT AREAS. The FAA recommends against locating dredge spoil containment areas (also known as Confined Disposal Facilities) within the separations identified in Sections 1-2 through 1-4 if the containment area or the spoils contain material that would attract hazardous wildlife.

2-6. AGRICULTURAL ACTIVITIES. Because most, if not all, agricultural crops can attract hazardous wildlife during some phase of production, the FAA recommends against the used of airport property for agricultural production, including hay crops, within the separations identified in Sections 1-2 through 1-4. . If the airport has no financial alternative to agricultural crops to produce income necessary to maintain the viability of the airport, then the airport shall follow the crop distance guidelines listed in the table titled "Minimum Distances between Certain Airport Features and Any On-Airport Agricultural Crops" found in AC 150/5300-13, *Airport Design*, Appendix 17. The cost of wildlife control and potential accidents should be weighed against the income produced by the on-airport crops when deciding whether to allow crops on the airport.

a. **Livestock production.** Confined livestock operations (i.e., feedlots, dairy operations, hog or chicken production facilities, or egg laying operations) often attract flocking birds, such as starlings, that pose a hazard to aviation. Therefore, The FAA recommends against such facilities within the separations identified in Sections 1-2 through 1-4. Any livestock operation within these separations should have a program developed to reduce the attractiveness of the site to species that are hazardous to aviation safety. Free-ranging livestock must not be grazed on airport property because the animals may wander onto the AOA. Furthermore, livestock feed, water, and manure may attract birds.

b. **Aquaculture.** Aquaculture activities (i.e. catfish or trout production) conducted outside of fully enclosed buildings are inherently attractive to a wide variety of birds. Existing aquaculture facilities/activities within the separations listed in Sections 1-2 through 1-4 must have a program developed to reduce the attractiveness of the sites to species that are hazardous to aviation safety. Airport operators should also oppose the establishment of new aquaculture facilities/activities within the separations listed in Sections 1-2 through 1-4.

c. **Alternative uses of agricultural land.** Some airports are surrounded by vast areas of farmed land within the distances specified in Sections 1-2 through 1-4. Seasonal uses of agricultural land for activities such as hunting can create a hazardous wildlife situation. In some areas, farmers will rent their land for hunting purposes. Rice farmers, for example, flood their land during waterfowl hunting season and obtain additional revenue by renting out duck blinds. The duck hunters then use decoys and call in hundreds, if not thousands, of birds, creating a tremendous threat to aircraft safety. A wildlife damage management biologist should review, in coordination with local farmers and producers, these types of seasonal land uses and incorporate them into the WHMP.

2-7. GOLF COURSES, LANDSCAPING AND OTHER LAND-USE CONSIDERATIONS.

a. **Golf courses.** The large grassy areas and open water found on most golf courses are attractive to hazardous wildlife, particularly Canada geese and some species of gulls. These species can pose a threat to aviation safety. The FAA recommends against construction of new golf courses within the separations identified in Sections 1-2 through 1-4. Existing golf courses located within these separations must develop a program to reduce the attractiveness of the sites to species that are hazardous to aviation safety. Airport operators should ensure these golf courses are monitored on a continuing basis for the presence of hazardous wildlife. If hazardous wildlife is detected, corrective actions should be immediately implemented.

b. **Landscaping and landscape maintenance.** Depending on its geographic location, landscaping can attract hazardous wildlife. The FAA recommends that airport operators approach landscaping with caution and confine it to airport areas not associated with aircraft movements. A wildlife damage management biologist should review all landscaping plans. Airport operators should also monitor all landscaped areas on a continuing basis for the presence of hazardous wildlife. If hazardous wildlife is detected, corrective actions should be immediately implemented.

Turf grass areas can be highly attractive to a variety of hazardous wildlife species. Research conducted by the USDA Wildlife Services' National Wildlife Research Center has shown that no one grass management regime will deter all species of hazardous wildlife in all situations. In cooperation with wildlife damage management biologist, airport operators should develop airport turf grass management plans on a prescription basis, depending on the airport's geographic locations and the type of hazardous wildlife likely to frequent the airport

Airport operators should ensure that plant varieties attractive to hazardous wildlife are not used on the airport. Disturbed areas or areas in need of re-vegetating should not be planted with seed mixtures containing millet or any other large-seed producing grass. For airport property already planted with seed mixtures containing millet, rye grass, or other large-seed producing grasses, the FAA recommends disking, plowing, or another suitable agricultural practice to prevent plant maturation and seed head production. Plantings should follow the specific recommendations for grass management and seed and plant selection made by the State University Cooperative Extension Service, the local office of Wildlife Services, or a qualified wildlife damage management biologist. Airport operators should also consider developing and implementing a preferred/prohibited plant species list, reviewed by a wildlife damage management biologist, which has been designed for the geographic location to reduce the attractiveness to hazardous wildlife for landscaping airport property.

c. Airports surrounded by wildlife habitat. The FAA recommends that operators of airports surrounded by woodlands, water, or wetlands refer to Section 2.4 of this AC. Operators of such airports should provide for a Wildlife Hazard Assessment (WHA) conducted by a wildlife damage management biologist. This WHA is the first step in preparing a WHMP, where required.

d. Other hazardous wildlife attractants. Other specific land uses or activities (e.g., sport or commercial fishing, shellfish harvesting, etc.), perhaps unique to certain regions of the country, have the potential to attract hazardous wildlife. Regardless of the source of the attraction, when hazardous wildlife is noted on a public-use airport, airport operators must take prompt remedial action(s) to protect aviation safety.

2-8. SYNERGISTIC EFFECTS OF SURROUNDING LAND USES. There may be circumstances where two (or more) different land uses that would not, by themselves, be considered hazardous wildlife attractants or that are located outside of the separations identified in Sections 1-2 through 1-4 that are in such an alignment with the airport as to create a wildlife corridor directly through the airport and/or surrounding airspace. An example of this situation may involve a lake located outside of the separation criteria on the east side of an airport and a large hayfield on the west side of an airport, land uses that together could create a flyway for Canada geese directly across the airspace of the airport. There are numerous examples of such situations;

therefore, airport operators and the wildlife damage management biologist must consider the entire surrounding landscape and community when developing the WHMP.

SECTION 3.

PROCEDURES FOR WILDLIFE HAZARD MANAGEMENT BY OPERATORS OF PUBLIC-USE AIRPORTS.

3.1. INTRODUCTION. In recognition of the increased risk of serious aircraft damage or the loss of human life that can result from a wildlife strike, the FAA may require the development of a Wildlife Hazard Management Plan (WHMP) when specific triggering events occur on or near the airport. Part 139.337 discusses the specific events that trigger a Wildlife Hazard Assessment (WHA) and the specific issues that a WHMP must address for FAA approval and inclusion in an Airport Certification Manual.

3.2. COORDINATION WITH USDA WILDLIFE SERVICES OR OTHER QUALIFIED WILDLIFE DAMAGE MANAGEMENT BIOLOGISTS. The FAA will use the Wildlife Hazard Assessment (WHA) conducted in accordance with Part 139 to determine if the airport needs a WHMP. Therefore, persons having the education, training, and expertise necessary to assess wildlife hazards must conduct the WHA. The airport operator may look to Wildlife Services or to qualified private consultants to conduct the WHA. When the services of a wildlife damage management biologist are required, the FAA recommends that land-use developers or airport operators contact a consultant specializing in wildlife damage management or the appropriate state director of Wildlife Services.

NOTE: Telephone numbers for the respective USDA Wildlife Services state offices can be obtained by contacting USDA Wildlife Services Operational Support Staff, 4700 River Road, Unit 87, Riverdale, MD, 20737-1234, Telephone (301) 734-7921, Fax (301) 734-5157 *(http://www.aphis.usda.gov/ws/)*.

3-3. WILDLIFE HAZARD MANAGEMENT AT AIRPORTS: A MANUAL FOR AIRPORT PERSONNEL. This manual, prepared by FAA and USDA Wildlife Services staff, contains a compilation of information to assist airport personnel in the development, implementation, and evaluation of WHMPs at airports. The manual includes specific information on the nature of wildlife strikes, legal authority, regulations, wildlife management techniques, WHAs, WHMPs, and sources of help and information. The manual is available in three languages: English, Spanish, and French. It can be viewed and downloaded free of charge from the FAA's wildlife hazard mitigation web site: http://wildlife-mitigation.tc.FAA.gov/. This manual only provides a starting point for addressing wildlife hazard issues at airports. Hazardous wildlife management is a complex discipline and conditions vary widely across the United States. Therefore, qualified wildlife damage management biologists must direct the development of a WHMP and the implementation of management actions by airport personnel.

There are many other resources complementary to this manual for use in developing and implementing WHMPs. Several are listed in the manual's bibliography.

3-4. WILDLIFE HAZARD ASSESSMENTS, TITLE 14, CODE OF FEDERAL REGULATIONS, PART 139. Part 139.337(b) requires airport operators to conduct a Wildlife Hazard Assessment (WHA) when certain events occur on or near the airport.

Part 139.337 (c) provides specific guidance as to what facts must be addressed in a WHA.

3-5. WILDLIFE HAZARD MANAGEMENT PLAN (WHMP). The FAA will consider the results of the WHA, along with the aeronautical activity at the airport and the views of the airport operator and airport users, in determining whether a formal WHMP is needed, in accordance with Part 139.337. If the FAA determines that a WHMP is needed, the airport operator must formulate and implement a WHMP, using the WHA as the basis for the plan.

The goal of an airport's Wildlife Hazard Management Plan is to minimize the risk to aviation safety, airport structures or equipment, or human health posed by populations of hazardous wildlife on and around the airport.

The WHMP must identify hazardous wildlife attractants on or near the airport and the appropriate wildlife damage management techniques to minimize the wildlife hazard. It must also prioritize the management measures.

3-6. LOCAL COORDINATION. The establishment of a Wildlife Hazards Working Group (WHWG) will facilitate the communication, cooperation, and coordination of the airport and its surrounding community necessary to ensure the effectiveness of the WHMP. The cooperation of the airport community is also necessary when new projects are considered. Whether on or off the airport, the input from all involved parties must be considered when a potentially hazardous wildlife attractant is being proposed. Airport operators should also incorporate public education activities with the local coordination efforts because some activities in the vicinity of your airport, while harmless under normal leisure conditions, can attract wildlife and present a danger to aircraft. For example, if public trails are planned near wetlands or in parks adjoining airport property, the public should know that feeding birds and other wildlife in the area may pose a risk to aircraft.

Airport operators should work with local and regional planning and zoning boards so as to be aware of proposed land-use changes, or modification of existing land uses, that could create hazardous wildlife attractants within the separations identified in Sections 1-2 through 1-4. Pay particular attention to proposed land uses involving creation or expansion of waste water treatment facilities, development of wetland mitigation sites, or development or expansion of dredge spoil containment areas. At the very least, airport operators must ensure they are on the notification list of the local planning board or equivalent review entity for all communities located within 5 miles of the airport, so they will receive notification of any proposed project and have the opportunity to review it for attractiveness to hazardous wildlife.

3-7 COORDINATION/NOTIFICATION OF AIRMEN OF WILDLIFE HAZARDS. If an existing land-use practice creates a wildlife hazard and the land-use practice or wildlife hazard cannot be immediately eliminated, airport operators must issue a Notice to Airmen (NOTAM) and encourage the land–owner or manager to take steps to control the wildlife hazard and minimize further attraction.

SECTION 4.

FAA NOTIFICATION AND REVIEW OF PROPOSED LAND-USE PRACTICE CHANGES IN THE VICINITY OF PUBLIC-USE AIRPORTS

4-1. FAA REVIEW OF PROPOSED LAND-USE PRACTICE CHANGES IN THE VICINITY OF PUBLIC-USE AIRPORTS.

a. The FAA discourages the development of waste disposal and other facilities, discussed in Section 2, located within the 5,000/10,000-foot criteria specified in Sections 1-2 through 1-4.

b. For projects that are located outside the 5,000/10,000-foot criteria but within 5 statute miles of the airport's AOA, the FAA may review development plans, proposed land-use changes, operational changes, or wetland mitigation plans to determine if such changes present potential wildlife hazards to aircraft operations. The FAA considers sensitive airport areas as those that lie under or next to approach or departure airspace. This brief examination should indicate if further investigation is warranted.

c. Where a wildlife damage management biologist has conducted a further study to evaluate a site's compatibility with airport operations, the FAA may use the study results to make a determination.

4-2. WASTE MANAGEMENT FACILITIES.

a. Notification of new/expanded project proposal. Section 503 of the Wendell H. Ford Aviation Investment and Reform Act for the 21st Century (Public Law 106-181) limits the construction or establishment of new MSWLF within 6 statute miles of certain public-use airports, when both the airport and the landfill meet very specific conditions. See Section 2-2 of this AC and AC 150/5200-34 for a more detailed discussion of these restrictions.

The Environmental Protection Agency (EPA) requires any MSWLF operator proposing a new or expanded waste disposal operation within 5 statute miles of a runway end to notify the appropriate FAA Regional Airports Division Office and the airport operator of the proposal (40 CFR 258, *Criteria for Municipal Solid Waste Landfills*, Section 258.10, *Airport Safety*). The EPA also requires owners or operators of new MSWLF units, or lateral expansions of existing MSWLF units, that are located within 10,000 feet of any airport runway end used by turbojet aircraft, or within 5,000 feet of any airport runway end used only by piston-type aircraft, to demonstrate successfully that such units are not hazards to aircraft. (See 4-2.b below.)

When new or expanded MSWLF are being proposed near airports, MSWLF operators must notify the airport operator and the FAA of the proposal as early as possible pursuant to 40 CFR 258.

b. Waste handling facilities within separations identified in Sections 1-2 through 1-4. To claim successfully that a waste-handling facility sited within the separations identified in Sections 1-2 through 1-4 does not attract hazardous wildlife and does not threaten aviation, the developer must establish convincingly that the facility will not handle putrescible material other than that as outlined in 2-2.d. The FAA strongly recommends against any facility other than that as outlined in 2-2.d (enclosed transfer stations). The FAA will use this information to determine if the facility will be a hazard to aviation.

c. Putrescible-Waste Facilities. In their effort to satisfy the EPA requirement, some putrescible-waste facility proponents may offer to undertake experimental measures to demonstrate that their proposed facility will not be a hazard to aircraft. To date, no such facility has been able to demonstrate an ability to reduce and sustain hazardous wildlife to levels that existed before the putrescible-waste landfill began operating. For this reason, demonstrations of experimental wildlife control measures may not be conducted within the separation identified in Sections 1-2 through 1-4.

4-3. OTHER LAND-USE PRACTICE CHANGES. As a matter of policy, the FAA encourages operators of public-use airports who become aware of proposed land use practice changes that may attract hazardous wildlife within 5 statute miles of their airports to promptly notify the FAA. The FAA also encourages proponents of such land use changes to notify the FAA as early in the planning process as possible. Advanced notice affords the FAA an opportunity (1) to evaluate the effect of a particular land-use change on aviation safety and (2) to support efforts by the airport sponsor to restrict the use of land next to or near the airport to uses that are compatible with the airport.

The airport operator, project proponent, or land-use operator may use FAA Form 7460-1, *Notice of Proposed Construction or Alteration*, or other suitable documents similar to FAA Form 7460-1 to notify the appropriate FAA Regional Airports Division Office. Project proponents can contact the appropriate FAA Regional Airports Division Office for assistance with the notification process.

It is helpful if the notification includes a 15-minute quadrangle map of the area identifying the location of the proposed activity. The land-use operator or project proponent should also forward specific details of the proposed land-use change or operational change or expansion. In the case of solid waste landfills, the information should include the type of waste to be handled, how the waste will be processed, and final disposal methods.

a. Airports that have received Federal grant-in-aid assistance. Airports that have received Federal grant-in-aid assistance are required by their grant assurances to take appropriate actions to restrict the use of land next to or near the airport to uses that are compatible with normal airport operations. The FAA recommends that airport operators to the extent practicable oppose off-airport land-use changes or practices within the separations identified in Sections 1-2 through 1-4 that may attract hazardous wildlife. Failure to do so may lead to noncompliance with applicable grant assurances. The FAA will not approve the placement of airport development projects pertaining to aircraft movement in the vicinity of hazardous wildlife attractants without appropriate mitigating measures. Increasing the intensity of wildlife control efforts is not a substitute for eliminating or reducing a proposed wildlife hazard. Airport operators should identify hazardous wildlife attractants and any associated wildlife hazards during any planning process for new airport development projects.

This page intentionally left blank.

APPENDIX 1. DEFINITIONS OF TERMS USED IN THIS ADVISORY CIRCULAR.

1. GENERAL. This appendix provides definitions of terms used throughout this AC.

1. **Air operations area.** Any area of an airport used or intended to be used for landing, takeoff, or surface maneuvering of aircraft. An air operations area includes such paved areas or unpaved areas that are used or intended to be used for the unobstructed movement of aircraft in addition to its associated runway, taxiways, or apron.

2. **Airport operator.** The operator (private or public) or sponsor of a public-use airport.

3. **Approach or departure airspace.** The airspace, within 5 statute miles of an airport, through which aircraft move during landing or takeoff.

4. **Bird balls.** High-density plastic floating balls that can be used to cover ponds and prevent birds from using the sites.

5. **Certificate holder.** The holder of an Airport Operating Certificate issued under Title 14, Code of Federal Regulations, Part 139.

6. **Construct a new MSWLF.** To begin to excavate, grade land, or raise structures to prepare a municipal solid waste landfill as permitted by the appropriate regulatory or permitting agency.

7. **Detention ponds.** Storm water management ponds that hold storm water for short periods of time, a few hours to a few days.

8. **Establish a new MSWLF.** When the first load of putrescible waste is received on-site for placement in a prepared municipal solid waste landfill.

9. **Fly ash.** The fine, sand-like residue resulting from the complete incineration of an organic fuel source. Fly ash typically results from the combustion of coal or waste used to operate a power generating plant.

10. **General aviation aircraft.** Any civil aviation aircraft not operating under 14 CFR Part 119, Certification: Air Carriers and Commercial Operators.

11. **Hazardous wildlife.** Species of wildlife (birds, mammals, reptiles), including feral animals and domesticated animals not under control, that are associated with aircraft strike problems, are capable of causing structural damage to airport facilities, or act as attractants to other wildlife that pose a strike hazard

12. **Municipal Solid Waste Landfill (MSWLF).** A publicly or privately owned discrete area of land or an excavation that receives household waste and that is not a land application unit, surface impoundment, injection well, or waste pile, as those terms are defined under 40 CFR § 257.2. An MSWLF may receive

other types wastes, such as commercial solid waste, non-hazardous sludge, small-quantity generator waste, and industrial solid waste, as defined under 40 CFR § 258.2. An MSWLF can consist of either a stand alone unit or several cells that receive household waste.

13. **New MSWLF.** A municipal solid waste landfill that was established or constructed after April 5, 2001.

14. **Piston-powered aircraft.** Fixed-wing aircraft powered by piston engines.

15. **Piston-use airport.** Any airport that does not sell Jet-A fuel for fixed-wing turbine-powered aircraft, and primarily serves fixed-wing, piston-powered aircraft. Incidental use of the airport by turbine-powered, fixed-wing aircraft would not affect this designation. However, such aircraft should not be based at the airport.

16. **Public agency.** A State or political subdivision of a State, a tax-supported organization, or an Indian tribe or pueblo (49 U.S.C. § 47102(19)).

17. **Public airport.** An airport used or intended to be used for public purposes that is under the control of a public agency; and of which the area used or intended to be used for landing, taking off, or surface maneuvering of aircraft is publicly owned (49 U.S.C. § 47102(20)).

18. **Public-use airport.** An airport used or intended to be used for public purposes, and of which the area used or intended to be used for landing, taking off, or surface maneuvering of aircraft may be under the control of a public agency or privately owned and used for public purposes (49 U.S.C. § 47102(21)).

19. **Putrescible waste.** Solid waste that contains organic matter capable of being decomposed by micro-organisms and of such a character and proportion as to be capable of attracting or providing food for birds (40 CFR §257.3-8).

20. **Putrescible-waste disposal operation.** Landfills, garbage dumps, underwater waste discharges, or similar facilities where activities include processing, burying, storing, or otherwise disposing of putrescible material, trash, and refuse.

21. **Retention ponds.** Storm water management ponds that hold water for several months.

22. **Runway protection zone (RPZ).** An area off the runway end to enhance the protection of people and property on the ground (see AC 150/5300-13). The dimensions of this zone vary with the airport design, aircraft, type of operation, and visibility minimum.

23. **Scheduled air carrier operation.** Any common carriage passenger-carrying operation for compensation or hire conducted by an air carrier or commercial

operator for which the air carrier, commercial operator, or their representative offers in advance the departure location, departure time, and arrival location. It does not include any operation that is conducted as a supplemental operation under 14 CFR Part 119 or as a public charter operation under 14 CFR Part 380 (14 CFR § 119.3).

24. **Sewage sludge.** Any solid, semi-solid, or liquid residue generated during the treatment of domestic sewage in a treatment works. Sewage sludge includes, but is not limited to, domestic septage; scum or solids removed in primary, secondary, or advanced wastewater treatment process; and a material derived from sewage sludge. Sewage does not include ash generated during the firing of sewage sludge in a sewage sludge incinerator or grit and screenings generated during preliminary treatment of domestic sewage in a treatment works. (40 CFR 257.2)

25. **Sludge.** Any solid, semi-solid, or liquid waste generated form a municipal, commercial or industrial wastewater treatment plant, water supply treatment plant, or air pollution control facility or any other such waste having similar characteristics and effect. (40 CFR 257.2)

26. **Solid waste.** Any garbage, refuse, sludge, from a waste treatment plant, water supply treatment plant or air pollution control facility and other discarded material, including, solid liquid, semisolid, or contained gaseous material resulting from industrial, commercial, mining, and agricultural operations, and from community activities, but does not include solid or dissolved materials in domestic sewage, or solid or dissolved material in irrigation return flows or industrial discharges which are point sources subject to permits under section 402 of the Federal Water Pollution Control Act, as amended (86 Stat. 880), or source, special nuclear, or by product material as defined by the Atomic Energy Act of 1954, as amended, (68 Stat. 923). (40 CFR 257.2)

27. **Turbine-powered aircraft.** Aircraft powered by turbine engines including turbojets and turboprops but excluding turbo-shaft rotary-wing aircraft.

28. **Turbine-use airport.** Any airport that sells Jet-A fuel for fixed-wing turbine-powered aircraft.

29. **Wastewater treatment facility.** Any devices and/or systems used to store, treat, recycle, or reclaim municipal sewage or liquid industrial wastes, including Publicly Owned Treatment Works (POTW), as defined by Section 212 of the Federal Water Pollution Control Act (P.L. 92-500) as amended by the Clean Water Act of 1977 (P.L. 95-576) and the Water Quality Act of 1987 (P.L. 100-4). This definition includes any pretreatment involving the reduction of the amount of pollutants, the elimination of pollutants, or the alteration of the nature of pollutant properties in wastewater prior to or in lieu of discharging or otherwise introducing such pollutants into a POTW. (See 40 CFR Section 403.3 (q), (r), & (s)).

30. Wildlife. Any wild animal, including without limitation any wild mammal, bird, reptile, fish, amphibian, mollusk, crustacean, arthropod, coelenterate, or other invertebrate, including any part, product, egg, or offspring thereof (50 CFR 10.12, *Taking, Possession, Transportation, Sale, Purchase, Barter, Exportation, and Importation of Wildlife and Plants*). As used in this AC, wildlife includes feral animals and domestic animals out of the control of their owners (14 CFR Part 139, Certification of Airports).

31. Wildlife attractants. Any human-made structure, land-use practice, or human-made or natural geographic feature that can attract or sustain hazardous wildlife within the landing or departure airspace or the airport's AOA. These attractants can include architectural features, landscaping, waste disposal sites, wastewater treatment facilities, agricultural or aquaculture activities, surface mining, or wetlands.

32. Wildlife hazard. A potential for a damaging aircraft collision with wildlife on or near an airport.

33. Wildlife strike. A wildlife strike is deemed to have occurred when:

a. A pilot reports striking 1 or more birds or other wildlife;

b. Aircraft maintenance personnel identify aircraft damage as having been caused by a wildlife strike;

c. Personnel on the ground report seeing an aircraft strike 1 or more birds or other wildlife;

d. Bird or other wildlife remains, whether in whole or in part, are found within 200 feet of a runway centerline, unless another reason for the animal's death is identified;

e. The animal's presence on the airport had a significant negative effect on a flight (i.e., aborted takeoff, aborted landing, high-speed emergency stop, aircraft left pavement area to avoid collision with animal) (Transport Canada, Airports Group, *Wildlife Control Procedures Manual*, Technical Publication 11500E, 1994).

Federal Aviation Administration

Advisory Circular

Subject: CONSTRUCTION OR ESTABLISHMENT OF LANDFILLS NEAR PUBLIC AIRPORTS

Date: January 26, 2006
Initiated by: AAS-300

AC No: 150/5200-34A
Change:

1. Purpose.

This advisory circular (AC) contains guidance on complying with Federal statutory requirements regarding the construction or establishment of landfills near public airports.

2. Application.

The guidance contained in the AC is provided by the Federal Aviation Administration (FAA) for use by persons considering the construction or establishment of a new municipal solid waste landfill (MSWLF) near a public airport. Guidance contained herein should be used to comply with MSWLF site limitations contained in 49 U.S.C. § 44718(d), as amended by section 503 of the Wendell H. Ford Aviation Investment and Reform Act for the 21st Century, Pub. L. No. 106-181 (April 5, 2000), "Structures interfering with air commerce." In accordance with § 44718(d), as amended, these site limitations are not applicable in the State of Alaska.

In addition, this AC provides guidance for a state aviation agency desiring to petition the FAA for an exemption from the requirements of § 44718(d), as amended.

3. Cancellation

This AC cancels AC 150/52300-34, *Construction or Establishment of Landfills Near Public Airports*, dated August 8, 2000.

This revision contains no substantive changes to the original. Changes include revised and new website addresses, revised strike statistics, and regulation titles.

4. Related Reading Materials.

AC - 150/5200-33, *Hazardous Wildlife Attractions On or Near Airports*.

Wildlife Strikes to Civil Aircraft in the United States. FAA Wildlife Aircraft Strike Database Serial Reports.

Report to Congress: *Potential Hazards to Aircraft by Locating Waste Disposal Sites in the Vicinity of Airports,* April 1996, DOT/FAA/AS/96-1.

Title 14, Code of Federal Regulation, Part 139, Certification of Airports.

Title 40, Code of Federal Regulation, Part 258, Municipal Solid Waste Landfill Criteria.

Some of these documents and additional information on wildlife management, including guidance on landfills, are available on the FAA's Airports web site at http://www.faa.gov/airports_airtraffic/airports/ or http://wildlife-mitigation.tc.faa.gov

5. Definitions.

Definitions for the specific purpose of this AC are found in Appendix 1.

6. Background.

The FAA has the broad authority to regulate and develop civil aviation under the Federal Aviation Act of 1958, 49 U.S.C. § 40101, et. seq., and other Federal law. In section 1220 of the Federal Aviation Reauthorization Act of 1996, Pub. L. No. 104-264 (October 9, 1996), the Congress added a new provision, section (d), to 49 U.S.C. § 44718 to be enforced by the FAA and placing limitations on the construction or establishment of landfills near public airports for the purposes of enhancing aviation safety. Section 503 of the Wendell H. Ford Aviation Investment and Reform Act for the 21st Century (AIR-21), Pub. L. No. 106-181 (April 5, 2000) replaced section 1220 of the 1996 Reauthorization Act, 49 U.S.C. § 44718 (d), with new language. Specifically, the new provision, § 44718(d), as amended, was enacted to further limit the construction or establishment of a municipal solid waste landfill (MSWLF) near certain smaller public airports.

In enacting this legislation, Congress expressed concern that a MSWLF sited near an airport poses a potential hazard to aircraft operations because such a waste facility attracts birds. Statistics support the fact that bird strikes pose a real danger to aircraft. An estimated 87 percent of the collisions between wildlife and civil aircraft occurred on or near airports when aircraft are below 2,000 feet above ground level (AGL). Collisions with wildlife at these altitudes are especially dangerous as aircraft pilots have minimal time to recover from such emergencies.

The FAA National Wildlife Aircraft Strike Database shows that more than 59,000 civil aircraft sustained reported strikes with wildlife from 1990 to 2004. Between 1990-2004, aircraft-wildlife strikes involving U. S. civil aircraft resulted in over $495 million/year worth of aircraft damage and associated losses and over 631,000 hours/year of aircraft down time.

From 1990 to 2004, waterfowl, gulls and raptors were involved in 77% of the 3,493 reported damaging aircraft-wildlife strikes where the bird was identified. Populations of Canada geese and many species of gulls and raptors have increased markedly over the last several years. Further, gulls and Canada geese have adapted to urban and suburban environments and, along with raptors and turkey vultures, are commonly found feeding or loafing on or near landfills.

In light of increasing bird populations and aircraft operations, the FAA believes locating landfills in proximity to airports increases the risk of collisions between birds and aircraft. To address this concern, the FAA issued AC 150/5200-33, *Hazardous Wildlife Attractions On or Near Airports*, to provide airport operators and aviation planners with guidance on minimizing wildlife attractants. AC 150/5200-33 recommends against locating municipal solid waste landfills within five statute miles of an airport if the landfill may cause hazardous wildlife to move into or through the airport's approach or departure airspace.

7. General.

Using guidance provided in the following sections, persons considering construction or establishment of a landfill should first determine if the proposed facility meets the definition of a new MSWLF (see Appendix 1). Section 44718(d), as amended, applies only to a new MSWLF. It does not apply to the expansion or modification of an existing MSWLF, and does not apply in the State of Alaska. If the proposed landfill meets the definition of a new MSWLF, its proximity to certain public airports (meeting the criteria specified in Paragraph 8 below) should be determined. If it is determined that a new MSWLF would be located within six miles of such a public airport, then either the MSWLF should be planned for an alternate location more than 6 miles from the airport, or the MSWLF proponent should request the appropriate State aviation agency to file a petition for an exemption from the statutory restriction.

In addition to the requirements of § 44718(d), existing landfill restrictions contained in AC 150/5200-33, *Hazardous Wildlife Attractions On or Near Airports* (see Paragraph 5, Background) also may be applicable. Airport operators that have accepted Federal funds have obligations under Federal grant assurances to operate their facilities in safe manner and must comply with standards prescribed in advisory circulars, including landfill site limitations contained in AC 150/5200-33.

8. Landfills Covered by the Statute.

The limitations of § 44718(d), as amended, only apply to a new MSWLF (constructed or established after April 5, 2000). The statutory limitations are not applicable where construction or establishment of a MSWLF began on or before April 5, 2000, or to an existing MSWLF (received putrescible waste on or before April 5, 2000). Further, an existing MSWLF that is expanded or modified after April 5, 2000, would not be held to the limitations of § 44718(d), as amended.

9. Airports Covered by the Statute.

The statutory limitations restricting the location of a new MSWLF near an airport apply to only those airports that are recipients of Federal grants (under the Airport and Airway Improvement Act of 1982, as amended, 49 U.S.C. § 47101, *et se*q.) and primarily serve general aviation aircraft and scheduled air carrier operations using aircraft with less than 60 passenger seats.

While the FAA does not classify airports precisely in this manner, the FAA does categorize airports by the type of aircraft operations served and number of annual passenger enplanements. In particular, the FAA categorizes public airports that serve air carrier operations. These airports are known as commercial service airports, and receive scheduled passenger service and have 2,500 or more enplaned passengers per year.

One sub-category of commercial service airports, nonhub primary airports, closely matches the statute requirement. Nonhub primary airports are defined as commercial service airports that enplane less than 0.05 percent of all commercial passenger enplanements (0.05 percent equated to 352,748 enplanements in 2004) but more than 10,000 annual enplanements. While these enplanements consist of both large and small air carrier operations, most are conducted in aircraft with less than 60 seats. These airports also are heavily used by general aviation aircraft, with an average of 81 based aircraft per nonhub primary airport.

In addition, the FAA categorizes airports that enplane 2,500 to 10,000 passengers annually as non-primary commercial service airports, and those airports that enplane 2,500 or less passengers annually as general aviation airports. Both types of airports are mainly used by general aviation but in some instances, they have annual enplanements that consist of scheduled air carrier operations conducted in aircraft with less than 60 seats. Of the non-primary commercial service airports and general aviation airports, only those that have scheduled air carrier operations conducted in aircraft with less than 60 seats would be covered by the statute. The statute does not apply to those airports that serve only general aviation aircraft operations.

To comply with the intent of the statute, the FAA has identified those airports classified as nonhub primary, non-primary commercial service and general aviation airports that:

1. Are recipients of Federal grant under 49 U.S.C. § 47101, et. seq.;

2. Are under control of a public agency;

3. Serve scheduled air carrier operations conducted in aircraft with less than 60 seats; and

4. Have total annual enplanements consisting of at least 51% of scheduled air carrier enplanements conducted in aircraft with less than 60 passenger seats.

Persons considering construction or establishment of a new MSWLF should contact the FAA to determine if an airport within six statute miles of the new MSWLF meets these criteria (see paragraph 11 below for information on contacting the FAA). If the FAA determines the airport does meet these criteria, then § 44718(d), as amended, is applicable.

An in-depth explanation of how the FAA collects and categorizes airport data is available in the FAA's National Plan of Integrated Airport Systems (NPIAS). This report and a list of airports classified as nonhub primary, non-primary commercial service and general aviation airports (and associated enplanement data) are available on the FAA's Airports web site at http://www.faa.gov/airports_airtraffic/airports/planning_capacity/.

10. Separation distance measurements.

Section 44718(d), as amended, requires a minimum separation distance of six statute miles between a new MSWLF and a public airport. In determining this distance separation, measurements should be made from the closest point of the airport property boundary to the closest point of the MSWLF property boundary. Measurements can be made from a perimeter fence if the fence is co-located, or within close proximity to, property boundaries. It is the responsibility of the new MSWLF proponent to determine the separation distance.

11. Exemption Process.

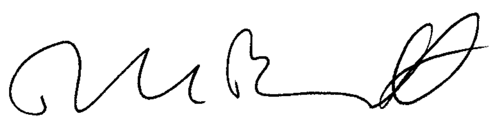
Under § 44718(d), as amended, the FAA Administrator may approve an exemption from the statute's landfill location limitations. Section 44718(d), as amended, permits the aviation agency of the state in which the airport is located to request such an exemption from the FAA Administrator. Any person desiring such an exemption should contact the aviation agency in the state in which the affected airport is located. A list of state aviation agencies and contact information is available at the National Association of State Aviation Officials (NASAO) web site at www.nasao.org or by calling NASAO at (301) 588-1286.

A state aviation agency that desires to petition the FAA for an exemption should notify the Regional Airports Division Manager, in writing, at least 60 days prior to the construction of a MSWLF. The petition should explain the nature and extent of relief sought, and contain information, documentation, views, or arguments that demonstrate that an exemption from the statute would not have an adverse impact on aviation safety. Information on contacting FAA Regional Airports Division Managers can be found on the FAA's web site at www.faa.gov.

After considering all relevant material presented, the Regional Airports Division Manager will notify the state agency within 30 days whether the request for exemption has been approved or denied. The FAA may approve a request for an exemption if it is determined that such an exemption would have no adverse impact on aviation safety.

12. Information.

For further information, please contact the FAA's Office of Airport Safety and Standards, Airport Safety and Operations Division, at (800) 842-8736, Ext. 7-3085 or via email at WebmasterARP@faa.gov. Any information, documents and reports that are available on the FAA web site also can be obtained by calling the toll-free telephone number listed above.



DAVID L. BENNETT
Director, Office of Airport Safety and Standards

APPENDIX 1. DEFINITIONS.

The following are definitions for the specific purpose of this advisory circular.

Construct a municipal solid waste landfill (MSWLF) means excavate or grade land, or raise structures, to prepare a municipal solid waste landfill as permitted by the appropriate regulatory or permitting authority.

Establish a municipal solid waste landfill (MSWLF) means receive the first load of putrescible waste on site for placement in a prepared municipal solid waste landfill.

Existing municipal solid waste landfill (MSWLF) means a municipal solid waste landfill that received putrescible waste on or before April 5, 2000.

General aviation aircraft means any civil aviation aircraft not operating under 14 CFR Part 119, Certification: Air carriers and commercial operators.

Municipal solid waste landfill (MSWLF) means publicly or privately owned discrete area of land or an excavation that receives household waste, and that is not a land application unit, surface impoundment, injection well, or waste pile, as those terms are defined under 40 CFR § 257.2. A MSWLF may receive other types of RCRA subtitle D wastes, such as commercial solid waste, nonhazardous sludge, small quantity generator waste and industrial solid waste, as defined under 40 CFR § 258.2. A MSWLF may consist of either a standalone unit or several cells that receive household waste.

New municipal solid waste landfill (MSWLF) means a municipal solid waste landfill that was established or constructed after April 5, 2000.

Person(s) means an individual, firm, partnership, corporation, company, association, joint-stock association, or governmental entity. It includes a trustee, receiver, assignee, or similar representative of any of them (14 CFR Part 1).

Public agency means a State or political subdivision of a State; a tax-supported organization; or an Indian tribe or pueblo (49 U.S.C. § 47102(15)).

Public airport means an airport used or intended to be used for public purposes that is under the control of a public agency; and of which the area used or intended to be used for landing, taking off, or surface maneuvering of aircraft is publicly owned (49 U.S.C. § 47102(16)).

Putrescible waste means solid waste which contains organic matter capable of being decomposed by micro-organisms and of such a character and proportion as to be capable of attracting or providing food for birds (40 CFR § 257.3-8).

Scheduled air carrier operation means any common carriage passenger-carrying operation for compensation or hire conducted by an air carrier or commercial operator for which the air carrier, commercial operator, or their representatives offers in advance the departure location, departure time, and arrival location. It does not include any operation that is conducted as a supplemental operation under 14 CFR Part 119, or is conducted as a public charter operation under 14 CFR Part 380 (14 CFR § 119.3).

Solid waste means any garbage, or refuse, sludge from a wastewater treatment plant, water supply treatment plant, or air pollution control facility and other discarded material, including solid, liquid, semi-solid, or contained gaseous material resulting from industrial, commercial, mining, and agricultural operations, and from community activities, but does not include solid or dissolved materials in domestic sewage, or solid or dissolved materials in irrigation return flows or industrial discharges that are point sources subject to permit under 33 U.S.C. § 1342, or source, special nuclear, or by-product material as defined by the Atomic Energy Act of 1954, as amended (68 Stat. 923) (40 CFR § 258.2).

Appendix A-4:

Meeting Notes
September 7, 2010 Meeting with
St. Louis Airport Authority

Summary of Airport Meeting

On September 7, 2010, representatives of Bridgeton Landfill LLC and the Environmental Protection Agency met with representatives of the St. Louis Airport Authority. The following persons attended the meeting:

Mario Pandolfo, legal services manager for the City of St. Louis/Lambert Airport
Joletta Golik, environment/health & safety manager for Lambert Airport
Robert C. Alexander, Jr., US Dept. of Agriculture/APHIS/Wildlife Services
Bill Beck, outside counsel (Lathrop & Gage) on behalf of Bridgeton Landfill
Dan Gravatt, EPA Region 7
Cheryle Micinski, EPA Region 7
David Vasbinder, environmental health & safety for Bridgeton Landfill
Jessie Merrigan, outside counsel (Lathrop & Gage) for Bridgeton Landfill
Kate Whitby, local counsel (Spencer Fane) for Bridgeton Landfill
Joseph Nassif, outside counsel (Husch Blackwell) for the Airport
Gerard Slay, Senior Deputy Director/COO, St. Louis Airport Authority

The meeting was requested by EPA to follow up on concerns raised by the PRPs that the Negative Easement recorded on the property would prohibit construction of the “on-site cell” evaluated as part of the Supplemental Feasibility Study.

Cheryle Micinski provided background on the site and the administrative process to date. Dan Gravatt provided a summary of the alternatives considered in the SFS – the ROD remedy; full excavation and disposal of all radiologically-contaminated materials off-site; and full excavation and disposal of all radiologically-contaminated materials in a new on-site cell.

Outside counsel for the Airport raised multiple questions about the logistics of an excavation remedy and any efforts thus far to estimate the risks created by such a remedy. He then stopped the discussion to state that the Airport could not accept the significant risks that would be created by an excavation remedy – either for on-site or off-site disposal.

The Airport representatives passed around (but did not provide copies of) a document displaying the actual flight paths used by aircraft at the Airport. This diagram showed multiple flight patterns extending directly over the Landfill. The Airport representatives also mentioned statistics indicating a significant decrease in bird strikes since the 2005 closure of the sanitary landfill at the site.

Senior Deputy Director Gerard Slay stated that use of the rail loading facility located at the Airport (as presumed by the SFS for the excavation and off-site disposal alternative) would not work for the Airport.

Airport representatives, including USDA, also stated that an excavation remedy would create risks that they could not even calculate, and that monitoring and management of risks created by wildlife would be impossible. They noted that under the ROD remedy the site will present no risk to human health or the environment, and said that creating new risks by implementing an excavation remedy did not seem advisable.

The representative for USDA noted that he investigated multiple wildlife vectors during the investigation and study processes for the SLAPS and Weldon Springs sites, including not only birds but other wildlife which might remove and ingest or otherwise disperse radiological materials made accessible by an excavation remedy. He suggested that the same issues would be problematic at West Lake.

The Airport representatives stated that while they would expect any damages (to aircraft, etc.) to be paid for by EPA or the PRPs, the risks of a bird strike or other adverse impacts on the Airport would still be unacceptable. They stated that this would necessitate FAA review of either an on-site or off-site excavation remedy and likely would result in objections from airlines as well as the FAA. The Airport representatives were particularly concerned that either excavation alternative would take years to perform.

Cheryle Micinski asked whether the Airport's concerns would be alleviated by excavation of only Area 2 (outside the 10,000 foot range). The unanimous response was no. They stated that the entire area is within the Negative Easement and subject to FAA review if "new landfilling operations" were to occur. In particular, they explained that construction of an on-site disposal cell would <u>not</u> qualify as an expansion or change to an existing landfill, but would instead constitute "new operations" at the site and therefore would trigger FAA review. They also could not predict the changes that any excavation activities would cause to the migratory patterns of birds using the site, and could not take the risk that such changes would increase the local bird population.

In 2006 the Airport submitted a comment letter in support of the ROD remedy. While the Airport representatives believe that this letter still accurately states their position, the Airport's outside counsel indicated that he wants to revisit the possible exposure of MSW waste during any regrading or contouring activities under the ROD Remedy.

The Airport representatives concluded the meeting by indicating that their attendees were unanimous in viewing any excavation remedy for the site as unwarranted and unacceptable to the Airport because of the increased risks to aircraft that would be created by such a remedy.

EPA asked that the Airport confirm this view in writing. The Airport representatives stated that they would provide a letter outlining their concerns about the risks created by an excavation remedy and the regulatory and other barriers which would impact such a remedy. They indicated that they would try to send such a letter to EPA prior to the September 22nd technical meeting.

The Airport representatives emphasized that while they work hard to cooperate with EPA, they could not accept the known and significant risks that an excavation remedy would cause to airport operations.

EPA asked the USDA representative for a similar letter confirming USDA's concerns in writing, and he said that he did not have counsel for this project, but would attempt to get such a letter prepared.

September 20, 2010

Mr. Daniel Gravatt
Project Manager/Environmental Scientist
U.S. EPA – Region 7
901 North 5th Street
Kansas City, Kansas 66101

Re: West Lake Landfill: Comments on Work Plan for Supplemental Feasibility Study

Dear Mr. Gravatt:

As requested, the City of St. Louis ("the City"), the owner and operator of Lambert-St. Louis International Airport® ("Airport") has reviewed the June 4, 2010 Work Plan for Supplemental Feasibility Study Radiological-Impacted Material Excavation Alternatives Analysis: West Lake Landfill Operable Unit-1 ("Work Plan"). The City supports the Environmental Protection Agency's ("EPA") evaluation of remedial alternatives to address radiologically contaminated materials located at the West Lake Landfill (formerly known as the Bridgeton Landfill). The City takes seriously the presence of radioactive materials at the West Lake Landfill and the long term impact those radioactive materials may have on water resources. The City urges EPA to select a remedy for the cleanup of the West Lake Landfill radioactive wastes that is practical and ensures that these wastes no longer pose a threat to human health and the environment. However, the City must ensure that any action involving the West Lake Landfill does not unnecessarily jeopardize the City's public safety obligations with respect to Airport and its operations.

The Federal Aviation Administration ("FAA") and United States Department of Agriculture, Animal and Plant Health Inspection Service, Wildlife Services ("USDA") previously determined that the West Lake Landfill was a hazardous wildlife attractant for the Airport. *See* June 2004 Lambert – St. Louis International Airport Wildlife Hazard Assessment for the Bridgeton Sanitary Landfill. The West Lake Landfill is located, at its closest point, within approximately 9,166 feet of Airport Runway 11/29 (formerly 12W/30W), which is inconsistent with FAA runway siting guideline requiring a 10,000 foot separation radius. *See* FAA Advisory Circular 150/5200 33B (Hazardous Wildlife Attractants on or near Airports). The FAA, in a September 1998 Record of

Decision ("1998 FAA ROD") concerning expanded operations at the Airport, directed the City to mitigate the West Lake Landfill to protect aircraft from bird strikes at the Airport. *See* September 30, 1998 FAA Record of Decision: Lambert-St. Louis International Airport, pg. 42 - 43. Pursuant to the requirements of the 1998 FAA ROD, the City entered into the Negative Easement Agreement ("NEA") with the Bridgeton Landfill operators, at significant cost, to prohibit depositing or dumping of new or additional putrescible waste on the entirety of the property after August 1, 2005, and to require the landfill operators to comply with laws and regulations concerning proper landfill cover, so as to reduce or mitigate wildlife hazards to aircraft and airport facilities. *See* Negative Easement Agreement at pg. 2 – 3. The restrictive covenants in the NEA for the Bridgeton Landfill, along with other FAA required programs, have successfully mitigated aircraft bird strikes at the Airport, and particularly runway 11/29 (formerly 12W/30W). *See* Lambert St. Louis International Airport 2005 – 2010 Bird Strike Report Summary. Although these FAA restrictions and requirements may be mentioned as guidance in the feasibility study undertaken at the insistence of EPA, we are informed that these restrictions should be considered applicable or relevant and appropriate requirements for remedy selection purposes.

After consultation with Airport engineers and USDA Wildlife Services staff, the City believes that the excavation alternatives described in the Work Plan would adversely affect wildlife mitigation measures taken by the Airport to protect aircraft from bird strikes; thereby placing the City in violation of the 1998 FAA ROD requiring that such mitigation efforts be undertaken and maintained. In addition, such action on the part of the former landfill operators would violate the NEA. The primary issue here is aircraft and passenger safety. Bird studies conducted by the USDA have identified 11 of the top 15 most hazardous bird species to aircraft (damage and effect on flight) at the West Lake Landfill and surrounding areas. Many of these bird species, which include vultures, geese, hawks, gulls, owls and pigeons, have been reported in the approximately 600+ bird strike incidents that have occurred at the Airport since the 1990s. The USDA Wildlife Service has advised the City that uncovered radiologically impacted municipal waste at the West Lake Landfill will serve as a food attractant for a variety of bird species and increase the risk of bird/aircraft strikes at the Airport. *See* September 17, 2010 USDA letter to the Airport.

The Work Plan contemplates that municipal waste in the landfill will be removed by excavation and disposed on the property during the creation of the on-site engineered disposal cell, in direct violation of Paragraph 1 of the NEA. Further, the radioactive municipal waste materials will remain exposed at the site throughout the duration of excavation and landfill activities without a daily cover, which is in violation of Missouri Solid Waste Regulation 10 CSR 80-3 (17)(C)(1) and Paragraph 2 of the NEA. Moreover, based on anticipated waste volumes and available funding, the response action contemplated in the Work Plan would, rationally speaking, appear to be a ten to twenty year effort. The FAA considers any facility handling uncovered quantities of municipal solid waste outside, even if only for a short time, incompatible with safe airport operations if they are located within a 10,000 foot radius of an active airport runway. *See* FAA Advisory Circular 150/5200 33B (Hazardous Wildlife Attractants On or Near

Airports) at pg. 4, § 2 – 2. Thus, the presence of uncovered municipal solid waste at the West Lake Landfill may place the City in violation of 1998 FAA ROD. The Work Plan does not explain how the Respondents/Operators will comply with the terms of the NEA or Missouri Solid Waste Regulation daily landfill soil cover requirements during excavation and transport of contaminated municipal solid waste from the landfill. Any remediation objective selected by EPA for the West Lake Landfill must ensure that the remediation activities do not create a wildlife attractant that presents an intolerable risk of aircraft bird strikes at the Airport.

The excavation, movement and transportation of radiologically impacted municipal waste required during the response action at the West Lake Landfill is consistent with the characteristics of an operational solid waste landfill, as described in the Missouri Solid Waste Regulations. As a result, certain operational requirements (i.e. daily cover and surface water management) and landfill site selection standards (i.e. airport safety, flood plains, wetlands, seismic impact zones and unstable areas) will apply to the excavation alternatives described in the Work Plan. _See_ 10 CSR 80-3.010 (4)(B)(1 – 6); 10 CSR 80-3.010(1)(C) (classifying non-compliant sanitary landfills as open dumps that are prohibited by law).

Missouri Solid Waste Regulations prohibit landfill operations within a 10,000 foot (3,048 meters) radius of any airport runway end used by turbojet aircraft unless the operators can demonstrate that the landfill operations pose no bird hazard to aircraft. _See_ 10 CSR §80-3 (Sanitary Landfill). The Respondents/Operators must demonstrate the remediation activities at the Bridgeton Landfill, portions of which are located within a 10,000 foot radius of the Airport's runway 11/29, do not pose a hazard to aircraft using the Airport's facilities; or at the very least, do not increase the likelihood of bird/aircraft collisions. _See_ Lambert – St. Louis International Airport Expansion Runway to Landfill Distance Study. It is very likely that the excavation and disposal alternatives contemplated in the Work Plan will disrupt the wildlife mitigation efforts undertaken by the City pursuant to the 1998 FAA ROD, and increase the likelihood of bird/aircraft collisions at the Airport. FAA Advisory Circular 150/5200 – 33B suggests that Respondents/Operators will not be able to mitigate the risk of wildlife strikes to aircraft during excavation and disposal activities at the Bridgeton/West Lake Landfill; as no facility has been able to demonstrate an ability to reduce and sustain hazardous wildlife to levels that existed before the putrescible–waste landfill began operating. _See_ Hazardous Wildlife Attractants On or Near Airports - Advisory Circular 150/5200 – 33B. In fact, FAA does not even allow landfill operators to conduct demonstrations of experimental wildlife control measures within a 10,000 foot radius of an airport because of this perfect failure rate. _Id._ Thus, it seems that the Respondents/Operators will not be able to demonstrate that excavation and landfill activities at the Bridgeton/West Lake Landfill do not pose a threat to aviation operations at the Airport, particularly since the FAA /USDA have already determined that the municipal waste operations at the Bridgeton/West Lake Landfill are a hazardous wildlife attractant for the Airport. _See_

June 2004 Lambert – St. Louis International Airport Wildlife Hazard Assessment for the Bridgeton Sanitary Landfill.[1]

Missouri Solid Waste Regulations also require all operating solid waste disposal sites to cover "disposed solid waste with six inches of earthen material at the end of each operating day, or at more frequent intervals, as necessary, to control disease vectors, fires, odors, blowing litter and scavenging . . .". *See* 10 CSR 80-3 (17)(C)(1). Missouri's Solid Waste Regulations should be applicable to the remediation activities contemplated at the West Lake Landfill, which consist of exposing municipal/putrescible waste that may attract wildlife, disease vectors, blowing liter and risks of fire. The risk of creating a wildlife attractant near the Airport mandates that Respondents/Operators comply with Missouri daily landfill cover requirements during any excavation or disposal activities at the West Lake Landfill. The necessity of compliance with 10 CSR 80-3(17) may further complicate the remediation objectives by creating additional quantities of radiologically contaminated soils for disposal and increase cost and duration estimates contemplated under the Work Plan. However, any failure to comply with the daily cover requirements would create an unacceptable risk to aviation operations at the Airport. The lack of daily cover would also contribute to the distribution of low level radioactive contamination throughout the site by allowing surface waters to come in contact with uncovered radiologically contaminated municipal waste material, and possibly air blown dust, without adequate controls. Missouri Solid Waste Regulations require all active solid waste disposal sites to minimize environmental hazards and conform to applicable ground and surface water quality standards. *See* 10 CSR 80-3 (8). The Work Plan does not explain how the Respondents/Operator's will manage daily landfill cover requirement, or the surface waters and wind blown dust that come into contact with radiologically-impacted waste materials exposed during remediation activities.

The City is also concerned that Respondents/Operators have not identified a viable disposal location for the radiologically-impacted municipal wastes and soils that will be excavated from the West Lake Landfill. The proposed on-site engineered disposal cell location (OU-2 Stockpile Area) is not an appropriate site for long term storage of the radiologically impacted waste due to regulatory and capacity restrictions, and there is no licensed treatment, storage or disposal facility that may accept a mixture of radiologically impacted soils and municipal waste. The Work Plan indicates that the existing OU-2 Stockpile Area is the only location on the West Lake Landfill property that the on-site engineered disposal cell may be sited due to the geomorphic flood plain. However, this location, approximately 8,000 feet from the Airport, is incompatible with

---

[1] Similar to the Missouri solid waste regulations, the Missouri legislature specifically promulgated legally applicable requirements prohibiting the creation or establishment of airport hazards within 2 miles (10,560 feet) from an airport boundary. *See* Mo. Rev. Stat. § 305 (Aircraft and Airports). Local regulations further prohibit the use of land or water near the Lambert – St. Louis International Airport in such a manner as to create bird strike hazards, or otherwise in any way endanger or interfere with the landing, takeoff, or maneuvering of any aircraft intending to use the airport. *See* St. Louis County, Missouri Ordinance 1003.161 (Air Navigation Space Regulations – including height restrictions for structures near the Airport). To the extent remediation activities at the Bridgeton Landfill present a risk of bird/aircraft strikes, such activities are contrary to the interests of public health, safety and general welfare; and a violation of Missouri zoning laws.

state and federal regulations that prohibit the placement of a new solid waste disposal site within a 10,000 foot radius of an active runway, with one statute requiring a minimum separation 6 miles between the airport and a new disposal location. *See* 40 CFR §258.10 (Airport Safety); 40 CFR §258.16 (Closure of Unsafe Landfills); 10 CSR §80-3 (Sanitary Landfill); 49 USC 44718 (Structures Interfering with Air Commerce); FAA Advisory Circular 150/5200 – 34A (Construction or Establishment of Landfills Near Public Airports), *see also*, Negative Easement Agreement. Furthermore, it is not clear that the OU-2 Stockpile Area could accommodate the quantity of radiologically impacted waste (also unknown) that will be excavated from Radiological Areas 1 and 2, which would include additional quantities of contaminated landfill cover material generated on a daily basis. The process of selecting and evaluating a location for the on-site engineered disposal cell must comply with state and federal landfill siting requirements; but sets forth no methodology to address the direct prohibition against placement of a new landfill disposal site within a 10,000 foot radius of an active airport runway.

The EPA Responsiveness Summary and Work Plan also indicate that Respondents/Operators are aware of no licensed treatment, storage or disposal facility that can accept radiologically impacted soils and municipal solid waste; and there are no feasible methods of separating contaminated soils from municipal waste without creating additional unnecessary risks of harm to human health or the environment.

As a final comment, we respect the possibility, however unlikely, that the Earth City Levee System, which protects the area from a 500 year flood event, might be breached and flood waters might cover the current landfill site. However, when the City last reviewed EPA's prior selected remedy, it learned that such a circumstance would have little if any environmental significance in light of steps that would be taken to further cap the existing site under EPA Preferred Alternatives L4/F4. Recognizing that EPA must deal with possibilities and weigh their likelihood at times, the reality is that bird strikes happen at the Airport, even with the current reduction in attractant sites and mitigation measures. No one wants to be in the position of trading risks associated with an unlikelihood or theoretical possibility for reality. Any balancing of risks must take reality into account.

The City reserves the right to amend or provide additional comments concerning the proposed remediation activities at the West Lake Landfill. The City also requests that EPA and/or Respondents provide regular updates concerning their progress toward selecting a remedy for the West Lake Landfill.

Respectfully submitted,

Rhonda Hamm-Niebruegge

Rhonda Hamm-Niebruegge
Director of Airports

Executive Summary

This report details the estimation of the extent of radiologically-impacted material (RIM) within Areas 1 and 2 of Operable Unit 1 (OU-1) at West Lake Landfill, near Bridgeton, Missouri. The three dimensional distribution of RIM was estimated using indicator kriging in order to obtain estimates of the extent and volume of RIM to support final feasibility study (FFS) evaluations associated with potential partial or complete excavation alternatives. The RIM assessment emphasizes obtaining a "best estimate" of the extent of RIM in both Areas 1 and Areas 2 at concentrations in soil exceeding four concentration thresholds: 7.9 pico-Curies per gram (pCi/g), 52.9 pCi/g, 500 pCi/g and 1,000 pCi/g. Additional calculations are provided that (a) assess a range of RIM extents at these thresholds that is reasonably consistent with the sample data assuming that the "best estimate" is an unbiased estimate, to illustrate the uncertainty that exists when estimating the extent of RIM at the scale of the two Areas, and (b) assess the potential for bias in the "best estimate," as well as the directional tendency of any bias.

The main outputs of the calculations are maps of estimated RIM extent together with estimated volumes of RIM at the four concentration thresholds, and estimated volumes of clean (i.e., non-RIM) overburden and set-back material that would be required to be excavated should a complete or partial excavation remedy be selected based upon these RIM volumes. To three significant digits, the "best-estimate" volumes of RIM calculated for Areas 1 and 2, respectively, using the concentration threshold of 7.9 pCi/g (i.e., for the complete rad removal (CRR) alternative) are about 48,200 cubic yards (Area 1) and about 213,000 cubic yards (Area 2), respectively. However, the additional calculations completed to assess bias and uncertainty inherent in these results – which is not atypical of such material volume estimates – suggest that these "best estimates" are likely to be biased low, such that the true volumes likely lie above these best estimate values.

Further, the uncertainty inherent in these estimates could have substantial implications for remedy design and cost. Many aspects of the cost of an excavation remedy alternative would increase as the volume (extent) increases, although the increases may not scale linearly with increasing extent or volume. For purposes of providing approximate extents to support costing of remedy alternatives, additional calculations were deemed unwarranted. However, additional analyses may be warranted if a complete or partial excavation remedy is selected in order to refine the estimates in areas of greatest uncertainty; evaluate and mitigate bias through further discretization of the CDF; and, incorporate information on practical excavation lifts (thicknesses) and other implications for the volume of RIM to be handled.

The work presented in this report was undertaken to estimate the extent of RIM, and associated extents and volumes of RIM and non-RIM material, in support of calculations required for the FFS. Considerable caution is advised regarding the use of these results for any other purposes.

REPORT

Section 1
Introduction

The West Lake Landfill Superfund Site (the Site) is located in Bridgeton, St. Louis County, Missouri. The objective of the study described herein is to estimate the extent of radiologically-impacted material (RIM) within Areas 1 and 2 of Operable Unit 1 (OU-1) at West Lake Landfill, in order to support the costing and design of complete and partial excavation remedy alternatives for a final feasibility study (FFS). A map of Areas 1 and 2 is reproduced in Figure 1. This report describes the method selected to interpolate sample results; the data processing steps; the interpolation steps; and the post-processing steps implemented to obtain a discretized estimate of the continuous three-dimensional (3D) distribution of RIM. Assumptions and limitations are summarized, and a discussion is provided to guide the interpretation and use of the results of the RIM analysis.

Section 2
Method Selection

2.1 Overview

A variety of methods can be used to obtain a 3D estimate of the extent of a subsurface characteristic or property based upon irregularly-spaced sample data. On many occasions, geostatistical methods provide advantages over other techniques for the interpolation of environmental data (see, for example, Reed et. al, 2004). In particular, non-parametric techniques developed within the field of geostatistics have been shown to be robust in the presence of skewed data such as arise commonly in environmental applications (see for example, Deutsch and Journel, 1992; Journel and Deutsch, 1997). Reed et al. (2004) compare various interpolation methods, illustrating several advantages of geostatistical methods as well as the relative benefit of implementations that implement data transforms versus ordinary kriging (OK) of raw sample data to interpolate data characterized by high skewness, such as concentration data. Journel and Deutsch (1997) also detail the use of rank-order geostatistics, wherein sample data values are transformed into standardized ranks. For example, when undertaking Quantile Kriging (QK), a uniform-score "rank" transform is applied to the raw sample data, wherein the data are ranked in ascending order to define a cumulative distribution function (CDF) between zero and one. The values ascribed to each sampled location from the CDF are then interpolated (generally using OK) to un-sampled locations, such as a grid, and subsequently back-transformed to the original concentration units (Deutsch and Journel, 1992; Journel and Deutsch, 1997; Reed et. al, 2004).

Indicator kriging (IK) can be considered a form of prescribed rank or prescribed category kriging (see for example, Hohn, 1988; Cressie, 1993). The sample data values are compared to threshold concentration levels of interest, such as cleanup standards. In the case of a single concentration threshold, sample values that lie above the threshold are assigned an index value of 1.0, and sample values that lie below the threshold are assigned an index value of 0.0: interpolation of these indexes (typically using OK) results in a continuous distribution of values that range between zero and one that in the simplest case reflect the probability that the criterion is exceeded at the corresponding un-sampled location. When multiple threshold concentrations are of interest, multiple indicator kriging (MIK) can be implemented, wherein sample concentrations are transformed using a CDF to assign to each sample location a probability that each successive threshold concentration is not exceeded at that location: the transformed sample data are interpolated, again typically using OK, and a posterior or conditional CDF (CCDF) is obtained. Indicator kriging can also incorporate secondary or "soft" data in addition to the primary "hard" sample results for the quantity of interest, which can be particularly beneficial when the secondary data are more plentiful than the primary data.

Given the objectives of this task – i.e., to estimate the extent of RIM that is present above a small number of pre-defined concentration thresholds for purposes of the FFS – and the desire to incorporate more than one data type in the interpolation exercise, the extent of RIM within OU-1 Areas 1 and 2 was estimated in 3D using MIK. The MIK method is commonly used to identify regions of the subsurface that exhibit properties that exceed one or more defined threshold criterion and, as such, is well-suited to delineating RIM. Furthermore, as explained in Section 3, there are two distinct data types available as input for the interpolation – hard data in the form of sample results for radionuclides and soft data in the form of gamma and alpha radiation counts – and MIK provides a flexible and expedient mechanism for combining these data types. All kriging calculations were completed using the Fortran-based Geostatistical Library (GSLIB: Deutsch and Journal, 1992) indicator kriging program IK3D, compiled with dynamic memory allocation to facilitate the use of the relatively large soft dataset that is available at West Lake Areas 1 and 2.

2.2 Relationship Between Radium and Thorium Isotopes, Alpha Radiation and Gamma Emissions

Sampling at West Lake landfill OU-1 Areas 1 and 2 includes results for thorium-232 and thorium-230, plus radium-228 and radium-226. Thorium-232 and radium-228 comprise the parent and first daughter isotope of the primordial thorium series: thorium-232 decays to radium-228 via alpha radiation (half-life [$t_{1/2}$] = 1.4×10^{10} years), whereas radium-228 decays primarily via beta radiation ($t_{1/2}$ = 5.7 years). Although decay of thorium-232 does not produce high gamma emissions, decay of some of the daughter isotopes does, and can be used to infer the presence and relative concentration of radium-228. Thorium-230 and radium-226 comprise daughter isotopes of the uranium-238 series: thorium-230 decays to radium-226 via alpha radiation ($t_{1/2}$ = 7.54×10^{4} years), and radium-226 also decays primarily via alpha radiation ($t_{1/2}$ = 1.6×10^{3} years). Decay of the daughter isotopes of radium-226 produces relatively high gamma emissions that can be used to infer the presence and relative concentration of radium-226. The primary radionuclides detected in Areas 1 and 2 are those that arise in the uranium-238 decay series.

Given the foregoing, it might be expected that concentrations of radium and thorium would illustrate a general relation characterized by higher concentrations of one isotope being typically associated with (i.e., detected together with) higher concentrations of the other isotope, and vice-versa. Furthermore, it might be expected that concentrations of radium or thorium would typically be associated with elevated counts of either alpha radiation or gamma energy emissions. Although many factors might result in these relationships not necessarily being simple linear correlations – such as historical material leaching processes for beneficiation and its effect on secular equilibrium; variable decay rates and ingrowth; and the combining of individual radium and thorium isotope results from separate decay chains – empirical confirmation that these relationships exist under current conditions was one premise for the selection of the indicator kriging method to estimate the extent of RIM as detailed in this report.

Figure 2 depicts a scatter plot of radium-226 plus radium-228 concentrations (i.e., combined radium) versus thorium-230 plus thorium-232 concentrations (i.e., combined thorium) for collocated samples from Area 1. The data used to prepare Figure 2 are listed on Table A-1 (Appendix A), and described further in Section 3. Figure 3 depicts a similar scatter plot of combined radium concentrations versus combined thorium concentrations for collocated samples from Area 2. The data used to prepare Figure 3 are listed on Table A-2 (Appendix A), and described further in Section 3. In each of Figure 2 and Figure 3 there is a clear relationship between concentrations of combined radium and combined thorium.

Figure 4 depicts two scatter plots of recorded gamma energy emissions counts versus (a) combined thorium concentration and (b) combined radium concentration for Area 1. Sample data used to prepare Figure 4 are listed on Table A-1 (Appendix A), plotted for visual inspection in Appendix B and described further in Section 3. Figure 5 depicts two scatter plots of recorded gamma energy emissions counts versus (a) combined thorium concentration and (b) combined radium concentration for Area 2. The data used to prepare Figure 5 are listed on Table A-2 (Appendix A), plotted for visual inspection in Appendix B and described further in Section 3. Figures 4 and Figure 5 demonstrate relationships between the concentration of combined radium or the concentration of combined thorium and the gamma counts recorded at the same location, particularly at relatively high concentrations and counts. The strength of the relationship is less clear for combined radium in Area 1 (Figure 4(b)) where radium concentrations and gamma counts are both relatively low. The gamma energy emissions counts used to prepare Figures 4 and 5 are "raw" measurements that have not been corrected for baseline responses: the process of removing baseline responses from alpha and gamma recordings is detailed in Section 3.

2.3 Threshold Concentration Values

Based upon prior correspondence and site reports, the multiple indicator kriging analysis was designed to estimate the extent of RIM present within Area 1 and Area 2 at concentrations exceeding three pre-defined threshold concentrations values – those listed as thresholds 1, 2 and 4 below – that were previously established by U.S. Environmental Protection Agency (USEPA) for remedial evaluation purposes, and also at concentrations exceeding a fourth intermediate threshold value (i.e., threshold 3 below) as follows:

1. Combined radium *or* combined thorium at greater than 7.9 pCi/g
2. Combined radium *or* combined thorium at greater than 52.9 pCi/g
3. Combined radium *or* combined thorium at greater than 500 pCi/g
4. Combined radium *or* combined thorium at greater than 1,000 pCi/g

All data pre- and post-processing for the calculations described in this report emphasize these concentration thresholds. Note that emphasis is placed on the "or" because this also determines how results are evaluated.

Section 3
Data Processing

3.1 Overview of Data Types

The method of MIK as implemented in IK3D can implement ordinary or simple kriging (SK) of either categorically-coded or continuous CDF-type indicator data. IK3D also allows the direct input of previously-transformed indicator data, including soft data. In this sense, the soft data can comprise any quantitative or quantifiable independent information that is correlated with the primary hard sample data values. Because both data types are available for Areas 1 and 2 of OU-1, the use of MIK as implemented with IK3D for the purpose of estimating the extent of RIM in Areas 1 and 2 of OU-1 therefore requires the compilation of:

1. hard sample results, which comprise values of radium and of thorium within landfill soil and waste materials obtained from borings and other samples; and,

2. soft data results, which comprise gamma and alpha responses obtained either within borings (i.e., downhole) or from retrieved core material.

Processing of these hard and soft data types for use in the indicator kriging is described below. Figures 2 and 3 depict the sample locations at Areas 1 and 2, respectively, and identify those locations that possess hard data, soft data, or both data types.

The data used as inputs to these calculations were obtained by a variety of methods, from a variety of sources that reported to varying numbers of significant digits. It is common practice in reporting the results of calculations or measurements that significant digits implicitly indicate the uncertainty in the result: e.g., the last digit is considered uncertain and the larger digits are considered certain. For example, a result reported as 1.23 implies a minimum uncertainty of ±0.01 and a range of 1.22 to 1.24. Because the RIM mass-volume calculations comprise a large number of sequential steps, over-zealous truncation would propagate truncation errors that would render results uninterpretable. Therefore, all RIM mass-volume calculations used as input data at their full reported precision: however, results are tabulated to three significant digits to provide sufficient significant digits to compare results. It is recognized, and described in this report, that the mass-volume calculations are not *accurate* to three significant digits, and the presentation of results to three significant digits should not in this instance be interpreted as implying that there is only uncertainty in the third significant digit.

3.2 Hard Data Processing

Reported values of radium-226 and radium-228 provided by Engineering Management Support Inc. (EMSI) as documented in the Remedial Investigation (RI) Addendum (EMSI, 2016: Table 6-4 and 6-6) were combined to provide a single value for the total combined radium at each sample location. Similarly, reported values of thorium-230 and thorium-232 were combined to provide a single value for the total combined thorium at each sample location. Appendix A Table A-1 lists the individual and combined radium and thorium sample results for Area 1, and Table Appendix A Table A-2 lists the individual and combined radium and thorium sample results for Area 2, as reported in the RI Addendum by EMSI (EMSI, 2016: Table 6-5). These combined sample results were associated with easting and northing coordinates, and with corresponding sample elevations, such that each hard data point comprises an easting coordinate, northing coordinate, elevation, and result value (the result value comprising *either* combined radium *or* combined thorium). These combined values comprised the hard data inputs required to implement independent indicator kriging of combined radium and of combined thorium within each area of OU-1. The following additional hard data processing was completed prior to preparing inputs for the indicator kriging:

1. For duplicate or co-located samples (i.e., replicates), the maximum value was selected.

2. Sample elevations were adjusted following the procedure detailed in section 3.4 for both hard and soft data.

Figures 1 and 2 depict the sample location within Area 1 and Area 2, respectively, and identify which forms of hard and soft data are available at each location.

3.3 Soft Data Processing

The available soft data group broadly into five different types or classes of measurements – i.e., the 2015 and 2016 drilling and characterization efforts (herein identified as "recent") and previously existing data. These comprise recent Gamma Cone Penetration Testing (GCPT) data; recent downhole gamma counts; recent core gamma counts; recent core alpha counts; and gamma count records that were digitized from the previous studies. These data were obtained from several different characterization events at OU-1, and they exhibit different characteristics in terms of the range of response; the baseline response that is not associated with RIM; and the correlation with the primary hard data (i.e., radium and thorium sample results). To accommodate these differences between the data types, the different events and also between individual borings within the same event so that the variation soft data can be incorporated into the indicator kriging in a consistent manner, the gamma and alpha counts were processed in the following manner:

1. Baseline response values were estimated for each class of measurement at each individual borehole or core location. Initial values for these background values were estimated based upon the median and 25th percentile response values for that class of measurement at that boring, and were then updated through a visual review of the plotted data.

2. The estimated baseline response value for each class of measurement at each individual boring was subtracted from the raw measured response.

3. Having removed the estimated baseline response value, the adjusted counts were then normalized by scaling the values to lie between 0 (zero) and 1 (one), providing a normalized response for each class of measurement at each location.

Completion of the above steps results in one or more class of soft data for each boring, each in the form of a normalized (i.e., continuous between 0.0 and 1.0) indicator of the relative response (gamma or alpha count) versus depth within that boring. Appendix B presents plots of the gamma and alpha radiation response profiles for each boring or retrieved core section obtained in Area 1 and Area 2. The raw gamma and alpha responses, the normalized responses, and the hard data are each depicted.

The resulting normalized response could be encoded for use as soft data in the indicator kriging in one of two ways – in either instance, the encoding relies upon a presumed correlation between the normalized response and the presence and concentration of radium or thorium. First, the soft data could be encoded using zeros and ones comprising a discrete CDF: in this case, a value of one would identify that the soft data indicate (essentially, without any associated uncertainty) that the material at that location and depth represent RIM within a specific threshold concentration interval. Alternatively, the soft data could be encoded using a continuous CDF: in this case, the values of the default CDF would increase as the threshold concentration increases, and the normalized response would be used to "shift" the CDF to reflect evidence for the presence of RIM. For example: a relatively high normalized response at a specific location and depth would tend to indicate that there is RIM present at some concentration (the latter depending on the relation between the normalized response and the radium or thorium concentration), which in turn indicates that at that location and depth the probability of *not* exceeding the lower thresholds is relatively low.

For purposes of this analysis, the second approach was used. Where the normalized response data indicated negligible response, a global default CDF was used (as described and presented in Section 7), and this default CDF was updated to reflect increasingly high normalized responses that indicated a likely presence of RIM at the corresponding location and depth.

3.4 Changes in Land Surface Elevation

Two processes have, over time, resulted in changes in surface elevation for Areas 1 and 2 that may also result in a change in the representative elevation for samples and alpha and gamma responses that have been obtained from different borings at different times. The first of these, subsidence, occurs primarily due to the settlement and compaction of landfill waste, and results in a lowered surface elevation over time. The second of these, additional disposal of waste of fill or other materials, results in an increased surface elevation over time. To accommodate this, the following adjustment was made to the sample elevation that is calculated from the entries in Tables 1 and 2 (after EMSI, 2016). These adjustments are only applicable to older borings that have existed for a number of years, over which time subsistence has occurred.

1. Two digital elevation models (DEMs) raster files were obtained from Feezor Engineering Inc. (Feezor), the first representing conditions in the year 2005 (filename: "srf_topo_05127_bridgeton_05.tif") and the second representing conditions in the year 2015 (filename: "srf_03_10_2015.tif").

2. In addition to the above, a raster file was obtained from Feezor (filename: ("srf_v_05_15_compare.tif") representing the difference between the two surfaces represented by the DEM raster files listed above.

    a. A positive value in the elevation difference file "srf_v_05_15_compare.tif" indicates where the 2005 surface elevation was higher than the 2015 surface elevation.

    b. A negative value in the elevation difference file "srf_v_05_15_compare.tif" indicates where the 2005 surface elevation was lower than the 2015 surface elevation.

3. Positive elevation differences were interpreted as dominated by waste material compaction and settlement that may have caused materials that were obtained in previously-completed borings moving deeper within the landfill body. The calculated positive difference at each boring location was used to adjust the reference elevation of any samples obtained from that boring – including both hard data and soft data – such that it moved deeper.

4. Negative elevation differences were interpreted as the addition of new materials above the previous waste, and not to have resulted in a deepening of the sample reference elevations for preexisting borings.

Tables A-1 and A-2 list the combined radium and combined thorium hard data used as input for kriging for Area 1 and Area 2, respectively, following the hard data processing steps detailed above and the elevation adjustments.

Section 4
Kriging Process

4.1 Overview

Estimation of the 3D extent of RIM using MIK of the combined hard and soft data (prepared as detailed in the previous section) was accomplished via the following steps, which are further detailed in the subsections that follow:

- Variogram modeling
- Definition of the interpolation grid
- Preparation of calculation inputs
- Multiple indicator kriging

Calculations were undertaken in two distinct phases:

1. Initial calculations, which were completed to provide timely input to the FFS during May 2016;
2. Additional work undertaken during June and July 2016 to revisit, QA and finalize calculations.

4.2 Variogram Modeling

The weight that ascribed to each sampled value when interpolating at an intermediate un-sampled location using any form of kriging is a function of the separation distance between neighboring sampled values and the spatial autocorrelation between sampled values. When kriging, the variogram is used to describe this spatial correlation, and to compute the interpolation weights.

The empirical or sample variogram constructed from sample data depicts the rate at which the difference between sample values, expressed as a (semi)-variance, increases within increasing separation distance. Ideally, the empirical variogram shows a pattern of strong spatial relationship at relatively small separation distances – indicated by a relatively low variance that reflects a correspondingly high correlation between closely-spaced locations – that diminishes with increasing separation distance until the variance reaches an asymptotic value at which separation distance the relationship between sampled values is negligible. For purposes of kriging, the discontinuous empirical variogram that is obtained from the sample data is represented using one of a number of relatively simple functions that is "fit" to the empirical variogram, thereby guaranteeing that the resulting variogram model will always be mathematically valid and lead to a solvable system of kriging equations.

When undertaking indicator kriging, the indicator variogram describes how often two values separated by a distance *h* lie on the opposite sides of a defined threshold. As such, it quantifies the "lack" of spatial connectivity of values at opposing sides of defined thresholds. The empirical indicator variogram is calculated from the indicator-transformed sample data, and the indicator variogram model is identified by fitting one of the small number of common variogram functions to this indicator-transformed empirical variogram.

The most common variogram models are the linear, the spherical, and the exponential. The main parameters used to describe a single-structure model variogram are the nugget (n), which describes the variance at very small separation distances; the sill (s), which describes the asymptotic limit of the variance of the model variogram or no correlation limit; and the range (r) which describes the separation distance at which the variogram value is asymptotically or practically equivalent to the sill. The value ascribed to the sill does not alter the value of the estimate that is obtained at intermediate locations when kriging; however, it does alter the value of the kriging variance that is obtained at locations. Since kriging variances were not employed for any purpose in this study of the likely extent of RIM, the actual values ascribed to the sills are not of great importance, and emphasis was instead placed upon estimating and modeling the form of the variogram and the range-lengths in the horizontal and vertical directions.

4.2.1 Initial Variogram Models

The use of MIK to evaluate data across multiple thresholds as undertaken for the assessment of RIM at Areas 1 and 2 could employ variograms that are specific to each threshold, resulting in four potentially different variograms to represent one constituent (e.g., combined radium) across four thresholds. However, since a relatively small number of samples exceed the higher threshold values - preventing the development of an empirical variogram to be modeled - a single variogram model was used for all indictor thresholds and emphasis was placed on estimating the directional range-lengths for this single, horizontally-isotropic vertically-anisotropic spherical variogram model, as follows:

- The isotropic variogram range-length in the horizontal direction and the sill were estimated for Areas 1 and 2 separately from the complete set of combined thorium and combined radium sample data obtained from each Area, respectively.
- The initial range-length in the vertical direction was estimated from gamma response data obtained from selected borings: examples are presented for AC-23 for illustration purposes.

The horizontal and vertical empirical variograms and corresponding variogram models that were calculated and used to estimate the extent of RIM for Areas 1 and 2 in initial calculations completed in May 2016 to provide input to the FFS are depicted in Figure 8. On the basis of these initial empirical variograms and associated variogram models, the following parameters were specified for purposes of initial indicator kriging. In all cases, the variogram models are spherical and the nugget (i.e., the near-field variance) was assumed equal to zero:

- Area 1: horizontal range-length = 140 feet; vertical range-length = 10 feet; radium sill = 0.08, thorium sill = 0.045.
- Area 2: horizontal range-length = 200 feet; vertical range-length = 10 feet; radium sill = 0.04, thorium sill = 0.17.

The following are noted regarding the variograms depicted in Figure 8:

- Although the range-lengths of the horizontal and vertical variogram models were defined on the basis of different data types – i.e., the range-length of the horizontal variogram was defined from the radium and thorium sample data, whereas the range-length of the vertical variogram was defined from gamma counts – it is assumed that the sill is equivalent in all directions and is equal to the sill value that is obtained from the horizontal empirical variogram calculated from the radium and thorium sample data in each area, respectively.
- The variogram range length was assumed equal for the radium and thorium sample data within each Area, and was derived on the basis of a visual "fit" to empirical indicator variograms constructed for indicator-transformed values of combined radium and combined thorium corresponding only to the first concentration threshold (i.e., greater than 7.9 pCi/g but less than 52.9 pCi/g: Figure 8, "Threshold 1 Only") and also corresponding to all thresholds, simultaneously (Figure 8, "All Thresholds").

Results of these initial calculations, which were completed to provide timely input to the FFS, are provided in Section 7.

4.2.2 Updated Variogram Models

Following these initial calculations, additional work was undertaken to further evaluate the empirical vertical variogram and corresponding model using the compiled ensemble of available soft data. The objective of this effort was to identify a single most representative variogram model structure and range length based upon all available soft data. For this purpose, one-dimensional empirical variograms were calculated using all available vertical profile records for the five classes of soft data (i.e., GCPT data ["downholeGCPTPointData"]; recent downhole gamma ["borehole response"]; recent core gamma ["core response"]; recent core alpha ["core alpha"]; and recently-digitized gamma ["gamma-digitizedWLHoles"]). These one-dimensional empirical variograms were plotted individually, and then gathered together into each of the five available data classes. The resulting plots are depicted in Appendix C. The plots are graphically overlaid by auto-scaling the (semi-)variance (ordinate) axes to the maximum value for each location/data-class combination: as a result, this gives the appearance that all variograms rise to the same sill but at different range-lengths, whereas the sills actually differ substantially between borings and have not been normalized at this stage.

Following the preparation of these initial plots and their simple graphical overlay, each individual one-dimensional empirical variogram calculated as above was normalized by dividing by the average of the binned (semi-)variances for the corresponding location/data-class, resulting in all *normalized* empirical variograms reaching a similarly-valued "sill" generally at a value slightly larger than 1. For each of the five classes of soft data, a single ensemble average empirical variogram was then calculated by taking a weighted average of the normalized (semi-) variance at each lag distance, where the weight was provided by the number of data pairs. The five resulting ensemble average empirical one-dimensional (vertical) variograms are plotted in Figure 9 for Area 1 (top panel) and Area 2 (bottom panel): also shown in Figure 9 is a single spherical variogram model visually-fitted to the normalized ensemble empirical variograms for both Areas using a range-length of 3.5 feet. The sill value shown in Figure 9 is not instructive or meaningful since it represents a normalized quantity used for plotting purposes only.

On the basis of the multi-boring vertical empirical variograms plotted together by data class in Appendix C, and the variogram model visually fit to the weighted average of these empirical variograms normalized by their average binned (semi-)variance (Figure 9), updated estimates of the extent of RIM and associated calculations were made using the following revised variogram models for Areas 1 and 2 (in each case, using a spherical model variogram structure):

- Area 1: horizontal range-length = 140 feet; vertical range-length = 3.5 feet; radium sill = 0.08, thorium sill = 0.045.
- Area 2: horizontal range-length = 200 feet; vertical range-length = 3.5 feet; radium sill = 0.04, thorium sill = 0.17.

The results of these calculations are provided in Section 7, and compared to the initial calculations provided in May 2016.

4.3 Definition of Interpolation Grid

The interpolation grid for the kriging was defined to provide estimates of the presence or absence of RIM above each threshold concentration on a vertical and horizontal discretization suitable for evaluating partial excavation remedy alternatives based upon 40 CFR § 192.12, as follows:

> Remedial actions shall be conducted so as to provide reasonable assurance that, *as a result of residual radioactive materials from any designated processing site:*
>
> > (a) The concentration of radium-226 in land averaged over any area of **100 square meters** shall not exceed the background level by more than—
> >
> > (1) 5 pCi/g, averaged over the first 15 cm of soil below the surface, and
> >
> > (2) 15 pCi/g, averaged over **15 cm thick layers of soil** more than 15 cm below the surface.

Consistent with these regulations regarding management of radiologically-impacted soils, the interpolation grids are defined by square blocks of side-length 10 meters (32.8 feet) and of thickness 0.15 meters (0.5 feet). Two grids were defined, the first encompassing Area 1 and the second encompassing Area 2. In each case, the grid was initially defined to extend beyond the hard data sample locations and later in the analysis was expanded to extend beyond the estimated excavation footprint for the most voluminous (i.e., complete rad removal) alternative in order to calculate the base elevations and volumes of potential excavations. The dimensions of the two grids are listed below in units of feet, in terms of the number of grid cells in the easting, northing and vertical directions where nx is the number of columns in the grid, ny is the number of rows, and nz is the number of layers, respectively; the spacing in the easting direction (x-size), spacing in the northing direction (y-size), spacing in the vertical direction (z-size), and the location of the origin that lies at the lower left bottom layer of the 3D interpolation grid (x-min, y-min, z-min), as follows:

Area 1 grid: nx = 36, x-min = 515740, x-size = 32.8

ny = 38, y-min = 1068340, y-size = 32.8

nz = 230, z-min = 410, z-size = 0.5

Area 2 grid: nx = 53, x-min = 514090, x-size = 32.8

ny = 60, y-min = 1069080, y-size = 32.8

nz = 230, z-min = 410, z-size = 0.5

All kriging calculations and all subsequent post-processing calculations were undertaken using these grids and dimensions: i.e., the volumes of RIM and the volumes of clean soil (overburden and setback) required to be removed under the various complete or partial rad removal alternatives that are presented in later report sections were also determined on the basis of these grids. Given this, figures presented in this report that depict the extent of RIM or of any excavations also reflect this grid and are not "smoothed" for aesthetic purposes, because this would not accurately depict the outputs of the calculations.

4.4 Preparation of Calculation Inputs

At the completion of the data processing and other processing steps, the principal inputs to each MIK calculation were compiled as follows:

- Hard data - tabulated values of easting coordinate, northing coordinate, sample elevation, and combined result for either radium *or* thorium. The actual values were listed, together with the global univariate default CDF describing the estimated occurrence of radium *or* thorium below each threshold concentration.
- Soft data - tabulated values of easting coordinate, northing coordinate, measurement elevation and normalized response for one or more classes of soft data, pre-coded into a CDF approximately relating the soft data to the occurrence of radium *or* thorium below each threshold value.
- Grid definition – the geometry and discretization of the interpolation grid.
- Variogram – as detailed above, for these calculations a single variogram was assumed to apply within each Area for all indicator thresholds, for both combined radium and combined thorium.

4.5 Multiple Indicator Kriging

The IK3D program was then executed in order to calculate the approximate extent of RIM above each threshold concentration in each of the two Areas, resulting in several 3D estimates of the extent of RIM. It might be possible, on the basis of established radiological and geochemical relationships between radionuclides and the empirical relationships shown in Section 2.2, to combine the radium and thorium data prior to undertaking indicator kriging. However, for purposes of this analysis of RIM, and for consistency with the comparison of both thorium and radium to the concentration thresholds separately, radium and thorium were interpolated independently and their results combined to estimate the extent of RIM, as detailed in the following section. MIK was completed using point kriging for computational expediency since sample replicates were not preserved and a zero-valued short-range variance was assumed, although as noted in the assumptions and limitations section, block kriging could be implemented to evaluate the variance within individual blocks if an excavation alternative was to be selected.

Section 5
Post-Processing of Indicator Kriging Outputs

5.1 Overview

The primary outputs from each IK3D calculation (i.e., one for combined radium and one for combined thorium for each area) comprise a table four columns wide with a number of rows equal to ncol *times* nrow *times* nlay where ncol is the number of columns in the interpolation grid; nrow is the number of rows; and nlay is the number of layers. Each row in the table comprises the updated conditional CDF (CCDF) for the non-exceedence of the far corresponding threshold concentrations at that location in the interpolation grid. These values themselves are of little practical use without additional processing – as a result, the greatest effort was expended to develop a post-processing procedure and codes that implemented that procedure to provide outputs suitable for purposes of the FFS. These steps are detailed in the following sub-sections.

5.2 Post-Processing Steps

For each pair of calculations (i.e., combined radium and combined thorium) in each Area, post-processing of the two tabular output files produced by IK3D was completed as follows:

1. Combine the results from the separate radium and thorium analyses;
2. Set interpolated values to zero beyond practical extents and other surfaces;
3. Identify the presence of RIM;
4. Identify the top and bottom elevation of RIM at each grid location;
5. Calculate the volume of material exceeding each concentration threshold;
6. Estimate the volume of clean material that may require excavation (overburden and setback);
7. Calculate the bottom elevation of the excavation.

Outputs from these calculations were then used as the basis for excavation planning, material volume balance, final grading plans, and cost estimation described in the FFS. Each of these post-processing calculations is detailed in a subsection below.

5.2.1 <u>Combine Results of Radium and Thorium Indicator Kriging</u>

The results of the indicator kriging undertaken independently for the combined radium and combined thorium data were combined by identifying the "higher" of the two estimates obtained at each interpolation point within the kriging grid, and writing a single file representing the combined results. Since the contents of the output files written by IK3D at the conclusion of the kriging represent the cumulative probability of non-exceedance, the value that expresses the union of the extents of RIM at any interpolated location based upon the combined radium and combined thorium interpolations is actually the lower of the CCDF values obtained for either the combined radium or combined thorium at that location. This post processing is consistent with the interpretation of the thresholds as introduced in Section 2.3.

5.2.2 Set Interpolated Values to Zero beyond Practical Extents and Other Surfaces

The 3D interpolation grids described in the previous section extend in many areas above the land surface, below the base of the documented waste and laterally beyond the extent of each landfill area. Interpolated values that are above the land surface and beyond the lateral extents of each landfill are non-physical and result from extrapolation beyond the convex hull of the sample data. For this reason, cells of the interpolation grid that extend beyond these physical limits were flagged and not considered further in calculations of either RIM or non-RIM extent or volume, using the 2015 ground surface elevation DEM as the most suitable identifier of land surface elevation; and using computer aided design (CAD) drawings provided by Feezor as the most suitable identifier of the lateral limits of waste within each Area. Interpolated values that are below the documented base of the waste cannot be ruled out a-priori as not meaningful, and for this reason no lower interpolation limits were enforced in the post-processing of the indicator kriging results.

5.2.3 Identify the Presence of RIM

The presence or absence of RIM at any elevation at each row-column location within the interpolation grid was determined by reading through the 3D grid of combined (i.e., maximum of radium *or* thorium) interpolation results and determining whether the values of the interpolated CCDF are consistent with RIM being present at that cell at (i.e., above) each of the four concentration thresholds. For example: for the "best-estimate" calculations, RIM is determined as more-likely-than-not to be present if the value of the CCDF at that location for that concentration threshold is less than 0.5 - i.e., if the cumulative probability of *non*-exceedance for the corresponding threshold is less than 0.5, then the probability of exceedance is greater than 0.5 and consequently RIM is interpreted as more-likely-than-not to be present at that location. At the conclusion of this post-processing step, the interpolated extent of RIM at concentrations greater than each of the four thresholds can be further post-processed to obtain other necessary quantities and outputs.

5.2.4 Identify the Top and Bottom Elevation of RIM at Each Grid Cell

The top and bottom elevation of RIM at concentrations exceeding each of the four thresholds at any row-column location within the interpolation grid was determined by reading through the 3D grid of RIM extents (determined as described above) first from the top (i.e., layer 1) and next from the bottom, identifying the first instance of RIM, and recording the elevation of the node at that center of that interpolation cell. The resulting two, two-dimensional (2D) arrays for each concentration threshold in each area describe two surfaces between which the identified RIM at the corresponding concentration threshold lies.

This procedure only identifies the elevations of the uppermost (i.e., shallowest) and lowermost (i.e., deepest) interpolated occurrences of RIM at each row-column location in the kriging grid: intervening layers of the interpolation grid may not exhibit continuous RIM but may instead comprise a combination of intervals of RIM and of intervening non-RIM. As a result, the use of these upper and lower RIM surfaces alone to make a calculation of the volume of RIM would not be appropriate as it would tend to over-estimate the actual volume of RIM material, by incorporating intervening non-RIM intervals. Despite the fact that the intervening non-RIM does not contribute to the volume of RIM, for all practical purposes when considering an excavation remedy, the intervening non-RIM would have to be removed in order to access the RIM. In consideration of these factors, the subsequent post-processing steps were implemented to properly reflect the actual volumes of RIM present above each concentration threshold in a manner that accounts for intermittent intervening non-RIM intervals, and to also account for the volume of these intervening non-RIM intervals when determining the volume of non-RIM material that would require removal, handling and staging as part of an excavation remedy.

5.2.5 Estimate the Volume of RIM above Each Threshold

The volume of RIM present in each of Area 1 and Area 2 at concentrations exceeding each of the four thresholds was determined by reading through the 3D grid of RIM extents (determined as described above) and summing the number of interpolation grid cells exhibiting RIM above each threshold, and then multiplying each of the four sums thus obtained by the dimensions of each interpolation grid cell (i.e., 32.8 *x* 32.8 *x* 0.5 ≈ 540 cubic feet (or approximately 20 cubic yards) per cell). At the conclusion of this post-processing step, "best estimates" of the volume of RIM present within each Area at concentrations greater than each of the four thresholds are tabulated.

5.2.6 Estimate the Volume of Clean (non-RIM) Material to be Excavated

Should a complete or partial excavation remedy be implemented, it will be necessary to remove, handle, temporarily stage and possibly restore landfill material that is un-impacted by radionuclides but that overlies or surrounds RIM. This will be necessary for two reasons: first, because the material directly overlies and is intervening between intervals of RIM (referred to as clean overburden in this report); and second, to provide for safe excavation by maintaining required slope stability during excavation using appropriate setbacks (referred to as set-back in this report). The volume of clean non-RIM material that would need to be removed in order to access and safely excavate the RIM present above each threshold concentration was determined as follows:

- Vertical clean overburden: this comprises all interpolation cells that are identified as clean (i.e., "non-RIM" at the corresponding concentration threshold) via the indicator kriging that vertically overly the lowermost (i.e., deepest) occurrence of RIM at each interpolation grid row-column location, up to the most recent (2015) digital land surface.
- Clean set-back material: this comprises all interpolation cells that are identified as clean (i.e., "non-RIM" at the corresponding concentration threshold) that were not identified as vertical clean overburden and that have a node elevation that is above a safe set-back ratio of 3:1 (i.e., corresponding to three units of distance in the horizontal direction for each unit

of distance in the vertical direction) with respect to any interpolated cell that is identified as RIM at the corresponding threshold.

At the conclusion of this post-processing step, for each of the four concentration thresholds, for each Area of OU-1, each cell of the interpolation grid has been ascribed a numeric flag indicating whether the cell is designated as RIM, clean vertical overburden or clean setback, enabling the volumes of clean vertical overburden and clean setback to be totaled in a similar manner to that used to totalize the RIM volumes.

5.2.7 <u>Calculate the Bottom Elevation of the Excavation</u>

The bottom elevation for each excavation that would result from accessing and removing RIM present above each of the four threshold concentrations (i.e., the excavation base for each of the four excavation alternatives) was determined by reading through the 3D grid of numeric flags identifying RIM, vertical clean overburden and clean setback determined as described above from the bottom, identifying the first instance of material - which in all cases comprises either RIM or set-back material – that will require excavation, and recording the elevation of the node at the center of that interpolation cell. For each of the four concentration thresholds, in each of the two areas, the resulting 2D array of elevations describes the bottom surface of the excavation required to safely remove the material that is identified as RIM.

5.3 Summary Tables and Figures

The following tables and figures present the principal outputs from the indicator kriging and associated post-processing steps as detailed above:

- Plan-view 2D maps of the extent of RIM present at concentrations exceeding each of the four concentration thresholds in each Area;
- Plan-view 2D maps of the extent of excavation required to remove RIM identified as present at concentrations exceeding each of the four concentration thresholds in each Area;
- Tabulations of the "best-estimate" of the top-and-bottom elevations of the vertically-bounding occurrences of RIM at each boring location at concentrations exceeding each of the four concentration thresholds in each Area;
- Tabulations of the following estimated material volumes corresponding to the identified 3D extent of RIM at concentrations exceeding each of the four concentration thresholds in each Area of OU-1:
  - Volume of RIM
  - Volume of clean overburden material
  - Volume of clean set-back material
  - Total volume of material required for excavation for that removal alternative

Additional tables and figures were produced as output from supplemental calculations that were undertaken to evaluate the uncertainty associated with these estimated extents and volumes, as described in Section 7.

Section 6
Assumptions and Limitations

6.1 Overview

The work presented in this report was undertaken to estimate the extent of RIM, and associated extents and volumes of RIM and non-RIM material, in support of calculations required for the FFS. Caution is advised regarding the use of these results for any other purposes.

Among others, the assumptions and limitations summarized in this section underpin the calculations and influence the output of the calculations. The effect of some assumptions and limitations likely could be reduced through the collection of additional data or application of increasingly sophisticated methods of analysis; however, the effect of some assumptions and limitations may not be substantively reduced through these mechanisms since they are inherent to the methods used and to the use of such methods to interpolate sparse data sets for the purposes detailed in this report. Furthermore, there is some structure exhibited by the data – including areas of demonstrably "non-RIM" versus areas of demonstrably "RIM" that were all treated within a singular kriging exercise – that might benefit from further, separate, analyses. However, such an effort was not undertaken in this study.

6.2 Assumptions

The following assumptions, among others, underlie the methods used for the analysis and the application of these methods for the purposes presented in this report:

- The use of geostatistics is premised on the a-priori assumption that the data (or more precisely, their transform) exhibit intrinsic stationarity.
    - Application of statistical tests to evaluate stationarity can be difficult; however, visual inspection both of the data and of the results of the kriging can help reveal deviations from stationarity.
- The available hard sample data are representative of conditions in the subsurface within OU-1 Areas 1 and 2 at the scale of interest.
    - This assumption embodies several assumptions regarding sampling and measurement accuracy, spatial distribution, local scale variability, and so on.
- The use of a single, horizontally isotropic, variogram structure and parameterization for each Area for both radium and thorium is reasonable and representative.
    - The variograms used in Area 1 and Area 2 were based on an analysis of, and assumed to be representative of, all available empirical variograms; however, those empirical variograms do exhibit differences.
- The use of a single variogram model, as described above, across all concentration thresholds is representative:

  - The validity of this assumption cannot easily be tested due to the small number of samples that exhibit concentrations exceeding the higher thresholds. Although guidelines vary generally between 20 and 100 data locations, consensus tends to suggest that 30 or more locations is necessary to estimate a stable variogram.

- Gamma emissions are a reliable relative indicator of the presence and concentration of either radium *or* thorium in landfill material.
  - Although gamma emissions are often used to infer the presence and relative concentration of radium, they are used less often to infer the presence of thorium. Use of gamma for this purpose in this report is premised on the empirical correlations presented in this report.

- Application of the baseline-adjustment and normalization to the soft data renders the information provided by each of the five classes of soft data regarding the presence and relative concentration of radium *or* thorium comparable.
  - Alternative methods to process the soft data could be considered, such as principal component analysis (PCA), to normalize and combine the five classes of soft data into a single soft-data "signal".

- Use of the 0.50 selection criterion provides a best-estimate of extents and volumes.
  - This assumption was tested to some extent via the cross-validation analysis, but more rigorous testing of this assumption would require greater discretization of the CDF, particularly close to and surrounding the target intervals.

6.3 Limitations

The following limitations, among others, underlie the methods used for the analysis and the application of these methods for the purposes presented in this report:

- The MIK approach has been demonstrated to be robust with skewed data sets. However, there is some loss of information using MIK to discretize the sample data into a fairly small number of thresholds.
  - The edges of the RIM extent might be defined more precisely by discretizing the CDF more finely; however, this precision would likely not alter the estimated extents or volumes substantially, and might result in less stable estimation of extents.

- Point kriging was used for expediency; however, block kriging could be implemented and could provide information regarding the block-variance if sample replicates were preserved in the analysis and a non-zero-valued short-range variance was assumed.
  - Rigorous implementation of block kriging would necessitate a thorough evaluation of both sample accuracy and variability, and near-field (within-block) variability, to help define the nugget term.

- The cross-validation analysis could only be undertaken for the 7.9 pCi/g (CRR) case due to the smaller number of data available at concentrations exceeding the higher thresholds, but its results are assumed indicative of the predictive performance of MIK at the higher thresholds.

Section 7
Calculations Results

7.1 Overview

As outlined in the introduction, the objective of the analyses detailed in this report is to obtain a best estimate of the 3D extent and volume of material classified as RIM within each Area of OU-1 that is present at concentrations exceeding four thresholds; and, secondarily, to estimate the associated extent and volume of clean non-RIM that would require excavation to access and remove the RIM from each Area. A best estimate is required because costing, scheduling and many other aspects of potential remedial alternatives of necessity rest upon the RIM extents and volumes. Results of the best-estimate calculations are depicted in this section. However, presentation of a single best estimate without any indication of the uncertainty associated with that estimate that arises from underlying assumptions and limitations, and the possible presence of bias in the best estimate, would misrepresent the study. For this reason, the best-estimates of RIM extent and associated RIM and non-RIM volumes are supplemented by additional calculations to indicate a range of extents and volumes that is reasonably consistent with available data, and the presence and direction of any bias that may be present in the best-estimates.

The map-based figures presented in this Section depict estimated extents of RIM based upon the multiple indicator kriging analysis. For qualitative comparison purposes, each of the map-based figures also depicts the approximate extent of RIM at concentrations greater than 7.9 pCi/g (combined thorium *or* combined radium) as estimated by EMSI based upon visual inspection of the distribution of locations exhibiting and not exhibiting RIM at any depth within each Area of OU-1. Additional information is provided on the estimates of vertical and horizontal RIM extent as obtained via visual inspection in Section 7.2.2; however, these estimates of vertical and horizontal extent obtained via visual inspection were used only as a means of evaluating and corroborating the results obtained from the indicator kriging.

7.2 Calculations

7.2.1 Initial "Best-Estimate" Extent and Volume Calculations

The initial "best estimates" of the extent of RIM within Area 1 and Area 2 at concentrations exceeding the four concentration thresholds were obtained using:

- The combined radium and combined thorium data available through early May 2016;
- The processed gamma and alpha count "soft-data" encoded as described in Section 4;
- The initial horizontal and vertical variograms defined and presented in Section 4;
- A posterior CCDF selection criteria of 0.50 to identify RIM as present.

To facilitate timely completion of the updated RI and the FFS, the results of these initial estimates were provided to EMSI and others in May 2016. These results are presented in the figures and tables described below:

- Figure 10 depicts the estimated lateral extent of RIM within Area 1 as calculated in May 2016 using the initial data sets and variogram model for Area 1, for each of the four concentration thresholds: (a) > 7.9 pCi/g, (b) > 52.9 pCi/g but within 16 feet of the 2005 land surface, (c) > 500 pCi/g, and (d) > 1,000 pCi/g.
- Figure 11 depicts the estimated lateral extent of RIM within Area 2 as calculated in May 2016 using the initial data sets and variogram model for Area 2, for each of the four concentration thresholds: (a) > 7.9 pCi/g, (b) > 52.9 pCi/g but within 16 feet of the 2005 land surface, (c) > 500 pCi/g, and (d) > 1,000 pCi/g.
- Figure 12 depicts the estimated lateral extent of the excavations that would be required to remove the RIM that is depicted in Figure 10 for Area 1, for each of the four concentration thresholds: (a) > 7.9 pCi/g, (b) > 52.9 pCi/g but within 16 feet of the 2005 land surface, (c) > 500 pCi/g, and (d) > 1,000 pCi/g.
- Figure 13 depicts the estimated lateral extent of the excavations that would be required to remove the RIM that is depicted in Figure 11 for Area 2, for each of the four concentration thresholds: (a) > 7.9 pCi/g, (b) > 52.9 pCi/g but within 16 feet of the 2005 land surface, (c) > 500 pCi/g, and (d) > 1,000 pCi/g.

In addition, Table 1 depicts the estimated volumes of both RIM and non-RIM vertical overburden and set-back materials that would be required to be excavated in each of Area 1 and Area 2 based upon the initial calculations completed May 2016.

7.2.2 Updated "Best-Estimate" Extent and Volume Calculations

Following receipt of the final comprehensive project database in June 2016, the "best-estimate" calculations were updated and used to form the basis for supplemental calculations of the uncertainty in the extent and volume estimates. When the final database was obtained, the "best-estimate" calculations completed during May 2016 in support of the FFS were revisited, and the following changes made to obtain updated "best estimates":

1. Revisions to the vertical variogram as detailed in Section 4;
2. Updates to hard data inputs reflecting a small number of additional sample results;

Other aspects of the calculations remained unchanged, and the updated "best estimates" generally differed by single-digit percentages from the initial estimates obtained in early May.

The resulting updated "best estimates" of the presence and thickness of RIM exceeding the lowest concentration threshold – i.e., the complete rad removal concentration threshold of 7.9 pCi/g – are listed on Table 2 (RIM Intervals – Area 1: Best-Estimate) and Table 3 (RIM Intervals – Area 2: Best-Estimate) for comparison with thicknesses of RIM that were estimated by EMSI through visual inspection of both the radium and thorium sample data and the gamma and alpha counts obtained at each boring location. Comparison of the "best-estimate" interpolated thicknesses of RIM listed on Tables 2 and 3 with the values obtained via visual inspection (the latter provided by EMSI in July, 2016) generally shows good correspondence. In some instances, the interpolated thicknesses obtained via MIK are substantially greater, or substantially smaller, than the thicknesses estimated via visual inspection. However, inspection of these instances reveals that these differences often arise in a systematic manner from consistent and understandable differences in the approaches used. For example, visual inspection provides an estimate of RIM thickness that is specific to the individual boring in consideration, whereas MIK provides an estimate of RIM thickness that pertains to the location of the interpolation point within the interpolation grid cell that contains that boring in addition to potentially other borings. As such, the MIK estimate is a locally-weighted value at the interpolation node determined from the neighboring borings. In addition, the visual inspection estimate is independent of surrounding boreholes, whereas MIK explicitly considers the spatial correlation between neighboring borings both within and beyond the interpolation grid cell. Finally, systematic rules were followed in undertaking the visual inspection (as previously described by EMSI) regarding the use of gamma data and the strength of signal versus the posited thickness of RIM. In contrast, MIK combines the hard and soft data in a manner that can produce more variable patterns of RIM.

Consider, for example, the vicinity of boring 5-3 within Area 1. At this location, the top and bottom elevations of RIM determined using the kriging method suggest at first glance a single thick RIM interval, whereas visual inspection suggests that the borings in the vicinity of 5-3 exhibit localized tops and bottoms of multiple RIM intervals. In this particular area, an upper RIM interval is identified in all borings (5-3, 5-4, 5-5, 5-6) whereas only one boring (5-3) extends deep enough to provide information beneath the base of the neighboring borings (i.e., 5-4, 5-5 and 5-6). The combination of the vertical variogram and the absence of data at depth from the neighboring borings results in the kriging indicating that the deeper RIM interval is likely present at these neighboring borings below the depth at which they were terminated. In this particular instance, a shorter horizontal variogram range-length might lead to a different result; however, the range length seems fairly well supported by the hard data.

The interpolated thicknesses of RIM listed on Tables 2 and 3 are considered "best estimates" in the sense only that they were obtained through an objective application of the data-processing and interpolation techniques described earlier in this report to the data available at the time of calculation and represent the central-tendency of the output obtained from the kriging under these conditions. The uncertainty associated with this "best estimate", and the possibility of systematic bias in the estimate, are detailed in subsequent subsections. The "best estimates" of the volumes of RIM, plus clean (non-RIM) overburden and setback, are listed on Tables 4 and 5 together with additional estimates, the complete contents of which are detailed in section 7.3.

7.2.3 Additional Extent and Volume Calculations

To provide an indication of the potential range of uncertainty that is associated with the "best-estimates" of the extents and the volumes of RIM plus clean (non-RIM) overburden and setback, two additional sets of calculations were performed. The additional extent and volume calculations were obtained as described below. A larger number of additional calculations could be undertaken by varying additional assumptions or inputs, and such an analysis would provide for a more comprehensive assessment of uncertainty; however, the results of the additional calculations that were completed are considered sufficiently illustrative of the range of uncertainty for the purposes of this study. Therefore, in each of the calculations described below, the hard data (i.e., combined radium and combined thorium concentrations), the soft data (i.e., the processed and normalized gamma and alpha responses), the variograms, and the interpolation grids were unaltered.

7.2.3.1 Comparison of Prior and Posterior Univariate CDFs

First, an assessment of the Area-wide univariate posterior CCDF was completed. The best-estimate and the ranges on this best-estimate described above were obtained using a prior univariate CDF, assumed applicable to both Area 1 and Area 2, that was estimated based upon review of the sample data from both Area 1 and Area 2 when initially received. However, estimated volumes of RIM at each concentration threshold within Area 1 and Area 2, when combined with the estimated total volumes of waste material within Area 1 and Area 2, respectively, provide some information regarding the appropriateness of this prior univariate CDF. Estimates of two univariate CDFs – one applicable to Area 1 and one applicable to Area 2 – were made based upon the outputs of intermediate calculations of the volumes of RIM present in each area above the four threshold concentrations. To make these calculations, the criterion of identifying only RIM that lies *within 16-ft of the 2005 land surface* was not considered, to ensure that a complete volume estimate for locations exceeding the 52.9 pCi/g concentration threshold regardless of depth could be obtained.

Table 4 lists the initial univariate CDF and the posterior univariate CCDFs calculated from the RIM and non-RIM volumes determined for Area 1 and Area 2. Inspection of Table 4 and the inset plot indicates that the volume estimates for Area 1 and Area 2 present slightly different CDFs between the two areas and as such might be treated differently in the geostatistical analysis. However, Table 4 and the inset plot also suggest that the initial univariate CDF that was developed based solely upon the hard sample data regardless of geographic location was a reasonable estimate of the global CDF throughout OU-1. Given this result, no additional calculations were made using revised or updated input CDFs specific to each Area. Subsequent calculations to illustrate uncertainty were completed using the CDFs inputs as ascribed to the initial and updated best-estimate calculations.

7.2.3.2 Selection Criteria as Intervals on the “Best-Estimate”

The best-estimate of the extent and volume of RIM above each of the four thresholds, and all associated outputs, were obtained using a selection criterion of 0.5 when post-processing the posterior CCDF obtained at each interpolation point at the conclusion of the MIK. As detailed earlier in this report, in the simplest case (i.e., of a single threshold) a criterion of 0.5 can be interpreted as discriminating between locations that more-likely-than-not exceed the threshold and those that more-likely-than-not fall below the threshold. However, it is common in post-processing of stochastic calculations to illustrate the range of plausible outcomes from the calculations. For example, in trivial cases, the 0.5 selection criterion might be interpreted as the central tendency of a distribution about which selection criteria of 0.25 and 0.75 would describe approximately symmetric intervals. In non-trivial cases such as the RIM mapping for Areas 1 and 2 these intervals might be asymmetric, illustrating that there may be greater uncertainty in one direction (i.e., on one side of the best estimate) than the other. To illustrate the relative range of uncertainty associated with the "best-estimate" and the asymmetry of this uncertainty, the MIK calculations were post-processed using selection criteria of 0.25 and 0.75 for the posterior CCDF rather than the central-tendency value of 0.5. In doing so, the following result is expected:

- The selection criterion of 0.75 should result in larger estimates of extent and associated volumes than the selection criteria of 0.5, because the value of 0.75 describes the cumulative probability of non-exceedance at the corresponding concentration threshold, and hence corresponds with a probability of (1.0 - 0.75 =) 0.25 probability of exceeding the threshold: i.e., less certainty is needed in order to identify a location as comprising RIM, and this requirement for less certainty results in larger extents and volumes
- The selection criterion of 0.25 should result in smaller estimates of extent and associated volumes than the selection criteria of 0.5, because the value of 0.25 describes the cumulative probability of non-exceedance at the corresponding concentration threshold, and hence corresponds with a probability of (1.0 - 0.25 =) 0.75 probability of exceeding the threshold: i.e., more certainty is needed in order to identify a location as comprising RIM, and this requirement for greater certainty results in smaller extents and volumes

These results are compared to the best-estimate below.

7.2.4 Cross-Validation Analysis

The additional kriging calculations described in section 7.2.3 were undertaken to provide an indication of the uncertainty associated with the best-estimate, under the assumption that the best-estimate is an unbiased estimate where bias is assessed in terms of the predicted volumes of RIM and of non-RIM overburden and setback materials. As detailed earlier, although kriging is referred to as an unbiased estimator this unbiasedness is only in the sense that the mean estimation error should be zero, and there is no guarantee that the best estimates of the RIM extents and volumes are indeed unbiased.

To assess whether the best-estimates of extents and volumes obtained from the indicator kriging may exhibit a bias – and, the typical direction of any such bias – a single-point cross-validation (CV) or "leave-one-out" analysis was conducted. The CV analysis was completed to establish whether outputs from the indicator kriging tend to over-predict the occurrence of RIM at sampled locations, which for purposes of this study can be considered a false-positive; or tend to under-predict the occurrence of RIM at sampled locations, which for purposes of this study can be considered a false-negative, with the inference that any tendency to over-predict the presence of RIM will tend to result in over-estimates of associated RIM and non-RIM volumes, and vice-versa.

The CV analysis that was undertaken is related in purpose to a simplified receiver operating characteristic (ROC) calculation, which can help identify optimal models and discard suboptimal ones. A rigorous ROC analysis is implemented, for example, by varying a discriminating threshold (such as a concentration that distinguishes RIM from non-RIM) and plotting the true positive rate (TPR) against the false positive rate (FPR) at various threshold settings, or plotting the false negative rate (FNR, comprising missed detections) vs. the FPR, which is also referred to as a detection error tradeoff (DET) plot. To construct a comprehensive ROC or DET plot for the West Lake RIM analysis would, require that CV analyses be undertaken on the basis of a piecewise-continuous distribution of thresholds, so that the results could be used to identify the location along the CCDF that provides the best predictor or identify the selection criterion that minimizes error in the sense that it balances Type I and Type II errors.

For purposes of this assessment of RIM, however, the CV analysis was implemented solely to assess whether the 0.50 selection criterion provides a balance between the FNR and FPR, under the assumption that if FNR>FPR then the interpolated extents and volumes will tend to underestimate the true extents and volumes, whereas if FPR>FNR then the interpolated extents and volumes will tend to overestimate the true extents and volumes. Furthermore, due to the small number of sample results that exceed higher concentration thresholds, the CV analysis was only undertaken for the complete rad removal case, i.e., for the concentration threshold of 7.9 pCi/g. The CV analysis is undertaken using IK3D separately for combined radium and for combined thorium as follows:

- Modify the input files previously prepared for independent indicator kriging of the combined thorium and combined radium data sets for each of Area 1 and Area 2, to undertake a CV analysis rather than to interpolate to a grid (see Deutsch and Journel, 1992, for further explanation on using IK3D to undertake CV analyses)
  - The output from the CV calculation is not a gridded result but is a posterior CCDF at each sample location, that is obtained when the hard data available at that sample location has been removed from the input data set
- Tabulate the posterior CCDFs that are obtained from the CV analysis, together with the prior CDF that would be assumed based on the hard result available at each location

Outputs from the CV calculations could be viewed from two perspectives. First, the CV analysis could be interpreted strictly in terms of the prediction of the presence or absence of RIM at each location that was suppressed from the data set: i.e., if the sample at the suppressed location indicated a concentration below 7.9 pCi/g, and the CV predicts that the concentration more-likely-than-not falls below this threshold, then this would be considered a true result, whereas if the CV predicts that this threshold more-likely-than-not is exceeded, then this would be considered a false positive. This analysis provides a useful indication of any potential bias although, by focusing strictly on the assessment of RIM versus non-RIM it neglects subtle shifts in the CDF that could result in either an over- or under-prediction of RIM extent a at intermediate locations away from sampled locations where there is no knowledge of the "true" value for comparison. A second interpretation of the CV output would be to compare the posterior CCDF that was obtained from the CV calculation with the prior CDF assigned to the location based upon the data, as follows:

- Where the CV CCDF and the data derived CDF are equivalent, the indicator kriging is interpreted to have correctly identified the presence (or absence) of RIM. Collected together these comprise the true negatives and true positives (T(P+N))
- Where the CV CCDF suggests a greater likelihood of RIM than does the data derived CDF, the indicator kriging is interpreted to have resulted in a false positive (FP)

- Where the CV CCDF suggests a lesser likelihood of RIM than does the data derived CDF, the indicator kriging is interpreted to have resulted in a false negative (FN)

The FPR and FNR can be calculated by summing the FP and the FN, respectively. The latter evaluation of the CV analysis outputs is emphasized in this report, although conclusions reached regarding the presence and direction of prediction bias were very similar for both methods of evaluation, as described in Section 7.3.2.

7.3 Results

7.3.1 Extent and Volume Calculations

Figures 14 and 15 depict the updated best estimates of the lateral extent of RIM that exceed the four concentration thresholds within Areas 1 and 2, respectively. Figures 16 and 17 depict the updated best estimate of the lateral extent of the excavations that would be required to access and remove the RIM estimated as being present within Areas 1 and 2, respectively (as depicted in Figures 14 and 15).

Estimated volumes of RIM present above each of the four concentration thresholds, within each of Area 1 and Area 2, are listed on Table 5 and Table 6, respectively. The estimates included in these tables comprise the updated best estimate obtained using a selection criterion of 0.5 (as depicted in Figures 6 and 7), together with higher and lower intervals obtained using selection criteria of 0.25 and 0.75, respectively. The values listed on Table 5 and Table 6 are also presented in Figures 18 and 19 for Areas 1 and 2, respectively. Inspection of the entries in Tables 5 and 6, and their graphical representation in Figures 18 and 19, indicates that there may be a substantial range of uncertainty associated with the estimated volumes of RIM and non-RIM. This is not unexpected, given the volume of the data support within each Area of OU-1; the variability in sample results demonstrated by closely-spaced borings; and the relatively short variogram range-lengths when compared with the size of the interpolation domains (i.e., the size of Areas 1 and 2), among other factors. Figures 18 and 19 also indicate that the intervals used to illustrate uncertainty are approximately symmetric about the updated best estimate when plotted on a logarithmic scale which, combined with the results of the CV analysis described next, has implications for the design and costing of an excavation remedy alternative.

7.3.2 Cross-Validation Analysis

Tables 7 and 8 list the results of the CV analysis for Area 1 and Area 2, respectively, in terms of both counts and rates. Simple charts are included below the corresponding tables to graphically present the counts of the (a) number of true positives and negatives, designated T(P+N), (b) number of false positives, designated FP, and (c) number of false negatives, designated FN. These counts are then related to corresponding "rates" which for purposes here are simply the percentage of false negatives or false negative rate, FNR, and the percentage of false positives or false positive rate, FPR.

Inspection of Table 7 reveals that for Area 1, for both the combined radium and combined thorium analyses, the CV analysis suggests that although the T(P+N) represents the majority of the results and is in each case larger than the sum of FN plus FP, in both cases FNR is larger than FPR. This result indicates that the MIK results may tend to be biased in the sense that they under-estimate the extent of RIM, and consequently under-estimate the volume of RIM and the volume of non-RIM overburden and setback material that would require excavation under a complete or partial rad removal alternative for Area 1.

Inspection of Table 8 reveals that for Area 2, for both the combined radium and combined thorium analyses, the CV analysis suggests that in each case FNR is larger than FPR and furthermore that in both cases the sum of FNR plus FPR is larger than the T(P+N). This result indicates that the MIK results likely tend to be biased in the sense that they under estimate the extent of RIM, and consequently underestimate the volume of RIM and the volume of non-RIM overburden and setback material that would require excavation under a complete or partial rad removal alternative for Area 2. Furthermore, the result that the T(P+N) is less than the sum of FNR plus FPR suggests there may be greater sensitivity of the MIK results to the location and removal of hard sample data which is expected given that the number of samples per unit volume of waste material is on the order of 3 to 4 times smaller, on average, in Area 2 than it is in Area 1, which tends to lead to greater uncertainty in interpolated results.

Section 8
Discussion

The foregoing calculations present for both Areas 1 and 2 estimates of the extent and volume of RIM above four threshold concentrations; the volume of any non-RIM surrounding the RIM, that would be required to be removed to safely access and excavate the RIM; and the lateral extent of any necessary excavations. These results are summarized within CAD- and GIS-ready electronic files for use in subsequent calculations.

The extent and volume estimates are based upon interpolation of irregularly-spaced sample data that directly indicate the presence or absence of RIM, together with more spatially dense measurements of radiation counts that indirectly indicate the presence or absence of RIM. Numerous features of the RIM spatial distribution analysis result in uncertainty about the final extent and volume estimates made using indicator kriging. The sources of uncertainty can be broadly categorized as follows (this list is indicative and not comprehensive):

1. Hard sample data – including all components of variation in the sampling, handling, measurement and reporting procedures when obtaining sample results; local-scale variability (some of which might be incorporated within a nugget); the distribution of sample results in 3D space and potential for non-representativeness of boring locations; and any systematic differences in sample selection between field sampling events.

2. Soft activity data – all of the above, in addition to variability in the strength and linearity of the relationship between activity results and concentrations of radium and thorium which are of primary interest.

3. Representative volumes – the individual samples represent small volumes of RIM and non-RIM material on the order of decimeter scale that are used to estimate average values for blocks of landfill waste material on the order of 10-meter scale. This might be alleviated through the use of block kriging, which was not completed for computational expediency.

4. Interpolation approach and parameters – the simplifications inherent in transforming data into multiple indicators; the assumption of horizontal isotropy within both Areas; the development of a single variogram for each Area and assumption of Area-wide applicability of those variograms; uncertainty in the estimates of the variogram parameters (particularly the range length); and the assumption of applicability of a single variogram to all four concentration thresholds within each Area.

5. Delineation (discretization) – all extent and volume estimates were made on a 10m by 10m by 0.15m grid, for consistency with 40 CFR §192.12; however, no final decision has been made as to the scale upon which RIM should be assessed, or the degree to which it might be remediated. For example, at each threshold concentration, there might be a reasonable minimal soil volume (although this might vary with depth) that might be subject to

remediation, and that would constitute a more practical representative volume for the interpolation.

6. Excavation and disposal: the RIM volume estimates distinguish between RIM and non-RIM based on interpolation. The non-RIM includes intervening “clean” intervals that lie between the lowest and highest RIM intervals and overlying “clean” material above the highest RIM interval. Some portion of the intervening non-RIM has a high likelihood of becoming mixed with, and contaminated by, RIM during excavation (presumably, overlying non-RIM has a lower probability of this occurring). Thus, at least some of the intervening non-RIM is likely to end up categorized as and disposed of with RIM so that the actual amount of material handled and disposed of as RIM is very likely to be larger than the interpolated RIM volumes.

Finally, the use of geostatistics in this instance was premised on the a-priori determination that the data (or more precisely, their transform) can be considered to exhibit stationarity. The existence of stationarity is to some extent a modeling decision rather than a true state of affairs; however, it is possible that there may be departures from stationarity that lead to errors in RIM estimates.

As a result of the foregoing (among other sources of uncertainty), estimates of RIM presence and extent in some locations within each Area may be less certain than others. For example, densely-sampled areas that exhibit concentrations substantially above threshold concentrations may be accompanied by much less uncertainty than infrequently sampled areas that exhibit concentrations close to threshold concentrations, where there would be greater sensitivity to the above-listed sources of uncertainty. Cross-validation suggested that the indicator kriging results obtained using a 0.50 selection criterion may underestimate the extent of RIM. As such, the RIM volumes and extents and corresponding non-RIM volumes required for excavation as determined using 0.50 should be viewed as likely underestimates. The reader is recommended to base any conclusions on the 0.50 selection criterion as a theoretical “best estimate,” but recognize that the actual extents and volumes are more likely to be larger than this estimate than to be smaller than this estimate. Figures 20 and 21 depict the estimated extent of RIM within Area 1 and Area 2, respectively, for each of the four concentration thresholds. In each figure, each panel depicts the extents obtained using the three selection criteria (i.e., 0.25, 0.50 and 0.75), to aid the reader in visualizing the range of results. Based on the analyses presented herein, and accepting the assumptions, limitations and other factors contributing to uncertainty, the reader should assume that the true extents and volumes lie somewhere between the “best estimate” and the higher interval result (i.e., between 0.50 and 0.75).

Given the above, many cost associated with an excavation remedy would increase as the volume increases, although the increases may not scale linearly with increasing volume. To provide approximate extents to support costing of remedy alternatives, additional calculations were deemed unwarranted. However, additional analyses may be warranted if a complete or partial excavation remedy is selected, in order to refine the estimates in areas of greatest uncertainty; evaluate and mitigate bias through further discretization of the CDF; and, incorporate information on practical excavation lifts (thicknesses) and other implications for the volume of RIM to be handled. The framework now established for the geostatistical estimation of RIM extents and volumes could also help guide an incremental or other sampling program to field-verify RIM.

amsl = above mean sea level   cpm = counts per minute

Notes: NA - Data were not collected or are otherwise not available.

X - Data support the presence of RIM in the indicated interval

'- Data do not indicate the presence of RIM at this location/interval

Notes:

Modified after original tables provided by Engineering Management Support Inc. (EMSI).

NDE = gamma log not deep enough   No Log = no log from RI investigation exists   * Indicates that result for one of the two isotopes was non-detect   Final Q = final qualifier   CSU1 = combined standard uncertainty (+/- sigma for McLaren/Hart samples)   CV = critical value   MDA= minimum detectable activity

[yellow highlight] indicates that combined value is greater than the unrestricted use criteria established by EPA.

J = The analyte was analyzed for, and was positively identified, but the associated numerical value may not be consistent with the amount actually present in the environmental sample.

J+ = Same as J qualification but with an indication of positive bias in the sample concentration.

U = The analyte was analyzed for and is not present above the level of the associated value. The associated numerical value indicates the approximate concentration necessary to detect the analyte in the sample.

For McLaren/Hart RI Soil Boring Data:

- In calculated combined Ra and combined Th values, if of the the results was <MDA, one-half of the MDA was used in the calculation and the combined value was noted with an *. If both values were <MDA, combined results reported as "Non-detect".
- In calculated combined U values, if one or two of the the results was <MDA, one-half of the MDA was used in the calculation and the combined value was noted with an *. If all three values were <MDA, combined results reported as "Non-detect".

Notes:

Modified after original tables provided by Engineering Management Support Inc. (EMSI).

NDE = gamma log not deep enough   No Log = no log from RI investigation exists   * Indicates that result for one of the two isotopes was non-detect   Final Q = final qualifier   CSU1 = combined standard uncertainty (+/- sigma for McLaren/Hart samples)   CV = critical value   MDA= minimum detectable activity

[highlighted cell] indicates that combined value is greater than the unrestricted use criteria established by EPA

J = The analyte was analyzed for, and was positively identified, but the associated numerical value may not be consistent with the amount actually present in the environmental sample.

J+ = Same as J qualification but with an indication of positive bias in the sample concentration.

U = The analyte was analyzed for and is not present above the level of the associated value. The associated numerical value indicates the approximate concentration necessary to detect the analyte in the sample.

For McLaren/Hart RI Soil Boring Data:

- In calculated combined Ra and combined Th values, if of the the results was <MDA, one-half of the MDA was used in the calculation and the combined value was noted with an *. If both values were <MDA, combined results reported as "Non-detect".
- In calculated combined U values, if one or two of the the results was <MDA, one-half of the MDA was used in the calculation and the combined value was noted with an *. If all three values were <MDA, combined results reported as "Non-detect".

Appendix C

Off-site Disposal Facilities – Waste Acceptance Criteria

Appendix C-1:

U.S. Ecology, Inc. – Grandview, Idaho

C.3 WASTE ACCEPTANCE CRITERIA

C.3.1 Pre-acceptance Review

The preacceptance protocol has been designed to ensure that only hazardous and radioactive material that can be properly and safely stored, treated and/or disposed of by USEI are approved for receipt at the facility. A two-step approach is taken by USEI. The first step is the chemical and/or radiological and physical characterization of the candidate waste stream by the generator. The second step is the preacceptance evaluation performed by USEI to determine the acceptability of the waste for receipt at the facility. Figure C-2 presents a logic diagram of the preacceptance protocol that is utilized at the facility.

C.3.2 Radioactive Material Waste Acceptance Criteria

The following waste acceptance criteria are established for accepting radiological contaminated waste material that is generally or specifically exempted from regulation by the Nuclear Regulatory Commission (NRC) or an Agreement State under the Atomic Energy Act of 1954 (“AEA”), as amended. Material may also be accepted if it is not regulated or licensed by the NRC or has been authorized for disposal by the IDEQ and is within the numeric waste acceptance criteria. Waste acceptance criteria are consistent with these restrictions.

The following five tables establish types and concentrations of radioactive materials that may be accepted. These tables are based on categories and types of radioactive material not regulated by the NRC based on statute or regulation or specifically approved by the NRC or and Agreement State for alternate disposal. The criteria are consistent with these restrictions and detailed analyses set forth in *Waste Acceptance Criteria and Justification for FUSRAP Material*, prepared by Radiation Safety Associates, Inc. (RSA) as subsequently refined, expanded and updated in *Waste Acceptance Criteria and Justification for Radioactive Material*, prepared by USEI.

Material may be accepted if the material has been specifically exempted from regulation by rule, order, license, license condition, letter of interpretation, or specific authorization under the following conditions: Thirty (30) days prior to intended shipment of such materials to the facility, USEI shall notify IDEQ of its intent to accept such material and submit information describing the material’s physical, radiological, and/or chemical properties, impact on the facility radioactive materials performance assessment, and the basis for determining that the material does not require disposal at a facility licensed under the AEA. The IDEQ will have 30 days from receipt of this notification to reject USEI’s determination or require further information and review. No response by IDEQ within thirty (30) days following receipt of such notice shall constitute concurrence. IDEQ concurrence is not required for generally exempted material as set forth in Table C.4a.

Based on categories of waste described in the waste acceptance criteria, the concentration of the various radionuclides in the conveyance (e.g., rail car gondola, other container etc.) shall not exceed the concentration limits established in the WAC without the specific written approval of the IDEQ unless generally exempted as set forth in Table C.4a. Radiological surveys will be performed as outlined in ERMP-01 to verify compliance with the WAC. If individual “pockets” of activity are detected indicating the limits may be exceeded, the RSO or RPS shall investigate the discrepancy and estimate the extent or volume of the material with the potentially elevated radiation levels. The RPS or RSO shall then make a determination on the compliance of the entire conveyance load with the appropriate WAC limits. If the conveyance is determined not to meet the limits, USEI will notify IDEQ's RCRA Program Manager within 24 hours of a concentration based exceedance of the facility WAC to evaluate and discuss management options. The findings and resolution actions shall then be documented and submitted to the IDEQ.

The radioactive material waste acceptance criteria, when used in conjunction with an effective radiation monitoring and protection program as defined in the USEI *Radioactive Material Health and Safety Plan* and *Exempt Radioactive Materials Procedures* provides adequate protection of human health and the environment. Included within this manual are requirements for USEI to submit a written summary report of Table C.1 through C.2 radioactive material waste receipts showing volumes and radionuclide concentrations disposed at the USEI site on a quarterly basis. USEI will also submit a Table C.3 through C.4b annual report of exempted products devices, materials or items within 60 (sixty) days of year end (December 31st). The annual report will provide total volumes or mass of isotopes and total activity by isotope listing the activity of each radionuclide disposed during the preceding year, and the cumulative total of activity for each radionuclide disposed at the facility. The report will include an updated analysis of the impact on the facility performance assessment.

These criteria and procedures are designed to assure that the highest potential dose to a worker handling radioactive material at USEI shall not exceed 400 mrem/year TEDE dose, and that no member of the public is calculated to receive a potential dose exceeding 15 mrem/year TEDE dose, from the USEI program. TEDE is defined as the "Total Effective Dose Equivalent", which equals the sum of external and internal exposures. The public dose limit during operation activities is limited to 100 mrem/yr TEDE dose. An annual summary report of environmental monitoring results will be submitted to IDEQ by June 1st for the preceding year.

Materials that have a radioactive component that meets the criteria described in Tables C.1 through C.4b and are RCRA regulated material will be managed as described within this WAP for the RCRA regulated constituents.

Table C.1: Unimportant Quantities of Source Material Uniformly Dispersed* in Soil or Other Media**

	Status of Equilibrium	Maximum Concentration of Source Material	Sum of Concentrations Parent(s) and all progeny present***
a	Natural uranium in equilibrium with progeny	<500 ppm / 167 pCi/g (^{238}U activity)	≤ 3000 pCi/g
	Refined natural uranium (^{238}U, ^{235}U, ^{234}U; ^{234Th}, ^{234m}Pa, ^{231}Th)	<500 ppm / 333 pCi/g	≤ 2000 pCi/g
	Depleted Uranium (^{234Th}, ^{234m}Pa)	<500 ppm / 169 pCi/g	≤ 2000 pCi/g
b	Natural thorium (^{232}Th + ^{228}Th)	<500 ppm / 110 pCi/g	≤ 2000 pCi/g
	^{230}Th in equilibrium with progeny	<0.01 ppm / 200 pCi/g	≤2000 pCi/g
	^{230}Th (with no progeny)	0.1 ppm / ≤2000 pCi/g	
	Any mixture of Thorium and Uranium	Sum of ratios ≤ 1****	≤2000 pCi/g

Table C.2: Naturally Occurring Radioactive Material Other Than Uranium and Thorium Uniformly Dispersed* in Soil or Other Media**

	Status of Equilibrium	Maximum Concentration of Parent Nuclide	Sum of Concentrations of Parent and All Progeny Present***
a	^{226}Ra or ^{228}Ra with progeny in bulk form [1]	500 pCi/g	≤ 4500 pCi/g
b	^{226}Ra or ^{228}Ra with progeny in reinforced IP-1 containers [1]	1500 pCi/g	13,500 pCi/g
c	^{210}Pb with progeny(Bi & ^{210}Po)	1500 pCi/g	4500 pCi/g
	^{40}K	818 pCi/g	N/A
	Any other NORM		≤3000 pCi/g

[1] Any material containing ^{226}Ra greater than 222 pCi/g shall be disposed at least 6 meters from the external point on the completed cell.

Table C.3: Non-Production Particle Accelerator Produced Radioactive Material*****

Acceptable Material	Activity or Concentration
Any non-production particle accelerator produced radionuclide.	All materials shall be packaged in accordance with USDOT packaging requirements. Any packages containing iodine or volatile radionuclides will have lids or covers sealed to the container with gaskets. Contamination levels on the surface of the packages shall not exceed those allowed at point of receipt by USDOT rules. Gamma or x-ray radiation levels may not exceed 10 millirem per hour anywhere on the surface of the package. All packages received shall be directly disposed in the active cell. All containers shall be certified to be 90% full.

*Average over conveyance or container. The use of the phrase "over the conveyance or container is meant to reflect the variability on the generator side. The concentration limit is the primary acceptance criteria.

**Unless otherwise authorized by IDEQ, other Media does not include radioactively contaminated liquid (except for incidental liquids in materials). See radioactive contaminated liquid definition (definition section of Part B permit).

******* Diffuse waste with a total concentration (sum of concentrations of all radionuclides present) which is 2000 pCi/g or less may be accepted at the site (i.e., the controlling limit is 2000 pCi/g).

******** $$\frac{\text{Conc. of U in sample}}{\text{Allowable conc. of U}} + \frac{\text{Conc. of Th in Sample}}{\text{Allowable conc. of Th}} \leq 1$$

***** Any material that has been made radioactive by use of a non-production particle accelerator as set forth in Federal Register, Vol. 72, No. 189, Monday October 1, 2007, page 55868.

Table C.4a: NRC Exempted Products, Devices or Items

Exemption 10 CFR Part*	Product, Device or Item	Isotope, Activity or Concentration
30.15	As listed in the regulation	Various isotopes and activities as set forth in 30.15
30.14, 30.18	Other materials, products or devices specifically exempted from regulation by rule, order, license, license condition, concurrence, or letter of interpretation	Radionuclides in concentrations consistent with the exemption
30.19	Self-luminous products containing tritium, ^{85}Kr, ^{3}H or ^{147}Pm	Activity by Manufacturing license
30.20	Gas and aerosol detectors for protection of life and property from fire	Isotope and activity by Manufacturing license
30.21	Capsules containing ^{14}C urea for *in vivo* diagnosis of humans	^{14}C, one µCi per capsule
40.13(a)	Unimportant quantity of source material: see table above	≤0.05% by weight source material
40.13(b)	Unrefined and unprocessed ore containing source material	As set forth in rule
40.13(c)(1)	Source material in incandescent gas mantles, vacuum tubes, welding rods, electric lamps for illumination	Thorium and uranium, various amounts or concentrations, see rules
40.13(c)(2)	(i)Source material in glazed ceramic tableware (ii)Piezoelectric ceramic (iii) Glassware not including glass brick, pane glass, ceramic tile, or other glass or ceramic used in construction	≤20% by weight ≤2% by weight ≤10% by weight
40.13(c)(3)	Photographic film, negatives or prints	Uranium or Thorium
40.13(c)(4)	Finished product or part fabricated of or containing tungsten or magnesium-thorium alloys. Cannot treat or process chemically, metallurgically, or physically.	≤4% by weight thorium content.
40.13(c)(5)	Uranium contained in counterweights installed in aircraft, rockets, projectiles and missiles or stored or handled in connection with installation or removal of such counterweights.	Per stated conditions in rule.
40.13(c)(6)	Uranium used as shielding in shipping containers if conspicuously and legibly impressed with legend “CAUTION RADIOACTIVE SHIELDING – URANIUM” and uranium incased in at least 1/8 inch thick steel or fire resistant metal.	Depleted Uranium
40.13(c)(7)	Thorium contained in finished optical lenses	≤30% by weight thorium, per conditions in rule.
40.13(c)(8)	Thorium contained in any finished aircraft engine part containing nickel-thoria alloy.	≤4% by weight thorium, per conditions in rule.

Table C.4b: Materials Specifically Exempted by the NRC Or NRC Agreement State

Exemption	Materials	Isotope, Activity or Concentration*
10 CFR 30.11***	Byproduct material including production particle accelerator material exempted from NRC or Agreement State regulation by rule, order, license, license condition or letter of interpretation may be accepted as determined by specific NRC or Agreement State exemption.****	Byproduct material at concentrations consistent with the exemption**
10 CFR 40.14***	Source material exempted from NRC or Agreement State regulation by rule, order, license, license condition or letter of interpretation may be accepted as determined by specific NRC or Agreement State exemption.****	Source material at concentrations consistent with the exemption.
10 CFR 70.17	Special Nuclear Material (SNM) exempted from NRC regulation by rule, order, license, license condition or letter of interpretation may be accepted as determined by specific NRC or Agreement State exemption.****	SNM at concentrations consistent with the exemption.

*Sum of all isotopes up to a maximum concentration of 3,000 pCi/gm.

**Specifically exempted production beam accelerator may be received under Table C.3 provisions [10 CFR 20.2008 (b)]

***Also includes equivalent Agreement State regulation where applicable.

**** Similar material not regulated or licensed by the NRC may also be accepted. Sum of all isotopes up to a maximum concentration of 3,000 pCi/gm. IDEQ shall be notified prior to the receipt of Special Nuclear Material not regulated or licensed by the NRC.

Additional Information for USEI's Waste Analysis Plan

1. US Ecology Idaho, Inc. (USEI) may receive contaminated materials or other materials as described in Tables C.1 - C.4b above. USEI may not accept for disposal any material that by its possession would require USEI to have a radioactive material license from the Nuclear Regulatory Commission (NRC).

2. Unless approved in advance by USEI and IDEQ, average activity concentrations may not exceed those concentrations enumerated in Tables C.1 and C.2. Additionally, for Tables C.1 and C.2, individual pockets of material may exceed the WAC for the radionuclides present as long as the average concentration of all radionuclides within the package or conveyance remains at or below the WAC and the highest dose rate measured on the outside of the unshielded package or conveyance does not exceed those action levels enumerated in ERMP-01.

3. Other items, devices or materials listed in Table C.4a, which are exempted in accordance with 10 CFR Parts 30, 40 or equivalent Agreement State regulations or 10 CFR Part 70 may be accepted at or below the activities (per device or item) or concentrations specified in those exemptions.

4. The generator of the exempted or non-production particle accelerator produced waste must specify that the waste meets applicable acceptance criteria and/or exemption requirements.

5. In accordance with permit requirements, notification of any exceedance of the WAC will be provided to the RCRA Program Manager within 24 hours, in accordance with the permit.

STATE OF IDAHO
DEPARTMENT OF
ENVIRONMENTAL QUALITY

1410 North Hilton • Boise, Idaho 83706-1255 • (208) 373-0502

Dirk Kempthorne, Governor
Toni Hardesty, Director

Permittee: U.S. Ecology Idaho Inc.
Facility Identification/Permit Number: IDD073114654

INTRODUCTION AND SIGNATURE PAGE

Pursuant to the Idaho Hazardous Waste Management Act of 1983 (HWMA), as amended, Idaho Code 39-4401 et seq., and the *Rules and Standards for Hazardous Waste*, as amended, IDAPA 58.01.05.000 et seq., a Hazardous Waste Treatment, Storage, and Disposal Permit is hereby issued to U.S. Ecology Idaho Inc. (USEI or Permittee) for operation of USEI's Site B facility, located in Owyhee county near Grand View, Idaho, on Lemley Road, at latitude 43° 03° 056° North and longitude 116° 15° 044° West.

The Permittee shall comply with all terms and conditions of this Permit, including Attachments 1 through 26. The Permittee must comply with all applicable state and federal regulations, including IDAPA 58.01.05.004 through 58.01.05.008 and 58.01.05.010 through 58.01.05.013 [40 Code of Federal Regulations (CFR), Parts 260 through 266, 268, 270, and 124] and as specified in this Permit. Any reference in this Permit to the Resource Conservation and Recovery Act (RCRA) or the Hazardous and Solid Waste Amendments of 1984 (HSWA), or federal regulations promulgated thereunder in 40 CFR, shall be deemed to include the equivalent HWMA statute or state regulation promulgated thereunder.

Applicable state and federal regulations are those that are in effect on the date of final administrative action on this Permit and any self implementing statutory provisions and related regulations that, according to the requirements of HWMA and/or HSWA, as amended, are automatically applicable to the Permittee's hazardous waste management activities, notwithstanding the conditions of this Permit.

This Permit is based upon the Administrative Record, as required by IDAPA 58.01.05.013 [40 CFR § 124.9]. The Permittee's failure, in the application or during the permit issuance process, to disclose fully all relevant facts, or the Permittee's misrepresentation of any relevant facts, at any time, shall be grounds for the termination or modification of this Permit and/or initiation of an enforcement action. To the extent there are inconsistencies between the Permit and the attachments, the language of the Permit shall prevail. The Permittee must inform the Director of the Idaho Department of Environmental Quality (Director) of any deviation from the permit conditions, or changes in the information on which the application is based that would affect the Permittee's ability to comply, or actual compliance with the applicable regulations or permit conditions, or which alters any permit condition in any way.

The Director shall enforce all conditions of this Permit. Any challenges of any permit condition shall be appealed to the Idaho Board of Environmental Quality, in accordance with IDAPA 58.01.05.013 [40 CFR § 124.19], and in accordance with the Idaho Department of Environmental Quality "*Rules Governing Declaratory Rulings and Contested Case Proceedings,*" IDAPA 58.01.23.043.

The United States Environmental Protection Agency (EPA) shall maintain an oversight role of the state-authorized program, and in such capacity, shall enforce any permit condition based on state requirements if, in the Agency's judgement, the Director should fail to enforce that permit condition. Any challenges to the Agency-enforced conditions shall be appealed to the Agency, in accordance with 40 CFR § 124.19.

This Permit is effective as of November 12, 2004 and shall remain in effect until November 12, 2014, unless, in accordance with IDAPA 58.01.05.012, the Permit is: revoked and reissued [40 CFR § 270.41], terminated [40 CFR § 270.43], modified [40 CFR § 270.42 Appendix I.A.6], or continued [40 CFR § 270.51].

Approval For Disposal and Commercial Storage of Polychlorinated Biphenyl (PCB) Wastes

U.S. Environmental Protection Agency
Region 10
1200 Sixth Avenue, AT-083
Seattle, Washington 98101
Telephone: (206) 553-1270

Issued in accordance with the provisions of Section 6(e)(1) of the Toxic Substances Control Act of 1976, 15 USC §2605(e)(1), and the Federal PCB Regulations, 40 CFR §§761.65(d) and 761.75(c).

ISSUED TO:

Envirosafe Services of Idaho, Inc.
Missile Base Road
Grandview, Idaho 83624
Telephone: (208) 384-1500

This approval is effective as of November 29, 1991, and shall remain in effect until December 15, 1998, unless rescinded for failure to comply with the terms and conditions herein, failure to disclose all relevant facts or for any other reasons which the Regional Administrator of Environmental Protection Agency (EPA) Region 10 deems necessary to protect human health and the environment. This approval on its effective date supersedes, replaces and renders void the March 10, 1982, PCB Landfill Approval (including any subsequent revisions), and the May 22, 1987, Temporary PCB Landfill Approval (including any subsequent revisions).

ISSUED BY THE U.S. ENVIRONMENTAL PROTECTION AGENCY REGION 10

Charles E. Findley (signature)
Charles E. Findley, Director
Hazardous Waste Division
Environmental Protection Agency
Date Sept 20, 1991

LIST OF ATTACHMENTS

The following documents are excerpts from the Permittee's RCRA Permit Application dated May 5, 2003. The Permit Application and applicable attachments from the previous RCRA Permit are part of the official Administrative Record for the facility. The documents listed below are hereby incorporated, in their entirety, by reference into this Permit. The Department has modified specific language in the attachments, as deemed necessary. These modifications are described in the permit conditions (Modules I through XIII) and, thereby, supersede the language of the original attachment. All references in these attachments to the Agency or to designated representatives of the Agency shall also refer to the Department or to designated representatives of the Department. All references in any of the attachments of this Permit to "Envirosafe Services of Idaho Inc. (ESII)" are superseded by reference to "U.S. Ecology Idaho (USEI)." These incorporated attachments are enforceable conditions of this Permit, as modified by the specific permit conditions.

∗ Taken from existing permit.
† This drawing is contained in Attachment 20, Master Book of Drawings.

Attachment 1	Facility Legal Description and Map of Facility Location, consisting of: Section B, Pages B-1 through B-4, of Permit Application, as last revised May 5, 2003. Appendix B.1, Corporate Warranty Deed of Correction, Pages B.1-1 through B.1-7, of Permit Application, as last revised May 30, 2006. Drawing PRMI-T03, Typical Facility Site Plan, Rev. D, of Permit Application, as last revised September 15, 2008. Drawing PRMI-T01, General Facility Topographic Plan Sheet 1, Rev. D, of Permit Application, as last revised September 15, 2008.
Attachment 2	Waste Analysis Plan, consisting of: Section C, Table of Contents and Pages C-1 through C-61, including Figures C.1 through C.11 and Tables C.1 through C.10, of Permit Application, as last revised July 24, 2009. Appendix C.1, Pages 1 through 3, of Permit Application, as last revised May 5, 2003. Appendix C.2, Page C.2-1 through C.2-20, of Permit Application, as last revised May 5, 2003.
Attachment 3	Security Procedures, consisting of: Subsection F.1, Pages F-1 through F-2, of Permit, as last revised September 3, 2008. Figure F-15a, of Permit Application, as last revised January 22, 2009.
Attachment 4	Inspection Plan, consisting of: Table of Contents and Subsection F.2 and F.3, Pages F-2 through F-12, including Table F-1 and Figures F-1 through F-15, as last revised May 17, 2009.
Attachment 5	Training Plan, consisting of: Section H, Table of Contents and Pages H-1 through H-3, including Tables H-1 through H-4 of Permit Application, as last revised May 5, 2003.

Attachment 6	Hazards Prevention Plan, consisting of: Subsections F.4 and F.5, Pages F-12 through F-19, as last revised May 5, 2003.
Attachment 7	Contingency Plan, consisting of: Section G, Table of Contents and Pages G-1 through G-13, including Tables G-1 through G-8 and Figures G-1 through G-9, of Permit, as last revised October 26, 2009.
Attachment 8	Response Action Plan, consisting of: Table of Contents and Appendix D.4.7, Pages 1-1 through 4-6, including Table 1 and Appendices A, B, and C, of Permit, as last revised May 17, 2009.
Attachment 9	Closure and Post-Closure Plans, consisting of: Section I, Table of Contents and Pages I-1 through I-44, including Tables I.1 through I.8 and Figures I.2 through I.5, of Permit, as last revised May 17, 2009. Drawing PRMI-T04, Facility Topographic Plan Existing Conditions, Rev. E, of Permit, as last revised September 15, 2008. Drawing PRMI-T13, Facility Typical Topographic Plan Final at Closure, Rev. D, of Permit, as last revised September 15, 2008. Drawing PRMI-T12, Facility Topographic Plan Interim Conditions, Rev. D, of Permit, as last revised September 15, 2008. Drawing PRMI-T11, Facility Typical Soil Sampling Plan, Rev. D, of Permit, as last revised September 15, 2008.
Attachment 9a	Alternative Final Cover Assessment Trenches 10 and 11 dated January 15, 1999, as revised July 15, 1999.*
Attachment 9b	Alternative Cover Monitoring Program Plan Trenches 10 and 11 and Test Pad as revised July 15, 1999.*
Attachment 10	Surface Water Management Plan, consisting of: Table of Contents and Pages 1 through 38, Appendix D.4.7, including Tables 1 and 2, and Figure 2, of Permit, as last revised May 17, 2009. Drawing 52-01-09, Site Drainage Existing Conditions and Interim Phase, Rev. C, of Permit, as last revised September 15, 2008.† Figure 1, Facility Overall Drainage Areas Plan and Existing Conditions, Rev. E, of Permit, as last revised September 15, 2008. Drawing PRMI-D01, Rev. F, of Permit Application, as last revised September 15, 2008 Drawing PRMI-D03, Rev. E, of Permit Application, as last revised September 15, 2008.
Attachment 11	Ground Water Monitoring Plan, consisting of: Section E, Table of Contents and Pages E-1 through E-90, including Tables E-1 through E-23, Figures E-2 through E-36, of Permit, as last revised May 17, 2009. Appendix E.6, 2001 Re-evaluation of Rising Ground Water, of Permit Application, as last revised May 5, 2003. Appendix E.11, 1986 Vadose Zone Characteristics Report, of Permit Application, as last revised May 5, 2003.

Appendix E.14, Alternative Concentration Limit Demonstration Report, of Permit Application, as last revised May 5, 2003.
"Proposed Ground Water Monitoring Program Cell 15 U.S. Ecology Idaho Site B," Pages 1 through 4, Table 1, and Figure 1 (Proposed Ground Water Monitoring Wells for Cell 15), from Class 3 Permit Modification, dated June 2002.*
Groundwater Monitoring for Proposed Cell 15 Expansion and Proposed Location for Well L-47, dated September 16, 2008.
IDEQ Response to Proposed Location of Well L-47, dated November 18, 2008.

Attachment 12 — RCRA Part A Permit Application, consisting of:
RCRA Part A Permit Application, dated January 26, 2009.
Section A, Table of Contents and Pages A-1 through A-3, Figures A-1 through A-4, of Permit, as last revised January 22, 2009.

Attachment 13 — Container Management Units - Design and Operations, consisting of:
Section D.1, Table of Contents and Pages D-1 through D-12, including Tables D-1 and D-1A and Figure D-1, of Permit, as last revised January 22, 2009.
Drawing PRMI-R11, Rev. B, as last revised April 8, 2003.
Drawing PRMI-R21, Rev. B, as last revised April 16, 2003.
Additional Container Management Unit Drawings in Attachment 20 including:
Drawing 793P-R01, Rev. E, as last revised May 5, 2003.†
Drawing PRMI-R15, Rev. D, as last revised April 22, 2003.†
Drawing PRMI-R22, Rev. B, as last revised April 22, 2003.†
Drawing PRMI-C11, Rev. B, as last revised May 5, 2003. †
Drawing PRMI-C12, Rev. B, as last revised May 5, 2003. †
Drawing PRMI-C13, Rev. B, as last revised May 5, 2003. †
Drawing PRMI-C14, Rev. B, as last revised May 5, 2003. †
Drawing PRMI-C15, Rev. B, as last revised April 22, 2003. †

Attachment 14 — Bulk Material Tank Systems - Design and Operations, consisting of:
Subsection D-2, Pages D-12 through D-19, including Table D-2, and Figures D-3 through D-7, of Permit Application, as last revised September 3, 2008
Appendix D.2.5, Tank Operation Outline, Pages 1-5, of Permit Application, as last revised May 5, 2003.
Additional Tank Drawings in Attachment 20 including:
Drawing 720C-G02, Rev. D, as last revised May 5, 2003. †
Drawing 720C-G03, Rev. D, as last revised May 5, 2003. †
Drawing 720C-G04, Rev. D, as last revised May 5, 2003. †
Drawing 720C-G05, Rev. E, as last revised May 5, 2003. †
Drawing 720C-G06, Rev. C, as last revised May 5, 2003. †
Drawing 720C-P01, Rev. D, as last revised April 22, 2003. †
Drawing 720C-P02, Rev. B, as last revised April 22, 2003. †
Drawing 793P-C06, Rev. E, as last revised April 22, 2003. †
Drawing 793P-C07, Rev. E, as last revised May 5, 2003. †
Drawing 793P-C08, Rev. E, as last revised May 5, 2003. †
Drawing 793P-C12, Rev. 4, as last revised May 5, 2003. †
Drawing 793P-C13, Rev. L, as last revised April 22, 2003. †

Attachment 14a	Debris Building Bulk Material Tanks System – Design and Operations, consisting of: Tables D-2a, D-2b, and D-2c, as last revised September 3, 2008 Containment Building (Debris Portion) Process Flow Description, as last revised September 3, 2008. Drawing C-1, Rev. B, as last revised September 8, 2006. Drawing C-3, Rev. B, as last revised September 8, 2006. Drawing 1 of 4, Rev. A, as last revised September 15, 2006. Drawing 2 of 4, Rev. A, as last revised September 15, 2006. Drawing 3 of 4, Rev. A, as last revised September 15, 2006. Drawing 4 of 4, Rev. A, as last revised September 15, 2006. Drawing D2020-R02, as last revised November 2, 2006
Attachment 15	Outdoor Stabilization Facility - Design and Operation, consisting of: Figure D-2, Stabilization Facility Process Flow Diagram, of Permit Application, as last revised May 5, 2003. Drawing PRMI-R31, Rev. B, as last revised April 16, 2003.
Attachment 16	General Construction Specifications, consisting of: Appendix D.3.3, Cell 15 Design Specifications, of Permit Application, as last revised May 5, 2003.
Attachment 17	Surface Impoundment Units - Design and Operation, consisting of: Subsection D-4, Pages D-19 through D-33, including Figures D-8 and D-9, of Permit Application, as last revised May 5, 2003. Additional Surface Impoundment Drawings in Attachment 20 including: Drawing PRMI-D05, Rev. B, as last revised April 22, 2003. † Drawing PRMI-D06, Rev. B, as last revised April 22, 2003. † Drawing PRMI-D07, Rev. C, as last revised April 22, 2003. † Drawing PRMI-L41, Rev. B, as last revised April 16, 2003. †
Attachment 18	Engineering Report for Landfill Cell 15 and Drawings, consisting of: Appendix D.3.1, Table of Contents, Pages 1 through 37, Tables 5-1 through 8-2, Figures 1.1 through 7.1, of Permit Application, as last revised May 5, 2003. Appendix D.3.2, Construction Quality Assurance Plan, of Permit Application, as last revised May 5, 2003. Drawing 52-00-0, Rev. 0, of Permit Application, as last revised January 9, 2002. Drawing 52-01-01, Rev. 0, of Permit Application, as last revised January 11, 2002. Drawing 52-01-02, Rev. 0, of Permit Application, as last revised January 9, 2002. Drawing 52-01-03, Rev. 0, of Permit Application, as last revised January 9, 2002. Drawing 52-01-04, Rev. 0, of Permit Application, as last revised January 9, 2002. Drawing 52-01-05, Rev. 0, of Permit Application, as last revised January 10, 2002. Drawing 52-01-06, Rev. 0, of Permit Application, as last revised January 10, 2002. Drawing 52-01-07, Rev. 0, of Permit Application, as last revised January 10, 2002.

Drawing 52-01-08, Rev. A, of Permit Application, as last revised January 14, 2002.
Drawing 52-01-09, Rev. C, of Permit Application, as last revised September 15, 2008.
Drawing 52-01-10, Rev. B, of Permit Application, as last revised January 14, 2002.

Attachment 18a — Landfill Engineering Report Cell 15 Modifications, including:
Appendix A – Report Figures 1-4
Appendix B – Cell 15 Modification Drawing Set
- Drawing 15-08-00 Cell 15 Modification, revised January 29, 2009
- Drawing 15-08-01 Cell 15 Modification, revised September 30, 2008
- Drawing 15-08-02 Cell 15 Modification, revised September 30, 2008

Drawing 793P-P04, Rev. E, of Permit Application, as last revised May 5, 2003. †
Drawing 793P-R01, Rev. E, of Permit Application, as last revised May 5, 2003. †
Drawing 793P-R02, Rev. E, of Permit Application, as last revised May 5, 2003. †

Attachment 25 Treatment Processes Description:
Section D.10, Table of Contents and D-70 through D-89, including Table D-4, of Permit Application, as last revised May 5, 2003, including the following subsections:

D.10.a	Stabilization
D.10.b	Microencapsulation
D.10.c	Macroencapsulation
D.10.d	Chemical Oxidation
D.10.e	Chemical Reduction
D.10.f	Deactivation
D.10.g	Neutralization
D.10.h	Precipitation

	D.10.i	Adsorption
	D.10.j.	Bioremediation
	D.10.k	Evaporation
	D.10.I	Size Reduction
	D.10.m	Decanting
Attachment 26	List of Permit Modifications: Reserved for listing of future modifications.	

---

* Taken from existing permit.

† This drawing is contained in Attachment 20, Master Book of Drawings.

DEFINITIONS

All definitions contained in IDAPA 58.01.05.004, .008 and .010 through .013 [40 CFR Parts 260, 264, 266, 268, 270, and 124] are hereby incorporated, in their entirety, by reference into this Permit, except that any of the definitions used below shall supersede any definition of the same term given in IDAPA 58.01.05.000 et seq. Where terms are not defined in the regulations or the Permit, the meaning associated with such terms shall be defined by a standard dictionary reference of the generally accepted scientific or industrial meaning of the term.

a "Application" shall mean Volumes 1 through 8 of the May 2003 HWMA/RCRA Permit Application containing Sections A through L.

b "Cell" shall mean the Landfill Units 5, 14 and 15. This includes, and supersedes, references to "Trench 5 or Trench 14."

c "Containment Building" shall mean the building consisting of the “debris portion” and the “stabilization portion” where hazardous waste management activities shall be conducted, for wastes which USEI is permitted to manage, including the handling and treatment/ stabilization of “fine wastes.”

d "Day," “Daily,” “Normal Working Day,” and “Business Day” shall mean any calendar working day(s) (excluding weekends and holidays) where waste management activities occur at the facility, unless otherwise specified. Any requirement of submittal, under the terms of this Permit, that would be due on a Saturday, Sunday, or a federal or state holiday shall be due on the following business day.

e "Department" shall mean the Idaho Department of Environmental Quality.

f "Director" shall mean the Director of the Idaho Department of Environmental Quality or his or her designee.

g "Facility or Site" shall mean (1) All contiguous land, structures, other appurtenances, and improvements on the land used for treating, storing, or disposing of hazardous waste. A facility may consist of several treatment, storage or disposal operational units (e.g., one or more landfills, surface impoundments, or combinations of these), (2) For the purpose of implementing corrective action under IDAPA 58.01.05.008 §264.101, all contiguous property under the control of the owner or operator seeking a permit under Subtitle C of RCRA. This definition also applies to facilities implementing corrective action under RCRA Section 3008(h). This facility description is as set forth in Attachment 1 of this Permit.

h “Fine Wastes” shall mean any waste containing fine particulate matter as determined by Exhibit A of the December 9, 1996 Consent Order (included as Figure C.11 of Attachment 2 of this Permit).

i "HWMA" shall mean the state of Idaho, Hazardous Waste Management Act of 1983, as amended, Idaho Code § 39-4401 et seq.

j "Hazardous Waste Constituent" means a constituent that could cause or has caused the EPA to list a waste as hazardous per 40 CFR Part 261, Subpart D, or any constituent listed in Appendix VIII of IDAPA 58.01.05.005 [40 CFR Part 261] or in Appendix IX of IDAPA 58.01.05.008 [40 CFR Part 264].

k "Hazardous Waste" shall mean a solid waste, or combination of solid wastes, due to its quantity, concentration, or physical, chemical, or infectious characteristics may cause, or significantly contribute to, an increase in mortality or an increase in serious irreversible or incapacitating reversible illness, or pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, or disposed of, or otherwise managed in [42 USC § 6903(5)], or that meets the definition of hazardous waste as specified in IDAPA 58.01.05.005 [40 CFR § 261.3].

l "Hazardous Waste Management Unit (HWMU)" shall mean those operable units subject to the requirements of IDAPA 58.01.05.012 [40 CFR §§ 270.14 to 270.25].

m "IDAPA" shall mean the Idaho Administrative Procedures Act, Chapter 52, Title 67, Idaho Code.
n "Load," in reference to temporary storage of interim piles, shall mean one treatment load or batch equal to the capacity of a Containment Building mixing bin tank (not to exceed 100 cubic yards).
o "MCL(s)" shall mean Maximum Contaminant Levels promulgated under the Safe Drinking Water Act.
p "Owner" shall mean U.S. Ecology Idaho Inc.
q "Permit" shall mean this Permit issued by the Idaho Department of Environmental Quality.
r "Permittee" shall mean U.S. Ecology Idaho, Inc.
s "Radioactive contaminated liquids" shall mean those radioactive liquids that exhibit a dose rate which exceeds 40 ΦR/hr.
t "Release" shall mean any spilling, leaking, pouring, emitting, emptying, discharging, injecting, pumping, escaping, leaching, dumping, or disposing of hazardous wastes (including hazardous waste constituents) into the environment (including the abandonment or discarding of barrels, containers, and other closed receptacles containing hazardous wastes or hazardous waste constituents).
u "Schedule of Compliance" shall mean a schedule of remedial and/or closure measures included in a permit, including an enforceable sequence of interim requirements (i.e., actions, operations, or milestone events) leading to compliance with the HWMA and regulations.
v "Solid Waste Management Unit (SWMU)" shall mean any discernable unit at which solid wastes have been placed at any time, despite whether the unit was intended for the management of solid or hazardous wastes. Such units include any area at a facility at which solid wastes have been routinely and systematically released.
w "Stabilization Facility" shall mean the outdoor area at which USEI is permitted to perform hazardous waste treatment activities
x "SW 846" shall mean "Test Methods for Evaluating Solid Waste Chemical/Physical Methods" (latest edition published by EPA).
y "Trench" shall mean shallow Land Disposal Units such as Landfill Units 10 and 11.
z "UHC" shall mean Underlying Hazardous Constituent. UHC means any constituent listed in IDAPA 58.01.05.011 [40 CFR § 268.48], Table UTS – Universal Treatment Standards, except fluoride, selenium, sulfides, vanadium, and zinc, which can reasonably be expected to be present at the point of generation of the hazardous waste at a concentration above the constituent – specific UTS Treatment Standard.

ACRONYMS AND ABBREVIATIONS

For the purpose of this Permit the following acronyms and abbreviations shall apply:

AASHTO	American Association of State Highway and Transportation Officials
ABS	Acrylonitrile Butadiene Styrene
ACI	American Concrete Institute
ACGIH	American Conference of Governmental Industrial Hygienists
ACL	Alternate Concentration Limit
AGA	American Gas Association
AGST	Above Ground Storage Tank
ALR	Action Leakage Rate
ANSI	American National Standards Institute
APC	Air Pollution Control
APP	Aquifer Protection Permit
API	American Petroleum Institute
ASA	American Standards Association
ASME	American Society of Mechanical Engineers
AST	Aboveground Storage Tanks
ASTM	American Society for Testing and Materials
BACT	Best Available Control Technology
BAT	Best Available Technology
BMP	Best Management Practice
BOD	Biochemical or Biological Oxygen Demand
C	Celsius/Centigrade
CAO	Corrective Action Order
CAA	Clean Air Act, 42 USC Section 7401 et seq. (Federal)
CAMP	Corrective Action Monitoring Program
CAMU	Corrective Action Management Unit
CEG	Certified Engineering Geologist
CERCLA	Comprehensive Environmental Response, Compensation and Liability Act
CERCLIS	Comprehensive Environmental Response, Compensation, and Liability Information System
CESQG	Conditionally Exempt Small Quantity Generators
CFCs	Chlorofluorcarbons

yd^3	Cubic yard

This space intentionally left blank

MODULE I - STANDARD PERMIT CONDITIONS

I.A. EFFECT OF PERMIT

I.A.1. The Permittee is authorized to store, treat, and dispose of hazardous waste in accordance with the conditions of this Permit. Any storage, treatment, or disposal of hazardous waste by the Permittee, at this facility, that is not authorized by this Permit or by IDAPA 58.01.05.006 [40 CFR § 262.34], and for which a permit is required under Idaho Code § 39-4409 or Section § 3005 of RCRA, is prohibited.

I.A.2. Pursuant to IDAPA 58.01.05.012 [40 CFR § 270.4], compliance with this Permit generally constitutes compliance, for purposes of enforcement, with the Idaho Hazardous Waste Management Act (HWMA), as amended, except for the requirements not included in this Permit, which become effective by future statute or regulatory changes, to include those requirements promulgated under IDAPA 58.01.05.011 [40 CFR Part 268] restricting the placement of hazardous waste in or on the land.

I.B. PERSONAL AND PROPERTY RIGHTS

This Permit does not convey any property rights of any sort, or any exclusive privilege; nor does this Permit authorize any injury to persons or property, or any invasion of other private rights, or any infringement of state or local laws.

I.C. ENFORCEABILITY

I.C.1. The terms and conditions of this Permit are enforceable pursuant to the HWMA or any other applicable federal, state, or local law. Violations of this Permit may result in civil penalties, in accordance with HWMA [Idaho Code § 39-4414] and the HWMA Civil Penalty Policy.

I.C.2. Any person who knowingly makes any false statement or representation in any application, label, manifest, record, report, permit, or other document filed, maintained, or used for the purposes of complying with the provisions of Idaho Code § 39-4415, shall be guilty of a misdemeanor and subject to a fine of not more than ten thousand dollars ($10,000) or to imprisonment not to exceed one (1) year, or to both, for each separate violation or for each day of a continuing violation.

I.D. OTHER AUTHORITY

The Department expressly reserves any right of entry provided by law, and any authority to order or perform emergency or other response activities as authorized by law.

I.E. PERMIT ACTIONS

I.E.1. This Permit may be modified, revoked, and reissued or terminated for cause, as specified in IDAPA 58.01.05.012 [40 CFR §§ 270.41, 270.42, and 270.43].

I.E.2. The filing of a request for a permit modification, or revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance on the part of the Permittee shall not stay the applicability or enforceability of any permit condition.

I.E.3. Except as provided by specific language in this Permit or except for the Director's approval of a Class 1 or 2 Permit Modification, in accordance with IDAPA 58.01.05.012 [40 CFR § 270.42 (a) and (b)], any modification that substantially alters the facility or its operation, as covered by this Permit, shall be administered as a Class 3 Permit Modification prior to such change taking place, in accordance with IDAPA 58.01.05.012 [40 CFR § 270.42(c)].

I.E.4. The Director may modify this Permit when the standards or regulations on which the Permit was based have been changed by statute, the standards or regulations have been amended, or the standards or regulations have changed by way of judicial decision after the effective date of this Permit.

I.E.5. Within forty-five (45) calendar days of a permit modification being put into effect or approved, the Permittee shall provide clean copies of the relevant portions of the Permit and revised Attachments (if not already reflected/provided in the change pages submitted with the Permit Modification Request), reprint the documents (as necessary), and submit to the Director. The Permittee shall submit an electronic version (in a format pre-approved by the Director) of all permit modifications and Permit Applications to the Director.

I.E.6. The Permittee shall ensure that Attachment 26, the permit modification tracking log, is up to date, consistent with Permit Condition I.E.5.

I.F. SEVERABILITY

I.F.1. The provisions of this Permit are severable, and if any provision of this Permit, or the application of any provision of this Permit to any circumstance, is held invalid, the application of such provision to other circumstances and the remainder of this Permit shall not be affected thereby. Invalidation of any state or federal statutory or regulatory provision that forms the basis for any condition of this Permit does not affect the validity of any other state or federal statutory, or regulatory basis for said condition.

I.F.2. In the event that a condition of this Permit is stayed for any reason, the Permittee shall continue to comply with the related applicable and relevant standards of the previous Permit until final resolution of the stayed condition, unless compliance with the related applicable and relevant standards would be technologically incompatible with compliance with other conditions of this Permit that have not been stayed.

I.G. DUTY TO COMPLY

I.G.1. The Permittee shall comply with all conditions of this Permit, except that the Permittee need not comply with the conditions of this Permit to the extent and for the duration such noncompliance is authorized in an emergency permit (issued under IDAPA 58.01.05.012 [40 CFR § 270.61]). Any permit noncompliance, except under the terms of an emergency permit, constitutes a violation of RCRA, amended by

HSWA, and/or of HWMA, and is grounds for enforcement action, permit termination, modification, or revocation and reissuance of the Permit and/or denial of a Permit Renewal Application.

I.G.2. Compliance with the terms of this Permit does not constitute a defense to any action brought under Sections §§ 3007, 3008, 3013, and 7003 of RCRA [42 U.S.C. §§ 6927, 6928, 6934, and 6973], 104, 106(a), or 107 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) [42 U.S.C. § 9604, 9606(a), or 9607], as amended by the Superfund Amendments and Reauthorization Act of 1986, or any other federal or state law governing protection of public health or the environment from any imminent and substantial endangerment to human health or the environment. However, compliance with the terms of this Permit does constitute a defense to any action alleging failure to comply with the applicable standards upon which this Permit is based.

I.H. DUTY TO REAPPLY

The Permittee must apply for a new permit, in accordance with IDAPA 58.01.05.012 [40 CFR § 270.30(b)], at least 180 calendar days prior to the expiration date of this Permit, in accordance with IDAPA 58.01.05.012 [40 CFR § 270.10(h)].

I.I. PERMIT EXPIRATION

I.I.1. Except as renewed, modified, revoked, reissued, or terminated by the Director, this Permit shall automatically expire ten (10) years from the effective date of this Permit.

I.I.2. In accordance with IDAPA 58.01.05.012 [40 CFR § 270.50(d)], this Permit shall be reviewed five (5) years after the effective date and modified, as necessary, in accordance with IDAPA 58.01.05.012 [40 CFR § 270.41].

I.J. CONTINUATION OF EXPIRING PERMIT

This Permit and all conditions herein shall continue in force until the effective date of a new permit, if the Permittee has submitted a timely complete application in accordance with IDAPA 58.01.05.012 [40 CFR §§ 270.10, 270.13 through 270.29], and through no fault of the Permittee, the Director has neither issued nor denied a new permit under IDAPA 58.01.05.013 [40 CFR § 124.15] on or before the expiration date of this Permit.

I.K. NEED TO HALT OR REDUCE ACTIVITY NOT A DEFENSE

It shall not be a defense for the Permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Permit.

I.L. DUTY TO MITIGATE

In the event of noncompliance with this Permit, the Permittee shall take all reasonable steps to minimize releases to the environment resulting from the noncompliance and shall carry out such measures, as are reasonable, to prevent significant adverse impacts on human health or the environment.

I.M PROPER OPERATION AND MAINTENANCE

The Permittee shall, at all times, properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) that are installed or used by the Permittee so as to achieve compliance with the conditions of this Permit. Proper operation and maintenance includes effective performance, adequate funding, adequate operator staffing and training, and adequate laboratory and process controls, including appropriate quality assurance procedures. This provision requires the operation of back-up or auxiliary facilities or similar systems, only when necessary, to achieve compliance with the conditions of this Permit.

I.N. DUTY TO PROVIDE INFORMATION

The Permittee shall furnish to the Director, within a reasonable time period established by the Director, any relevant information that the Director may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Permit, or to determine compliance with this Permit. The Permittee shall also furnish to the Director, within five (5) days of the Director's request, copies of records required to be kept by this Permit.

I.O. INSPECTION AND ENTRY

Pursuant to IDAPA 58.01.05.012 [40 CFR § 270.30(i)], the Permittee shall allow the Director (or an authorized representative) upon the presentation of credentials and other documents, as may be required by law, to:

I.O.1. Enter (at reasonable times) upon the Permittee's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Permit;

I.O.2. Have access to and copy (at reasonable times) any records that must be kept under the conditions of this Permit;

I.O.3. Inspect at reasonable times, any portion of the facility, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Permit; and

I.O.4. Sample or monitor (at reasonable times), for the purposes of assuring permit compliance or as otherwise authorized by RCRA or state law, any substances or parameters at any location.

I.P. MONITORING AND RECORDS

I.P.1. The Permittee shall retain records of all monitoring information (including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation), copies of all reports required by this Permit, the certification required by IDAPA 58.01.05.008 [40 CFR § 264.73(b)(9)], and records of all data, used to complete the application for this Permit, for a period of at least three (3) years from the date of the sample, measurement, report, certification, or recording unless a longer retention period is required by other conditions of this

Permit. The three-year period may be extended by the Director (upon request), in writing, to the Permittee.

I.P.2. The Permittee shall retain (at the facility) all monitoring records from all surface water sampling, seep sampling, soil sampling, sediment sampling, and ground water monitoring wells and associated ground water surface elevations for the active life of the facility, and for disposal units for the active life of the facility and the Post-Closure Care Period. The retention periods may be extended by request of the Director, at any time, by written notification to the Permittee, and the retention times are automatically extended, during the course of any unresolved enforcement action regarding this facility, to three (3) years beyond the conclusion of the enforcement action.

I.P.3. Pursuant to IDAPA 58.01.05.012 [40 CFR § 270.30(j)(3)], records of monitoring information shall specify:

I.P.3.a. The date(s), exact place, and times of sampling or measurements;

I.P.3.b. The name(s), title(s), and affiliation of the individual(s) who performed the sampling or measurements;

I.P.3.c. The date(s) analyses were performed;

I.P.3.d. The name(s), title(s), and affiliation of the individual(s) who performed the analyses;

I.P.3.e. The analytical techniques or methods used; and

I.P.3.f. The results of such analyses, including Quality Assurance/Quality Control data.

I.P.4 Samples and measurements taken for monitoring purposes shall be representative of the monitored activity. The method used to obtain a representative sample of the waste, to be analyzed, shall be the appropriate method from IDAPA 58.01.05.005 [40 CFR Part 261, Appendix I], EPA's most recent edition of *Technical Enforcement Guidance Document* (hereinafter referred to as TEGD), or an equivalent method approved by the Director. Laboratory methods shall be those specified in the most recent edition of *Test Methods for Evaluating Solid Waste: Physical/Chemical Methods SW-846* (herein referred to as SW-846), the most recent edition of *Standard Methods for the Examination of Wastewater*, or other alternate method approved in this Permit, or an equivalent method in accordance with Permit Condition I.P.5.

I.P.5. The Permittee may substitute analytical methods that are equivalent to those specifically approved for use in this Permit, in accordance with the following:

I.P.5.a. The Permittee submits to the Director a request for substitution of an analytical method(s) that is equivalent to the method(s) specifically approved for use in this Permit. The request shall provide information demonstrating that the proposed method(s) is equal or superior to the analytical method(s) requested to be substituted in terms of sensitivity, accuracy, and precision (i.e., reproducibility).

I.P.5.b. The Director notifies the Permittee (in writing, by certified mail, or hand delivery) that the substitution of the analytical method(s) is approved. Such approval shall not require a permit modification under IDAPA 58.01.05.012 [40 CFR § 270.42].

I.P.6. Results of all ground water analyses required by this Permit shall be submitted to the Director within thirty (30) calendar days of the Permittee's receipt of sample data from the laboratory, but in no case shall the period between the date of sampling and the date of submission of analytical results, to the Director, exceed one hundred twenty (120) calendar days.

I.Q. REPORTING PLANNED CHANGES

The Permittee shall give notice to the Director, as soon as possible, of any planned physical alterations or additions to the facility before such planned physical alterations or additions occur, in accordance with IDAPA 58.01.05.012 [40 CFR § 270.30(l)(1)].

I.R. CERTIFICATION OF CONSTRUCTION OR MODIFICATION

I.R.1. The Permittee may not commence storage, treatment, or disposal in a new Hazardous Waste Management Unit or in a modified portion of an existing Hazardous Waste Management Unit, except as provided in IDAPA 58.01.05.012 [40 CFR §270.42], until the Permittee has submitted a letter to the Director (by certified mail, express mail, or hand delivery) along with the attachments required under Permit Condition II.A.2, signed by the Permittee and a registered professional engineer, certifying that the permitted unit(s) have been constructed or modified in accordance with the approved plans and specifications in compliance with this Permit (IDAPA 58.01.05.012 [40 CFR §270.30(l)]); and

I.R.2. The Director has reviewed and inspected the modified or newly constructed Hazardous Waste Management Unit(s) and has notified the Permittee in writing that he finds the unit(s) to be in compliance with the conditions of this Permit; or

I.R.3. In accordance with IDAPA 58.01.05.012 [40 CFR § 270.30(l)(2)(ii)(B)], if within fifteen (15) calendar days of the date of submittal, required by I.R.1 of this Permit, the Permittee has not received notice from the Director of his or her intent to inspect, prior inspection is waived and the Permittee may commence treatment, storage, or disposal of hazardous waste.

I.S. REPORTING ANTICIPATED NONCOMPLIANCE

The Permittee shall give advance notice to the Director of any planned changes in the permitted facility or activity that may result in noncompliance with requirements of this Permit, in accordance with IDAPA 58.01.05.012 [40 CFR § 270.30(l)(2)]. Advance notice shall not constitute a defense for any noncompliance.

I.T. TRANSFER OF PERMIT

This Permit is not transferable to any person, except after notice to and acceptance by the Director. The Director may require modification or revocation and reissuance of the Permit, pursuant to IDAPA 58.01.05.012 [40 CFR § 270.40]. Before transferring ownership or operation of the facility during its operating life, or of a disposal facility during the Post-Closure Period, the Permittee must notify the new owner or operator (in writing) of the requirements of IDAPA 58.01.05.008, 58.01.05.012 [40 CFR Parts 264 and 270] and this Permit.

I.U. TWENTY-FOUR HOUR REPORTING

I.U.1. In accordance with IDAPA 58.01.05.012 [40 CFR § 270.30(l)(6)], the Permittee shall verbally report to the Director (or the Idaho Emergency Communication Center during off-hours) any noncompliance with this Permit that might endanger human health or the environment. Any such information shall be reported, as soon as possible, but not later than twenty-four (24) hours from the time the Permittee becomes aware of the noncompliance. Potential endangerment to human health and the environment may include, but not be limited to, information concerning:

I.U.1.a. A release of any hazardous waste that may endanger public drinking water supplies; or

I.U.1.b. A release or discharge of hazardous waste, or of a fire or explosion, at the facility that could threaten human health or the environment outside the facility; or

I.U.1.c. Noncompliance with Permit Condition II.A.1 of this Permit.

I.U.2. The verbal description of the occurrence and its cause, if available, shall include the following (at a minimum):

- Name, title, and telephone number of the individual reporting;
- Name, address, and telephone number of the owner or operator;
- Name, address, and telephone number of the facility;
- Date, time, and type of incident;
- Location and cause of the accident;
- Name and quantity of material(s) involved;
- The extent and description of injuries, if any;
- An assessment of actual or potential hazards to the environment and human health, where this is applicable;
- Description of any emergency action taken to minimize possible threat(s) to human health or the environment;
- Estimated quantity and disposition of recovered material that resulted from the incident; and
- Any other information necessary to fully evaluate the situation and to develop an appropriate course of action.

I.U.3. Within five (5) calendar days after the Permittee is required to provide verbal notification, as specified in Permit Condition I.U.1 and I.U.2 of this Permit, the Permittee shall provide (to the Director) a written submission that shall include, but not be limited to, the following:

- Name, address, and telephone number of the individual reporting;
- A description (including cause, location, extent of injuries, if any, and an assessment of actual or potential hazard(s) to the environment and human health outside the facility, where this is applicable) of the incident (noncompliance and/or release);
- The period(s) in which the incident (noncompliance and/or release) occurred

including exact dates and times;

- Whether the results of the incident remain a threat to human health and the environment (whether the noncompliance has been corrected and/or the release has been adequately remediated); and
- If not, the anticipated time it is expected to continue; the steps taken or planned to reduce, eliminate, and prevent recurrence of the noncompliance; and/or steps taken or planned to adequately remediate the release.

I.U.3.a. The Permittee need not comply with the five (5) calendar day, written notice requirement if the Director waives (in writing) the requirement, and the Permittee submits a written report within fifteen (15) calendar days from the time the Permittee is required to provide verbal notification, as specified in Permit Condition I.U.1 of this Permit.

Twenty-four (24) hour telephone number 1-800-632-8000
(Idaho Emergency Communication Center)
The address and telephone numbers listed above are current as of the effective date of this Permit and may be subject to change.

I.V. OTHER NONCOMPLIANCE

The Permittee shall report to the Director (on a quarterly basis) all other instances of noncompliance, not reported under Permit Condition I.U of this Permit, from the effective date of the Permit. The reports shall contain the applicable information listed in Permit Condition I.U of this Permit. Reporting shall not constitute a defense for any noncompliance.

I.W. OTHER INFORMATION

Whenever the Permittee becomes aware that he/she failed to submit any relevant facts in the Permit Application or submitted incorrect information in a Permit Application, or in any report to the Director, the Permittee shall promptly submit such facts or information to the Director, in accordance with Permit Condition I.Z of this Permit.

I.X. SIGNATURE AND CERTIFICATION

All applications, reports, or other information submitted to the Director (by the Permittee) shall be signed and certified in accordance with IDAPA 58.01.05.012 [40 CFR § 270.11 and § 270.30(k)].

I.Y. CONFIDENTIAL INFORMATION

The Permittee may be able to make a confidentiality claim regarding information submitted to the Department. Any such claim shall be governed by Sections 39-4411 and 39-337 to 39-350 of the Idaho Code, Sections 58.01.05.004 [40 CFR § 260.2], 58.01.05.012 [40 CFR § 270.12] and 58.01.05.997, and any other applicable state or local law. Pursuant to those authorities, if no claim of confidentiality is made at the time of submission, the Department may make the information available to the public without further notice.

I.Z. REPORTS, NOTIFICATIONS, AND SUBMISSIONS TO THE DIRECTOR

All reports, notifications, or other submissions that are required by this Permit and IDAPA 58.01.05.012 [40 CFR § 270.5] shall be sent or given to the Director (in duplicate) by certified mail, or express mail, or hand delivered to:

Director, c/o Hazardous Waste Program Manager
Idaho Department of Environmental Quality
1410 North Hilton
Boise, Idaho 83706-1255
Telephone No. (208) 373-0502

I.AA. DOCUMENTS TO BE MAINTAINED AT THE FACILITY

I.AA.1. The Permittee shall maintain at the facility (until closure is completed and certified by an independent, registered professional engineer) the following documents and amendments, and revisions or modifications to these documents:

I.AA.1.a. A complete copy of this Permit, including all attachments, figures, tables, and modifications (at a minimum) including the following:

- Waste Analysis Plan, as required by IDAPA 58.01.05.008 [40 CFR § 264.13] and this Permit (Attachment 2).
- Inspection Procedures, Schedules, Logs, and Records, as required by IDAPA 58.01.05.008 [40 CFR §§ 264.15(b)(2) and 264.73(b)(5)] and this Permit.
- Personnel training requirements for each position and personnel training records for each individual, involved with the management of hazardous waste, as required by IDAPA 58.01.05.008 [40 CFR § 264.16(d)] and this Permit.
- Contingency Plan, as required by IDAPA 58.01.05.008 [40 CFR § 264.53(a)] and this Permit (Attachment 7).
- Operating Record, as required by IDAPA 58.01.05.008 [40 CFR § 264.73] and this Permit.
- Closure Plan and Closure Cost Estimate, as required by IDAPA 58.01.05.008 [40 CFR § 264.112(a) and § 264.142] and this Permit.

This space intentionally left blank.

MODULE II - GENERAL FACILITY CONDITIONS

II.A. DESIGN AND OPERATION OF FACILITY

II.A.1. The Permittee shall design, construct, maintain, and operate the facility to minimize the possibility of a fire, explosion, or any unplanned sudden or non-sudden release of hazardous waste constituents to air, soil, ground water, or surface water that could threaten human health or the environment.

II.A.2. The Permittee shall construct all future and maintain all existing Hazardous Waste Management Units in accordance with the approved designs, specifications, and maintenance schedules that are included in Attachments 10, 11, 13 through 20, 24, and 25 of this Permit, except for minor changes deemed necessary by the Permittee to facilitate proper construction of the Hazardous Waste Management Units. Minor deviations from the approved designs or specifications necessary to accommodate proper construction, and the substitution of the use of equivalent or superior materials or equipment, must be noted on the as-built drawings and the rationale for those deviations must be provided in narrative form. After completion of construction of each future Hazardous Waste Management Unit, the Permittee shall submit to the Director final as-built drawings and the narrative report as part of the construction certification document specified in Permit Condition I.R.1.

II.A.3. A 100-foot wide strip of land, located within the outside perimeter (i.e., the fenceline) of the facility's legal boundaries as defined in Attachment 1 of this Permit, shall be set aside as a buffer strip for any hazardous waste treatment, storage, or disposal. New hazardous waste treatment, storage, or disposal units shall not be constructed within the buffer strip (except as relating to inspection requirements) nor shall the buffer strip be subdivided for the hazardous waste disposal site.

II.A.3.a. The company-owned land surrounding the Facility to the west, east, and south is subject to the Hazardous Waste Facility Siting Act (Idaho Code §§ 39-5801 through 5820).

II.A.3.b. The company-owned land along the northern boundary of the Facility, as defined in Permit Condition II.A.3.b.(1), shall remain undeveloped land and no application under the Hazardous Waste Facility Siting Act (Idaho Code §§ 39-5801 through 5820) shall be made to utilize this land for any activities permitted by the Act. This land shall be set aside as a buffer zone where no new hazardous waste treatment, storage, or disposal units, or ancillary structures, shall be constructed (except as relating to inspection requirements and other permit-required activities, such as corrective action) nor shall the buffer zone be subdivided for use as a hazardous waste disposal site. Except as specified above, the buffer zone, as defined in Permit Condition II.A.3.b.(1), will be maintained in a natural state and will not be developed or used in a manner that will impair the historic viewshed or cultural and natural resources. This Permit Condition shall bind USEI, its successors, and assigns.

II.A.3.b.(1) The buffer zone subject to the requirements of Permit Condition II.A.3.b shall encompass approximately 309 acres and is located as follows:

T4S, R1E, Owyhee County
Section 13: E1/2 SE1/4

T4S, R2E, Owyhee County
Section 18: Lots 3 and 4, E1/2 SW1/4, S1/2 SE1/4

II.A.4. The Permittee shall comply with all applicable requirements of the Land Disposal Restrictions of IDAPA 58.01.05.011 [40 CFR Part 268].

II.B. REQUIRED NOTICES FOR RECEIPT OF OFF-SITE HAZARDOUS WASTE

II.B.1. The Permittee may receive hazardous waste from a foreign source provided that the Permittee notify the Director (in writing) at least four (4) weeks in advance of the date hazardous waste, from a foreign source, is expected to arrive at the facility, as required by IDAPA 58.01.05.008 [40 CFR § 264.12(a)]. Notice of subsequent shipments of the same waste from the same foreign source is not required.

II.B.2. When the Permittee is to receive hazardous waste from an off-site source (except where the Permittee is also the generator), it must inform the generator in writing that it has the appropriate permits for and will accept the waste the generator is shipping. The Permittee must keep a copy of this written notice as part of the Operating Record, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.12(b) and § 264.73(b)(7)] and this Permit.

II.B.3. The Permittee shall notify the Department in writing, within three (3) business days of the occurrence, that the Permittee has rejected for acceptance a hazardous waste shipment. This notice shall contain the following information:

II.B.3.a. Generator name, EPA ID Number, address, and telephone number;

II.B.3.b. Transporter name and EPA ID Number;

II.B.3.c. Waste description and quantity;

II.B.3.d. Reason for rejection;

II.B.3.e. Date of generator signature;

II.B.3.f. Date of receipt and rejection; and

II.B.3.g. Copy of manifest.

II.C. GENERAL WASTE ANALYSIS

II.C.1. The Permittee shall comply with the procedures and requirements of the Waste Analysis Plan, in accordance with IDAPA 58.01.05.008 and 58.01.05.011 [40 CFR § 264.13 and § 268.7], and Attachments 2 and 23 of this Permit.

II.C.2. For every waste stream received, the Permittee shall have on file (at the site), the generator-provided “Waste Product Questionnaire” (Figure C-1 of Attachment 2).

II.C.3. The Permittee may revise Figure C-1, as designated in Permit Conditions II.C.3.a and II.C.3.b, without first obtaining a permit modification under IDAPA 58.01.05.012 [40 CFR § 270.42]. The procedures designated under Permit Condition II.S shall be followed to implement these revisions:

II.C.3.a. The Permittee may add information requirements to Figure C-1 in cases where such additional information will result in a more comprehensive Figure C-1.

II.C.3.b. The Permittee may delete information from Figure C-1 if the information is not essential for determining the acceptability of a waste stream for management at the Permittee's site (i.e., revisions made to Figure C-1 to comply with IDAPA 58.01.05.011 [40 CFR Part 268] restrictions).

II.C.4. The Permittee shall ensure that the wastes are not managed at the facility in violation of the provisions of the Land Disposal Restrictions rule as contained in IDAPA 58.01.05.011 [40 CFR Part 268] with the exception of CAMU-eligible wastes, per section II.C.5 of this permit. To the extent that modifications to the Permittee’s Waste Analysis Plan are needed to comply with future self implementing provisions of IDAPA 58.01.05.011 [40 CFR Part 268], the Permittee must submit a Permit Modification Request to the Director within ninety (90) calendar days of the effective date of the self-implementing provisions.

II.C.4.a. The Permittee is authorized to accept CAMU-eligible wastes for disposal. The Permittee shall ensure CAMU-eligible wastes are managed in accordance with the provisions contained in IDAPA 58.01.05.008 [40 CFR Part 264] and Attachment 2 of this Permit.

II.C.5. All waste analysis procedures designated in Attachment 2 and 17 of this Permit shall be adhered to for the placement of on-site-generated landfill leachate and any other wastes into the evaporation pond.

II.C.6 The Permittee shall maintain a copy of the latest approved Waste Analysis Plan, included as Attachment 2 of this Permit, at the facility until the facility is fully closed and certified per IDAPA 58.01.05.008 [40 CFR § 264 Subpart G].

II.C.7. The Permittee shall comply with the requirements of IDAPA 58.01.05.008 [40 CFR § 264.17(a)] and follow the procedures for handling ignitable, reactive, and incompatible wastes set forth in Attachment 2 of this Permit.

II.C.8. The Permittee shall comply with the 40 CFR 264 Subpart CC waste determination procedures, as required by IDAPA 58.01.05.008 [40 CFR § 264.1083].

II.D. SECURITY PROCEDURES

The Permittee shall comply with the security provisions of IDAPA 58.01.05.008 [40 CFR § 264.14(b)] and as described in Attachment 3 of this Permit.

II.E. INSPECTION PLAN

The Permittee shall follow the procedures of the approved Inspection Plan included as Attachment 4 of this Permit. The Permittee shall comply with the inspection provisions of IDAPA 58.01.05.008 [40 CFR § 264.15], and as follows:

II.E.1. The Permittee shall maintain the inspection records and results, in accordance with Permit Condition I.AA. The Permittee shall record inspections on the Inspection Log sheet (included in Attachment 4 of this Permit) or an equivalent, approved log sheet, as specified in IDAPA 58.01.05.008 [40 CFR § 264.15(d)].

II.E.2. The Permittee shall record on the Inspection Logs and Inspection Log Sheets (required by Permit Condition II.E.1) as specified in IDAPA 58.01.05.008 [40 CFR § 264.15(d)]. At a minimum, the following shall be recorded:

- The date and time of the inspection;
- The name and title of the inspector;
- A notation of the observations made; and
- The date and nature of any repairs or other remedial actions.

II.E.3. The Permittee shall remedy, as required by IDAPA 58.01.05.008 [40 CFR § 264.15(c)], on a schedule approved by the Director, any deterioration or malfunction discovered by an inspection.

II.E.4. The Permittee shall retain the Inspection Logs and Inspection Log Sheets required by Permit Condition II.E.1 until closure is completed and certified, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.73(b)(5)] and Permit Condition I.AA.

II.E.5. In the event of a facility shutdown or an extended holiday, no more than seventy-two (72) hours shall elapse between inspections listed at a frequency of "normal working day" on the inspection schedule (Table F-1 in Attachment 4).

II.E.6. The Permittee may make only the following revisions to the Inspection Plan, without first obtaining a permit modification, in accordance with IDAPA 58.01.05.012 [40 CFR § 270.42]. The procedures designated under Permit Condition II.S shall be followed to implement these revisions.

II.E.6.a. Upon certification of closure of an individual Waste Management Unit, any portion of the Inspection Plan, specific to that unit, may be deleted from the Inspection Plan (Attachment 4 of this Permit).

II.E.6.b. The Permittee may modify orientations of inspection-related items on inspection figures.

II.E.6.c. The Permittee may add inspection requirements to an existing inspection form, table, figure, or disposal record form in cases where such additional requirements will result in a more comprehensive or detailed Inspection Plan.

II.E.6.d. The Permittee may create additional inspection forms, tables, figures, or disposal record forms to address inspection requirements for equivalent replacement equipment that must be routinely inspected.

II.F. TRAINING PLAN

II.F.1. The Permittee shall ensure that all personnel who handle hazardous waste are trained in hazardous waste management, safety and emergency procedures (as applicable to their job description) in accordance with the Permittee's Training Plan. These personnel shall be trained in accordance with the Training Plan, as included in Attachment 5 of this Permit, and documentation of training shall be maintained, as specified in Attachment 5 of this Permit.

II.G. PREPAREDNESS AND PREVENTION

II.G.1. The Permittee shall comply with the preparedness and prevention procedures included as Attachment 6 of this Permit, and in accordance with IDAPA 58.01.05.008 [40 CFR § 264 Subpart C] and as follows:

II.G.2. The Permittee shall operate the permitted units so as to minimize the possibility of a fire, explosion or sudden or non-sudden releases to the air or soil, which could threaten human health or the environment, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.31] and Attachment 6 of this Permit.

II.G.3. The Permittee shall maintain the communications and alarm systems, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.34] and Attachment 6 of this Permit.

II.G.4. The Permittee shall maintain the aisle space necessary to allow the unobstructed movement of personnel, fire protection equipment, spill control equipment, and decontamination equipment, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.35] and Attachment 6 of this Permit.

II.G.5. The Permittee shall maintain arrangements with state and local authorities, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.37] and Attachment 7 of this Permit. If state or local officials refuse to enter into preparedness and prevention arrangements with the Permittee for a given HWMU, the Permittee must document this refusal in the Operating Record.

II.H. CONTINGENCY PLAN

II.H.1. The Permittee shall follow the procedures outlined in the Contingency Plan, included as Attachment 7 of this Permit, and comply with IDAPA 50.01.05.008 [40 CFR 264 Subpart D] and as follows:

II.H.2. The Permittee shall notify the Department by calling the Idaho Emergency Communication Center's 24-hour phone number (1-800-632-8000), as soon as practical, but in no event more than 24 hours after the discovery of any release of hazardous waste that may pose an immediate threat to the Permittee's personnel or the environment, or that requires the Permittee to take corrective action to mitigate the effects of the release, including implementing the Contingency Plan. Releases requiring such notification shall include, but are not limited to, incidents such as personnel exposure or contamination for which outside medical attention is sought; storm events that result in run-off leaving the active areas of the site; or any fire or explosion at the site that requires use of emergency equipment to extinguish or control the fire.

II.H.3. The Permittee shall review and immediately amend, as necessary, the Contingency Plan whenever:

II.H.3.a. This Permit is revised;

II.H.3.b. The Contingency Plan fails in an emergency;

II.H.3.c. The Permittee changes the facility design, construction, operation, maintenance, or other circumstances in a way that materially increases the potential for fires, explosions, or releases of hazardous waste or hazardous waste constituents, or changes the response necessary in an emergency;

II.H.3.d. The list of emergency coordinators changes; or

II.H.3.e. Major changes to the list of emergency equipment occur.

II.H.4. The Permittee shall submit to the Director the names, addresses, and phone numbers of all persons qualified to act as emergency coordinators. The Permittee shall ensure that a trained emergency coordinator be available at all times in case of an emergency.

II.H.5. The Permittee shall submit a copy of the Contingency Plan, and all revisions to the plan, to all local police departments, fire departments, hospitals, and state and local emergency response teams that may be called upon to provide emergency services, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.53(b)].

II.H.6. The Permittee shall document the time, date, and details of any incident that requires implementing the Contingency Plan in the Facility Operating Record. Within fifteen (15) days after the incident, the Permittee shall submit a written report of the incident to the Director.

II.I. MANIFEST SYSTEM

II.I.1. The Permittee shall follow the procedures for using the Manifest System and identifying and resolving manifest discrepancies, in accordance with IDAPA 58.01.05.008, 58.01.05.012 [40 CFR §§ 264.71, 264.72, and 270.30(1)(7)] and the Waste Analysis Plan, included as Attachment 2 of this Permit.

II.I.2. The Permittee shall submit an unmanifested waste report to the Director, in accordance with IDAPA 58.01.05.008, IDAPA 58.01.05.012 [40 CFR §§ 264.76 and 270.30(1)(8)], within fifteen (15) calendar days of receipt of unmanifested waste.

II.J. RECORD KEEPING AND REPORTING

In addition to the record keeping and reporting requirements specified elsewhere in this Permit, the Permittee shall comply with the following:

II.J.1. The Permittee shall maintain a written Operating Record at the facility, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.73(a)], for all records identified in IDAPA 58.01.05.008 [40 CFR §§ 264.73(b)(1) through 264.73(b)(16)].

II.J.2. The Permittee shall, by March 1st of each year, submit to the Director a certification pursuant to IDAPA 58.01.05.008 [40 CFR § 264.73(b)(9)], that the Permittee has a program in place to reduce the volume and toxicity of hazardous waste generated, to the degree determined to be economically practicable; and that the proposed method of treatment, storage, or disposal is the most practicable method currently available to the Permittee, which minimizes the present and future threat to human health and the environment.

II.J.3. The Permittee shall, by March 1st of each even-numbered year, submit to the Director a Biennial Report covering the facility activities during the previous calendar year, pursuant to IDAPA 58.01.05.008, 58.01.05.006, 58.01.05.012 [40 CFR §§ 264.75(a) through (j), 262.41, 270.30(l)(9)].

II.J.4. The Permittee shall retain all hazardous waste management records, including data collected in accordance with procedures of the Response Action Plans, and make such records available to the Director (at reasonable times) for inspection, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.74(a)].

II.J.5. The retention period for all records required by this Permit is extended automatically during the course of any unresolved enforcement action regarding the Permittee or as directed by the Director, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.74(b)].

II.J.6. The Permittee shall submit a survey plat of waste disposal locations to the local land authority and to the Director in accordance with the closure requirements of Permit Condition II.K.8 and IDAPA 58.01.05.008 [40 CFR § 264.116].

II.J.7. The Permittee shall submit additional reports to the Director in accordance with IDAPA 58.01.05.008 [40 CFR § 264.77].

II.K. CLOSURE

II.K.1. The Permittee shall meet the general closure performance standard, as specified in IDAPA 58.01.05.008 [40 CFR § 264.111], during closure of all Hazardous Waste Management Units at the facility. Compliance with IDAPA 58.01.05.008 [40 CFR § 264.111] shall require closure of each Hazardous Waste Management Unit in accordance with the Closure Plan, included as Attachment 9 of this Permit and all applicable requirements of Permit Condition II.K.

II.K.2. For all Hazardous Waste Management Units, other than landfills and surface impoundments, minor deviations from the permitted closure procedures, necessary to accommodate proper closure, must be described in a narrative form with the closure certification statements. The Permittee shall describe the rationale for implementing minor changes as part of this narrative report. Within sixty (60) calendar days after completion of closure of each Hazardous Waste Management Unit, other than Landfill and Surface Impoundment Units, the Permittee shall submit the certification statements and narrative report to the Director.

II.K.3. The Permittee shall amend the Closure Plan, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.112(c)], whenever necessary, by submitting a written request for a permit modification to the Director.

II.K.4. The Permittee shall notify the Director at least sixty (60) calendar days prior to the date it expects to begin closure of any surface impoundment or landfill unit, and at least forty-five (45) calendar days prior to the date it expects to begin closure of any tanks, container storage units, or containment buildings.

II.K.5. The Permittee shall close all Hazardous Waste Management Units within the time limits specified in the Closure Plan in Attachment 9 of this Permit, with the exception that the closure time for the surface impoundments shall be 1,460 days after receiving the final volume of hazardous wastes, unless extended, pursuant to Permit Condition V.B.

II.K.6. The Permittee shall decontaminate or dispose of all facility equipment as specified in the Closure Plan included in Attachment 9 of this Permit.

II.K.7. The Permittee shall provide certification statements attesting that each Hazardous Waste Management Unit at the facility has been closed in accordance with the applicable specifications in the Closure Plan included in Attachment 9 of this Permit, as required by IDAPA 58.01.05.008 [40 CFR § 264.115].

II.K.8. The Permittee shall submit to the local land use authority, and to the Director, upon submission of the certification of closure of each hazardous waste disposal unit, a survey plat indicating the waste disposal locations and dimensions, with respect to permanently surveyed benchmarks, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.116].

II.K.9. In the event that any Hazardous Waste Management Unit, other than the Landfill and Surface Impoundment Units, cannot be closed by removing hazardous waste, hazardous constituents, contaminated subsoil, and any contaminated ground water (i.e., clean-closed) as specified in Permit Condition II.K.1, the Permittee shall revise the Facility Post-Closure Plan to include a Post-Closure Plan for that Hazardous Waste Management Unit. The Permittee shall submit to the Director the Post-Closure Plan for that Hazardous Waste Management Unit, as a Permit Modification Request, within ninety (90) calendar days of the date that the Director notifies the Permittee in writing that the unit must be closed as a landfill, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.118(a)].

II.L. COST ESTIMATE FOR FACILITY CLOSURE

II.L.1. The Permittee shall comply with the requirements of IDAPA 58.01.05.008 [40 CFR § 264.142(a)]. The Permittee shall maintain a current closure cost estimate for each individual Hazardous Waste Management Unit. The costs shall be summarized, by the Permittee, for final closure of the entire facility.

II.L.2. In accordance with IDAPA 58.01.05.008 [40 CFR § 264.142(b)], the Permittee shall annually adjust the closure cost estimate for inflation, prior to June 1st, the anniversary date of the establishment of the original financial instrument(s) used to comply with Permit Condition II.O and IDAPA 58.01.05.008 [40 CFR § 264.143].

II.L.3. During the active life of the facility, the Permittee shall submit to the Director a revised closure cost estimate within thirty (30) calendar days of an approved modification to the Closure Plan, if such modification results in an increase in the closure cost estimate, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.142(c)].

II.L.4. During the operating life of the facility, the Permittee shall keep a copy of each closure cost estimate and adjustment made at the facility, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.142(a), (b), and (c)].

II.L.5. The Permittee shall maintain an updated summary of current closure costs for the entire facility closure, based on the Hazardous Waste Management Units that have received RCRA waste but have not yet been certified as closed, and have not been released from the financial responsibility requirements as specified in Permit Condition II.O (i.e., active units).

II.L.6. Prior to placement of waste in any new Hazardous Waste Management Unit, the Permittee must amend, as necessary, the summary of current closure costs to reflect the estimated closure cost of that new unit. Such amended closure costs shall be annually adjusted for inflation, as required by IDAPA 58.01.05.008 [40 CFR § 264.142(b)].

II.L.7. Upon certification for closure of any Hazardous Waste Management Unit, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.115], and after the Director has released the Permittee from the financial responsibility requirements for that unit as specified in Permit Condition II.O, the Permittee may adjust the summary of current closure costs to reflect the closure cost of that unit. The Permittee shall submit to the Director a current version of the closure cost estimate for the facility, indicating cost estimates for each remaining unit to be closed.

II.M. POST-CLOSURE CARE

II.M.1. The Permittee shall comply with the approved Post-Closure Plan, included in Attachment 9 of this Permit. In addition, the Permittee shall comply with all modifications to the Post-Closure Plan, and with all provisions of IDAPA 58.01.05.008 [40 CFR §§ 264.117, .118, .119, and .120].

II.M.2. Except as the period may be shortened or extended, as provided in IDAPA 58.01.05.008 [40 CFR § 264.117(a)(2)], the period of Post-Closure Care for each Landfill and Surface Impoundment Unit and any other Hazardous Waste Management Unit, as applicable, shall be thirty (30) years after Director approval of closure certification.

II.N. COST ESTIMATE FOR POST-CLOSURE CARE

II.N.1. The Permittee shall comply with IDAPA 58.01.05.008 [40 CFR § 264.144(a)]. The Permittee shall maintain a current post-closure cost estimate for each post-closure activity.

II.N.2. The Permittee shall annually adjust the post-closure cost estimate for inflation, prior to June 1st, the anniversary date of the establishment of the original financial instrument(s) used to comply with Permit Condition II.P and IDAPA 58.01.05.008 [40

CFR § 264.144(b)].

II.N.3. During the active life of the facility, the Permittee shall submit to the Director a revised post-closure cost estimate, within thirty (30) days of an approved modification to the Post-Closure Plan, if such modification results in an increase in the post-closure cost estimate, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.144(c)].

II.N.4. During the operating life of the facility, the Permittee shall keep a copy at the facility of each post-closure cost estimate and adjustments prepared, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.144(a), (b), and (c)].

II.O. FINANCIAL ASSURANCE FOR FACILITY CLOSURE

II.O.1. The Permittee shall comply with IDAPA 58.01.05.008 [40 CFR § 264.143] by providing documentation of financial assurance, as required by IDAPA 58.01.05.008 [40 CFR § 264.151], in the amount of the cost estimates required by Permit Condition II.L.1.

II.O.2. Prior to placement of waste in any new Hazardous Waste Management Unit, the Permittee shall update the closure financial assurance mechanism, as necessary, and demonstrate that an adequately, funded financial assurance mechanism for closure of the facility, including the new Hazardous Waste Management Unit, is in effect. A copy of the updated, financial assurance mechanism shall be approved by the Director before waste is placed in the new unit. (See Permit Condition II.L.6.)

II.O.3. Changes in financial assurance mechanisms for closure must be approved by the Director, pursuant to IDAPA 58.01.05.008 [40 CFR § 264.143].

II.P. FINANCIAL ASSURANCE FOR FACILITY POST-CLOSURE

II.P.1. The Permittee shall comply with IDAPA 58.01.05.008 [40 CFR § 264.145 or 264.146] by providing documentation of financial assurance, as required by IDAPA 58.01.05.008 [40 CFR § 264.151], in the amount of the cost estimates required by Permit Condition II.N.1.

II.P.2. Changes in financial assurance mechanisms for post-closure must be approved by the Director, pursuant to IDAPA 58.01.05.008 [40 CFR § 264.145].

II.Q. LIABILITY REQUIREMENTS

II.Q.1. The Permittee shall comply with the requirements of IDAPA 58.01.05.008 [40 CFR § 264.147(a)] and the documentation requirements of IDAPA 58.01.05.008 [40 CFR § 264.151], including the requirements to have and maintain liability coverage for sudden accidental occurrences in the amount of at least $1 million per occurrence, with an annual aggregate of at least $2 million, exclusive of legal defense costs.

II.Q.2. The Permittee shall comply with the requirements of IDAPA 58.01.05.008 [40 CFR § 264.147(b)] and the documentation requirements of IDAPA 58.01.05.008 [40 CFR § 264.151], including the requirements to have and maintain liability coverage for non-sudden accidental occurrences in the amount of at least $3 million per occurrence, with an annual aggregate of at least $6 million, exclusive of legal defense costs.

II.R. INCAPACITY OF OWNERS OR OPERATORS GUARANTORS, OR FINANCIAL INSTITUTIONS

The Permittee shall comply with IDAPA 58.01.05.008 [40 CFR § 264.148].

II.S. EQUIVALENT MATERIALS/INFORMATION

II.S.1. If certain equipment, materials, and administrative information (such as names, phone numbers, addresses) are specified in this Permit, the Permittee is allowed to use an equivalent or superior substitute. Use of such equivalent or superior items, within the limits (e.g. ranges, tolerances, and alternatives) already specified in sufficient detail in this Permit and the Permit Attachments, shall not be considered a modification of the Permit. However, the Permittee must place in the Operating Record (prior to the institution of such revision) the revision, accompanied by a narrative explanation, and the date the revision became effective. Documentation of the substitution shall be submitted to the Director on a quarterly basis (at a minimum). The Department may judge the soundness of the revision and take appropriate action. The format of tables and forms are not subject to the requirements of this Permit, and may be revised at the Permittee's discretion.

II.S.2. If the Department determines that the substitution was not equivalent to the original, it will notify the Permittee that the Permittee's claim of equivalency has been denied, the reasons for the denial, and that the original material or equipment must be used. If the product substitution is denied, the Permittee shall comply with the original, approved product specification, find an acceptable substitution, or apply for a permit modification, in accordance with IDAPA 58.01.05.012 [40 CFR § 270.42].

II.T. AIR EMISSION STANDARDS

II.T.1. The Permittee shall comply with the Phase 1 Organic Air Emission Standards of IDAPA 58.01.08.008 [40 CFR Part 264] for hazardous waste treatment, storage, and disposal (TSD) facilities including:

- IDAPA 58.01.08.008 [40 CFR Part 264, Subpart AA] for emission standards of total organics from process vents associated with distillation, fractionation, thin-film evaporation, solvent extraction, and air or steam-stripping operations that process hazardous waste, with an annual average total organic concentration of at least ten (10) parts per million by weight (ppmw).
- IDAPA 58.01.08.008 [40 CFR Part 264, Subpart BB] for emission standards that address leaks of total organics from specific equipment (i.e., pumps, valves, compressors, etc.) that contains or contacts hazardous waste that has a total organic concentration of at least 10% by weight.
- IDAPA 58.01.08.008 [40 CFR Part 264, Subpart CC] for emission standards that address the management of hazardous waste, containing an average volatile organic (VO) concentration at the point of waste origination of more than 500 ppmw, in tanks, surface impoundments, and containers.

II.T.2. The Permittee shall not treat, store, or dispose of hazardous wastes subject to

IDAPA 58.01.05.008 [40 CFR § 264.1082] (e.g., wastes that exceed an average volatile organic (VO) concentration at the point of waste origination of more than 500 ppmw) in tanks, surface impoundments, or containers, unless the appropriate emission control requirements are met, as specified in IDAPA 58.01.05.008 [40 CFR Subpart CC]. Prior approval from the Director is required for the treatment or disposal of wastes exceeding an average VO concentration at the point of waste origination of 500 ppmw in tanks, surface impoundments, or containers.

II.T.3. Prior to installing or using any additional equipment (including air emission controls) subject to the requirements of IDAPA 58.01.05.008 [40 CFR Part 264, Subpart CC], the Permittee shall supply the specific Part B information required, pursuant to IDAPA 58.01.05.012 [40 CFR § 270.27], and shall obtain a permit modification in accordance with the provisions of IDAPA 58.01.05.012 [40 CFR § 270.42].

II.T.4. Prior to installing or using any equipment with process vents subject to the requirements of IDAPA 58.01.05.008 [40 CFR Part 264, Subpart AA], the Permittee shall supply the specific Part B information required, pursuant to IDAPA 58.01.05.012 [40 CFR § 270.24], and shall obtain a permit modification in accordance with the provisions of IDAPA 58.01.05.012 [40 CFR § 270.42].

II.T.5. Prior to installing or using any equipment subject to the requirements of IDAPA 58.01.05.008 [40 CFR Part 264, Subpart BB], the Permittee shall supply the specific Part B information required pursuant to IDAPA 58.01.05.012 [40 CFR § 270.25] and shall obtain a permit modification, in accordance with the provisions of IDAPA 58.01.05.012 [40 CFR § 270.42].

II.T.6. The Permittee shall record the information required in accordance with IDAPA 58.01.05.008 [40 CFR § 264.1089] in a log kept in the Facility Operating Record for use in determining exemptions, as provided in the Applicability Section of IDAPA 58.01.05.008 [40 CFR § 264.1050].

II.U. QUARTERLY REPORTS

II.U.1. The following reports shall be submitted to the Department on a quarterly basis:

- Minor discrepancies and items not requiring 24-hour reporting, including documentation of equivalent or superior items, treatment failures (i.e., failed stabilization results), and other noncompliance items under Permit Condition I.V.;
- Summary of NORM/FUSRAP waste receipts, providing volumes and concentrations of waste disposed; and
- Alternative Cover data summary for Test Pad and Trenches 10 and 11.

Note: Ground Water Monitoring Reports shall be submitted per the schedule stated in Module IX of this Permit.

II.V. COMPLIANCE SCHEDULE

II.V.1. Within 180 days of the April following the effective Permit date, the Pug Mill shall be closed in accordance with IDAPA 58.01.08.008 [40 CFR Part 264 Subpart G] and Attachment 9.

II.V.2. Within 180 days of the April following the effective Permit date, landfill Cell 5 shall be closed in accordance with IDAPA 58.01.08.008 [40 CFR Part 264 Subpart G] and Attachment 9.

This space intentionally left blank

MODULE III - CONTAINER STORAGE AND TREATMENT

III. Subject to the terms of this Permit, the Permittee may store and/or treat hazardous wastes in permitted Container Management Units, as follows:

III.A. DESIGN AND OPERATION

III.A.1. The Permittee's compliance with the requirements of Permit Conditions III.A through III.C shall constitute compliance with the requirements of IDAPA 58.01.05.008 [40 CFR Part 264, Subpart I] for the management of hazardous waste in containers.

III.A.2. The Container Management Units are identified as follows: Container Storage Pad 4; Container Storage Pad 5; Container Storage Area 1; Stabilization Facility; Truck Unloading Apron Nos. 1, 2, and 3; and the RCRA portion of the RCRA/PCB Building. In these Container Management Units and in the Containment Building, the Permittee may store and/or treat containerized wastes, as listed on the Part A Permit Application (included as Attachment 12 of this Permit) except that the limitations designated on Table C-8 and Table C-10 of Attachment 2 of this Permit apply to the wastes stored in containers at any time.

III.A.3. The Permittee shall not store waste using glass as the primary container.

III.A.4. The quantity of 55-gallon containers stored in each designated storage unit, or its volumetric equivalent, shall be limited to the maximum storage capacities designated on Tables D-1 and D-1A of Attachment 13 of this Permit.

III.A.5. The Permittee shall store and/or treat containerized waste, in Container Management Units and in the Containment Building, in the manner described in Attachment 13 of this Permit, except as otherwise specified in this Permit, and in accordance with Permit Condition II.A.I. Additionally, the Permittee shall comply with all applicable sections of Attachments 2, 4, 6, 7, 15, 24, and 25 of this Permit.

III.A.6. The Permittee shall assure that the ability of the container to contain the waste is not impaired, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.172].

III.A.7 If a container holding hazardous waste is not in good condition (e.g., severe rusting, apparent structural defects) or if it begins to leak, the Permittee shall transfer the hazardous waste from such container to a container that is in good condition, or otherwise manage the waste in compliance with the conditions of this Permit and IDAPA 58.01.05.008 [40 CFR § 264.171].

III.A.8 The Permittee shall maintain all Secondary Containment Systems, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.175] and the attached plans and specifications in Attachment 13 of this Permit.

III.A.9. The Permittee shall inspect the Container Management Units weekly, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.174] and the inspection schedules in Attachment 4 of this Permit, to detect leaking containers and deterioration of containers and the Containment System caused by corrosion and other factors. The Permittee shall document the results of all inspections and wastes analyses performed in the Operating Record.

III.A.10. The Permittee shall keep all relevant figures, drawings, and diagrams, related to the Container Management Units, readily available for inspection at the facility, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.74].

III.B. INCOMPATIBLE WASTE

III.B.1. The Permittee shall not place incompatible wastes, or wastes and materials which are incompatible in the same container, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.177].

III.B.2. The Permittee shall not place hazardous waste or materials in an unwashed container that previously held an incompatible waste or material.

III.B.3. The Permittee shall not store a container holding hazardous waste that is incompatible with any waste, or any materials stored nearby in containers, without separating these incompatible wastes or materials by protecting the wastes from commingling by means of a dike, berm, or wall.

III.C. SPECIAL REQUIREMENTS

III.C.1. The Permittee shall keep all containers closed during storage and shall not open, handle, or store containers in a manner which may rupture the container or cause it to leak, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.173]. The Permittee shall provide temporary cover for all water-reactive, containerized wastes (meeting Permit Condition II.C) that are stored in the Container Management Units located outside, including Container Storage Pad 4, Container Storage Pad 5, Container Storage Area 1, and the Stabilization Facility. This temporary cover may be in the form of any structure, tarp, or other device that serves to prevent precipitation from accumulating on the tops of containers. Such containers shall be covered at all times except when being removed, rearranged, inspected or otherwise managed as part of routine operation.

III.C.2. The RCRA/PCB Storage Building (100 feet x 100 feet) shall be used for storage of containerized waste materials that do not contain free liquids, as measured with the following test method: Method 9095 (Paint Filter Test). All containerized waste (as described in Attachment 13 of this Permit) shall be placed on pallets with adequate aisle space to facilitate inspection. All spills shall be managed in accordance with the applicable sections of the Contingency Plan (Attachment 7 of this Permit).

III.C.3. The Permittee shall not locate containers holding ignitable or reactive waste within fifteen (15) meters (50 feet) of the facility's property line. The Permittee shall take precautions to prevent accidental ignition or reaction of ignitable or reactive wastes by following the procedures of Attachment 13 of this Permit. In accordance with Section D.1.b of Attachment 13 of this Permit, the Permittee shall designate all containers that are to be transported off-site for disposal (i.e., trans-shipped and brokered waste) with a unique marking (e.g "red label/mark) on the container.

III.C.4. The Permittee shall comply with Permit Condition II.T. of this Permit, for all hazardous wastes subject to IDAPA 58.01.05.008 [40 CFR 264 Subpart CC] in containers.

III.C.4.a For storage of containers of hazardous waste exceeding an average VO concentration at the point of origin of 500 ppmw, the Permittee shall comply with all applicable regulations of 40 CFR 264 Subpart CC, including the container standards in IDAPA 58.01.05.008 [40 CFR § 264.1086] as specified in Permit Condition II.T.2

III.C.4.b For containers within the Containment Building and the Container Management Units that contain organic materials, with a volatile organic concentration at the point of origin less than 500 ppmw, and are therefore exempt from using air emission control equipment, documentation shall be recorded that includes the information that was used by the Permittee for each waste determination (e.g., test results, measurements, calculations, and other documentation) in the Facility Operating Record. If analytical results for waste samples are used for the waste determination, then the Permittee shall record the date, time, and location that each waste sample is collected, in accordance with applicable requirements of 40 CFR § 264.1083, and keep this information in the Operating Record for a minimum of three (3) years.

III.C.5. Reporting Requirements:

If the Permittee does not comply with Permit Condition III.C.4., a report shall be submitted to the Director on each occurrence when hazardous waste is placed in the Waste Management Unit in noncompliance with the conditions of 40 CFR §§ 264.1082(c)(1) or 264.1082(c)(2), as applicable. A written report shall be submitted within fifteen (15) calendar days of the time that the Permittee becomes aware of the occurrence. The written report shall contain: the EPA Identification Number, facility name and address, a description of the noncompliance event and the cause, the dates of the noncompliance, and corrective actions taken to prevent reoccurrence of the noncompliance. The report shall be signed and dated by an authorized representative of the Permittee per IDAPA 58.01.05.008 [40 CFR § 264.1090].

III.D. CLOSURE AND POST-CLOSURE

Closure and Post-Closure Care of all Container Management Units shall be completed in accordance with IDAPA 58.01.05.008 [40 CFR § 264.178], and the applicable sections of Attachment 9 of this Permit.

This space intentionally left blank.

MODULE IV - TANK STORAGE AND TREATMENT

IV. Subject to the terms of this Permit, the Permittee may store and /or treat hazardous wastes in the permitted HWMA tanks, as follows:

IV.A. GENERAL OPERATING REQUIREMENTS

IV.A.1 The Permittee's compliance with the requirements of Permit Conditions IV.A through IV.F shall constitute compliance with the requirements of IDAPA 58.01.05.008 [40 CFR Part 264, Subpart J], pertaining to the management of hazardous wastes in tanks.

IV.A.2 The Permittee shall comply with the tank operating requirements of IDAPA 58.01.05.008 [40 CFR § 264.194] and Attachments 14 and 24 of this Permit.

IV.A.3 The Permittee shall inspect the tank systems according to IDAPA 58.01.05.008 [40 CFR § 264.195], and the inspection schedule contained in Attachment 4 of this Permit.

IV.A.4 The Permittee shall maintain all Secondary Containment Systems in accordance with IDAPA 58.01.05.008 [40 CFR § 264.193] and the attached plans and specifications, as contained in Attachments 14 and 24 of this Permit.

IV.A.5. The Permittee shall remove any spilled or leaked wastes and any accumulated precipitation from the Secondary Containment Systems of each tank within 24 hours of detection, unless the waste or precipitation in the Secondary Containment System is frozen. The Permittee shall manage said wastes and precipitation as hazardous wastes. Within two (2) normal working days after the waste or precipitation in the Secondary Containment System is no longer frozen, the contained liquids will be characterized and removed.

IV.A.6. The Permittee shall respond to leaks or spills and disposition of leaking or unfit-for-use tank systems, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.196].

IV.A.7. Ignitable or reactive wastes must not be placed in tank systems unless the special requirements of IDAPA 58.01.05.008 [40 CFR § 264.198] are met.

IV.A.8. Incompatible wastes and materials must not be placed in the same tank system unless the special requirements of IDAPA 58.01.05.008 [40 CFR § 264.199] are met.

IV.A.9. The Permittee shall comply with Permit Condition II.T of this Permit, for all hazardous waste subject to IDAPA 58.01.05.008 [40 CFR Subpart CC] in tanks.

IV.A.9.a. For tanks that manage organic materials with a volatile organic concentration at the point of origin less than 500 ppmw, and are therefore exempt from using air emission control equipment, documentation shall be recorded that includes the information that was used by the Permittee for each waste determination (e.g., test results, measurements, calculations, and other documentation) in the Facility Operating Record. If analytical results for waste samples are used for the waste determination, then the Permittee shall record the date, time, and location that each waste sample is collected in accordance with applicable requirements of 40

CFR § 264.1083, and keep this information in the Operating Record for a minimum of three (3) years.

IV.A.9.b. Reporting Requirements: If the Permittee does not comply with Permit Condition IV.9.a., a report shall be submitted to the Director on each occurrence when hazardous waste is placed in the Waste Management Unit in noncompliance with the conditions of 40 CFR § 264.1082(c)(1) or § 264.1082(c)(2), as applicable. A written report shall be submitted within fifteen (15) calendar days of the time that the Permittee becomes aware of the occurrence. The written report shall contain: the EPA Identification Number, facility name and address, a description of the noncompliance event and the cause, the dates of the noncompliance, and corrective actions taken to prevent reoccurrence of the noncompliance. The report shall be signed and dated by an authorized representative of the Permittee, per IDAPA 58.01.05.008 [40 CFR § 264.1090].

IV.A.10. The Permittee shall keep all relevant figures, drawings, and diagrams, related to the tank systems, readily available for inspection at the facility, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.74].

IV.B. BULK LIQUID STORAGE TANKS

IV.B.1. The Bulk Liquid Storage Tanks shall be defined as four (4) existing storage tank units designated as Nos. 1, 2, 3, and 4. References to the Bulk Liquid Storage Tanks shall also include any associated piping, appurtenances, and the Secondary Containment Systems for these units.

IV.B.2. The Bulk Liquid Storage Tanks shall be designed and operated in accordance with Attachment 14 of this Permit, except as otherwise specified in this Permit, and in accordance with Permit Condition II.A. Additionally, the Permittee shall comply with all applicable sections of Attachments 2, 4, 6, and 7 of this Permit.

IV.B.3. The Permittee may store, in liquid form, any of the hazardous wastes listed on the Part A Form (included as Attachment 12 of this Permit), except that the limitations designated on Table C-8 and Table C-10 of Attachment 2 of this Permit apply to the wastes stored in any Bulk Liquid Storage Tank at any time.

IV.B.4. Since the Secondary Containment Systems for Tank Nos. 1 and 4 are common and shared, the Permittee shall not at any time store incompatible wastes in Tanks Nos.1 and 4. Similarly, since the Secondary Containment Systems for Tank Nos. 2 and 3 are common and shared, the Permittee shall not at any time store incompatible wastes in Tank Nos. 2 and 3.

IV.C. STABILIZATION MIXING BIN TANKS

IV.C.1. The Stabilization Mixing Bin Tanks shall be defined as four (4) existing, open-topped tank units located in the Containment Building. Two tank units are located in the Stabilization Portion of the building and two tank units are located in the Debris Portion of the building. References to the above-defined Mixing Bin Tanks shall also include any appurtenances and the Secondary Containment Systems for these units.

IV.C.2. The Mixing Bin Tanks shall be designed and operated in accordance with

Attachments 14 and 24 of this Permit, except as otherwise specified in this Permit, and in accordance with Permit Condition II.A. Additionally, the Permittee shall comply with all applicable sections of Attachments 2, 4, 6, and 7 of this Permit.

IV.C.3. The storage capacity of each installed Mixing Bin Tank located in the Stabilization Portion of the building shall not exceed 120 cubic yards. The storage capacity of each installed Mixing Bin Tank located in the Debris Portion of the building shall not exceed 226 cubic yards for wastes in solid form. The storage capacity of each installed Mixing Bin Tank located in the Debris Portion of the building shall not exceed 12,000 gallons for waste in liquid form.

IV.C.4. The Permittee shall manage non-containerized waste in the Mixing Bin Tanks such that the height and location of the waste does not allow these materials to overflow.

IV.D. CLOSURE AND POST-CLOSURE

Closure and Post-Closure Care of the tank systems shall be completed in accordance with IDAPA 58.01.05.008 [40 CFR § 264.197], and all applicable sections of Attachment 9 of this Permit.

This space intentionally left blank.

MODULE V - SURFACE IMPOUNDMENT STORAGE, TREATMENT, AND DISPOSAL

V. Subject to the terms of this Permit, the Permittee may store, treat, and/or dispose of hazardous wastes in permitted surface impoundments, as follows:

V.A. DESIGN AND OPERATION

V.A.1. Surface impoundments shall consist of Collection Ponds 1, 2, and 3, and Evaporation Pond 1.

V.A.2. The Permittee may store and treat (by evaporation and physical settling) any of the liquid or semi-solid wastes that are listed on the Part A Permit Application, included as Attachment 12 of this Permit, in Evaporation Pond 1, except that the following limitations apply:

V.A.2.a. The Permittee shall not store or treat in the impoundments any wastes that are currently restricted from land disposal under IDAPA 58.01.05.011 [40 CFR Part 268] unless that waste has been granted an exemption, extension, or variance, or unless the applicable treatment standard as specified in IDAPA 58.01.05.011 [40 CFR Part 268] has been achieved prior to placement in the units. In addition, as new wastes are specified for Land Disposal Restriction under IDAPA 58.01.05.011 [40 CFR Part 268], the Permittee shall immediately cease introducing such wastes for storage and treatment in the impoundment upon the effective date of the IDAPA 58.01.05.011 [40 CFR Part 268] regulation unless the waste has been granted an exemption, extension, or variance, or meets the treatment standard as specified in IDAPA 58.01.05.011 [40 CFR Part 268], prior to placement in the units;

V.A.2.b. The Permittee shall not store or treat any wastes that are restricted from placement in the impoundments by the limitations designated on Table C-8 and Table C-10 of Attachment 2 of this Permit;

V.A.2.c. The Permittee shall not place hazardous wastes F020, F021, F022, F023, F026, and F027 in any surface impoundment unless the special requirements of IDAPA 58.01.05.008 [40 CFR § 264.231] are met by submitting a permit modification, in accordance with of IDAPA 58.01.05.012 [40 CFR § 270.42], for the addition of a management plan for handling these wastes.

V.A.3. The Permittee shall comply with Permit Condition II.T of this Permit for all hazardous wastes subject to IDAPA 58.01.05.008 [40 CFR Subpart CC] in surface impoundments.

V.A.3.a. For surface impoundments that receive organic wastes, with a volatile organic concentration at the point of origin less than 500 ppmw, and are therefore exempt from using air emission control equipment, documentation shall be recorded in the Facility Operating Record that includes the information that was used by the Permittee for each waste determination (e.g., test results, measurements, calculations, and other documentation). If analytical results for waste samples are used for the waste determination, then the Permittee shall record the date, time, and location that each waste sample is collected, in accordance with applicable requirements of 40 CFR § 264.1083. This information shall be kept in the Operating Record for a minimum of three (3) years.

V.A.3.b. Reporting Requirements: If the Permittee does not comply with Permit Condition V.A.3.a, a report shall be submitted to the Director on each occurrence when hazardous waste is placed in the Waste Management Unit in noncompliance with the conditions of 40 CFR § 264.1082(c)(1) or § 264.1082(c)(2), as applicable. A written report shall be submitted within fifteen (15) calendar days of the time that the Permittee becomes aware of the occurrence. The written report shall contain: the EPA Identification Number, facility name and address, a description of the noncompliance event and the cause, the dates of the noncompliance, and corrective actions taken to prevent reoccurrence of the noncompliance. The report shall be signed and dated by an authorized representative of the Permittee, per IDAPA 58.01.05.008 [40 CFR § 264.1090].

V.A.4. The Permittee may store and treat (by evaporation and physical settling) in Collection Ponds 1, 2, and 3, any of the following:

V.A.4.a. Surface run-off from the site;

V.A.4.b. Leachate from on-site landfills; and

V.A.4.c. Liquid from Evaporation Pond 1 only under the following condition:

V.A.4.c.(1). Evaporation Pond 1 is required to be taken out of service and emptied as specified by the Contingency Plan (Attachment 7 of this Permit) or the Response Action Plan (Attachment 8 of this Permit).

V.A.5. The Permittee shall maintain the design of Collection Ponds 1, 2, and 3 and Evaporation Pond 1 in accordance with IDAPA 58.01.05.008 [40 CFR § 264.221] and Attachments 17 and 20 of this Permit, except as otherwise specified in this Permit, and in accordance with Permit Condition II.A.

V.A.6. The Permittee shall operate Collection Ponds 1, 2, and 3 and Evaporations Pond 1, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.221 and § 264.227] and Attachments 2, 6, 7, 8, and 17 of this Permit, except as otherwise specified in this Permit, and in accordance with Permit Condition II.A.

V.A.7. The Permittee shall inspect and monitor the surface impoundments in accordance with IDAPA 58.01.05.008 [40 CFR § 264.226] and the inspection schedule contained in Attachment 4 of this Permit.

V.A.8. In accordance with IDAPA 58.01.05.008 [40 CFR § 264.223] and Attachment 8 of this Permit, the Permittee shall follow the Response Action Plan for any exceedance of the action leakage rate.

V.A.9. The Permittee shall sample and analyze all liquid removed from the leak detection, collection, and removal system sump for the surface impoundments, to determine whether the liquid is derived from hazardous waste. The Permittee shall determine the list of parameters for analysis, based on its knowledge of the wastes placed in the unit. Results of analyses shall be maintained in the Operating Record. Alternatively, the Permittee may delete this sampling and analysis requirement if all liquid removed from any leachate detection, collection, and removal system sump is properly managed as hazardous waste.

V.A.10. Ignitable or reactive wastes must not be placed in surface impoundments unless the special requirements of IDAPA 58.01.05.008 [40 CFR § 264.229] are met.

V.A.11. Incompatible wastes and materials must not be placed in surface impoundments unless the special requirements of IDAPA 58.01.05.008 [40 CFR § 264.230] are met.

V.A.12. The Permittee shall keep all relevant figures, drawings, and diagrams related to surface impoundments readily available for inspection at the facility, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.74].

V.B. CLOSURE AND POST-CLOSURE

V.B.1. Closure and Post-Closure Care of the Surface Impoundment Units (Evaporation Pond 1, Collection Ponds 1, 2, and 3) shall be completed in accordance with IDAPA 58.01.05.008 [40 CFR § 264.228] and the applicable sections of Attachments 9, 18, and 21, and Permit Condition II.K.

V.B.1.a. If a soil cover is used during surface impoundment closure, prior to construction of the soil cover of Evaporation Pond 1 and Collection Ponds 1, 2, and 3, the Permittee shall (for clay sources not previously tested) perform field/in-situ hydraulic conductivity testing on a test fill, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.19] and EPA/600/R-93/182, September 1993, *Quality Assurance and Quality Control for Waste Containment Facilities*. The field/in-situ testing shall be done in addition to laboratory testing.

V.B.2. For all Surface Impoundment Units, minor deviations from the permitted closure design specifications or procedures necessary to accommodate proper closure, must be noted on the as-built drawings and the rationale for those deviations in designs, specifications, or procedures must be provided in narrative form with the closure certification statements. Within sixty (60) calendar days after completion of closure of each Surface Impoundment Unit, the Permittee shall submit to the Director the final as-built drawings of the closed unit, the narrative report, and certification statement.

This space intentionally left blank.

MODULE VI - LANDFILL DISPOSAL

VI. Subject to the terms of this Permit, the Permittee may dispose of hazardous wastes in permitted Landfill Units, as follows:

VI.A. LANDFILL DESIGN AND OPERATION

VI.A.1. Landfills shall consist of existing units: Cell 5, Trench 10, Trench 11, and Cell 14, and Cell 15.

VI.A.2. The Permittee may dispose of any waste listed on the Part A Application (included as Attachment 12 of this Permit), in Landfill Units Cell 14, and Cell 15, except that the following limitations apply:

VI.A.2.a. The Permittee shall not dispose any waste that is restricted from placement in landfills by the limitations designated on Table C-8 and Table C-10 of Attachment 2 of this Permit.

VI.A.2.b. The Permittee shall not dispose of wastes containing free liquids. Free liquids analyses shall be performed in accordance with the applicable procedures in Attachment 2 of this Permit.

Note: Liquid wastes that are contained in lab packs (packaged in accordance with IDAPA 58.01.05.008 [40 CFR § 264.316]) or very small containers, ampules, capacitors, or batteries (in accordance with IDAPA 58.01.05.008 [40 CFR § 264.314]) may be disposed without stabilization and related stabilization testing and verification procedures, provided other restrictions, as specified in this Permit or by other laws or regulations, do not prohibit the land disposal of such wastes. However, no regulated quantities of hazardous waste lab packs can be disposed in Landfill Units unless the Land Disposal Restriction Standards of IDAPA 58.01.05.011 [40 CFR § 268.42(c)] are met.

VI.A.2.c. The Permittee shall not dispose of any bulk waste that was generated as a liquid and was then stabilized by the generator (or another off-site treatment facility) unless the Permittee has conducted analytical testing to ensure that the waste has been properly stabilized and the applicable treatment standard, as specified in IDAPA 58.01.05.011 [40 CFR Part 268], has been achieved. Such testing shall be done by the Permittee, using sampling and analytical methods consistent with Permit Condition II.C, Attachments 2, 15, 24, and 25 of this Permit. Records of such analyses shall be maintained in the Operating Record for a minimum period of three (3) years. This Permit Condition (VI.A.2.c) shall not apply if the Permittee complies with Permit Condition VI.A.2.d.

Note: Liquid wastes that are contained in lab packs (packaged in accordance with IDAPA 58.01.05.008 [40 CFR § 264.316]) or very small containers, ampules, capacitors, or batteries (in accordance with IDAPA 58.01.05.008 [40 CFR § 264.314]) may be disposed without stabilization and related stabilization testing and verification procedures, provided other restrictions, as specified in this Permit or by other laws or regulations, do not prohibit the land disposal of such wastes. However, no regulated quantities of hazardous waste lab packs can be disposed in Landfill Units unless the Land Disposal Restriction Standards of IDAPA 58.01.05.011 [40 CFR § 268.42(c)] are met.

VI.A.2.d. As an alternative to the bulk waste testing by the Permittee specified in Permit Condition VI.A.2.c, the Permittee shall maintain documentation supplied by the generator (or another off-site treatment facility) that proper stabilization has been achieved. Documentation from the generator (or another off-site treatment facility) must contain a description of the stabilization procedures used, including a signed certification that the stabilized waste achieved the applicable treatment standard, as specified in Attachment 2 of this Permit and in accordance with IDAPA 58.01.05.011 [40 CFR Part 268]. The Permittee shall maintain such documentation in the Operating Record for a minimum period of three (3) years.

VI.A.2.e. The Permittee shall not dispose of any wastes that are restricted from land disposal under IDAPA 58.01.05.011 [40 CFR Part 268] unless that waste has been granted an exemption, extension, or variance, or unless the applicable treatment standard, as specified in IDAPA 58.01.05.011 [40 CFR Part 268], has been achieved prior to placement in the units. In addition, as new wastes are specified for Land Disposal Restriction under IDAPA 58.01.05.011 [40 CFR Part 268], the Permittee shall immediately cease disposing of such wastes upon the effective date of the regulation, unless the waste has been granted an exemption, extension, or variance, or meets the treatment standard specified in IDAPA 58.01.05.011 [40 CFR Part 268], prior to placement in the Landfill Units.

VI.A.2.f. The Permittee shall not dispose of ignitable or reactive wastes (Waste Numbers D001 or D003, respectively) or any listed waste for which the basis for listing is ignitability or reactivity, unless the waste has been treated to render it non-ignitible or non-reactive. For such wastes, the Permittee shall follow testing procedures used to determine ignitability and reactivity as specified in Attachment 2 of this Permit.

Note: Cyanide or sulfide bearing waste, as defined in IDAPA 58.01.05.005 [40 CFR § 261.23(a)(5)], may be packaged in accordance with IDAPA 58.01.05.008 [40 CFR § 264.316], and disposed without first being treated to render it non-reactive. Ignitable wastes in containers may be landfilled without first being treated to render it non-ignitable, if they are disposed in accordance with IDAPA 58.01.05.008 [40 CFR § 264.312].

VI.A.2.g. The Permittee shall limit the number of Interim Processing Loads for storage in the active portion of disposal Cell 14 and Cell 15 to a maximum of 50 loads at any one time (50 loads combined). The Permittee shall manage the storage of Interim Processing Loads in accordance with Attachments 4 and 19 of this Permit.

VI.A.2.h. The Permittee shall comply with IDAPA 58.01.05.008 [40 CFR § 264.317], the 1995 Dioxin Management Plan, and all applicable Land Disposal Restriction treatment standards under IDAPA 58.01.05.011 [40 CFR § 268.40] for disposal of hazardous wastes F020, F021, F022, F023, F026, and F027 in landfills. The Permittee shall make a written request for pre-approval from the Director for the storage, treatment, or disposal of these dioxin-listed wastes.

VI.A.3. The Permittee shall maintain the approved designs of Trench 10, Trench 11, Cell 14, and Cell 5 in accordance with Attachments 19 and 20 of this Permit, except as otherwise specified in this Permit, and in accordance with Permit Condition II.A.1.

VI.A.4. The Permittee shall construct the modified Cell 15, in accordance with Attachments 16, 18, 18a, 19, and 20 of this Permit, except as otherwise specified in this Permit, and in accordance with Permit Conditions II.A.1 and II.A.2.

VI.A.5. Prior to construction of any soil liner for a Landfill Unit, a test fill (using materials characterized the same as those used in the new Landfill Unit) shall be required. The Permittee shall, except as noted below, construct and test the soil liner in accordance with the procedures contained in Attachment 16, 18, 18a, and 19 of this Permit. The exception to these procedures shall be that the Permittee shall perform field/in-situ hydraulic conductivity testing on a test fill, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.19] and EPA/600/R-93/182, September 1993, *Quality Assurance and Quality Control for Waste Containment Facilities*. The field/in-situ testing shall be done in addition to laboratory testing.

VI.A.6. The Permittee shall operate Cells 14 and 15 in accordance with IDAPA 58.01.05.008 [40 CFR § 264.301] and the operating practices described in Attachments 2, 6, 7, 19, and 23 of this Permit, except as otherwise specified in this Permit, and in accordance with Permit Condition II.A.1.

VI.A.6.a. The Permittee shall cease landfilling operations when the sustained wind speed conditions exceed 25 miles per hour (25 mph average for an hour) and apply asphaltic emulsion or soil cover on the freshly spread landfill surface. Waste placement operations in the landfill cells shall resume only after the sustained wind speed is below 25 mph (25 mph average for an hour).

VI.A.7. The Permittee shall monitor and inspect the landfill in accordance with IDAPA 58.01.05.008 [40 CFR § 264.303] and Attachments 4 and 19 of this Permit.

VI.A.8. The Permittee shall maintain a permanent and accurate record of the three-dimensional location of each waste type, based on grid coordinates, within units Cell 5, Trench 11, Cell 14, Cell 15, Trench 10 (to the extent the records exist for Trench 10), and records for all previous disposal areas for which the records exist, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.309]. This record shall include the information necessary to locate a specific waste and shall be based on information contained in the manifest (Generator Identification Number, waste code, and date of disposal). This condition shall apply to all wastes placed in existing units Cell 5, Trench 11, Cell 14, and Cell 15 irrespective of the date of disposal. Upon final closure of the facility, the Permittee shall submit, to the Director, copies of these records for units Cell 5, Trench 11, Cell 14, Cell 15, and for Trench 10 (to the extent the records exist for Trench 10),.

VI.A.9. Liquid in the primary Leachate Collection System of units Cell 5, Cell 14, and Cell 15 shall not exceed 30 cm (one foot) in depth over the primary liner after waste has been placed, as specified in IDAPA 58.01.05.008 [40 CFR § 264.301(c)(2)]. (This does not include the area of the sump used to accumulate sufficient quantities of liquid for pumping). Liquid in the secondary Leachate (leak) Collection System of units Cell 5, Cell 14, and Cell 15 will be removed, when pumpable quantities exist (to the extent practicable) within 24 hours after those quantities are found. The liquid from both the primary and secondary Leachate Collection Systems shall be managed as a hazardous waste. During the Post-Closure Period, after final facility closure, liquid from the secondary Leachate (leak) Collection Systems must be pumped (as described above) within 72 hours after such liquid is found.

VI.A.10. For all Landfill Units, the Permittee shall establish Action Leakage Rates (included in Table VI-1 of this Permit) and follow the Response Action Plan (included as Attachment 8 of this Permit), in accordance with IDAPA 58.01.05.008 [40 CFR § 264.302 and § 264.304].

VI.A.11. The Permittee shall keep all relevant figures, drawings, and diagrams, related to Landfill Disposal Units, readily available for inspection at the facility, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.74].

VI.B. CLOSURE AND POST-CLOSURE

VI.B.1. The Permittee shall close units Cell 5, Trench 10, Trench 11, Cell 14, and Cell 15 in accordance with IDAPA 58.01.05.008 [40 CFR § 264.310(a)] and the applicable sections of Attachment 9, 9a, 9b, 18, 18a, 19, 20, and 21, and Permit Condition II.K and II.V.2.

VI.B.2. The Permittee shall follow the requirements for Post-Closure Care of units Cell 5, Trench 10, Trench 11, Cell 14, and Cell 15 in accordance with IDAPA 58.01.05.008 [40 CFR § 264.310(b)], and the applicable sections of Attachment 9 and Permit Condition II.M. Post-Closure Care for each unit shall begin at the time of receipt of the closure certification statements by the Department.

VI.B.3. Final cover designs for Landfill Cells 5, 14 and 15, and Trenches 10 and 11 shall be specified in Attachments 9, 18a, 20, 21, and 23 of this Permit. These cover designs incorporate a geosynthetic clay liner (GCL) and, where applicable, the following conditions apply:

VI.B.3.a. The gas venting layer shall consist of either a Geosynthetic Drainage System (i.e., geonet), as specified in Attachment 16, or six (6) inches of coarse aggregate meeting the American Association of State Highway & Transportation Officials (AASHTO) Standards and a geotextile above and below the geonet or aggregate layer, or an equivalent alternate approved by the Department, that will provide adequate venting. The procedures designated under Permit Condition II.S shall be followed to implement the use of equivalent materials.

VI.B.3.b. A rock cover meeting the approval of the Department shall be placed over all cover areas where vegetation is not established within two (2) years after placement of the cover, and where significant erosion is occurring. Significant erosion for this item will be defined as the formation of erosion gullies greater than six (6) inches deep for lengths of ten (10) feet or more.

VI.B.3.c. The Temporary Alternative cover design for Landfill Trenches 10 and 11 shall be specified in Attachments 9a, 9b, and 21a. The final cover design for Trenches 10 and 11, if the Alternative Cover Demonstration Program fails, shall be specified in Attachment 9, 20, and 21 of this Permit, except the changes specified in Permit Conditions VI.B.3.a and VI.B.3.b are hereby made to Attachments 9, 20, and 21.

VI.B.3.d. If a GCL is not used, prior to construction of a soil cover for any landfill unit, the Permittee shall (for clay sources not previously tested) perform field/in-situ hydraulic conductivity testing on a test fill, in accordance with IDAPA

58.01.05.008 [40 CFR § 264.19] and EPA/600/R-93/182, September 1993, *Quality Assurance and Quality Control for Waste Containment Facilities*. The field/in-situ testing shall be done in addition to laboratory testing.

VI.B.4. For all Landfill Units, minor deviations from the permitted closure design specifications, or procedures necessary to accommodate proper closure, must be noted on the as-built drawings and the rationale for those deviations in designs, specifications, or procedures must be provided in narrative form with the closure certification statements. Within sixty (60) calendar days after completion of closure of each Landfill Unit, the Permittee shall submit, to the Director, the final as-built drawings of the closed unit, the narrative report, and certification statement. All other deviations from the permitted closure design specifications shall be approved in advance by the Director, in accordance with IDAPA 58.01.05.012 [40 CFR § 270.42].

VI.B.5. The Permittee shall provide certification statements attesting that each Landfill Unit at the facility has been closed in accordance with the applicable specifications in the Closure Plan included as Attachment 9 of this Permit, as required by IDAPA 58.01.05.008 [40 CFR § 264 Subpart G].

VI.B.6. The Permittee shall submit to the local land use authority and to the Director, a survey plat indicating the location and dimensions of closed Landfill Units, with respect to permanently surveyed benchmarks, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.116].

VI.B.7 In the event that any Hazardous Waste Management Unit, other than the Landfill and Surface Impoundment Units listed in Permit Condition V.B.1 and VI.B.1, cannot be closed by removing hazardous waste, hazardous constituents, contaminated subsoil, and any contaminated ground water (i.e., clean-closed) as specified in Permit Condition II.K.1, the Permittee shall revise the Facility Post-Closure Plan to include a Post-Closure Plan for that Hazardous Waste Management Unit. The Permittee shall submit the Post-Closure Plan for that Hazardous Waste Management Unit to the Director, as a Permit Modification Request, within ninety (90) calendar days of the date that the Director notifies the Permittee in writing that the unit must be closed as a landfill, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.118(a)].

VI.B.8 The Permittee may complete the five-year Alternative Cover Demonstration Program for Trench 10 and 11, for the purpose of demonstrating equivalency to the performance standards of IDAPA 58.01.05.008 [40 CFR § 264.111]. The Alternative Cover Demonstration Program for Trench 10 and 11 started in August, 2000. If approved by the Department, the alternative cover, as specified in Attachment 9a and 9b, would displace the approved final cover design specified in Attachment 9. If the Alternative Cover Demonstration Test Pad fails, Trench 10 and 11 shall be closed under the traditional landfill closure specifications on a schedule approved by the Director, as detailed in Section I.2.h of Attachment 9. Completion of the Alternative Cover Demonstration Program for closure of Trench 10 and Trench 11 shall be in accordance with Attachment 9a, Attachment 9b, and as follows:

VI.B.8.a. The Permittee shall perform maintenance of the temporary alternative cover during the demonstration period, as specified in Section I.2.h.(5)(c) of Attachment 9.

VI.B.8.b. Landfill Units 10 and 11 shall be evaluated by the Department during the demonstration period. The demonstration period commenced following Department approval of the Construction Quality Assurance Report, and shall be completed within a period not to exceed five (5) years, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.113(b)(1)(i)].

VI.B.8.c. The Permittee shall monitor the results of the Test Pad for this demonstration, as described in Attachment 9a and 9b and shall provide monitoring data results to the Department on a quarterly basis.

VI.B.8.d. Failure of the Alternative Cover Demonstration Test Pad to demonstrate equivalence shall be defined as follows:

- The bromide concentrations in the Test Pad sub-base material (at a depth of five (5) feet below ground surface) are high (twice background concentrations or higher), providing direct evidence of wetting front movement through the cover and into the underlying sub-base soils; or
- Measured water potentials at the base of the Test Pad (at a depth of five (5) feet below ground surface) exceed an equivalent flux of 3.2 mm/year.

VI.B.8.e. Within ninety (90) days following the completion of the demonstration period of the temporary alternative cover, the Permittee shall submit to the Department a final comprehensive report summarizing all the Test Pad Monitoring Data results and evaluating whether the performance criteria, as specified in Attachment 9a and 9b of this Permit, have been met.

VI.B.8.f. If, at any time during the Trench 10 and 11 Alternative Cover Demonstration Period, the Department determines that the Permittee has failed to achieve the performance criteria, as specified in Permit Condition VI.B.8.d and in Attachment 9a and 9b of this Permit, for the demonstration of the equivalency of the temporary alternative cover, the Department shall provide the Permittee written notification. Within thirty (30) days of Permittee's receipt of written notification by the Department that the Permittee has failed to achieve the performance criteria, the Permittee shall perform Closure and Post-Closure Care, in accordance with Permit Condition II.K and II.M and as follows:

VI.B.8.f.(i). In accordance with 58.01.05.008 [40 CFR §§ 264.112(c) and 264.301(g), (h) & (i)], the Permittee shall submit a Permit Modification Request to the Department to address the following:

VI.B.8.f.(i)(a). An amendment to Attachments 9a, 9b, and 21a of this Permit, to incorporate the traditional closure requirements for Landfill Trenches 10 and 11, as specified in Attachment 9, 19, 20, and 21 of this Permit; and

VI.B.8.f.(i)(b). An update to Attachment 10 of this Permit for changes to the Surface Water Management Plan, as affected by the partial closure of Landfill Trenches 10 and 11. Additionally, the Permittee shall update all applicable drawings to reflect these changes.

VI.B.8.f.(i)(c). Upon Departmental approval of the permit modification in Permit Condition VI.B.8.f.(i), Attachments 9a, 9b, and 21a will be removed and, hence, superseded by Attachments 9, 20, and 21, incorporating the traditional landfill closure design and specifications.

VI.B.8.g. If the Department determines that the Permittee has successfully achieved the performance criteria for the demonstration of the equivalency of the temporary alternative cover, the Permittee shall perform closure and Post-Closure Care, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.310], as specified in Attachment 9 of this Permit, and shall provide notification to the Department in accordance with Permit Condition II.K.4 of this Permit. In addition, in accordance with Permit Condition II.S of this Permit, the Permittee shall submit to the Department notification identifying Attachments 9a, 9b, and 21a as the approved Closure Plan.

TABLE VI-1. ACTION LEAKAGE RATES (ALR)

Disposal Unit	Area (acres)	ALR * (gal/day)	WLR ** (gal/day)
Surface Impoundment 1 (Evaporation Pond)	2.31	2310	1732
Collection Pond 1	0.38	380	285
Collection Pond 2	0.34	340	255
Collection Pond 3	0.54	540	405
Landfill Trench 5 –Phase 1 (Zones 1 and 2)	1.82	182	136
Landfill Trench 5 –Phase 2 (Section 2)	1.92	192	144
Landfill Trench 5 – (Section 3)	1.62	162	121
Landfill Trench 14 – Subcell 1	4.47	447	335
Landfill Trench 14 – Subcell 2	2.32	232	174
Landfill Trench 14 – Subcell 3	2.75	275	206
Landfill Trench 14 – Subcell 4	3.00	300	225
Landfill Trench 14 – Subcell 5	3.00	300	225
Landfill Trench 14 – Subcell 6	5.17	517	388
Landfill Cell 15 – Phase 1	12.1	1,210	907
Landfill Cell 15 – Phase 2	8.5	850	637
Landfill Cell 15 – Phase 3/4 ***	17.3	1,730	1,297

* Based on a 7-day average
** Measured on any given day
*** When constructed, adjust for as-built
Note: ALR's based on EPA Guidance of 100 gallons per acre day (gpad) and 1,000 gpad for surface impoundments
Note: WLR's = 75% of ALR measured on any given day

MODULE VII - SURFACE WATER MANAGEMENT PLAN

VII.A. DESIGN, OPERATION, AND MAINTENANCE OF SURFACE WATER MANAGEMENT SYSTEM

VII.A.1. The Permittee shall construct the Surface Water Management System in accordance with the design, description and specifications in Attachments 10, 16, and 18 of this Permit and in accordance with Permit Condition II.A of this Permit.

VII.A.2. The Permittee shall operate and maintain the Surface Water Management System in the manner specified in Attachment 10 of this Permit and in accordance with Permit Condition II.A.1.

VII.A.3. The Permittee shall be allowed to implement changes to the Surface Water Management Plan, in the event of emergency conditions, without obtaining a permit modification from the Department. Any emergency changes to the Surface Water Management System must be documented and reported to the Director, in writing, within thirty (30) calendar days of such changes. If the Director determines that such changes constitute a significant deviation from the Permit (Attachment 10), the Director shall notify the Permittee that a permit modification, in accordance with IDAPA 58.01.05.012 [40 CFR § 270.42], will be required. The Permittee shall submit any required Permit Modification Request within thirty (30) calendar days of such notification.

VII.A.4. The Permittee shall be allowed to implement changes to the Surface Water Management Plan, consistent with the criteria specified in Permit Conditions VII.A.4.a and VII.A.4.b, after providing revisions to narrative, tables, and drawings in Attachment 10 necessary to incorporate these changes, and providing calculations necessary to support these changes, and upon receipt of written acceptance (by certified mail or hand delivery) of these changes by the Department. These changes and their acceptance by the Department shall not require a permit modification, pursuant to IDAPA 58.01.05.012 [40 CFR § 270.42].

VII.A.4.a. The collection ponds shall be operated to maintain available capacity for the volume from the greater of either the 25-year, 24-hour storm event, plus two (2) feet of freeboard or a 100 year, 24-hour storm; and

VII.A.4.b. Run-off from on-site areas, which are designated within a development phase of the Surface Water Management System, to be contained on-site, shall not be diverted off-site during that development phase.

VII.A.5. The Permittee shall keep all relevant figures, drawings, and diagrams related to the Surface Water Management Plan readily available for inspection at the facility, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.74].

VII.B. COMPLIANCE SCHEDULE

The portion of the facility Surface Water Management System that is designed to serve proposed Waste Management Units must be installed and operational prior to placement of waste into that unit. The Permittee shall follow the provisions of Permit Condition I.R for new system construction.

MODULE VIII - PAST PRACTICE UNITS

VIII.A. POST-COVER CARE

VIII.A.1. The Permittee shall maintain ground water monitoring wells and implement a Ground Water Monitoring Program for Past Practice Units Silo 1, Silo 2, and Silo 3, Exhaust Shaft, the Radar Silos, the Elevator Shaft and the Control Center (the locations of which are designated on Drawing PRMI-T05 in Attachment 22 of this Permit) and Past Practice Units PCB 1, PCB 2, PCB 3, and PCB 4, Chem 1, Chem 1B, Chem 2, Chem 2B, Chem 2C, Chem 2D, Chem 2E, Chem 3, Chem 4, Chem 4B, Chem 5, Chem 5B, Chem 6, Chem 6A, Chem 6B, Chem 7, Chem 8, Chem 9, Buried Drum Area 1 (NW corner - near Silo 2), Buried Drum Area 2 (middle of site - near Silo 3), Acid Disposal Pits, Chemical Area 1, Disposal Area 9A, and the Electrical Vault (the locations of which are designated on drawings in Attachment 22 of this Permit).

VIII.A.2. The Permittee shall conduct Post-Cover Care, inspection, and maintenance of the Past Practice Units Silo 1, Silo 2, and Silo 3 with their ancillary equipment, exhaust and propellant shafts, the Radar Silos, the Elevator Shaft, and the openings to the powerhouse dome (the locations of which are designated on Drawing PRMI-T05 in Attachment 22 of this Permit) and Past Practice Units PCB 1, PCB 2, PCB 3, and PCB 4, Chem 1, Chem 1B, Chem 2, Chem 2B, Chem 2C, Chem 2D, Chem 2E, Chem 3, Chem 4, Chem 4B, Chem 5, Chem 5B, Chem 6, Chem 6A, Chem 6B, Chem 7, Chem 8, Chem 9, and the Electrical Vault (the locations of which are designated on drawings in Attachment 22 of this Permit), as specified in Attachment 9 [Section I.3.h.(3)] of this Permit for closed Land Disposal Units, with the following exceptions:

VIII.A.2.a. Prior to final closure, the Permittee shall inspect the leachate collection/ observation wells for Past Practice Units PCB 1, PCB 2, PCB 3, and PCB 4, Chem 1, Chem 1B, Chem 6 and Chem 6B as specified in Attachment 4 of this Permit. All pumpable quantities of liquids found in the leachate collection/ observation wells shall be removed (to the extent practical), within 24 hours of the time such liquid is found. After facility closure, the requirement for removal of leachate shall be to the extent practical within 72 hours of the time such liquid is found.

VIII.A.2.b. The Permittee shall install and maintain the Carbon Adsorption Units for the exhaust vents of Past Practice Units Silo 1, Silo 2, Silo 3, Powerhouse Dome, the Radar Silos, and the Control Center, in accordance with the approved Capping Plan in Attachment 22. The Permittee shall monitor the Carbon Adsorption Units and determine a replacement frequency as specified in Permit Condition VIII.D.1.

VIII.A.3. The period of Post-Cover Care for the Past Practice Units, designated in Permit Condition VIII.A.2, shall be at least thirty (30) years after Director approval of closure certification.

VIII.A.4. The Director reserves the right to re-open Permit Condition VIII.A.3 and extend the Post-Cover Period for any applicable unit at any time during the life of this Permit, as deemed necessary to protect human health and the environment. In such a case, re-opening the Permit would be done as a major permit modification, in accordance with

IDAPA 58.01.05.012 [40 CFR § 270.42].

VIII.A.5. The Permittee shall keep all relevant figures, drawings, and diagrams (related to Past Practice Units) readily available for inspection at the facility, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.74].

VIII.B. POST-COVER MAINTENANCE COST ESTIMATE

VIII.B.1. The Permittee shall prepare a detailed cost estimate for inspection and maintenance of the cover systems for the Past Practice Units identified in Permit Condition VIII.A to be submitted to the Department, along with the cost estimates prepared under Permit Conditions II.L and II.N.

VIII.B.2. The Permittee shall adjust the cost estimate for inflation within sixty (60) calendar days prior to the anniversary date on which the first cost estimate was prepared under Permit Condition VIII.B.1.

VIII.B.3. The Permittee shall revise the post-cover cost estimate for the Past Practice Units within thirty (30) calendar days of an approved modification to the Past Practice Units.

VIII.C. POST-COVER FINANCIAL ASSURANCE
The Permittee shall, within sixty (60) calendar days of preparation of the cost estimates required by Permit Condition VIII.B.1, establish and maintain financial assurance by one of the forms provided for under IDAPA 58.01.05.008 [40 CFR §§ 264.143 and 264.145], in the amount of the cost estimates required by Permit Condition VIII.B.

VIII.D. COMPLIANCE SCHEDULE

VIII.D.1. In accordance with IDAPA 58.01.05.008 [40 CFR § 264.101(a)], the Permittee shall institute corrective action to address air emissions from the six (6) Past Practice Units (PPUs): Silo 1, Silo 2, Silo 3, Powerhouse Dome, Control Room, and Radar Silo. The Permittee shall submit to the Department, within 180 days of the effective date of this Permit, a Plan describing the Carbon Unit System used to treat air emissions, including maintenance of the activated carbon (i.e., replacement frequency).

VIII.D.2. Failure on the part of the Permittee to complete the total scope of work approved under Permit Condition VIII.D.1, in the time frame specified within the approved Work Plan, shall constitute a permit violation unless granted a written extension from the Department.

This space intentionally left blank.

MODULE IX – GROUND WATER MONITORING

IX.A. GROUND WATER MONITORING PROGRAM

The Ground Water Monitoring Program, applicable under the terms of this Permit, shall be undertaken in accordance with IDAPA 58.01.05.008 [40 CFR §§ 264.97, 264.98, 264.99 and 264.100]. Table IX-1 summarizes key components of the Ground Water Monitoring Program. The Ground Water Monitoring Program shall consist of and be implemented as follows:

IX.A.1. A Detection Monitoring Program (DMP) shall be put into effect immediately and shall remain in effect until:

IX.A.1.a. The detection monitoring criteria, as listed in Permit Condition IX.F.1 as the Estimated Quantitation Limits (EQL), for any single constituent(s) are exceeded. The EQL for all parameters shall be one (1) microgram per liter for any single Volatile Organic Constituent (VOC) or as specified in Table IX-2. At that time, the Permittee shall comply with Permit Condition IX.G and proceed in accordance with Permit Condition IX.A.2; or

IX.A.1.b. The Post-Closure Period is over.

IX.A.2. A Compliance Monitoring Program (CMP) shall be put into effect at such time as the detection monitoring criteria are demonstrated, through Permit Condition IX.G, to have been exceeded. A CMP is currently in effect for monitoring Wells U-1, U-5, U-6, U-7, U-20, U-21, U-23, U-24, and U-25. The CMP shall remain in effect until:

IX.A.2.a. The detection monitoring criteria are demonstrated, through Permit Condition IX.G, to not have been exceeded during four (4) consecutive CMP sampling events, at which time the Permittee shall reactivate the DMP specified in Permit Condition IX.F; or

IX.A.2.b. The compliance monitoring criteria, demonstrated through Permit Condition IX.G, have been exceeded, at which time the Permittee shall proceed in accordance with Permit Condition IX.A.3 (Corrective Action); or

IX.A.3. A Corrective Action Monitoring Program (CAMP), which shall be put into effect at such time as any Ground Water Protection Standard (GPS) criteria are exceeded. The CAMP shall remain in effect until: a) the compliance monitoring criteria are not exceeded during four (4) consecutive CAMP events. At such time the CMP shall be reactivated; or b) until such time as a Corrective Measures Implementation Plan is submitted to meet the requirements of IDAPA 58.01.05.008 [40 CFR § 264.100] and is approved by the Director.

TABLE IX-1. GROUND WATER MONITORING CRITERIA FOR THE GROUND WATER MONITORING PROGRAMS

MONITORING PROGRAM	BEGIN	MONITORING CRITERIA
Corrective Action Monitoring Program	In accordance with Permit Condition IX.A.3.	Exceedance of Ground Water Protection Standard for one or more constituent(s).
Compliance Monitoring Program	At Permit issuance for the following monitoring wells: U-1, U-5, U-6, U-7, U-20, U-21, U-23 U-24, U-25; or in accordance with Permit Condition IX.A.2, when the detection monitoring criteria are exceeded.	Constituent concentrations less than, or equal to, the Ground Water Protection Standards, but are greater than the Estimated Quantitation Limit of 1 microgram per liter (1 µg/l). [Refer to Table IX-6]
Detection Monitoring Program	At Permit issuance for all monitoring wells except: U-1, U-5, U-6, U-7, U-20, U-21, U-23, U-24, and U-25; or in accordance with Permit Condition IX.A.1.	Analytical results indicate constituent concentrations are below the Estimated Quantitation Limit (EQL), as shown in Table IX-2. EQLs for all constituents shall be 1 µg/l.

IX.B. GROUND WATER MONITORING WELLS

IX.B.1. The Ground Water Monitoring Network shall consist of the Upper and Lower Aquifer monitoring wells and piezometers listed in Table IX-3, and shown on Figures 1 and 2 of this Permit. The sampling frequencies for all ground water monitoring wells are listed in Table IX-3. For each regulated unit, the point of compliance monitoring wells are listed in Table IX-4 and Figures E-27 and E-28 of Attachment 11 of this Permit.

IX.B.2. All changes to the Ground Water Monitoring Network and sampling frequencies shall require a permit modification, in accordance with IDAPA 58.01.05.012 [40 CFR § 270.42] and Permit Condition I.E.3. The only exceptions to this are the monitoring wells addressed in Permit Condition IX.B.3.

IX.B.3. Lower Aquifer Monitoring Wells L-43, L-44, and L45 were installed during construction of Cell 15, Phases 2 and 3. Monitoring well L-47 was installed as part of the Cell 15, Phase 4 construction, as specified in Permit Condition IX.D.3 and Attachment 11 of this permit, and replaced L-46, which was abandoned due to its proximity to the Phase 4 construction area. The location of L-47 is shown on Figure 2.

IX.B.4. The Permittee shall calculate the ground water elevations, flow directions, and rates for the Ground Water Monitoring Network on a semi-annual basis, during the spring and fall monitoring events. The methods, calculations, and parameters used shall be provided in the Ground Water Monitoring Reports required under Permit Conditions IX.F.6 and IX.G.9. Ground water flow rates, directions, contour maps, and summary tables shall be submitted annually to the Director with the analytical results of the spring sampling event. Additionally, the Permittee shall submit, at this time, a written review of the adequacy of the Ground Water Monitoring System.

IX.C. MONITORING WELL MAINTENANCE

IX.C.1. The Permittee shall maintain all monitoring wells in good working order, making necessary repairs in a timely manner so that the sampling program is not unreasonably hindered or delayed.

IX.C.2. A Monitoring Well Maintenance Program consisting of wellhead monitoring, well sounding, well yield and specific capacity determination and well redevelopment will be conducted for the facility as part of the Ground Water Monitoring Program as follows:

IX.C.2.a. The Permittee shall perform well maintenance activities in accordance with the schedule set forth in Attachment 11 of this Permit.

IX.C.2.b. The Permittee shall maintain complete records of all well maintenance activities for the term of this Permit, in accordance with Permit Condition I.P.

IX.C.2.c. The Permittee shall inspect and maintain all monitoring wells throughout operation, closure and post-closure, in accordance with Permit Condition II.E and Attachments 4 and 11 of this Permit.

IX.C.3. The Permittee shall maintain borehole integrity of each monitoring well, as required by IDAPA 58.01.05.008 [40 CFR § 264.97(c)]. The Permittee shall maintain the wells utilized solely as piezometers, in accordance with Permit Condition IX.C.4.

IX.C.3.a. Monitoring wells shall be sounded every two years. If the well has a build up of one (1) foot or more of sediment, USEI will note the build up in the resulting monitoring report. If build up of two (2) feet or more is measured, or if the well is unable to yield sufficient water for analysis, the well shall be redeveloped and the sediment removed prior to the next monitoring event.

IX.C.3.b. The Permittee shall perform a slug test or pumping test for all new monitoring wells during construction/development to determine hydraulic conductivity. This data may be used at a later date to determine adequate performance of the monitoring well.

IX.C.4. Wells utilized solely as piezometers shall only be subject to the maintenance requirements of well head inspection and sounding. Redevelopment of these wells is only required if the buildup of sediment interferes with the Permittee's ability to take water-level measurements.

IX.C.5. The need for maintenance shall not constitute grounds for missing a sampling event. The only reason this would constitute grounds for missing a scheduled sampling event would be the accidental destruction of the well. Under no circumstances shall a monitoring well remain out of commission for two (2) consecutive sampling events. The construction of the repair or replacement shall be in accordance with Attachment 11 of this Permit.

IX.C.6. In the event a monitoring well is destroyed, the Permittee shall:

- Notify the Director within seven (7) calendar days of discovery of the destroyed well.
- The Permittee shall immediately propose a new location for a replacement well that is neither less than twenty (20) feet nor more than fifty (50) feet from the original destroyed well, or other suitable location upon approval from the Director.
- The Permittee shall plug and abandon the destroyed well in accordance with the Idaho Department of Water Resources' abandonment criteria.
- The Permittee shall notify the Director at least five (5) days before installation of any replacement wells. Replacement wells shall be constructed in accordance with Permit Condition IX.D and Attachment 11 of this Permit.

IX.C.7. If a monitoring well/piezometer must be replaced for any reason during the term of this Permit, it shall be replaced within ninety (90) calendar days of the date taken out of service, and/or be fully operational at the time of the next sampling event.

IX.D. MONITORING WELL CONSTRUCTION

IX.D.1. All monitoring wells will be constructed and developed in accordance with EPA's *Technical Enforcement Guidance Document* (latest edition), Attachment 11 of this Permit, and as follows:

IX.D.2. The Permittee shall submit to the Director a copy of the well construction record and boring logs, with the as-built drawings for each well, within sixty (60) days after completion of each well.

IX.D.3. The monitoring wells specified in Table IX-4 of this Permit for proposed units (Cell 15 Phase 4) shall not be required to be constructed until ninety (90) calendar days prior to the placement of waste in the unit. Sampling shall have taken place and analytical results evaluated prior to waste placement in these units. The following exceptions to the requirements for installation of the future monitoring wells, listed in Table IX-4 of this Permit, shall also apply as follows:

IX.D.3.a. Prior to the placement of any waste in Phase 4 of Cell 15, as described in Attachment 18a, monitoring well L-47, as specified in Table IX-3 and Attachment 11, shall be fully operational. At least one sampling event shall be completed and analytical results evaluated by the director a minimum of thirty (30) days prior to any waste placement into this unit. Also, the Monitoring Well Construction Report for L-47 shall be submitted to and approved by the Director, prior to waste placement into this unit.

IX.D.4. If at anytime, perched water is identified (whether seasonal or manmade), the Permittee shall submit a Monitoring Plan, within sixty (60) calendar days, of the discovery for the Department's review and approval. The Monitoring Plan shall propose additional perched zone monitoring wells, for the purpose of determining (but not limited to) the perched water characteristics, flow path(s) and a proposed schedule for the drilling and completion of the proposed wells.

IX.E. GROUND WATER SAMPLING AND ANALYSIS

IX.E.1. The Permittee shall sample (semi-annually) all monitoring wells designated in Table IX-3 of this Permit. The Permittee shall perform this sampling in accordance with Permit Condition IX.A and Attachment 11 of this Permit.

IX.E.1.a. The spring monitoring event shall take place during the months of April, May, or June of each year.

IX.E.1.b. The fall monitoring event shall take place during the months of September, October, or November of each year.

IX.E.1.c. The fall and spring monitoring events shall be separated by at least one hundred twenty (120) days.

IX.E.2. The Permittee shall notify the Director of all planned sampling events at least five (5) working days in advance of the planned sampling, and shall notify the Director of all other sampling events, as soon as possible prior to the event.

IX.E.3. The Permittee shall analyze the ground water samples obtained for the volatile organic compounds (VOC) or other constituents as defined on Table IX-2 of this Permit. The Permittee shall perform this analysis in accordance with Method 8260 of the Third Edition, or latest, of EPA SW-846 "Test Methods for evaluating Solid Waste, Physical/Chemical Methods" or an equivalent or superior method, with prior Director approval.

IX.E.4. Sample Collection Procedures

IX.E.4.a. Wellhead Inspection and Organic Vapor Screening
On arrival at each wellhead, the sampling team shall determine background organic vapor levels in the breathing zone and at the level of the wellhead, in accordance with Attachment 11 of this Permit.

IX.E.4.b. Measurement of Static Water Elevation
Prior to purging or sampling any monitoring wells, the elevation of the ground water shall be determined as required by IDAPA 58.01.05.008 [40 CFR § 264.97(f)] and Attachment 11. Ground water elevations shall be measured to the nearest 0.01 foot. A registered surveyor shall survey the elevation datum and water level measurement point, relative to mean sea level, for all monitoring wells. This datum shall be related to a fixed reference point on the well casing, prior to the first monitoring event for each well.

IX.E.4.c. Field Measurements for field parameters including temperature, pH, and specific conductivity shall be measured and recorded at each monitoring well, in accordance with Attachment 11.

IX.E.4.d. Pre-sample Purging

Monitoring wells shall be purged of standing water in the casing. Low-yield wells shall be evacuated to dryness, and a minimum of three casing volumes shall be removed from higher yielding wells. Casing volumes shall be calculated prior to each monitoring event. Field parameter readings shall be stabilized to within 10% for temperature and specific conductance; pH shall stabilize to within 0.1 units.
For low-yielding wells purged to dryness, samples shall be collected as soon as a sufficient volume of water is available for collection. Under no circumstances shall collection of the sample take place more than 24 hours after evacuation. If adequate water is not available to sample within 24 hours, the Permittee shall notify the Director and redevelop or replace the well within ninety (90) days. The Permittee may, with prior Director approval, substitute purging stabilization parameters without effecting a modification to this Permit.

The Permittee shall store all purge water in properly labeled, secure containers until analytical results are obtained and the appropriate method of disposal of the containerized ground water is identified. Alternatively, the Permittee may assume that all purge water is hazardous waste and immediately treat the waste in an appropriate manner.

IX.E.4.e. Sample Collection

The Permittee shall conduct sample collection and preservation in accordance with Attachment 11 of this Permit.

IX.E.4.f. Chain-of-Custody Control

As required by IDAPA 58.01.05.008 [40 CFR § 264.97(d)(4)], and Attachment 11 of this Permit, the Ground Water Monitoring Program shall include chain-of-custody control to maintain integrity of samples.

IX.E.4.f.(1). Field Log Book

A field log book shall be kept for each sampling event. A copy of the field log book shall be kept at the facility and shall be available for inspection. The field log book shall include those items in accordance with Attachment 11.

IX.E.4.f.(2). Sample Receipt

Upon receipt of the samples at the contract laboratory, the security of the shipping containers shall be checked. Outer seals that are broken or missing shall be noted, and reported to the Permittee's facility contact.

IX.E.4.g. Quality Assurance/Quality Control (QA/QC)

Quality Assurance of sampling, analysis, and reporting of data to the Department shall be the responsibility of the Permittee. The Permittee shall be responsible for the QA/QC activities of the samplers, drillers, and analytical laboratories.

Components of the QA/QC Program shall be in accordance with Attachment 11 of this Permit; and

IX.E.4.g(1). A full laboratory QA/QC Report shall accompany each data report and shall be kept on file at the facility.

IX.E.4.g(2). Sample Collection: A standardized field log book shall be kept for each sampling event, including the information described in Attachment 11 of this Permit. It shall include documentation of all QA/QC procedures related to sample collection and the type and number of QA/QC samples. QA/QC samples may include (but are not limited to) duplicate, field, trip, lab, equipment, and blind/spike, and shall be consistent with the Third (*or latest)* Edition of EPA SW-846 "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods."

IX.E.4.g(3). QA/QC of Raw Data: The raw data from the analytical laboratory, as reported, shall be reviewed to determine that it is correctly and accurately reported. If outliers are identified and can be documented, they shall be flagged and included in the data submission.

IX.F. DETECTION MONITORING PROGRAM

IX.F.1. The detection monitoring criteria for evaluating data from each sampling event for any volatile organic compound, shall be the EQL, of 1 microgram per liter for any single VOC, or as specified in Table IX-2 for any other constituent.

IX.F.2. Upon detection of any VOC or other constituents exceeding an EQL for any monitoring well, the Permittee shall, within seven (7) calendar days, notify the Director in writing of the findings, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.98(g)(1)]. At this time, the Permittee may elect to immediately collect two (2) verification samples from any affected well(s), purging the well(s) between samples, and reanalyze for all VOCs or other constituents included in the Detection Monitoring Program.

IX.F.3. If analytical results from either verification sample, described in Permit Condition IX.F.2, confirm the detection of VOCs or other constituents above the detection monitoring criteria, described in Permit Condition IX.F.1, the affected well(s) shall be sampled and analyzed for the constituents identified in IDAPA 58.01.05.008 [40 CFR Part 264, Appendix IX]. The Permittee shall notify the Director, in writing, within seven (7) days of making this finding and submit all analytical results. Within 90 (ninety) calendar days of confirmation of an exceedance, as described in Permit Condition IX.F.2, the Permittee shall submit to the Director either of the following:

IX.F.3.a. A report summarizing the analytical results from the monitoring events described in Permit Conditions IX.F.2 and IX.F.3, and the notification that the affected well(s) is being removed from the Detection Monitoring Program and is being incorporated into the CMP or CAMP; or

IX.F.3.b. A report demonstrating that a source, other than a regulated unit or Past Practice Unit, caused the detection or that the detection resulted from an error in sampling, analysis, or evaluation. This demonstration report must be submitted to the Director for approval.

IX.F.4. If the Permittee is unable to verify that the source of contamination is from other than a regulated unit or Past Practice Unit (in accordance with Permit Condition IX.F.3.b), or if the report submitted in accordance with Permit Condition IX.F.3.b is not approved by the Director, then the Permittee shall, within 90 (ninety) days of receiving notice the demonstration report of Section IX.F.3 has been denied, remove the affected well(s) from the Detection Monitoring Program and incorporate the affected well and all other monitoring wells associated with the applicable Hazardous Waste Management Unit or Past Practice Unit into the Compliance Monitoring Program, in accordance with Permit Condition IX.G.

IX.F.5. If analytical results from both verification samples, described in Permit Condition IX.F.2, fail to confirm the detection of VOCs or other constituents above an EQL, the Director shall be notified in writing that the Detection Monitoring Program is being resumed.

IX.F.6. Data Reporting for Detection Monitoring

While in the Detection Monitoring Program, the Permittee shall submit to the Director a semi-annual Detection Monitoring Report, in accordance with Permit Condition IX.E.1. This report shall contain a narrative summary of ground water monitoring data that has been collected to date, and a detailed listing of the monitoring and analytical data obtained since submitting the previous report, including (at a minimum) all QA/QC information, a table summary of ground water elevations, all equations, calculations, and parameters used to calculate ground water velocities and flow direction, in accordance with Permit Condition IX.B.4.

IX.G. COMPLIANCE MONITORING PROGRAM

IX.G.1. As of the effective date of this Permit, Monitoring Wells U-1, U-5, U-6, U-7, U-20, U-21, U-23, U-24, and U-25 shall be in the Compliance Monitoring Program. All other compliance monitoring wells shall be determined in accordance with Permit Condition IX.A.2.

IX.G.2. The Permittee shall sample the monitoring wells in the Compliance Monitoring Program semi-annually, during the compliance monitoring period.

IX.G.3. The Permittee shall perform this sampling in accordance with Permit Condition IX.E, and as follows:

IX.G.3.a. The Permittee shall sample the CMP wells for the VOCs or other constituents outlined in Table IX-2.

IX.G.3.b. On an annual basis, the Permittee shall sample all monitoring wells in the CMP and analyze for the constituents identified in IDAPA 58.01.05.008 [40 CFR Part 264, Appendix IX], in lieu of the parameters outlined in Permit Condition IX.G.3.a. Upon detection of any additional monitoring constituents, as a result of the annual Appendix IX sampling, the permittee may resample within thirty (30) days and repeat the Appendix IX analysis. The Permittee shall submit the resample analytical results to the Director, and if the second analysis confirms the presence of the new constituents, the Permittee shall, within seven (7) calendar days of receiving the data that identifies new constituents, notify the Director in writing of the findings and the new constituents shall be included in the Detection and Compliance Monitoring Programs.

IX.G.3.c. All analytical results shall meet the established reporting limit or EQL. If the reporting limit is greater than the established EQL, the Director may require the analysis to be rerun.

IX.G.4. The Permittee shall obtain water-level measurements from the CMP wells prior to each sampling event. Measurements for each monitoring well shall be obtained prior to purging the well. The Permittee shall incorporate this data in determining the rate and direction of ground water flow annually, in accordance with Permit Condition IX.B.5.

IX.G.5. Data Evaluation for Compliance Monitoring

IX.G.5.a. Data in the CMP will be evaluated by comparing the analytical results to the GPS(s) presented in Table IX-6. Level 1 monitoring well criteria was established by the Alternate Concentration Limits (ACL) presented in Table IX-6. The GPSs for Level 2 monitoring wells shall be those established in Table IX-6 of this Permit and determined by Permit Conditions IX.G.5.b through IX.G.5.e, IX.G.8, and IX.G.9, and as follows:

IX.G.5.b. The down-gradient monitoring wells have been divided into two (2) categories as follows:

IX.G.5.b.(1). Level 1 Compliance Wells:
Level 1 Compliance Wells consist of interior monitoring wells located down-gradient of designated Solid Waste Management Units and regulated units and include the following Wells: U-1, U-17, U-18, U-19, U-20, U-21, U-22, U-23, U-24, U-25, L-31, L-32, L-33, L-37, L-39, L-41, and L-42.

IX.G.5.b.(2). Level 2 Compliance Wells:
Level 2 Compliance Wells consist of down-gradient wells on the eastern and northern site boundaries where ground water flow paths will potentially carry impacted ground water off the facility. Level 2 Compliance Wells consist of the following wells: U-5, U-6, U-7, U-8, U-9, U-10, U-11, U-12, L-28, L-29, L-30, L-43, L-44, L-45, and L-47.

IX.G.5.c. The compliance monitoring criteria (GPS) for evaluating data collected from Level 1 and Level 2 Compliance Wells for each monitoring event for any anthropogenic organic compound, shall be as follows:

IX.G.5.c.1. Level 1 Compliance Wells
Any single Table IX-2 organic compound equal to one-half percent (0.5%) of its solubility in water, as presented in Table IX-6. If multiple constituents are present, a cumulative total of 0.5% solubility based on the summation of solubility percentages, presented by the concentration of each constituent detected.

IX.G.5.c.2. Level 2 Compliance Wells
For any single Table IX-2 organic constituent equal to the Maximum Concentration Limit (MCL), as established by EPA, for drinking water presented in Table IX-6; or

IX.G.5.c.2(a). Where an MCL has not been established, a concentration equal to 1×10^{-5} industrial cancer risk for carcinogenic constituents will apply. This will be calculated in accordance with Permit Condition IX.G.5.e.

IX.G.5.c.2(b). If multiple carcinogenic compounds are present, but none exceed their respective MCL (if appropriate), a cumulative 1×10^{-5} industrial cancer risk will apply; or

IX.G.5.c.2(c). For individual non-carcinogenic hazardous constituents, the compliance monitoring criteria shall be a hazard quotient of 1 based upon the calculation of the hazard quotient, in accordance with Permit Condition IX.G.5.d.

IX.G.5.c.2(d). If multiple non-carcinogenic hazardous constituents are present, but none exceed their respective MCL (if available), the cumulative hazard quotient shall be calculated in accordance with the equation presented in Permit Condition IX.G.5.d. The action criteria shall be based upon a cumulative hazard quotient of 1.

IX.G.5.c.2.(e). In the event additional anthropogenic compounds are identified through Appendix IX sampling, GPSs for Level 1 and Level 2 Monitoring Wells shall be established and incorporated into this Permit through a modification.

IX.G.5.d. Calculation for determination of the Hazard Quotient (Index) using standard default factors.

Industrial Non-Carcinogenic Hazard Quotient Determination:

HQ={C * 1 mg/1000 ug * EFr * EDr *[(IRWa/RfDo) + (VFw * IRAa/RfDi)]} / (BWa * ATn)

Where:

HQ	=	Hazard Quotient
C	=	Chemical Concentration in the ground water (ug/L) of the specific constituent
RfD_O	=	Oral reference dose in mg/kg-day (Table IX-7)
IRWa	=	Ingestion Rate, water, adult (2 L/day)
IRAa	=	Inhalation Rate, adult (20 m^3/day)
EFr	=	Exposure Frequency, occupational (250 days/year)
EDr	=	Exposure Duration, occupational (25 years)
BWa	=	Body weight, adult (70 kg)
RfDi	=	Inhalation Reference Dose, in mg/kg-day (Table IX-7)
ATn	=	Averaging time, 9125 days (25 yr*365 days/yr)
VFw	=	Volatilization Factor for water (0.5 L/ m^3)

Refer to Table IX-7, *Toxicity Values for RfDo and RfDi values for calculating the Industrial Non-Carcinogenic Hazard Quotient*. Note: N-A means that no oral and/or inhalation reference dose is available for use.

Non-cancer Hazard Determination for multiple constituents:
For each non-carcinogenic constituent from Permit Condition IX.I.G.a, detected at or above the EQL limit, calculate the Hazard Quotient as shown above and sum as follows:

Hazard Index = $HQ_1 + HQ_2 + HQ_3 + \ldots$

IX.G.5.e. Calculation for determination of the Total Cancer Risk using standard default factors.

Calculating the Estimated Industrial Cancer Risk for Each Constituent:

CR={C * 1 mg/1000 ug * EFr[(IFWadjo * SFo)+(VFw * InhFadjo * SFi)]} / (ATc)

Where:

CR	=	Constituent Cancer Risk (based on industrial exposure factors)
C	=	Chemical Concentration in the ground water (ug/L) of the specific constituent
EFr	=	Exposure Frequency (250 days/year)
ATc	=	Averaging Time, carcinogenic (25550 days)
IFWadjo	=	Ingestion Factor, water, occupational (0.714 L-yr/Kg-day) *Calculated as follows: IFWadjo = IRWa*1/BWa*EDo =* *2 L/day*1/70kg* 25 yrs*
SF_0	=	Oral slope factor in kg-day/mg (Table IX-8)
VFw	=	Volatilization Factor for water (0.5 L/m^3)
InhFadjo	=	Inhalation Factor, occupational (7.14 m^3-yr/Kg-day) *Calculated as follows: InhFadjo = IRAa*1/BWa*EDo =* *20 m3/day*1/70kg*25 yrs*
SF_i	=	Inhalation slope factor in kg-day/mg (Table IX-8)

Refer to Table IX-8, *Toxicity Values for SFo and SFi values for calculating Total Cancer Risk*. Note: *N-A* means that no oral and/or inhalation reference dose is available for use.
Calculating the Total Industrial Cancer Risk:
For each constituent from Permit Condition IX.G.3.a, detected at or above the EQL limit, calculate the Cancer Risk as shown above and sum as follows:

Total Cancer Risk = $CR_1 + CR_2 + CR_3 + ...$

IX.G.5.f. The toxicity values in Table IX-7 and Table IX-8 will be updated during the Permit Reopener five (5) years from the effective date of permit issuance per IDAPA 58.01.05.012 [40 CFR § 270.50(d)]. Toxicity factors will be updated, based on the published values in: 1) Integrated Risk Information System (IRIS); 2) Health Effects Assessment Summary Tables (HEAST), databases maintained by the U.S. EPA; and 3) EPA Region 9, Preliminary Remediation Goals (PRGs). The Permittee shall use the updated, toxicity values for all calculations.

IX.G.5.g. Upon detection of VOC concentrations at concentrations exceeding the GPS, set forth in Permit Condition IX.G.5.a and/or listed in Table IX-6 of this Permit, the Permittee shall:

IX.G.5.g(1). Notify the Director of the finding (in writing) within seven (7) calendar days of receipt of the analytical results, identifying the presence of contaminants at or above the established GPSs, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.99(h)(1)]. At this time, the Permittee may elect to immediately collect two (2) verification samples from any affected well(s), purging the well(s) between samples, and reanalyze for all compounds required in the Compliance Monitoring Program. If analytical results from either verification sample confirm the detection of compounds above the Compliance Monitoring Criteria, as specified in Permit Condition IX.G.5.a, then the Permittee shall:

IX.G.5.g(2). Submit to the Director a Corrective Action Plan, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.100], applicable to the affected area(s) and constituents, within 120 calendar days of receipt of the analytical results, identifying the presence of contaminants at or above the established GPSs; or

IX.G.5.g(3). Submit to the Director, a report demonstrating that a source (other than a Past Practice Unit or regulated unit) caused the contamination and/or that the reported contaminant concentrations resulted from an error in sampling, analysis, or evaluation. In making this demonstration, the Permittee shall follow procedures in accordance with IDAPA 58.01.05.008 [40 CFR § 264.99(i)]:

- Notify the Director, in writing, within seven (7) calendar days of the Permittee's intent to make such a demonstration;
- Within ninety (90) days, submit a report to the Director that demonstrates that a source (other than the Past Practice Unit or regulated unit) caused the standard to be exceeded or that the apparent noncompliance with the standards resulted from an error in sampling, analysis, or evaluation;
- Within ninety (90) days, submit to the Director an application for a permit modification to make any appropriate changes to the Compliance Monitoring Program at the facility; and
- Continue ground water monitoring for the affected well(s), in accordance with the Compliance Monitoring Program.

IX.G.6. The Permittee shall continue the Compliance Monitoring Program at the affected well(s) until:

IX.G.6.a. Constituents identified in the affected well(s) do not exceed the limit specified in Permit Condition IX.G.5.a for four (4) consecutive sampling events; or

IX.G.6.b. The Permittee enters into a Corrective Action Program under IDAPA 58.01.05.008 [40 CFR § 264.101] for the affected area(s).

IX.G.7. If the Permittee determines that the Compliance Monitoring Program no longer satisfies the requirements of the IDAPA 58.01.05.008 [40 CFR § 264.99], the Permittee shall, within ninety (90) days, submit an application for permit modification to make any appropriate changes to the program, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.99(j)].

IX.G.8. In the event VOCs are detected above an EQL in an up-gradient or background monitoring well, the well shall be incorporated in the Compliance Monitoring Program, as a Level 1 Compliance Well, in accordance with Permit Condition IX.G.

IX.G.9. Data Reporting for Compliance Monitoring

While in the Compliance Monitoring Program, the Permittee shall submit a semi-annual Compliance Monitoring Report, to the Director, in accordance with Permit Condition I.P.6. This report shall contain a narrative summary of ground water monitoring data that has been collected over the past five (5) years, a detailed listing of the monitoring, and analytical data obtained since the previous report (including any/all newly identified compounds from the Appendix IX Sampling), and (at a minimum) all QA/QC information, a table summary of ground water elevations, all equations, calculations, and parameters used to calculate ground water velocities, and ground water flow direction, in accordance with Permit Condition IX.B.4.

IX.H. POST-CLOSURE AND POST-COVER CARE MONITORING

IX.H.1. All procedures described in Part IX of this Permit for inspection, maintenance, and monitoring shall apply to the Post-Closure Care Period, as well as the active life of each regulated unit, and to the Post-Cover Care Period for each Past Practice Unit.

IX.H.2. The period of Post-Closure for each regulated unit shall be as specified in Permit Condition II.M.2. The period of Post-Cover Care for each Past Practice Unit shall be as specified in Permit Conditions VIII.A.3 and VIII.A.4.

IX.I. UNSATURATED ZONE MONITORING

Upon the Director's request, the Permittee shall prepare a Work Plan for the design, construction, operation, and maintenance of an Unsaturated Zone Monitoring System for the facility, capable of detecting changes from unsaturated to saturated conditions that could move contaminants laterally above the monitored aquifer. The Director shall reserve the right to reopen this permit condition, at any time, to include a specific design and implementation schedule, if the Director determines that the Permittee is not making all reasonable efforts to meet this permit condition. The reopening of this permit condition would be done as an agency-initiated permit modification under IDAPA 58.01.05.012 [40 CFR § 270.41].

IX.J. COMPLIANCE SCHEDULE — RISING WATER TABLE STUDY

IX.J.1. On December 17, 1998, the Department approved the Rising Water Table Study Work Plan. The Department evaluated the Rising Ground Water Study's results and issued a conditional approval on November 23, 1999. As stated in the approval, the Permittee shall submit in reports to the Director (every two years) the continuing evaluations of the rising ground water, beginning in 2001. After submittal of the third such report, the Permittee may request a five (5) -year interval for evaluation of the rising ground water. These reports shall include a summary of current rising ground water conditions, an assessment of the probable scenarios causing the rising ground water, an evaluation of the potential consequences to the Ground Water Monitoring Network (due to the rising ground water), and a description of proposed future tasks to address the situation.

IX.J.2. Failure on the part of the Permittee to carry out the approved Work Plan in the time specified shall be deemed as a violation of this Permit unless the Permittee has been granted a written extension from the Department.

MODULE X - CONTAINMENT BUILDING AND DEBRIS TREATMENT

X. Subject to the terms of this Permit, the Permittee may store and/or treat hazardous wastes in the Containment Building, as follows:

X.A. CONTAINMENT BUILDING

X.A.1. Containment Building Design and Equipment

The Permittee shall maintain the containment building, in accordance with the design standards for a containment building, as provided in IDAPA 58.01.05.008 [40 CFR § 264.1101], Attachment 24 of this Permit, and Permit Condition II.A.1 of this Permit. The containment building houses a Size Reduction System that consists of a Crusher System and associated equipment. The Permittee shall maintain the Crusher System in accordance with the requirements of IDAPA 58.01.05.008 [40 CFR § 264 Subpart X] and as provided by Permit Module XII. The arrangement of the equipment is depicted in Drawings D2020-R05, D2020-R07, and D2020-R08 of Attachment 20 of this Permit. The containment building is enclosed; and in areas where waste could become mobile, air pollution control equipment has been installed. Drawings D2020-H01, D2020-H03, and D2020-H04 in Attachment 20 of this Permit provide design details of the Air Handling and Pollution Control System for the containment building. The debris portion of the containment building contains three (3), steel-lined sort floors and two (2) Mixing Bin Tanks. The steel lined sort floors will not be in use when the Mixing Bin Tanks are in place. The stabilization portion of the containment building contains two (2) Mixing Bin Tanks. The Mixing Bin Tanks are further described in Permit Module IV. The permitted storage areas are depicted in drawings in Attachment 20 of this Permit.

X.A.1.a. The Permittee shall keep all relevant figures, drawings, and diagrams related to the containment building readily available for inspection at the facility, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.74].

X.A.1.b. Within forty-five (45) days after approval of the CQA Report for Mixing Bin Tanks 3 and/or 4, the Permittee shall submit all relevant updated drawings, which were not included in the CQA Report, illustrating current conditions in the Debris Portion of the Containment Building.

X.A.2. Containment Building Operation

X.A.2.a. The Permittee shall follow the approved containment building operation procedures, included as Attachments 2, 4, 6, 7, 13, 14, 24, and 25 of this Permit, and as provided by Permit Conditions X.A.2.a.(1) through (8).

X.A.2.a.(1). The Permittee shall operate the containment building so as not to exceed the maximum waste processing rate for the containment building (stabilization portion and debris portion) of 300 tons of waste per hour for the building based on a daily average, nor exceed 2,628,000 tons of waste per year for the building.

X.A.2.a.(2). The maximum waste processing rate for the other operations performed in the containment building shall not exceed 50 tons per hour for the Crusher System and

100 tons per hour for the sort floor, based on daily averages.

X.A.2.a.(3). The Permittee shall maintain non-containerized waste in the containment building sort floors such that the height and location of the waste does not allow these materials to escape or overflow the walls of the containment building.

X.A.2.a.(4). In the event of a power outage, or other event that reduces the operating efficiency below the manufacturer's specifications of the air pollution control equipment for the sort floors and mixing bins, the Permittee shall cease all hazardous waste and debris treatment operations on the sort floors and mixing bins that generate a "fine waste" until such time as the power is restored, or the air pollution control equipment is repaired.

X.A.2.a.(5). In the event of a power outage, or other event that reduces the operating efficiency below the manufacturer's specifications of the air pollution control equipment for the general floor area, the Permittee shall cease all hazardous debris treatment operations that generate a "fine waste" (including crushing and movement of non-containerized hazardous debris/waste and all operations on the general floor area other than storage or movement of closed containers of hazardous debris/waste, in the Containment Building on the general floor area) until such time as the power is restored or the air pollution control equipment is repaired.

X.A.2.a.(6). Containers of hazardous wastes removed from the Containment Building must be managed in accordance with IDAPA 58.01.05.008 [40 CFR § 264.173]. Prior to the transportation of any crushed wastes from the Containment Building, a determination for the presence of 'fine wastes' shall be made.

X.A.2.a.(7). The Permittee shall operate, service, and maintain the air pollution control equipment listed and/or depicted in Attachment 24 of this Permit according to the manufacturers' recommended instructions and/or specifications, which shall be maintained on-site.

X.A.2.a.(8). Closure of the Containment Building and associated areas and equipment shall be conducted in accordance with Attachment 9 of this Permit.

X.B. HAZARDOUS DEBRIS TREATMENT

X.B.1. All hazardous waste and debris-processing operations including unloading, staging, storing, sorting, pre-treating, or treating shall be conducted in compliance with IDAPA 58.01.05.011 [40 CFR Part 268] and Attachment 25 of this Permit. The hazardous waste and debris treatment processes include, but are not limited to, the following (as described in Attachment 25): stabilization, microencapsulation, macroencapsulation, chemical oxidation, chemical reduction, deactivation, solidification, neutralization, precipitation, adsorption, bioremediation, size reduction, decanting, and mechanical processing (sorting/crushing).

X.B.2. Hazardous waste and debris processing, treatment, and storage shall be in accordance with Attachments 2, 4, 6, 7, 13, 14, 15, 24, and 25 of this Permit.

X.B.3. Hazardous waste and debris processing, treatment, and storage shall be in accordance with Permit Condition II.T and IDAPA 58.01.05.008 [40 CFR 264 Subpart CC].

X.B.4. Hazardous waste and debris treated by the Permittee, using macroencapsulation or microencapsulation technologies, shall meet the requirements of IDAPA 58.01.05.011 [40 CFR § 268.45, Table 1] and the following permit conditions.

X.B.5. Macroencapsulation

X.B.5.a. The Permittee shall conduct macroencapsulation treatment of hazardous debris in the Containment Building and in Container Storage Pads 4 and 5 and at the Outdoor Stabilization Facility in accordance with Attachment 13, 15, and 25 of this Permit, and as provided by Permit Conditions X.B.4.a.(1) through X.B.4.a.(3).

X.B.5.a.(1). For macroencapsulation of hazardous debris, the Permittee shall use only high density polyethylene liner materials or polyethylene drums as specified in Attachment 25 of this Permit.

X.B.5.a.(2). For macroencapsulation of large pieces of debris that are wrapped or coated with an inert surface coating material, the Permittee shall demonstrate to the Director that the requirements of IDAPA 58.01.05.011 [40 CFR § 268.45, Table 1] have been met.

X.B.5.a.(2)(a). Upon the Director's approval of the demonstration in Permit Condition X.B.5.a.(2), the Permittee may begin utilizing the requested macroencapsulation process.

X.B.5.a.(3). Landfill placement of containers of macroencapsulated hazardous debris shall be in accordance with Attachments 19 and 25 of this Permit.

X.B.6. Microencapsulation

X.B.6.a. The Permittee shall conduct microencapsulation treatment of hazardous debris in accordance with Attachment 25 of this Permit, and as provided by the following permit conditions.

X.B.6.b. The Permittee shall conduct microencapsulation of hazardous debris at the Stabilization Facility or the Containment Building.

X.B.6.c. All size reduction operations of hazardous debris, prior to microencapsulation treatment, shall be performed in the containment building. Additional locations for size reduction operations, such as Container Management Units, may be utilized upon the Director's approval.

X.B.6.d. Landfill placement of microencapsulated hazardous debris shall be in accordance with Attachment 19 and 25 of this Permit.

X.C. CYANIDE DESTRUCTION

X.C.1. Cyanide destruction shall be conducted in accordance with all applicable sections of Attachments 2, 4, 6, 7, and 25 of this Permit.

X.C.2. Cyanide destruction performed by the Permittee shall be limited to chemical oxidation (e.g., alkaline chlorination), and shall be limited to the following parameters in order to protect human health and the environment:

- Waste containing less than 10,000 ppm of total cyanide may be accepted for cyanide destruction provided that the appropriate safety controls and procedures are followed. Prior approval from the Director is required for the receipt of any cyanide wastes exceeding 10,000 ppm.

- Cyanide destruction shall be performed in the Stabilization Facility and/or the Containment Building in containers and/or the Mixing Bin Tanks.

X.D. CLOSURE AND POST-CLOSURE

Closure and Post-Closure Care of the Containment Building shall be completed in accordance with IDAPA 58.01.05.008 [40 CFR § 264.1102], and all applicable sections of Attachment 9 of this Permit.

This space intentionally left blank

MODULE XI - STABILIZATION OPERATIONS

XI.A. GENERAL OPERATING REQUIREMENTS

XI.A.1. The Permittee shall remove spilled or leaked wastes and accumulated liquid from the Secondary Containment Systems of the Stabilization Facility and the containment building (stabilization and/or debris portion) within 24 hours of detection, unless the waste or liquid in the Secondary Containment System is frozen. The Permittee shall manage these wastes and liquid as hazardous wastes. Within two (2) normal working days after the waste or liquid in the Secondary Containment System is no longer frozen, the contained liquids will be characterized and removed.

XI.A.2. The Permittee shall keep all relevant figures, drawings, and diagrams related to the Stabilization Facility and Containment Building (stabilization portion) readily available for inspection at the facility, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.74].

XI.B. STABILIZATION FACILITY

XI.B.1. The outdoor Stabilization Facility includes rolloffs (stabilization bins) of 25 to 52 cubic yards in capacity and shall be designed, constructed, and operated by the Permittee in accordance with Attachments 2, 4, 6, 7, 13, 15, 24, and 25 of this Permit, except as otherwise specified in this Permit, and in accordance with Permit Conditions II.A.1 and II.A.2.

XI.B.2. The Permittee may conduct treatment utilizing stabilization at the Stabilization Facility on all hazardous wastes listed in the Part A Permit Application (included as Attachment 12 of this Permit), except for "fine wastes" as defined in Attachment 2, and subject to any other applicable conditions in Attachment 2 of this Permit that apply to hazardous wastes to be stabilized.

XI.C. CONTAINMENT BUILDING (STABILIZATION OPERATIONS)

XI.C.1. Containment Building Design and Construction

XI.C.1.a. The Containment Building includes four (4) Mixing Bin Tanks, and the building shall be equipped with air pollution control equipment to control particulate emissions. Two (2) tanks are located in the Stabilization Portion and two (2) tanks are located in the Debris Portion of the building.

XI.C.1.b. The Containment Building includes container storage capacity, as shown in Attachment 13 of this Permit. The maximum waste processing rate for the Containment Building shall not exceed 300 tons of waste per hour based on a daily average, nor exceed 2,628,000 tons of waste per year.

XI.C.2. Containment Building Operation

XI.C.2.a. The Permittee may conduct stabilization, microencapsulation, macroencapsulation, and size reduction within the stabilization portion of the containment building.

XI.C.2.b. The Permittee shall follow, as appropriate, the operating procedures for stabilization, microencapsulation, macroencapsulation, and size reduction as provided in Attachments 2, 4, 6, 7, 13, 24, and 25 of this Permit and as provided by Permit Conditions X.B and XI.B.2.

XI.C.2.c. The Permittee shall operate each Stabilization Portion mixing bin tank so as not to exceed the maximum capacity of 120 cubic yards. The Permittee shall operate each Debris Portion mixing bin tank so as not to exceed the maximum capacity of 226 cubic yards for wastes in solid form. The Permittee shall operate each Debris Portion mixing bin tank so as not to exceed the maximum capacity of 12,000 gallons for wastes in liquid form.

XI.C.2.d. The Permittee shall manage non-containerized waste in the Containment Building such that the height and location of the waste does not allow these materials to overflow any mixing bin tank.

XI.C.2.e. In the event of a power outage, or other event that reduces the required operating efficiency of the air pollution control equipment, the Permittee shall cease all unloading and treatment operations of “fine wastes” until such time as the power is restored or the air pollution control equipment is returned to normal operation. Other treatment and storage operations not involving “fine wastes” may continue.

XI.C.2.f. The Permittee shall maintain and operate the air pollution control equipment, provided in Attachment 24 of this Permit, in accordance with the manufacturers' instructions and/or specifications, and shall keep these on-site.

XI.D. CLOSURE AND POST-CLOSURE

Closure and Post-Closure Care of the Containment Building (stabilization portion and debris portion) and Stabilization Facility, and associated equipment, shall be completed in accordance with IDAPA 58.01.05.008 [40 CFR § 264 Subpart G] and all applicable sections of Attachment 9 of this Permit.

This space intentionally left blank.

MODULE XII - MISCELLANEOUS UNITS UNDER SUBPART X

XII.A. APPLICABILITY OF RULES

The Permittee's compliance with the requirements of Permit Conditions XII.A through XII.G shall constitute compliance with the requirements of IDAPA 58.01.05.008 [40 CFR Parts 264.601 - 603] pertaining to the treatment, storage, or disposal of hazardous waste in miscellaneous units.

XII.B. DESCRIPTION OF MISCELLANEOUS UNIT

The miscellaneous unit consists of the Crusher System and associated equipment. An equipment list for the Crusher System and associated equipment is provided as Table I-2 of Attachment 24 of this Permit. The arrangement of the equipment is depicted in Drawings D2020-A02, -R07, and –R08 of this Permit.

XII.C. APPROVED WASTE

The Permittee may process waste meeting the general waste acceptance criteria in Permit Condition II.C and Attachment 2 of this Permit.

XII.C.1. The Permittee shall comply with Permit Condition II.T of this Permit, and the requirements of IDAPA 58.01.05.008 [40 CFR § 264.601] by not accepting or managing hazardous waste subject to the 40 CFR 264 Subpart CC requirements (e.g. wastes exceeding a volatile organic concentration of 500 ppmw at the point of origin).

XII.C.2. For miscellaneous units that receive organic wastes with a volatile organic concentration at the point of origin less than 500 ppmw, and are therefore, exempt from using air emission control equipment, documentation shall be recorded, in the Facility Operating Record, that includes the information that was used by the Permittee for each waste determination (e.g., test results, measurements, calculations, and other documentation). If analytical results for waste samples are used for the waste determination, then the Permittee shall record the date, time, and location that each waste sample is collected, in accordance with applicable requirements of 40 CFR § 264.1083. This information shall be kept in the Operating Record for a minimum of three (3) years.

XII.C.3. Reporting Requirements: If the Permittee does not comply with Permit Condition V.A.3.a, a report shall be submitted to the Director on each occurrence when hazardous waste is placed in the Waste Management Unit in noncompliance with the conditions of 40 CFR §§ 264.1082(c)(1) or 264.1082(c)(2), as applicable. A written report shall be submitted within fifteen (15) calendar days of the time that the Permittee becomes aware of the occurrence. The written report shall contain: the EPA Identification Number, facility name and address, a description of the noncompliance event and the cause, the dates of the noncompliance, and corrective actions taken to prevent reoccurrence of the noncompliance. The report shall be signed and dated by an authorized representative of the Permittee per IDAPA 58.01.05.008 [40 CFR § 264.1090].

XII.D. PROCESS DESIGN CAPACITY

The maximum waste processing rate for the Crusher System in the containment building shall not exceed 50 tons per hour or 50,000 tons per year.

XII.E. GENERAL MISCELLANEOUS UNIT MANAGEMENT PRACTICES

XII.E.1. The Permittee shall not place waste, treatment reagents, or other material in the miscellaneous unit that may cause the unit to rupture, leak, corrode, or otherwise fail.

XII.E.2. The Permittee shall maintain the Operating Record in accordance with IDAPA 50.01.05.008 [40 CFR § 264.73] and Permit Condition II.J of this Permit.

XII.E.3. The Permittee shall track waste processed through the miscellaneous unit, in accordance with Permit Condition XII.D.

XII.E.4. The Permittee shall maintain the Environmental Performance Standards for the miscellaneous unit, in accordance with IDAPA 50.01.05.008 [40 CFR § 264.601], as described in Attachments 24 and 25 of this Permit.

XII.E.5. In the event of a power outage, or other event that reduces the operating efficiency below the manufacturer's specifications of the air pollution control equipment for the Crusher System, all crushing operations shall cease until such time as the power is restored or the air pollution control equipment is repaired.

XII.E.6. The satellite accumulation container under the crusher discharge chute may remain uncovered/open under the following conditions:

XII.E.6.a. The immediate area around the crusher discharge chute must fully enclose the container on all four sides and above, with suspended tarps or an equivalent or superior curtain or structural material; and

XII.E.6.b. The containment building overhead door, adjacent to the crusher discharge chute, remains closed.

XII.F. INSPECTIONS

XII.F.1. The Permittee shall inspect the Crusher System, including the crusher discharge chute, the transfer vertical conveyor, Dust Collector System, and feed hopper for waste accumulation, in accordance with IDAPA 50.01.05.008 [40 CFR § 264.601], as described in Attachment 4 of this Permit.

XII.F.2. The Permittee shall keep all relevant figures, drawings, and diagrams related to the miscellaneous unit readily available for inspection at the facility, in accordance with IDAPA 58.01.05.008 [40 CFR § 264.74].

XII.G. CLOSURE AND POST-CLOSURE

Closure and Post-Closure Care of the miscellaneous unit shall be completed in accordance with IDAPA 58.01.05.008 [40 CFR § 264.603] and all applicable sections of Attachment 9 of this Permit.

MODULE XIII – CORRECTIVE ACTION

XIII.A. SOLID WASTE MANAGEMENT UNITS

XIII.A.1. The Director may require corrective action, as specified in the following permit conditions for any newly identified Solid Waste Management Units (SWMUs), where newly identified SWMUs are those not documented in the facility Administrative Record, maintained by the Department, as having undergone corrective action.

XIII.A.2. The Permittee shall conduct a corrective action investigation, in accordance with Permit Conditions XIII.B through XIII.H of this Permit, for each newly identified SWMU.

XIII.B. STANDARD CONDITIONS

XIII.B.1. Failure to submit the information required by the permit conditions within Module XIII of this Permit, or falsification of any submitted information, is grounds for termination of this Permit in accordance with IDAPA 58.01.5012 [40 CFR § 270.43], and for an enforcement action pursuant to Permit Condition I.C of this Permit.

XIII.B.2. All plans, reports, notifications, and other submissions to the Director, as required by the permit conditions within Module XIII of this Permit, shall be signed and certified in accordance with Permit Condition I.R of this Permit.

XIII.B.3. The Permittee shall submit to the Director (by certified mail, express mail, or hand delivered to the address specified in Permit Condition I.Z of this Permit) a minimum of three (3) copies of each plan, report, notification, or other submissions required by the permit conditions within Module XIII of this Permit.

XIII.B.4. All plans and schedules, as required by the permit conditions in Module XIII of this Permit (upon written approval from the Director) shall be incorporated into Module XIII of this Permit, in accordance with Permit Condition XIII.H of this Permit. Any noncompliance with such approved plans and schedules shall be deemed noncompliance with this Permit.

XIII.B.5. The Permittee shall only receive extension(s) of the specified Compliance Schedule due date(s) for the submittal(s), required by the permit conditions within Module XIII of this Permit, upon written approval from the Director, in accordance with Permit Condition XIII.H of this Permit.

XIII.B.6. If the Director determines that further actions beyond those provided by the permit conditions within Module XIII of this Permit, or changes to permit conditions stated herein, are warranted, the Director shall modify the permit condition in Module XIII, in accordance with Permit Condition XIII.H of this Permit.

XIII.B.7. All raw data (such as laboratory reports, drilling logs, bench-scale or pilot-scale data, and other supporting information gathered or generated during activities undertaken, pursuant to the permit conditions in Module XIII of this Permit) shall be maintained at the facility during the effective term of this Permit.

XIII.C. NOTIFICATION REQUIREMENTS & ASSESSMENT OF NEWLY-IDENTIFIED SWMUs

XIII.C.1. The Permittee shall notify the Director in writing (by certified mail, express mail, or hand delivery) of any newly identified SWMU(s). The Permittee shall submit written notification within thirty (30) calendar days of discovering the SWMU(s). The notification shall include the location of the new SWMU(s) and information on the suspected or known wastes at the site.

XIII.C.2. Within one hundred fifty (150) calendar days following discovery of the SWMU(s), the Permittee shall submit to the Director (by certified mail or hand delivery)a SWMU Assessment Plan.

XIII.C.3. The SWMU Assessment Plan shall include the information or the means by which the following information will be obtained:

XIII.C.3.a. Information concerning past and present operations at the unit(s); and

XIII.C.3.b. Any ground water, surface water, soil (surface or subsurface strata), or air sampling and analysis data needed to determine whether a release of hazardous waste and/or hazardous waste constituent(s) from such unit(s) has occurred, is occurring, or is likely to occur. The SWMU Assessment Plan shall demonstrate that the Sampling and Analysis Program (if applicable) is capable of yielding representative samples, and must include parameters sufficient to identify migration of hazardous waste and/or hazardous waste constituent(s) from the newly discovered SWMUs to the environment.

XIII.C.4. The Permittee shall receive written approval from the Director for the SWMU Assessment Plan; or

XIII.C.5. The Permittee shall receive written notice from the Director of the SWMU Assessment Plan's deficiencies, and the written notice will specify a due date for submittal of a revised Assessment Plan; or

XIII.C.6. The Permittee shall receive written notice from the Director of the revisions incorporated, by the Director, in the SWMU Assessment Plan. The revised Assessment Plan shall become the approved SWMU Assessment Plan.

XIII.C.7. The SWMU Assessment Plan, as approved by the Director and as specified in Permit Conditions XIII.C.4, XIII.C.5, or XIII.C.6 of this Permit, shall be incorporated within Module V of this Permit, in accordance with Permit Condition XIII.H of this Permit. The Permittee shall be notified in writing of the approval of the permit modification.

XIII.C.8. The Permittee shall implement the approved SWMU Assessment Plan within thirty (30) calendar days of receiving written notice of the permit modification approval, specified in Permit Condition XIII.C.7 of this Permit.

XIII.C.9. The SWMU Assessment Plan shall contain a schedule, including the submission date for a SWMU Assessment Report.

XIII.C.10. The SWMU Assessment Report shall describe all results obtained from the implementation of the approved SWMU Assessment Plan. At a minimum, the report shall provide the following information for each newly SWMU identified:

XIII.C.10.a. The SWMU location, identified on a map;

XIII.C.10.b. The type and function of the unit, including general dimensions and a structural description;

XIII.C.10.c. The period during which the unit was operated; and

XIII.C.10.d. All wastes that were or are being managed at the SWMU, including results of any sampling and analysis used to determine whether releases of hazardous wastes and/or hazardous waste constituent(s) have occurred, are occurring, or are likely to occur from the unit.

XIII.C.11. Based on the results of SWMU Assessment Report, the Director shall determine the need for further investigations at specific unit(s) included in the SWMU assessment. If the Director determines that such investigations are needed, the Director will require the Permittee to prepare a plan for such investigations. This plan shall be reviewed for approval in accordance with the requirements of Permit Condition XIII.D of this Permit.

XIII.C.12. The Permittee shall notify the Director (in writing by certified mail, express mail, or hand delivery) of any release(s) of hazardous waste and hazardous waste constituent(s) discovered during the course of ground water monitoring, field investigation, environmental auditing, or other activities undertaken during the RCRA Facility Investigation (RFI) and Permit Condition XIII.D of this Permit. The written notification shall be received by the Director no later than fifteen (15) calendar days after discovery. Such releases may be from already documented or newly identified units. The Director may require further investigation of the new releases. Further investigation, if required, shall be performed in accordance with the requirements of Permit Condition XIII.D of this Permit.

XIII.D. RCRA FACILITY INVESTIGATION (RFI)

XIII.D.1. The Permittee shall conduct a RFI, as deemed necessary by the Director, to determine the nature and extent of known and suspected releases of hazardous wastes and/or hazardous waste constituent(s) from each SWMU at the facility, identified in accordance with Permit Condition XIII.C of this Permit, and to gather data to support a Corrective Measures Study. The Permittee shall conduct the RFI in accordance with an approved Work Plan, completed in accordance with current guidance documents from EPA (*RCRA Facility Investigation Guidance, Volumes I through IV*, or equivalent).

XIII.D.2. The Permittee shall conduct the RFI for each newly identified SWMU, in accordance with the schedule specified in Table XIII-1 of this Permit.

XIII.D.3. The RFI Compliance Schedules, specified in Table XIII-1 of this Permit, may be modified in accordance with Permit Condition XIII.H of this Permit.

XIII.E. INTERIM MEASURES

XIII.E.1. If, during the course of any activity initiated in compliance with the permit conditions of Module XIII of this Permit, the Director determines that a release or potential release of hazardous waste and/or hazardous waste constituent(s) from a SWMU poses a threat to human health or the environment, the Director may require the Permittee to perform specific interim measures.

XIII.E.2. The Director shall notify the Permittee in writing of the requirement to perform the interim measures specified in the Interim Measures Plan, in accordance with Permit Condition XIII.E.3 of this Permit. The Permittee shall comply with the specified Interim Measures Plan alternative (Permit Condition XIII.E.3.a or XIII.E.3.b of this Permit) designated in the written notification.

XIII.E.3. The Permittee shall perform the requirements of the Interim Measures Plan, in accordance with the alternative specified in either Permit Condition XIII.E.3.a or XIII.E.3.b of this Permit.

XIII.E.3.a. The Director shall determine specific actions to implement the interim measures. The Director shall provide an Interim Measures Plan with the written notification specified in Permit Condition XIII.E.2 of this Permit; or

XIII.E.3.b. Within thirty (30) calendar days of receiving the written notification requiring the Interim Measures Plan, as specified in Permit Condition XIII.E.2 of this Permit, the Permittee shall provide (by certified mail, express mail, or hand delivery) the Interim Measures Plan to the Director for approval.

XIII.E.4. The Interim Measures Plan shall identify specific action(s) to be taken to implement the interim measures and a schedule for implementing the required measures. At a minimum, the Interim Measures Plan shall consider (but not be limited to) the following factors:

XIII.E.4.a. Time required to develop and implement a final remedy;

XIII.E.4.b. Actual and potential exposure of human and environmental receptors;

XIII.E.4.c. Actual and potential contamination of drinking water supplies and sensitive ecosystems;

XIII.E.4.d. The potential for further degradation of the medium absent of interim measures;

XIII.E.4.e. Presence of hazardous waste in containers that may pose a threat of release;

XIII.E.4.f. Presence and concentration of hazardous waste, including hazardous waste constituent(s) in solids that have the potential to migrate to ground water or surface water;

XIII.E.4.g. Weather conditions that may affect the current levels of contamination;

XIII.E.4.h. Risks of fire, explosion, or accident; and

XIII.E.4.i. Other situations that may pose threats to human health and the environment.

XIII.E.5. The Interim Measures Plan shall be incorporated into this Permit, in accordance with Permit Condition XIII.H of this Permit.

XIII.F. CORRECTIVE MEASURES STUDY AND IMPLEMENTATION

XIII.F.1. Based on the results of the RFI, the Permittee shall identify, screen, and develop the alternative or alternatives for removal, containment, treatment and/or other remediation of the contamination. The Permittee shall conduct the Corrective Measures Study in accordance with an approved Work Plan, completed in accordance with current guidance documents from EPA (*RCRA Corrective Action Interim Measures Guidance – Interim Final, RCRA Facility Investigation Guidance, Volumes I through IV*, or equivalent).

XIII.F.2. Upon the Director's approval of the Corrective Measures Study, pursuant to Permit Condition XIII.F.1 of this Permit, the Permittee shall prepare and submit to the Director for approval (by certified mail, express mail, or hand delivery), the Corrective Measures Implementation Program Plan, in accordance with an approved Work Plan.

XIII.F.3. Upon the Director's approval of the Corrective Measures Implementation Program Plan, pursuant to Permit Condition XIII.F.2 of this Permit, the Permittee shall conduct the Corrective Measures Implementation Program Plan, in accordance with the approved Work Plan for the corrective measures design and construction.

XIII.F.4. The Permittee shall conduct the Corrective Measures Study and prepare the Corrective Measures Implementation Program Plan, as specified in Permit Conditions XIII.F.1 and XIII.F.2 of this Permit, in accordance with the schedule specified in Table XIII-2.

XIII.F.5. The Permittee shall prepare and submit to the Director for approval a Compliance Schedule for conducting the Corrective Measures Implementation Program Plan, as required by Permit Condition XIII.F.3 of this Permit.

XIII.F.5.a. The Permittee shall provide a justification for each compliance date in the Compliance Schedule, based on the complexity of the Corrective Measures Implementation Program Plan, and reasonable contract and administrative time requirements.

XIII.F.5.b. On or before the compliance date for submittal of the draft Corrective Measures Implementation Program Plan specified in Table XIII-2 of this Permit, the Permittee shall submit to the Director for approval (by certified mail, express mail, or hand delivery) the Compliance Schedule and subsequent justification, pursuant to Permit Condition XIII.F.5 of this Permit,.

XIII.F.5.c. Upon the Director's approval of the Corrective Measures Implementation Program Plan Compliance Schedule, the Compliance Schedule shall be incorporated into this Permit concurrently with the final Corrective Measures Implementation Program Plan, in accordance with IDAPA 58.01.5012 [40 CFR §§ 270.41 and 270.42].

XIII.F.6. The Permittee shall conduct the Corrective Measures Implementation, as specified in Permit Condition XIII.F.3 of this Permit, in accordance with Permit Condition XIII.F.5 of this Permit.

XIII.F.7. The Corrective Measures Study and Corrective Measures Implementation Compliance Schedules, specified in Table XIII-2 of this Permit, shall be modified in accordance with Permit Condition XIII.H of this Permit.

XIII.G. REPORTING REQUIREMENTS

XIII.G.1. The Permittee shall submit to the Director signed quarterly progress reports of all activities (i.e., SWMU Assessments, Interim Measures, RFIs, and/or Corrective Measures Studies) conducted, pursuant to the permit conditions of Module V of this Permit. The Permittee shall initially submit the quarterly progress reports no later than ninety (90) calendar days after being notified in writing that the approved SWMU Assessment Plan has been incorporated within Module XIII of this Permit, through a permit modification, in accordance with Permit Condition XIII.H of this Permit.

XIII.G.2. At a minimum, the quarterly progress reports shall contain the following:

XIII.G.2.a. A description of the work completed;

XIII.G.2.b. Summaries of all findings and all raw data;

XIII.G.2.c. Summaries of all problems or potential problems encountered during the reporting period, and actions taken or to be taken to rectify the problems; and

XIII.G.2.d. Projected work for the next reporting period.

XIII.G.3. The Permittee shall maintain copies of other reports, drilling logs, etc. at the facility during the effective period of this Permit. The Permittee shall provide copies of the said reports, logs, etc. to the Director upon request.

XIII.G.4. As specified under Permit Condition XIII.B.5 of this Permit, the Director may require the Permittee to conduct new or more extensive assessments, investigations, or studies (as needed) based on information provided in these progress reports or other supporting information.

XIII.H. MODIFICATION OF THE CORRECTIVE ACTION SCHEDULE OF COMPLIANCE

XIII.H.1. Requests for modifications of the final compliance dates, pursuant to the permit conditions in Module XIII of this Permit, shall be submitted to the Director for approval, in accordance with IDAPA 58.01.5012 [40 CFR §§ 270.41 and 270.42]. The Corrective Action Schedule of Compliance (final compliance dates), subject to modification, includes the following:

XIII.H.1.a. The compliance date(s), as specified in Table XIII-1 of this Permit, for submittal of the RFI Final Report;

XIII.H.1.b. The compliance date(s), as specified in Table XIII-2 of this Permit, for submittal of the Corrective Measures Study Report;

XIII.H.1.c. The compliance date(s), as specified in Table XIII-2 of this Permit, for submittal of the final Corrective Measures Implementation Program Plan, in accordance with Permit Condition XIII.F.2 of this Permit;

XIII.H.1.d. Once established in accordance with Permit Condition XIII.F.5 of this Permit, the compliance date(s) for submittal of the corrective measures final (100% completion) Design and Construction Plans, in accordance with Permit Condition XIII.F.3 of this Permit;

XIII.H.1.e. Compliance dates, as specified in Tables XIII-1 and XIII-2 of this Permit, for implementing the approved plans and/or reports; and

XIII.H.1.f. Compliance dates for quarterly submittal of progress reports.

XIII.H.2. Pursuant to IDAPA 58.01.5012 [40 CFR § 270.42(a)], the Compliance Schedules, specified by the Director, shall be modified if the Director determines that good cause exists for which the Permittee had no control, and for which there is no reasonable available remedy.

XIII.H.3. If adequate funds for Corrective Measures Implementation are not available, the Director and the Department reserve the right to pursue any actions deemed necessary to protect human health and the environment, not excluding judicial recourse or termination of this Permit.

XIII.H.4. The Permittee shall submit to the Director for approval a request for modifications of the interim compliance dates that do not affect the final compliance dates. If the Director approves the interim compliance date modifications, Tables XIII-1 and/or XIII-2 of this Permit shall incorporate the modified compliance dates as approved, and such change shall not be considered a permit modification under IDAPA 58.01.5012 [40 CFR § 270.41].

TABLE XIII-1. RCRA FACILITY INVESTIGATION (RFI) COMPLIANCE SCHEDULE FOR NEWLY IDENTIFIED SOLID WASTE MANAGEMENT UNITS (SWMUs)

RFI ACTIVITY	DUE DATE
Submit Draft RFI-Phase II (Task II & III) Work Plan and Schedule	Within ninety (90) calendar days of the Director's notification that an RFI is needed, in accordance with Permit Condition XIII.C.11 of this Permit.
Initiate RFI-Phase II (Task II & III) Activities	Within forty-five (45) calendar days of the Director's approval of the Task II and III Work Plan and Schedule.
Submit Task IV Draft Report	As specified in the Director's approved RFI-Phase II (Task II & III) Work Plan and Schedule.
Submit Task IV Final & Summary Reports	As specified in the Director's approved RFI-Phase II (Task II & III) Work Plan and Schedule.
Progress Reports on Tasks II through IV	Quarterly (every 90 days) beginning ninety (90) calendar days after the Director's approved RFI-Phase II (Task II & III) activities.

TABLE XIII-2. CORRECTIVE MEASURES STUDY AND IMPLEMENTATION COMPLIANCE SCHEDULE
SOLID WASTE MANAGEMENT UNITS (SWMUs)

CMS SUBMISSION/CMI SUBMISSION	**DUE DATES**
Submit CMS Work Plan (Appendix B, Task I & II)	Within sixty (60) calendar days of the RFI Final Report.
Submit Draft CMS Report (Appendix B, Task I, II & III)	Within three hundred (300) calendar days of the Director's approval of the CMS Work Plan.
Submit Final CMS Report (Appendix B, Task I, II & III)	Within sixty (60) calendar days of receiving the Director's comments on the Draft CMS Report.
Submit Draft CMS Program Plan (Appendix B, Task IV)	Within ninety (90) calendar days of the Director's approval of the Final CMS Report.
Submit Final CMS Program Plan (Appendix B, Task IV)	Within sixty (60) calendar days of receiving the Director's comments on the Draft CMI Program Plan.
Submit Corrective Measures Design Preliminary Design Approximately 30% Complete	As specified in the Director's approved CMI Program Plan.
Submit Corrective Measures Design Preliminary Design Approximately 60% Complete	As specified in the Director's approved CMI Program Plan.
Submit Corrective Measures Design Preliminary Design Approximately 95% Complete	As specified in the Director's approved CMI Program Plan.
Submit Final Corrective Measures Design	As specified in the Director's approved CMI Program Plan.
Progress Reports on Appendix B, Tasks I through IV	Quarterly, every ninety (90) calendar days, beginning 90 calendar days after the Director's approval of the Final RFI Report.
Submit Draft CQA Program Plan	As specified in the Director's approved CMI Program Plan.
Submit Final CQA Program Plan	Within sixty (60) calendar days of the Director's approval of the Draft CQA.
Construction of Corrective Measures	Within sixty (60) calendar days of the Director's approval of the Final CQA.
Pre-Final Inspection	Forty-five (45) calendar days following report of pre-final inspection.
Corrective Measures Construction Report	Within ninety (90) calendar days following completion of construction.
Corrective Measures Implementation Quarterly Progress Reports	Quarterly, every ninety (90) calendar days, beginning 90 calendar days after the Director's approval of the Final RFI Report.

SECTION C
WASTE ANALYSES PLAN (WAP)
TABLE OF CONTENTS

LIST OF FIGURES

LIST OF TABLES

LIST OF APPENDICIES

C.1 INTRODUCTION

The purpose of this Waste Analysis Plan (WAP) is to provide guidance on the necessary waste characterization, sampling methodologies, analytical techniques, and overall procedures which are undertaken during hazardous waste management activities including treatment, storage and/or disposal. Treatment and disposal activities include but are not limited to stabilization[1], solidification, chemical oxidation, chemical reduction, neutralization, deactivation, evaporation, macro/micro encapsulation, adsorption (clay, carbon, etc.) and subsequent landfilling of hazardous and non-hazardous wastes. As a general rule, USEI use the term stabilization in the more industry wide generic sense, which implies the treatment of a waste material to make it physically and chemically stable. In this sense, stabilization consists of those treatment processes (including but not limited to all the treatment types described above), which are used to meet applicable LDR treatment standards or other applicable standard(s). The specific treatment technologies utilized by USEI are defined in more detail in Section C.8.3. Process operation descriptions for hazardous waste management units are provided in Section D.10. Specifically and in accordance with IDAPA 58.01.05.008 {40 CFR § 264.13(b)}, this plan delineates the following:

- Waste determination procedures (Section C.2);
- Waste Acceptance Criteria and associated review procedures for radioactive materials (Section C. 3);
- Sampling Methodologies and associated sampling equipment (Section C.4);
- The parameters for which each hazardous waste will be analyzed and the rationale for the selection of these parameters [i.e.; how analysis for these parameters will provide sufficient information on the properties of the waste (Section C.5)];
- Test methods which will be used to test for these parameters (Section C.5);
- The frequency with which the initial analysis of the waste will be reviewed or repeated to assure the analysis is accurate and up to date (Section C.6.3);
- The methods which will be used to meet the additional waste analysis requirements for specific waste management methods as specified in IDAPA 58.01.05.008 {40 CFR § 264.17, 264.314, 264.341, 268.7} (Section C.5.2);
- Waste receipt and acceptance procedures (Section C.6 & C.7);
- The types of treatment technologies (Section C.8);
- The treatment units (Section C.9);

[1] The term "stabilization" is defined by the EPA under 40 CFR 268.42 as "Stabilization with the following reagents (or waste reagents) or combination of reagents (1) Portland Cement; or (2) lime/pozzolans (e.g., fly ash and cement kiln dust) – this does not preclude the addition of reagents (e.g., iron salts, silicates, and clays) designed to enhance the set/cure time and/or compressive strength, or to overall reduce the leachability of the metal or organic. USEI uses the term Stabilization in a more generic sense to mean the treatment of a waste material to make it physically and chemically stable. In this sense, it consists of those processes, which make the material conform to applicable LDR treatment standards or other applicable standard(s).

- The quality control and quality assurance procedures (Section C.10); and

- Other general considerations for treatment, storage and disposal operations.

It is USEI's policy that all wastes managed on-site will adhere to the procedures outlined in this WAP. This document will ensure facility compliance with applicable permits and regulations. For the purpose of implementation and performance of this WAP, "USEI" means any US Ecology Idaho laboratory, subsidiary/affiliated laboratory, or designated contract laboratory.

USEI maintains, as part of its WAP required records, generator/internally developed information. This documentation may be received, stored, transmitted, and/or retrieved electronically in addition to, or in lieu of, hard (paper) copy.

"Facility Management" includes the General Manager and the managers of the major facility functions, such as Laboratory, Technical, Operations, Health and Safety, Environmental, and/or their designees.

References are made throughout this plan to regulations promulgated by the EPA regarding waste analysis requirements for hazardous waste management facilities. These requirements are found in IDAPA 58.01.05.008 and 40 CFR Part 264, Subpart B, which have been adopted by reference in the rules of the Idaho Department of Environmental Quality (IDEQ). Unless otherwise specified herein, cited federal regulations have been adopted by the IDEQ. USEI strives to maintain full compliance with the hazardous waste regulations. New testing requirements, such as those promulgated under the Land Disposal Restrictions (LDRs), often become effective prior to the time WAP revisions can be formally executed and approved by all appropriate agencies. Accordingly, the WAP utilizes references to the most recent appropriate EPA and ASTM methods and analytical procedures. If WAP revisions are necessary because of a new regulatory rule, they will be submitted as appropriate within 90 days after their effective date.

C.2 WASTE DETERMINATION

Waste determinations will be conducted in accordance with IDAPA 58.01.05.006 {40 CFR § 262.11}. In general, generators are required to conduct waste determination as follows:

- Determine if the waste is excluded from regulation under IDAPA 58.01.05.005 {40 CFR § 261.4};
- Determine if the waste is listed as a hazardous waste in subpart D of IDAPA 58.01.05.005 {40 CFR Part 261};
- Determine if the waste is identified in subpart C of IDAPA 58.01.05.005 {40 CFR Part 261} by either testing the waste using analytical methods or applying knowledge of the hazard characteristics of the waste;
- Determine if the waste is regulated by a state other than Idaho and associated manifesting requirements; and
- If the waste is determined to be hazardous, the generator must refer to IDAPA 58.01.05.005/008/009/010/016 {40 CFR parts 261, 264, 265, 266, 268, and 273} for possible exclusions or restrictions pertaining to management of the specified waste.

The waste characterization on the Waste Product Questionnaire (WPQ) provides information concerning the distribution/concentration, as well as the characteristics of the waste components. An example of the WPQ is provided in Figure C.1.

Certain generators will not utilize USEI's WPQ and insist on using their own waste characterization form. This is often the case with large generators that are trying to reduce the amount of paperwork associated with the characterization process. Under these circumstances, USEI will transfer the waste characterization information to USEI's WPQ and identify data deficiencies, if any. Any data deficiencies necessary for the treatment, storage and disposal of the waste will be added to USEI's WPQ by contacting the generator and requesting the deficient information. USEI will then include both USEI's WPQ and the generator supplied waste characterization form as part of the profile package.

When a waste shipment arrives on-site for treatment, storage, or disposal, a determination has usually been made by the generator that the waste is either:

- Excluded as a solid waste under IDAPA 58.01.05.005 {40 CFR § 261.4(a)};
- A listed hazardous waste, as defined in Subpart D of IDAPA 58.01.05.005 {40 CFR Part 261};
- A characteristic hazardous waste, as defined in Subpart C of IDAPA 58.01.05.005 {40 CFR Part 261};
- A solid waste, which is not hazardous waste, as defined by IDAPA 58.01.05.005 {40 CFR § 261.4(b)}; and
- A Corrective Action Management Unit (CAMU)-eligible waste, as defined by IDAPA 58.01.05.008 {40 CFR 264.552(a)(1) & (2)

C.3 WASTE ACCEPTANCE CRITERIA

C.3.1 Pre-acceptance Review

The preacceptance protocol has been designed to ensure that only hazardous and radioactive material that can be properly and safely stored, treated and/or disposed of by USEI are approved for receipt at the facility. A two-step approach is taken by USEI. The first step is the chemical and/or radiological and physical characterization of the candidate waste stream by the generator. The second step is the preacceptance evaluation performed by USEI to determine the acceptability of the waste for receipt at the facility. Figure C-2 presents a logic diagram of the preacceptance protocol that is utilized at the facility.

C.3.2 Radioactive Material Waste Acceptance Criteria

The following waste acceptance criteria are established for accepting radiological contaminated waste material that is generally or specifically exempted from regulation by the Nuclear Regulatory Commission (NRC) or an Agreement State under the Atomic Energy Act of 1954 (“AEA”), as amended. Material may also be accepted if it is not regulated or licensed by the NRC or has been authorized for disposal by the IDEQ and is within the numeric waste acceptance criteria. Waste acceptance criteria are consistent with these restrictions.

The following five tables establish types and concentrations of radioactive materials that may be accepted. These tables are based on categories and types of radioactive material not regulated by the NRC based on statute or regulation or specifically approved by the NRC or and Agreement State for alternate disposal. The criteria are consistent with these restrictions and detailed analyses set forth in *Waste Acceptance Criteria and Justification for FUSRAP Material*, prepared by Radiation Safety Associates, Inc. (RSA) as subsequently refined, expanded and updated in *Waste Acceptance Criteria and Justification for Radioactive Material*, prepared by USEI.

Material may be accepted if the material has been specifically exempted from regulation by rule, order, license, license condition, letter of interpretation, or specific authorization under the following conditions: Thirty (30) days prior to intended shipment of such materials to the facility, USEI shall notify IDEQ of its intent to accept such material and submit information describing the material’s physical, radiological, and/or chemical properties, impact on the facility radioactive materials performance assessment, and the basis for determining that the material does not require disposal at a facility licensed under the AEA. The IDEQ will have 30 days from receipt of this notification to reject USEI’s determination or require further information and review. No response by IDEQ within thirty (30) days following receipt of such notice shall constitute concurrence. IDEQ concurrence is not required for generally exempted material as set forth in Table C.4a.

Based on categories of waste described in the waste acceptance criteria, the concentration of the various radionuclides in the conveyance (e.g., rail car gondola, other container etc.) shall not exceed the concentration limits established in the WAC without the specific written approval of the IDEQ unless generally exempted as set forth in Table C.4a. Radiological surveys will be performed as outlined in ERMP-01 to verify compliance with the WAC. If individual “pockets” of activity are detected indicating the limits may be exceeded, the RSO or RPS shall investigate the discrepancy and estimate the extent or volume of the material with the potentially elevated radiation levels. The RPS or RSO shall then make a determination on the compliance of the entire conveyance load with the appropriate WAC limits. If the conveyance is determined not to meet the limits, USEI will notify IDEQ's RCRA Program Manager within 24 hours of a concentration based exceedance of the facility WAC to evaluate and discuss management options. The findings and resolution actions shall then be documented and submitted to the IDEQ.

The radioactive material waste acceptance criteria, when used in conjunction with an effective radiation monitoring and protection program as defined in the USEI *Radioactive Material Health and Safety Plan* and *Exempt Radioactive Materials Procedures* provides adequate protection of human health and the environment. Included within this manual are requirements for USEI to submit a written summary report of Table C.1 through C.2 radioactive material waste receipts showing volumes and radionuclide concentrations disposed at the USEI site on a quarterly basis. USEI will also submit a Table C.3 through C.4b annual report of exempted products devices, materials or items within 60 (sixty) days of year end (December 31st). The annual report will provide total volumes or mass of isotopes and total activity by isotope listing the activity of each radionuclide disposed during the preceding year, and the cumulative total of activity for each radionuclide disposed at the facility. The report will include an updated analysis of the impact on the facility performance assessment.

These criteria and procedures are designed to assure that the highest potential dose to a worker handling radioactive material at USEI shall not exceed 400 mrem/year TEDE dose, and that no member of the public is calculated to receive a potential dose exceeding 15 mrem/year TEDE dose, from the USEI program. TEDE is defined as the "Total Effective Dose Equivalent", which equals the sum of external and internal exposures. The public dose limit during operation activities is limited to 100 mrem/yr TEDE dose. An annual summary report of environmental monitoring results will be submitted to IDEQ by June 1st for the preceding year.

Materials that have a radioactive component that meets the criteria described in Tables C.1 through C.4b and are RCRA regulated material will be managed as described within this WAP for the RCRA regulated constituents.

Table C.1: Unimportant Quantities of Source Material Uniformly Dispersed* in Soil or Other Media**

	Status of Equilibrium	Maximum Concentration of Source Material	Sum of Concentrations Parent(s) and all progeny present***
a	Natural uranium in equilibrium with progeny	<500 ppm / 167 pCi/g (^{238}U activity)	≤ 3000 pCi/g
	Refined natural uranium (^{238}U, ^{235}U, ^{234}U; ^{234Th}, ^{234m}Pa, ^{231}Th)	<500 ppm / 333 pCi/g	≤ 2000 pCi/g
	Depleted Uranium (^{234Th}, ^{234m}Pa)	<500 ppm / 169 pCi/g	≤ 2000 pCi/g
b	Natural thorium (^{232}Th + ^{228}Th)	<500 ppm / 110 pCi/g	≤ 2000 pCi/g
	^{230}Th in equilibrium with progeny	<0.01 ppm / 200 pCi/g	≤2000 pCi/g
	^{230}Th (with no progeny)	0.1 ppm / ≤2000 pCi/g	
	Any mixture of Thorium and Uranium	Sum of ratios ≤ 1****	≤2000 pCi/g

Table C.2: Naturally Occurring Radioactive Material Other Than Uranium and Thorium Uniformly Dispersed* in Soil or Other Media**

	Status of Equilibrium	Maximum Concentration of Parent Nuclide	Sum of Concentrations of Parent and All Progeny Present***
a	^{226}Ra or ^{228}Ra with progeny in bulk form [1]	500 pCi/g	≤ 4500 pCi/g
b	^{226}Ra or ^{228}Ra with progeny in reinforced IP-1 containers [1]	1500 pCi/g	13,500 pCi/g
c	^{210}Pb with progeny(Bi & ^{210}Po)	1500 pCi/g	4500 pCi/g
	^{40}K	818 pCi/g	N/A
	Any other NORM		≤3000 pCi/g

[1] Any material containing ^{226}Ra greater than 222 pCi/g shall be disposed at least 6 meters from the external point on the completed cell.

Table C.3: Non-Production Particle Accelerator Produced Radioactive Material*****

Acceptable Material	Activity or Concentration
Any non-production particle accelerator produced radionuclide.	All materials shall be packaged in accordance with USDOT packaging requirements. Any packages containing iodine or volatile radionuclides will have lids or covers sealed to the container with gaskets. Contamination levels on the surface of the packages shall not exceed those allowed at point of receipt by USDOT rules. Gamma or x-ray radiation levels may not exceed 10 millirem per hour anywhere on the surface of the package. All packages received shall be directly disposed in the active cell. All containers shall be certified to be 90% full.

*Average over conveyance or container. The use of the phrase "over the conveyance or container is meant to reflect the variability on the generator side. The concentration limit is the primary acceptance criteria.

**Unless otherwise authorized by IDEQ, other Media does not include radioactively contaminated liquid (except for incidental liquids in materials). See radioactive contaminated liquid definition (definition section of Part B permit).

******* Diffuse waste with a total concentration (sum of concentrations of all radionuclides present) which is 2000 pCi/g or less may be accepted at the site (i.e., the controlling limit is 2000 pCi/g).

******** $$\frac{\text{Conc. of U in sample}}{\text{Allowable conc. of U}} + \frac{\text{Conc. of Th in Sample}}{\text{Allowable conc. of Th}} \leq 1$$

***** Any material that has been made radioactive by use of a non-production particle accelerator as set forth in Federal Register, Vol. 72, No. 189, Monday October 1, 2007, page 55868.

Table C.4a: NRC Exempted Products, Devices or Items

Exemption 10 CFR Part*	Product, Device or Item	Isotope, Activity or Concentration
30.15	As listed in the regulation	Various isotopes and activities as set forth in 30.15
30.14, 30.18	Other materials, products or devices specifically exempted from regulation by rule, order, license, license condition, concurrence, or letter of interpretation	Radionuclides in concentrations consistent with the exemption
30.19	Self-luminous products containing tritium, ^{85}Kr, ^{3}H or ^{147}Pm	Activity by Manufacturing license
30.20	Gas and aerosol detectors for protection of life and property from fire	Isotope and activity by Manufacturing license
30.21	Capsules containing ^{14}C urea for *in vivo* diagnosis of humans	^{14}C, one µCi per capsule
40.13(a)	Unimportant quantity of source material: see table above	≤0.05% by weight source material
40.13(b)	Unrefined and unprocessed ore containing source material	As set forth in rule
40.13(c)(1)	Source material in incandescent gas mantles, vacuum tubes, welding rods, electric lamps for illumination	Thorium and uranium, various amounts or concentrations, see rules
40.13(c)(2)	(i)Source material in glazed ceramic tableware (ii)Piezoelectric ceramic (iii) Glassware not including glass brick, pane glass, ceramic tile, or other glass or ceramic used in construction	≤20% by weight ≤2% by weight ≤10% by weight
40.13(c)(3)	Photographic film, negatives or prints	Uranium or Thorium
40.13(c)(4)	Finished product or part fabricated of or containing tungsten or magnesium-thorium alloys. Cannot treat or process chemically, metallurgically, or physically.	≤4% by weight thorium content.
40.13(c)(5)	Uranium contained in counterweights installed in aircraft, rockets, projectiles and missiles or stored or handled in connection with installation or removal of such counterweights.	Per stated conditions in rule.
40.13(c)(6)	Uranium used as shielding in shipping containers if conspicuously and legibly impressed with legend "CAUTION RADIOACTIVE SHIELDING – URANIUM" and uranium incased in at least 1/8 inch thick steel or fire resistant metal.	Depleted Uranium
40.13(c)(7)	Thorium contained in finished optical lenses	≤30% by weight thorium, per conditions in rule.
40.13(c)(8)	Thorium contained in any finished aircraft engine part containing nickel-thoria alloy.	≤4% by weight thorium, per conditions in rule.

Table C.4b: Materials Specifically Exempted by the NRC Or NRC Agreement State

Exemption	Materials	Isotope, Activity or Concentration*
10 CFR 30.11***	Byproduct material including production particle accelerator material exempted from NRC or Agreement State regulation by rule, order, license, license condition or letter of interpretation may be accepted as determined by specific NRC or Agreement State exemption.****	Byproduct material at concentrations consistent with the exemption**
10 CFR 40.14***	Source material exempted from NRC or Agreement State regulation by rule, order, license, license condition or letter of interpretation may be accepted as determined by specific NRC or Agreement State exemption.****	Source material at concentrations consistent with the exemption.
10 CFR 70.17	Special Nuclear Material (SNM) exempted from NRC regulation by rule, order, license, license condition or letter of interpretation may be accepted as determined by specific NRC or Agreement State exemption.****	SNM at concentrations consistent with the exemption.

*Sum of all isotopes up to a maximum concentration of 3,000 pCi/gm.

**Specifically exempted production beam accelerator may be received under Table C.3 provisions [10 CFR 20.2008 (b)]

***Also includes equivalent Agreement State regulation where applicable.

**** Similar material not regulated or licensed by the NRC may also be accepted. Sum of all isotopes up to a maximum concentration of 3,000 pCi/gm. IDEQ shall be notified prior to the receipt of Special Nuclear Material not regulated or licensed by the NRC.

Additional Information for USEI's Waste Analysis Plan

1. US Ecology Idaho, Inc. (USEI) may receive contaminated materials or other materials as described in Tables C.1 - C.4b above. USEI may not accept for disposal any material that by its possession would require USEI to have a radioactive material license from the Nuclear Regulatory Commission (NRC).

2. Unless approved in advance by USEI and IDEQ, average activity concentrations may not exceed those concentrations enumerated in Tables C.1 and C.2. Additionally, for Tables C.1 and C.2, individual pockets of material may exceed the WAC for the radionuclides present as long as the average concentration of all radionuclides within the package or conveyance remains at or below the WAC and the highest dose rate measured on the outside of the unshielded package or conveyance does not exceed those action levels enumerated in ERMP-01.

3. Other items, devices or materials listed in Table C.4a, which are exempted in accordance with 10 CFR Parts 30, 40 or equivalent Agreement State regulations or 10 CFR Part 70 may be accepted at or below the activities (per device or item) or concentrations specified in those exemptions.

4. The generator of the exempted or non-production particle accelerator produced waste must specify that the waste meets applicable acceptance criteria and/or exemption requirements.

5. In accordance with permit requirements, notification of any exceedance of the WAC will be provided to the RCRA Program Manager within 24 hours, in accordance with the permit.

C.4 SAMPLING METHODOLOGY

Sampling is performed by the generator and/or their representatives to make the initial waste determination and/or by USEI to identify incoming waste shipments. Waste generators are referred to IDAPA 58.01.05.005 {40 CFR Part 261}, Appendix I, II and III for sampling procedures. IDAPA 58.01.05.005 {40 CFR Part 261, Appendix I, II and III} describes sampling and analysis method selection procedures generators should consult when determining the specific sample analysis situation. Sampling is usually conducted as described in EPA document SW-846.
The sampling strategy employed for a given WAP activity is dependent on the nature of the waste being sampled, the type of container/vehicle in which it has been shipped, or the type of hazardous waste management unit in which the waste resides. Hazardous waste is received at the facility in various containers/vehicles including, but not limited to, bulk tanks, end dump trucks, drums, and boxes. Inside the facility, hazardous wastes are contained in landfills, surface impoundments, tanks, waste bins, containers, and other hazardous waste management units. Access to the container/vehicle or hazardous waste management unit influences sampling strategy.

This section presents sampling methodologies to be utilized by USEI personnel when collecting representative samples for analysis pursuant to IDAPA 58.01.05.008 {40 CFR §§264.13(a), 264.13(b), and 264.13(c)}.

The waste shipment is inspected, sampled, and/or analyzed to ensure it matches the overall identity of the waste designated on the accompanying manifest (or shipping paper) and the pre-acceptance paperwork (WPQ, etc). If examination indicates strata in the waste, then each layer may be composited in proportion to its estimated volume or analyzed separately.

The sampling equipment and procedures described in this WAP represent USEI's recommended sampling protocol for general types of waste materials and containment. Specific waste materials or shipments may require different sampling techniques as outlined in the Waste Analysis at Facilities That Generate, Treat, Store, and Dispose of Hazardous Wastes: A Guidance Manual, USEPA OSWER 9938.4-03, April 1994. Therefore, deviations from the recommended protocol do not constitute violations of acceptable sampling practices or conditions of this WAP. USEI personnel follow the QA/QC procedures outlined in Section C.10 when collecting samples for characterization.

C.4.1 Sampling Materials

At a minimum, the methodologies utilized for specific materials correspond to those referenced in IDAPA 58.01.05.005 {40 CFR Part 261, Appendix I}. The types of sampling methods and the most common equipment utilized for different materials are presented in the following table.

Table C.5 Sampling Methods and Equipment

Material	Equipment
Extremely viscous liquid	Thief or COLIWASA/tube sampler
Crushed or powdered material	Tube sampler, trier, auger, scoop, or shovel
Soil-like material	Tube sampler, trier, auger, scoop, or shovel
Fly ash-like material	Tube sampler, trier, auger, scoop, or shovel
Containerized liquids	COLIWASA/tube sampler, weighted bottle, cup, bomb, or tank sampling port

C.4.2 Sampling of Containers

USEI has instituted specific methodologies for taking samples from various container types. The type of container may be stationary or transportable, such as drums, tanks, portable transport units (e.g., tote bins, drums, roll-off boxes, Iugger boxes), tankers, or dump-type trucks. Sampling devices are selected depending on the size and type of the container and on the specific material involved.

Access to a container influences the location from which samples can be taken. Specific sampling procedures are dependent on both the distribution and the nature of the waste components in the container. Due to these variations, minor modifications may be needed to the recommended sampling procedure in order to obtain a sample.

C.4.2.1 Sampling Containers and Tanks

Sampling small containers (e.g., drums, boxes, cartons, & other small units) varies with the nature of the waste. For flowable materials, the sampling device of choice is either a Coliwasa or tubing (or other device noted in Table C.5). For non-flowable wastes, a tubing or trier is typically used to obtain a representative sample (or other device noted in Table C.5).

Large containers and tanks of flowable materials and bulk containers of solid materials may be either stationary or mobile. Liquids may be sampled with Coliwasa, tubing, weighted bottle, or bomb sampler to allow for sampling at various depths. Tank sampling may be accomplished through ports or taps located along the side of the tank or sampling through pumps or fittings at the tank inlet or outlet.

Under some circumstances, multiple samples collected from a single container/tank or hazardous waste management unit are composited prior to analysis. For example, multiple point samples obtained from a bulk truckload can be composited so long as there are no obvious physical differences among the samples. In all cases, wastes exhibiting distinctly different visual physical characteristics that are inconsistent with the approved WPQ and/or Internal Control Form (ICF) are sampled and analyzed independently.

C.4.3 Compositing Samples

Compositing of samples is conducted at the facility laboratory. Each composited sample is composed of equal portions, by weight, of each sample. The individual sample portions are combined and mixed until homogenous (i.e., the sample visually appears uniform in texture, particle size distribution, and color). The weight of sample portions utilized for the composited sample is determined with consideration of the sample size required by the analytical method to be performed. The appropriate sized sample, in accordance with the analytical procedures to be utilized, is then randomly removed from the homogenous composited sample for analysis.

Where the composited samples of separate batches of treated waste are to be further composited for additional testing, the composited sample from each batch is stored for inclusion in the final composited sample for additional testing. At the time of additional testing, each composited batch sample is particle size reduced and mixed until homogeneous, as necessary, in accordance with the analytical procedures to be utilized. The individual composited samples of each treated batch are then composited, as described above, to produce the final composited sample for additional testing.

C.5 ANALYTICAL RATIONALE

Waste characterization information is obtained by USEI on a WPQ. An example of the WPQ is provided in Figure C.1. USEI obtains all the information required by IDAPA 58.01.05.008 {40 CFR §§264.13(a)(1) and 264.13(a)(2)} to treat, store, or dispose of a waste. At a minimum, the analysis must contain all the information necessary to treat, store, or dispose of the waste.

Analyses are provided by USEI to augment the waste characterization, when necessary, and to identify incoming waste shipments. Analyses are utilized to provide data necessary for proper waste handling.

Analytical parameters are classified as Fingerprint Analyses and Supplemental Analyses.

Fingerprint Analyses – Fingerprint Analyses are performed on incoming waste shipment samples, except as noted in Section C.5.1 and C.7.1.6, in order to: 1) identify a waste shipment; and 2) ensure the appropriate waste management technique will be utilized. Fingerprint Analyses will be performed on a waste sample, when necessary for pre-acceptance purposes, if the generator-supplied information is not sufficient.

Supplemental Analyses – Facility management may select additional supplemental analyses to obtain information required for efficient process control or to further evaluate a positive result from a screening test (for example, a flash point may be run to provide more specific waste data when a positive flammability potential is reported during the initial testing). Supplemental analyses are performed on incoming waste shipment and in-process samples as specified by this WAP or facility management to:

- Confirm and/or augment existing information on the waste;
- Further identify a waste;
- Further ensure the appropriate treatment, storage, or disposal process(es) can be utilized to provide operations information utilized for control of these processes; and
- Supplemental Analyses may also be performed on any waste sample, when necessary for pre-acceptance purposes, if the generator-supplied information is not sufficient.

This arrangement allows a tiered approach to waste identification, enabling USEI to structure the analyses to adequately identify the waste or to define operational parameters for various treatment processes. At a minimum, all wastes, except as noted in Section C.7.1.6, are subjected to the Fingerprint Analyses as a 1st step in the analytical scheme. Supplemental Analyses are performed at the direction of facility management. The parameters which constitute the Fingerprint Analyses and Supplemental Analyses are described below and primarily consist of "standard" analytical techniques (recognized by the EPA, ASTM or other authoritative sources). In addition to the identified Fingerprint and Supplemental Analyses, USEI may utilize other "standard" analytical techniques and "unique" analyses (developed by USEI) for analysis of wastes. A summary of the analytical parameters and their usage is provided herein. Analyses will be consistent with the QA/QC procedures outlined in Section C.10.

C.5.1 Fingerprint Analyses

Fingerprint Analyses consist of basic screening procedures performed to provide general waste identification and associated waste confirmation. The Fingerprint Analyses is compared with the WPQ/ICF and pre-acceptance evaluation data to confirm that the waste is the same waste that was characterized during the pre-acceptance process (e.g., WPQ, manifest and/or shipping papers). These analyses may be used in conjunction with other waste analyses and information to further identify a waste and/or ensure the type of on-site management chosen is suitable for that particular waste.

During the Pre-Acceptance process, USEI personnel develop a fingerprint analysis based on the characteristics of the waste in question as well as the limits of fingerprint parameter variability. Parameters that are applicable to the waste stream will be specified for fingerprinting. Certain types of waste streams that are not conducive to fingerprint sampling (e.g., debris, solid resins) are not readily sampled and as a result fingerprint parameters may be limited to field-testing and observations. Also, due to the diversity of potential waste streams, the selection of discretionary parameters for waste receipt (and process control) is made on a case-by-case evaluation. If a discretionary fingerprint is no longer needed for proper waste receipt control, it may be suspended or eliminated. USEI will conduct a visual inspection on 100% of all waste received.

Table C.6 provides a default list of fingerprint control parameters and the allowable variability for fingerprint parameters. Unless otherwise specified by the Lab Manager (or his/her designee) or on the WPQ/ICF the default values from Tables C.6 will apply.

The primary parameters and associated rationale of the Fingerprint Analyses are as follows:

- **Physical Description** (appearance) is used to determine the general properties of the waste. This facilitates comparison of the sampled waste with prior waste descriptions or samples. It is also used to verify the presence or absence of free standing liquid, as well as any obvious change in physical properties. Typical physical properties include color, physical description, texture, and percent water (free liquids).

- **pH Screen** is undertaken to indicate the pH and, in general, the corrosive nature of the waste. pH may not apply to certain waste types, (e.g., organic wastes, oil waste, or wastes which are not water soluble).

- **Water Reactivity Screen (Water Compatibility)** is used to determine whether the waste has a potential to vigorously react with water to form gases or other products, or whether it generates significant heat. This testing does not apply to wastes that are already in contact with excess water, or for which sufficient analytical data indicate no potential reactivity with water.

- **Flammability Potential Screen** is used to indicate the fire-producing potential of the waste. This testing can be applied to all waste liquids, semi-solids or solids. It is used to identify obvious changes in a waste such as flammable waste substituted for an inert solid. This test is not performed on solids unless the waste contains free liquids.

- **Cyanides Screen** is used to indicate whether the waste has the potential to produce hydrogen cyanide gas upon acidification below pH 2. It is not required if the pH of the waste is < 5.0, or if the waste is not water-soluble.

- **Sulfide Screen** is used to indicate whether the waste has the potential to produce hydrogen sulfide gas upon acidification below pH 2. It is not required if the pH of the waste is < 5.0, or if the waste is not water-soluble.

- **Radioactive Screen** is used on material that are considered radioactive (per the WPQ) to ensure the compliance with the WAC. A radioactive screen is not required on non-radioactive waste streams.

C.5.2 Supplemental Analyses

Supplemental Analyses are performed to further identify wastes, verify treatment standards, provide safety information, and/or to provide process control information, as directed by facility management. The results of these analyses provide additional confidence concerning the proper management methods. Most of the parameters, which constitute the Supplemental Analyses utilize the most recent analytical techniques recognized by EPA, ASTM and other authoritative sources or have been developed by USEI through its operating experience for general waste identification and / or proper waste management and which meet USEI performance standards. Standard supplemental analytical parameters are identified in Table C.7. The referenced method or equivalent standard method will be used for analyses of these parameters. Table C.7 provides a list of available test methods.

TABLE C.7 – Test Methods

Sample Work Up Techniques:	
Method	Reference
General Extractions	
EP Toxicity	1-1310A
TCLP	1-1311
Metals Acid Digestion	
Flame atomic absorption spectroscopy (AAS) or inductively coupled plasma spectroscopy (ICP)	1-3005, 3010
Microwave assisted	1-3015, 2-3030, 3-D4309, D5258
Graphite furnace atomic absorption spectroscopy (GFDAA)	1-3020
Oils, greases, or waxes	1-3031
Dissolution procedure for oils, greases, waxes	1-3040
Sludge's, soils, and oils	1-3050
Microwave assisted	1-3051
Alkaline digestion	1-3060
Parr acid bomb digestion	3-E886, E926
Organic Extractions and Cleanups	
Extraction Procedure for Oily Wastes	1-1330
Organic Extraction and Sample Preparation	1-3500
Waste Dilution	1-3580, 3585
Separatory funnel liquid-liquid extraction	1-3510
Continuous liquid-liquid extraction	1-3520
Soxhlet extraction	1-3540, 3541
Sonication extraction	1-3550
Purge and Trap	1-5030
Solid phase extraction (SPE)	1-3535
Hexadecane Extraction and Screening of purgeable organics	1-3820
Alumina cleanup	1-3610, 3611
Florisil cleanup	1-3620
Silica gel cleanup	1-3630
Gel-permeation cleanup	1-3640
Acid-base partition cleanup	1-3650
Sulfur cleanup	1-3660
Sulfuric acid / permanganate cleanup	1-3665
Inorganic analytical methods:	
Inductively coupled plasma atomic emission spectroscopy/Mass spec.	1-6010, 6020
Antimony	
Atomic absorption, direct aspiration method	1-7040, 4-204.1
Atomic absorption, furnace method	1-7041, 4-204.2
Arsenic	
Atomic absorption, furnace method	1-7060, 4-206.2
Atomic absorption, gaseous hydride method	1-70614-206.3
Barium	
Atomic absorption, direct aspiration method	1-7080, 4-208.1
Atomic absorption, furnace method	1-7081, 4-208.2
Beryllium	
Atomic absorption, direct aspiration method	1-70904-210.1
Atomic absorption, furnace method	1-7091, 4-210.2
Cadmium	
Atomic absorption, direct aspiration method	1-7130, 4-213.1
Atomic absorption, furnace method	1-7131, 4-213.2
Calcium	
Atomic absorption, direct aspiration method	1-7130, 4-213.1
Atomic absorption, furnace method	1-7131, 4-213.2
Chromium	
Atomic absorption, direct aspiration method	1-7190, 4-218.1
Atomic absorption, furnace method	1-7191, 4-218.2
Hexavalent chromium: Co-precipitation	1-7195

Sample Work Up Techniques:	
Method	Reference
Hexavalent chromium: Colorimetric	1-7196, 2-3500CrD
Hexavalent chromium: Chelation-extraction	1-7197, 4-218.4
Hexavalent chromium: Diff. phase polarography	1-7198
Copper	
Atomic absorption, direct aspiration method	1-7210, 4-220.1
Atomic absorption, furnace method	1-7211, 4-220.2
Iron	
Atomic absorption, direct aspiration method	1-7380, 4-236.1
Atomic absorption, furnace method	1-7381, 4-236.2
Phenanthroline method (ferrous)	2-3500FeD
Lead	
Atomic absorption, direct aspiration method	1-7420, 4-239.1
Atomic absorption, furnace method	1-7421, 4-239.2
Magnesium	
Atomic absorption, direct aspiration method	1-7450, 4-242.1
Manganese	
Atomic absorption, direct aspiration method	1-7460, 4-243.1
Atomic absorption, furnace method	1-7461, 4-243.2
Mercury (manual cold-vapor technique	
In liquid waste	1-7470
In solid or semisolid waste	1-7471
Nickel	
Atomic absorption, direct aspiration method	1-7520, 4-249.1
Atomic absorption, furnace method	1-7521, 4-249.2
Osmium	
Atomic absorption, direct aspiration method	1-7550
Atomic absorption, furnace method	1-7551
Selenium	
Atomic absorption, furnace method	1-7740, 4-270.2
Atomic absorption, gaseous hydride method	1-7741, 4-270.3
Atomic absorption, gaseous hydride method	1-7742, 4-206.3
Silver	
Atomic absorption, direct aspiration method	1-7760, 4-272.1
Atomic absorption, furnace method	1-7761, 4-272.2
Thallium	
Atomic absorption, direct aspiration method	1-7840, 4-279.1
Atomic absorption, furnace method	1-7841, 4-279.2
Vanadium	
Atomic absorption, direct aspiration method	1-7910
Atomic absorption, furnace method	1-7911
Zinc	
Atomic absorption, direct aspiration method	1-7950, 4-289.1
Atomic absorption, furnace method	1-7951, 4-289.2
Organic Analytical Methods:	
Gas Chromatographic Methods	
Halogenated volatile organics	1-8010, 8021
Non-halogenated Volatile Organics	1-8015
Aromatic Volatile Organics	1-8020, 8021
Acrolein, Acrylonitrile, Acetonitrile	1-8031
Phenols	1-8040, 8041
Phthalate Esters	1-8060, 8061
Nitrosamines	1-8070
Organochlorine pesticides, halowaxes, and PCB's	1-8080, 8081
PCBs	1-8080, 8082
Nitroaromatics and cyclic ketones	1-8090, 8091
Polynuclear Aromatic Hydrocarbons	1-8100
Haloethers	1-8110, 8111
Chlorinated Hydrocarbons	1-8120, 8121

Sample Work Up Techniques:

Standard analytical procedures not listed here, which may be needed, will be taken from the above-referenced sources or other recognized sources (e.g.; Official Methods of Analysis of the Association of Official Analytical Chemist (AOAC), 15th Edition, AOAC, Arlington Virginia, 1990) or more recent supplements or editions.

The following list provides a general explanation of various analytical methods that may be used:

- **Beilstein Screen** is used to indicate the presence of halogenated organics in aqueous and organic wastes.

- **Bench-Scale Treatment Evaluation** to determine the appropriate ratios of wastes to reagents or waste-to-waste to be used in the treatment process to produce the desired reaction / result.

- **Chlorides** determine if the major acid component is hydrochloric acid or its salt.

- **Cyanides Peroxide Amenability** determines the effectiveness of H_2O_2 for cyanide treatment.

- **Cyanides Chlorination Amenability** (Sodium Hypochlorite or direct Chlorination) is run to determine the effectiveness of hypochlorite for cyanide treatment.

- **Cyanides Conversion Amenability** is performed to determine the effectiveness of other types of reagents treatment for cyanides.

- **Filter time** is used to determine filterability of waste.

- **Filterable Residue** quantifies the suspended solids present to determine filtration requirements in process operations.

- **Flash Point/Ignitability** further identifies ignitable wastes to establish proper storage mode and conformance with permit conditions.

- **Gas Chromatographic Scan** is used to identify specific organic compounds.

- **Qualitative IR Spectroscopy** is run to provide a fingerprint spectrum of organic wastes.

- **Liquid Waste Compatibility** determines whether liquid wastes which are to be combined together are compatible. This is a required supplemental analysis when combining different wastes.

- **Metals Content** may be determined to quantify metals concentrations for process operating parameters or potential salt precipitation for monitoring certain processes.

- **Nitrates** determine if the major acid component is nitric acid or its salt.

- **Non-Filterable Residue** quantifies the dissolved solids present to determine acceptability for certain processes.

- **Oil and Grease** quantifies the amount of oil and grease so as not to impact certain processes.

- **Organic Content** (OC) provides a conservative measure of organic carbon in a waste. This determination may use the procedure for Total Organic Carbon (for suitable waste forms), or my be calculated based on the results of a water content test using Karl Fisher or Dean Stark methods. Organic content is conservatively determined as the difference of water and ash from the total sample.

- **Oxidizer Screen** is used to indicate the oxidation characteristics of a waste stream.
- **Paint Filter Test** is used to indicate if free liquids are present in a solid or semi-solid material.
- **PCB Screening** indicates whether or not PCBs are present in a waste.
- **PCBs in Aqueous Liquids** determines whether PCBs are present in a liquid waste.
- **Percent Acidity** determines the acidity in the waste. It may be performed if the waste is aqueous and below a pH of 4.
- **Percent Alkalinity** determines the amount of alkalinity in the waste. It may be performed if the waste is aqueous and above a pH of 7.
- **Percent Ash** is used to determine the ash content in waste feeds to the indirect thermal desorber.
- **Percent Solids by Centrifuge** determines the percentage of suspended solids by centrifugation.
- **pH** provides a more precise measurement of pH and an indication of corrosivity when determining process parameters.
- **Phosphates** determine if the major acid component is phosphoric acid or its salt.
- **Soluble Sulfides** are analyzed to provide quantitative backup to the reactive sulfides screen.
- **Solvent Screen** is used to identify the presence of LDR solvent constituents.
- **Specific Gravity / Bulk Density** indicates density of the waste. This information is used to convert weight of materials to volumes (and vice versa).
- **Stabilization Treatment Studies** are run to determine if a waste is amenable to stabilization and to determine the appropriate reagent-to-waste ratio.
- **Sulfates** determine if the major acid component is sulfuric acid or its salt.
- **Sulfide** Peroxide Amenability determines the effectiveness of H_2O_2 for sulfide treatment.
- **Sulfide Conversion Amenability** is tested to determine the effectiveness of other types of reagents treatment for sulfides.
- **Sulfur Content** determines the sulfur content of waste to be incinerated and thus its capability to generate SO_2 (SO_x) gases.

- **Total and Amenable Cyanides** quantifies the concentration of all free and most complexed cyanides (total cyanides) and/or cyanide species amenable to alkaline chlorination (amenable cyanides). Results may be used for treatability determinations, to monitor treatment processes, and/or to meet disposal restrictions including Land Disposal Restrictions.

- **TOC** may be used to determine the organic concentration in waste.

- **TOX** may be used to determine the organic-chloride concentration in waste.

- **Total Solids** quantifies suspended and dissolved solids and moisture content for selected processes.

- **Total Sulfides** is used to quantify the concentration of total sulfides to back up the sulfides screen.

- **Viscosity** determines the waste pumpability.

- **Visual Oil and Grease** provides a qualitative assessment of filterability and organic contents.

- **Waste Compatibility** is tested to determine whether wastes stored or processed together are compatible.
- **Water Compatibility** is used to deter whether the waste has a potential to react vigorously with water, to form gases, other products, or to generate extreme heat and to determine if it is soluble in water. This test does not apply to wastes already in contact with excess water or to wastes known to be water reactive.

- **Water Content** is used to determine the percent of water present in a waste.

Other standard analytical techniques not listed here may be added as required by changes in regulations, company policy, etc. These techniques will be taken from recognized sources (e.g., SW-846, ASTM, AWWA, etc.).

C.6 PRE-ACCEPTANCE PROCEDURES

The generator is responsible for characterizing the waste (IDAPA 58.01.05.006) (40 CFR §262.11) and determining the applicability of IDAPA 58.01.05.008 {40 CFR Part 264, Subpart CC} via an associated certification of subpart CC compliance. The generator is also responsible for presenting the waste characterization results on a completed WPQ. Although USEI cannot require generators to submit a certification by regulation, USEI asks waste generators to provide a certification on the WPQ as follows:

> "I hereby certify that as an authorized representative of the generator named above, all information submitted in this and all attached documents are true and accurate. Pre-shipment and all other samples provided and a true representative sample of the waste and were samples in accordance with 40 CFR Part 261.20. Any analysis of the waste was conducted in accordance with the approved test methods in 40 CFR Part 261 on a representative sample as defined in 40 CFR Part 261.20. To the best of my knowledge all known and suspected hazardous components have been included in this documentation. All material, descriptions, and packaging will comply with current regulations".

The generator's waste characterization normally includes an analysis of at least one representative sample of the waste for hazardous characteristics and chemical composition. In some cases, generator knowledge of the waste is sufficient. The generator or an independent laboratory (including USEI) may perform analyses. Testing and analyses are performed using standard test methods (EPA, ASTM, AWWA, or other approved standards) or alternative methods approved in the facility's RCRA permit.

The generator also evaluates the candidate waste for additional characteristics that may prohibit the waste from acceptance at USEI and certifies that the waste does not exhibit any of these characteristics. Table C.8 provides a complete list of materials that are restricted from on-site disposal. .

USEI has developed a series of criteria to determine the acceptability of specific wastes for management at USEI. These criteria are referred to as pre-acceptance reviews and dictate what information USEI must have available in order to determine the acceptability of the waste for on-site management. At a minimum, USEI will obtain all the information required by IDAPA 58.01.05.008 {40 CFR §264.13(a)(1)}.

The pre-acceptance review is the mechanism for deciding to reject or accept a particular type of waste, prior to its acceptance at the facility, based on the conditions or limitations of existing permits, the waste's compatibility with other wastes being managed on-site, and the waste's suitability for management utilizing the process options available on-site. The pre-acceptance review for USEI may be carried out on-site, or upon receipt of the load prior to (or in conjunction with) waste acceptance. Accordingly, and consistent with EPA guidance and this WAP, USEI will obtain applicable information, either during the pre-acceptance, incoming load review, or prior to on-site disposal to confirm the concentration level of constituents of concern (those reasonably expected to be in the waste).

C.6.1 Procedural Requirements

For each new waste stream that is a candidate for on-site management, except where noted herein, the following procedures are implemented:

During the pre-acceptance process USEI will obtain:

- Pertinent chemical and physical data (i.e., waste characteristics) and associated certification on the WPQ.
- A representative sample, if required (a representative sample may not be required by USEI if facility management determines the pre-acceptance documentation gives sufficient information to maintain compliance with permit and operational constraints and submittal of a sample for analysis would not aid in the disposal decision process).
- Land Disposal Restriction Notification/Certification and/or data (IDAPA 58.01.05.011) (40 CFR §268.7) unless submitted on a load-by-load basis or the certification required by IDAPA 58.01.05.008 (40 CFR § 264.555) if the waste is received under a CAMU-eligibility determination.
- Other supporting documentation as appropriate, including any information such as process description, additional analytical results, Material Safety Data Sheets (MSDS), product ingredients, etc.

As required, USEI will perform the Fingerprint Analyses and any Supplemental Analyses necessary on a pre-acceptance sample of the waste. These analyses are performed to provide the information needed to determine if the waste can be managed on-site and/or to determine if it matches the identity of the waste from the pre-acceptance review. The analyses will be performed utilizing the parameters outlined in Section C.5.

After evaluating the above information and any information obtained from the Fingerprint Analyses or Supplemental Analyses, USEI will determine the acceptability of the waste based on:

- The permit conditions for the facility, and
- The availability of the proper waste management techniques.

USEI maintains, as part of its pre-acceptance information, generator-supplied and USEI-developed information. This information may be accessed either electronically or via hard copy.

C.6.2 Pre-Acceptance Evaluation

USEI is responsible for the pre-acceptance evaluation decision (i.e., whether to accept or reject the waste). Samples of waste necessary for pre-acceptance consideration are subjected to Fingerprint Analyses. USEI may require Supplemental Analyses to screen samples for other contaminants or properties, which indicate possible treatment or disposal modes. Figure C.2 provides a flow diagram for the pre-acceptance evaluation. The basis for requiring these additional analyses is:

- Determination of waste management technique(s) to be used;
- Facility management's experience and judgment;
- WPQ description of the chemical and physical properties of the waste;
- WPQ description of the process generating the waste;
- Any additional documentation supplied by the generator, including information that the waste is subject to the Land Disposal Restrictions of IDAPA 58.01.05.011 {40 CFR Part 268}, or the treatment standards referenced in IDAPA 58.01.05.008 {40 CFR § 264.555) if appropriate; and
- Results of any Fingerprint Analyses and any previous Supplemental Analyses, including LDR confirmatory analyses.

The pre-acceptance evaluation is concluded with documentation of the decision regarding the acceptability of the waste and the proposed method of management. Included within the documentation is the required notification to the generator that the waste is approved for management in accordance with the facility's permit and IDAPA 58.01.05.008 {40 CFR §264.12(b)}. A Waste Shipment Identification Number (WSID) is assigned to the waste shipment upon approval for acceptance.

USEI's technical disposal decisions are based on:

- Management methods available;
- Conditions or limitations of existing permits and regulations;
- Capability to manage the waste in a safe and environmentally sound manner;
- WPQ description of the process generating the waste;
- WPQ description of the chemical and physical properties of the waste;
- Any additional documentation supplied by the generator, including information that the waste is subject to a Land Disposal Restriction of IDAPA 58.01.05.011 {40 CFR Part 268}, or the treatment standards referenced in IDAPA 58.01.05.008 {40 CFR § 264.555) if appropriate;
- Results of Fingerprint Analyses, if necessary;
- Results of Supplemental Analyses, as appropriate; and
- Management's technical experience and judgment.

Table C.8 provides a list of restricted waste for on-site disposal and the management response if this type of material is received.

C.6.3 Waste Profile/WPQ Re-evaluation

In accordance with IDAPA 58.01.05.008 {40 CFR §264.13(a)(3)}, a WPQ/waste profile re-evaluation will be repeated as necessary to ensure that it is accurate and up to date. At a minimum, the analysis must be conducted when one of the following occurs:

- A generator notifies USEI that the process generating the waste has changed; or
- The results of inspection or analysis indicate the waste received at the facility does not match the identity of the waste designated on the accompanying manifest (or shipping paper).

When this occurs USEI will review the available information, if existing analytical/knowledge of the waste is not sufficient, the generator may be asked to review and update the current WPQ, supply a new WPQ, and/or to submit a sample for analysis, or USEI may utilize a sample obtained from a load of the waste. Figure C.3 provides a flow chart for waste/process changes management methods.

C.6.4 Requirements for Ignitable, Reactive, or Incompatible Wastes

USEI takes precautions to prevent the accidental ignition or reaction of ignitable or reactive waste per the requirements of IDAPA 58.01.05.008 {40 CFR §264.17}. This waste must be separated and protected from sources of ignition or reaction including but not limited to: open flames, smoking, cutting, and welding hot surfaces, frictional heat, sparks, spontaneous ignition, and radiant heat.

Any time USEI treats, stores, or disposes of ignitable or reactive wastes, or mixes reactive incompatible wastes, USEI will take precautions to prevent reactions which:

- Generate extreme heat or pressure, fire or explosions, or violent reactions;
- Produce uncontrolled toxic mists, fumes or gasses in sufficient quantities to threaten human health or environment;
- Produce uncontrolled flammable fumes or gasses in sufficient quantities to threaten human health or environment;
- Damage the structural integrity of the device or facility;
- Through other means threaten human health or environment.

USEI will document compliance with these requirements through references to published literature, data from test trials (e.g., treatability studies), waste analysis or the results from similar treatment processes under similar conditions.

Highly reactive wastes and other wastes identified in Table C.8 are restricted from on-site disposal at the facility.

C.6.5 Compatibility Groups

Establishing waste compatibility and identifying potential incompatibilities are important components of the pre-acceptance evaluation. The waste compatibility evaluation accomplishes the following:

- Prevents the intermingling of incompatible wastes;
- Prevents the contact of waste streams or leachate from wastes with incompatible process equipment; and
- Establishes handling, storage, treatment, and disposal requirements consistent with regulatory compliance, worker safety and health, and the protection of human health and the environment.

To achieve these objectives, waste compatibility information and processing requirements for each waste stream are required. The basic waste compatibility characteristics for a given candidate waste stream are established using the generator's waste characterization information as reviewed and approved by USEI. The key compatibility concerns at this stage of the pre-acceptance evaluation are compatibility groupings as follows:

- Waste/waste compatibility;
- Waste/tank compatibility;
- Waste/container compatibility;
- Waste/stabilization equipment compatibility;
- Waste/landfill liner compatibility;
- Waste/evaporation pond liner compatibility; and
- Waste/containment building barrier compatibility.

The pre-acceptance waste/waste compatibility determination identifies:

- Drum storage, landfill disposal, and laboratory pack segregation requirements;
- Storage tanks or the stabilization unit decontamination requirements; and
- Preliminary classifications for tank storage and evaporation pond scheduling (confirmed by waste-to-waste testing).

Waste/waste compatibility is determined by categorizing a waste's reactive characteristics. The USEPA guidance document "A Method for Determining the Compatibility of Hazardous Wastes" (EPA-600/2-80-076) is used as a guide to group the wastes listed in the Part A of this Document into the 41 different reactivity groups established in the USEPA guidance manual. An example of the Hazardous Waste Compatibility Chart provided in EPA-600/2-80-076 is included in Appendix

C.1 for reference. The 41 reactivity groups established in the guidance document have been composited into eight compatibility groupings (Groups A through H). A majority of the USEPA-listed wastes accepted by the facility are listed by both reactivity group numbers (RGNs) and by USEI compatibility groupings in Table C.9 and Appendix C.2. Additional wastes not listed on this compatibility chart will be placed in the appropriate compatibility grouping based on the characteristics of the material in question. Chemical composition plays an important role in classifying wastes into compatibility groups. The major constituents of the waste determine the primary compatibility characteristics of the waste. Minor components are screened and assessed on the basis of their relative proportion to the total waste and the potential incompatibilities they might present. If the hazardous constituent contained in the USEPA waste listing is a minor component, and if the major component(s) is of a different compatibility group than that indicated for the listing constituent, then the major components will generally determine the compatibility group. If necessary, analyses for compatibility are conducted to assist in the proper compatibility group classification.

Waste/waste compatibility is typically determined using the following three steps:

1. Initially, all data regarding the waste are compared with the waste compatibility chemical listings in Appendix C.2 and with USEPA guidance document EPA-600/2-80-076 to determine waste/waste compatibility.

2. If necessary, a representative sample of the candidate waste is submitted by the generator to the facility for compatibility testing. The waste is tested for compatibility with a mixture of laboratory reagent chemicals representing each reactivity group (in equal proportion) within the candidate waste's compatibility group. If the compatibility group mixture results in separate liquid or solid phases, waste compatibility testing is performed on each phase.

3. The information generated in Steps 1 and 2 is evaluated to verify that no excessive, flammable, or toxic gas is generated, that fire and/or explosions do not occur, and that violent polymerization or uncontrolled reactions do not occur. Should the data indicate any of these conditions, testing may be conducted to identify the correct reactivity group.

The compatibility group determination is used to segregate drummed wastes and laboratory pack wastes for storage and landfill disposal, to segregate bulk wastes for landfill disposal, and to determine the probable compatibility for direct contact of liquids in tank storage and evaporation pond treatment. Should a waste be suspected of having any storage, treatment, or disposal incompatible with other wastes within its assigned compatibility group, additional compatibility tests will be performed.

There are multiple methods and schemes for determining compatibility. As a result, USEI may submit an alternate method for compatibility for Department review.

C.7 INCOMING WASTE SHIPMENT PROCEDURES

Each shipment of waste will be inspected, sampled and analyzed as defined herein before acceptance, except as noted in Section C.7.1.6. This serves two purposes. First, it compares the actual waste identity with that determined in the pre-acceptance phase and the waste manifest. Second, it further ensures proper disposition of the waste for treatment, storage, and/or disposal. Other USEI personnel (or USEI-approved subcontractor) can provide the Fingerprint and/or Supplemental Analyses required for acceptance. Waste shipments, which have arrived on-site, are considered to be in the receiving process until a final decision regarding waste acceptability is made; at such time the wastes are considered “accepted” or “rejected”. Waste may be stored at the "staging area" or one of waste management units while awaiting receipt determination. Figure C.4 provides a flow chart for waste receipt control procedures.

In addition, all initial waste shipments which are subject to the Land Disposal Restrictions of IDAPA 58.01.05.011 {40 CFR Part 268}, or the CAMU-eligible treatment standards referenced at IDAPA 58.01.05.008 {40 CFR § 264.555}, and which have been treated, exempted, subject to a variance, or already meet the appropriate treatment standard may be accompanied by a one-time form from the treater or generator certifying the waste meets the appropriate treatment standard, treated with the prescribed treatment method, prohibition exemption, or variance. This form must include the applicable analytical data or reference to such data, in accordance with IDAPA 58.01.05.011 {40 CFR §268.7}. Furthermore, initial waste shipments subject to the Land Disposal Restrictions of IDAPA 58.01.05.011 {40 CFR Part 268} that require treatment may be supported by one-time written documentation notifying USEI of the appropriate treatment standard or prohibition including any applicable data or reference to such data or documentation which must be met in accordance with IDAPA 58.01.05.011 {40 CFR §268.7}, except as otherwise allowed.

C.7.1 Receiving Procedures

Upon receipt of a waste shipment, samples are assigned an internal tracking number. If the waste is a routine waste stream, it has an associated Internal Control Form (ICF)/load number assigned. The sample identification number consists of an ICF/load number followed by the ICF item number and a specific container designation. Non-routine sample (those without an ICF number) are consecutively numbered based upon yearly sequential numbers as follows:

03-0001

- “03” indicates the year the received and/or sample collected and
- “0001” is a consecutive number that progresses upwards throughout the year.

The type of tracking system may change depending on the type of waste management tracking software and other operational considerations, however, the facility will have a waste tracking system in place at all times.

The sampling and analysis of the incoming waste will utilize appropriate methods (Section C.4) and parameters (Section C.5). Inspections are performed as described in Section F. Upon arrival of a waste shipment at USEI, the accompanying manifest is reviewed for completeness and the shipment is inspected for agreement with the manifest information (see Section C.11.8 for resolution of significant manifest discrepancies).

All shipments arriving on-site will be visually inspected. The visual inspection is the first step in the fingerprint process. The intent of the visual is to identify any obvious discrepancies such as unidentified liquids or other physical properties.

Incoming shipments are also sampled and analyzed for the Fingerprint Parameters as identified in Section C.5 and any Supplemental Analyses specified by facility management, except as noted in Section C.7.1.6.

C.7.1.1 Debris Receipt

For Debris, a visual inspection will be utilized to determine if the waste meets the definition of debris. Debris refers to solid material exceeding 60 mm in particle size that is a manufactured object, plant or animal matter, or natural geologic material. However, the following materials are not debris:

- Any material for which a specific treatment standard is provided in Subpart D, Part 268 (e.g., lead acid batteries, cadmium batteries, radioactive lead solids);
- Process residuals such as smelter slag and residues from the treatment of waste, wastewater, sludge's, or air emission residues; and
- Intact containers of hazardous waste that are not ruptured and contain at least 75% of their original volume.

A mixture of debris that has not been treated to the standards provided by IDAPA 58.01.05.011 {40 CFR §268.45} and other material is subject to regulation as debris if the mixture is comprised primarily of debris, by volume based on the visual inspection. Figure C.5 provides a flow chart describing the decision process for the pre-acceptance of debris and debris loads.

C.7.1.2 Bulk Receipt

Subject to the exceptions in Section C.7.1.6, bulk waste loads are sampled and analyzed, except where large volumes from a campaign shipment of a single waste stream are received from a single source, (e.g., a site cleanup, a large volume generator, etc.). In such cases, all shipments are visually inspected and at least 10% of such loads are sampled and analyzed except as otherwise noted in Section C.5.1. Bulk waste may also be sampled in an original bulk container (e.g., rail tanker, gondola car, etc.).

For campaign shipments, 50 percent of the first 10 truckloads are sampled for fingerprint analysis. In addition, every truck comprising a campaign shipment is visually inspected (per Waste Receipt Control procedures) and any truckload of waste showing unexpected variations in color, texture, or moisture content is subject to sampling. If the sampled truckloads show variation, the 50 percent sampling frequency is continued for the next 10 truckloads. If there are no variations among the sampled truckloads, the sample regime is reduced to 10 percent of the truckloads for the remainder of the campaign shipment, thereafter. If variations are later found during the 10 percent sampling regime, the 50 percent sampling frequency is re-instituted for the next 10 truck loads. If these do not show variation, then the frequency is returned to 10 percent of the next 10 truckloads.

Bulk solids are sampled by obtaining point samples using the sampling equipment indicated in Table C.5. These samples are collected from the following three points:

- The front 1/3 of the truck/container load;
- The center 1/3 of the truck/container load; and
- The rear 1/3 of the truck/container load, within one (1) to two (2) feet of the rear tailgate or container wall, if possible.

Samples are collected in a manner that is best representative of the vertical composition of the waste within the limitations of the available sampling equipment and container configuration. If the physical characteristics of the hazardous waste are such that a full vertical section of the load cannot be reasonably sampled with the equipment listed in Table C.5 then a sample is collected at an approximate depth of one foot at each sampling point. The three point samples are composited prior to analysis. If a truckload is domed and easily accessible to within one (1) to two (2) feet of the bottom of the load, then one of the samples is collected near the bottom to obtain a more appropriate vertical sample of the waste.

In addition, all visible areas of each bulk hazardous waste load are inspected for physical differences and for variations from the characterization of the hazardous waste presented in the WPQ. The load is also visually observed during off-loading for any such variations. Any portion of the waste that exhibits such variations is sampled and analyzed separately, if possible.

A hazardous waste bulk load (e.g., truck and trailer or two truck-mounted rolloffs) manifested as a single item is considered one shipment for sampling purposes. Each container is sampled per the previous paragraph, and the six sample points are composited into one sample for analysis. Alternatively, a hazardous waste bulk load (i.e., truck and trailer or two truck-mounted rolloffs) manifested on separate distinct manifests or presented as two waste streams is considered two units for sampling and analysis purposes.

C.7.1.3 Bulk Liquid Receipt

Liquids are sampled utilizing the appropriate sampling equipment as shown in Table C.5. Shipments of bulk liquid are generally received in tanker trucks. For each tanker, a single sample is removed for analysis from each segregated compartment within the tanker. If the compartments all hold the same waste stream, the samples may be composited at a rate of five samples per composite. This presumes that all samples are visually equivalent and match the characteristics expected from information on the WPQ.

A tanker may be sampled by withdrawing a sample from available valves on the tanker. This necessitates that the waste within the tanker is either homogenous or that the tanker is adequately circulated/mixed prior to sampling to ensure a representative sample is obtained.

C.7.1.4 Sludge Receipt

Bulk shipments of sludge are sampled as either liquids in bulk or solids in bulk depending on the physical characteristics of the sludge. If the sludge is primarily liquid in nature, then it is sampled as appropriate for a liquid in bulk. Conversely, if the sludge is essentially a solid, then it is sampled as appropriate for a solid in bulk.

C.7.1.5 Non-Bulk Receipt

In the case of shipments of non-bulk containers, at least 10% of the containers from each waste stream in the shipment are sampled, except as provided in Section C.7.1.6. Container samples from the same profile may be composited prior to analysis, providing the individual samples are similar. Any composited samples will be composited as described in Section C.4.3. At a minimum, all remaining unopened containers are visually inspected for container integrity and consistent labeling. If a significant discrepancy in waste type is discovered, the contents of all of the containers for that waste stream are inspected. In some cases, where the waste stream is consistent but packaged for ease of transportation or disposal (e.g., multiple yd^3 bags containing the same waste) the load may be managed as a bulk load.

C.7.1.6 Exceptions

Exceptions to the foregoing requirements include the following:

- Waste contained in a lab-Pack (combination packaging). Combination packaging is defined in 49 CFR §171.8 as "......one or more inner packaging secured in a non-bulk outer packaging" and is subject to the Department of Transportation shipping package requirements of 49 CFR Part 173.

- Commercial products or chemicals: off-specification, outdated, unused, or banned. This also includes products voluntarily removed from the market place by a manufacturer or distributor.

- "Empty" containers of waste materials, commercial products or chemicals. This applies to portable containers which have been emptied, but which may hold residues of the product, chemical, or containers containing other empty containers. Examples of containers are: tanks, drums, barrels, cans, bags, liners, etc. A container shall be determined "empty" according to the criteria specified at IDAPA 58.01.05.005 {40 CFR §261.7}. These empty containers may be crushed, shredded, or intact.

- Residue and debris from the cleanup of spills or releases of chemical substances, previously approved wastes, commercial products, or a waste, which would otherwise qualify as an exception.

- Wastes, which are visually identifiable through an inspection process. (Examples may include cathode ray tubes, batteries, fluorescent light tubes, filters and filter cartridges, wire or tubing, paper products, metal sheeting and parts, crushed glass, piping, etc.)

- Demolition wastes. This consists of waste produced from the demolition or dismantling of industrial process equipment or facilities contaminated with chemicals from the process. Knowledge of the process and chemicals used in the process allows characterization of the waste sufficient for safe management.

- Articles, debris, non-RCRA wastes, equipment and clothing containing or contaminated with polychlorinated biphenyl's (PCBs). This includes PCB capacitors, transformers, gloves or aprons from draining operations, empty drums that formerly held PCBs, etc.

- PCB draining and flushing removed from PCB articles. This includes PCB articles flushed with a substance (e.g. toluene or unused diesel).

- USEI site generated waste, including hazardous and non-hazardous waste.

- Controlled substances regulated by government agencies including drugs and/or materials from clandestine labs.

- Materials that are brokered for management at an alternate facility. These materials are received for storage and subsequent offsite management only. If it is determined USEI will process a waste previously designated for storage and subsequent off-site shipment, the waste will be reviewed utilizing the normal approval process prior to on-site processing. For materials received at another regulated company and subsequently shipped to USEI, the other facility may transmit the relevant information to USEI for use in the pre-acceptance or load arrival review programs, as is appropriate.

- Wastes from remedial projects in which the waste characterization is known through a sampling plan that was approved by a federal or state agency (e.g.; CERCLA or Potentially Responsible Party type project) or other well-developed plan.

- Debris as defined at IDAPA 58.01.05.011 {40 CFR §268.2}. These materials will be visually inspected prior to acceptance in order to ensure the waste meets the definition of debris. Detailed procedures are provided in Section C.7.1.1.

- Contaminated personnel protective equipment (PPE) (e.g., gloves, tyveks, respirator cartridges).

- Aerosol cans.

- Vitrified, Cemented, and Other Materials Exhibiting High Structural Integrity. There are several materials which are not conducive to sampling which must be recognized. Structural steel, tanks, pipe, cement, glass, empty drums, machinery, equipment, manufactured items, monolithic / cemented materials, and several other materials are managed which do not allow for normal sampling protocols. By necessity, these materials must be managed on a case-by-case basis. In some cases a clean-up agency (e.g., EPA, IDEQ, etc.), generator, or contractor has established a rational basis of data and waste characterization information. In those cases, this information may be utilized in lieu of pre-acceptance analytical and incoming load analytical information, and the physical appearance screen will be utilized to confirm material acceptability upon arrival;

- Non- RCRA Radioactive Waste (including NORM, NARM, etc) and waste as described below:

  - Sampling and analysis of the above waste materials is not required: unless specifically requested by USEI. These materials are not sampled and analyzed because if the chemical and physical characteristics of the waste are known in sufficient and reliable detail or if the waste has been previously characterized and shipped from another generator, broker or TSDF, or visual inspection of these shipments is sufficient for verification of their identity. USEI will obtain and evaluate all the information required by IDAPA 58.01.05.008 {40 CFR §§264.13(a)(1) and 264.13(a)(2)} necessary to characterize, treat, store, or dispose of the waste.

- In addition, USEI may waive incoming waste load sampling and analysis where the pre-acceptance documentation supplies sufficient information to assure compliance with permit conditions and operational constraints, or any of the following conditions exist:

  - A sample cannot be reasonably obtained, such as filter cartridges, tank clean-out sludge (prior to the clean-out), large pieces of contaminated material, or contaminated debris;

  - In these cases, the shipment will still be inspected for conformance with manifest and pre-acceptance documentation as previously described;

  - Obtaining a representative sample poses an unnecessary or unavoidable hazard of acute or chronic exposure of USEI employees to carcinogenic, mutagenic, neoplasticgenic, teratogenic, or sensitizing materials (e.g., asbestos); or.

C.7.2 Decision Evaluation Logic

There are major decision points regarding the need for evaluation of whether a waste found to be dissimilar to the pre-acceptance evaluation can still be accepted. USEI decides whether additional analyses are required for a particular waste based on the following:

- Results of Fingerprint Analyses;
- Knowledge of generator and/or waste-generating process;
- Results of pre-acceptance evaluation; and
- Waste codes.

Further testing will be conducted as necessary if the results indicate unexpected characteristics with respect to pre-acceptance analytical results, or if there is suspicion the waste composition has changed. Effectiveness of the waste identification step is dependent on the following components:

- Inspection;
- Sampling (where required);
- Analytical results (where required);
- Waste Product Questionnaire;
- Hazardous Waste Manifest;
- Waste Screening Analytical Results;
- Facility management's judgment.

To facilitate the waste identification process, fingerprint analytical data is compared to the corresponding pre-acceptance analysis (WPQ, ICF, etc.). The Fingerprint Analysis verifies the waste is indeed the same waste as represented by the pre-acceptance analysis. When a load is received, the pre-acceptance information is reviewed. USEI classifies waste as being in non-conformance when it is significantly different in composition from the information shown in the WPQ or the pre-acceptance results, or if there is a significant discrepancy between the waste shipment and the manifest (as defined in IDAPA 58.01.05.008 and 40 CFR §264.72), unless the discrepancy can be clarified. Figure C.6 provides a flow chart for waste reevaluation procedures.

Wastes found to be in non-conformance may be rejected immediately, or may be re-evaluated for possible acceptance despite the variance. Re-evaluation will be based on any or all of the following criteria:

- Permit authorization;
- Land Disposal Restrictions;
- Discussions with the generator; and
- Facility conditions.

Pursuant to IDAPA 58.01.05.008 {40 CFR §264.72}, USEI must attempt to resolve with the generator or transporter significant discrepancies between the actual waste and that shown on the manifest. Changes to the manifest or WPQ may be made with the customer's concurrence or at the customer's request. Any corrections or other changes made to the manifest or WPQ will be initialed by the person making the change. Other discrepancies noted (such as improper mailing addresses, identification numbers, telephone numbers) may be either corrected or noted in manifest block 19.

For bulk loads manifested by weight, the load is typically weighed on-site. However, if the scale is out of service, other methods may be employed to estimate the weight of the delivery. Other methods include utilization of nearby (off-site) scales, weight estimation techniques, and utilization of tare weights to calculate approximate net weights. If a significant weight discrepancy is noted, the procedures of IDAPA 58.01.05.008 {40 CFR §264.72} are employed. For piece count deliveries (e.g., vans of containers, etc.), the piece count is confirmed. Under typical conditions all of these activities are conducted upon delivery to the facility or within a short time thereafter. However, there are situations when these conditions are not satisfied upon delivery (e.g., a load is delivered and staged prior to being approved or accepted, small containers are contained within heat shrink material and cannot be counted prior to breaking the load, etc.). In these instances and consistent with IDAPA 58.01.05.008 {40 CFR §264.71(a)(3)}, the transporter is given a signed copy of the manifest. If a significant weight or piece count discrepancy is later discovered, an attempt to reconcile it will be made. If a significant manifest discrepancy cannot be resolved within 15 days of discovery, notification of the discrepancy will be sent to the IDEQ, along with the steps taken to resolve the discrepancy.

C.8 PROCESS OPERATIONS PROCEDURES

Each movement of a waste within the facility, during which any change in its characteristics may occur, may make the waste subject to additional inspection, sampling, and analysis to determine appropriate handling and management of the waste. Many of the analyses needed for the treatment, storage, and/or disposal functions are performed during incoming shipment identification and are not repeated unless it is known or believed that waste characteristics may have significantly changed during storage or processing and/or such information is deemed necessary for the safe management of the waste.

Existing and anticipated process operations at the facility, for which current and periodic sampling and analyses are important, include the following:

- Treatment, including stabilization;
- Storage; and
- Disposal, consisting of landfilling and/or solar evaporation.

The analytical procedures for each of these processes are described in the following Sections.

C.8.1 Storage

Before any waste is placed into storage USEI will assess the compatibility of the waste with wastes already in storage as described in Section C.6.5.

C.8.1.1 Liquid Storage / Transfer / Management

Liquid wastes may be transferred from containers to tanks or to trucks although a waste may be fed directly to the designated treatment unit (e.g.; tanks). Upon arrival, liquid waste will be subjected to the appropriate waste identification analyses, plus a commingled waste compatibility test, if appropriate, to assure safe storage. If a liquid load is exempted from sampling, as described in Section C.7.1.6, the waste will be segregated from other wastes based on USEI's technical assessment of the waste (e.g., compatibility class).

C.8.1.2 Containerized Storage

Using the predominant hazard classification on incoming containerized waste, the proper storage area will be designated to insure segregation of stored incompatible waste.

Based on the initial hazard determination made by the generator on the WPQ and/or the final identification of the waste shipment, containerized waste will be segregated in the following manner: flammable, corrosive, and oxidizing waste materials will be separated from incompatible materials or stored in separate areas. Wastes are separated/maintained in separate storage areas until they are treated, transferred, or disposed as described in Section C.6.5.

C.8.2 Brokering and Material Transfer Operations

This section discusses process analyses associated with the brokering of materials. Transfer of materials for off-site disposition is discussed, since this process may involve consolidation/bulking of waste materials to meet the receiving facility's specifications.

C.8.2.1 Consolidation/Bulking for Off-Site Transfer

This activity involves the consolidation/bulking of solid wastes into rolloffs or other appropriate containers or the pumping of containerized liquid wastes into tank trucks or other large containers for delivery off-site. Additionally, liquid waste containing sufficient heating values for combustion are bulked with other suitable waste. The resultant liquid bulked materials are used to provide heat content for combustion processes (either as hazardous waste derived fuel or as a hazardous waste, as applicable) at off-site lime kilns, incinerators, or similar operations (e.g. disposal).

According to IDAPA 58.01.05.004 {40 CFR §260.10}, treatment is defined as "Any method, technique, or process, including neutralization, designed to change the physical, chemical, or biological character or composition of any hazardous waste so as to neutralize such waste, or so as to recover energy or material resources from the waste, or so as to render such wastes non-hazardous; safer to transport, or dispose of; or amenable for recovery, amenable for storage or reduced volume". In short, if an activity does not change a hazardous waste, it is not treatment. Waste bulking or otherwise containerizing multiple hazardous wastes for transportation will not typically change the physical and chemical properties of the waste.

The EPA has provided guidance (Faxback 13308, 13720, 11281, 11497, 12458, and 13764) that activities such as bulking, containerizing, and consolidation are not considered treatment, as long as no blending (e.g., selective mixing to meet a fuel standard) is taking place. Incidental mixing of wastes that occurs when several waste streams of similar waste types are bulked is not considered treatment. Also, if the intent of consolidation is to make it more efficient and cost effective to transport the shipment, the activity is not considered treatment. The important point in this discussion is that as long as the intent of the consolidation/bulking in question is not intended as treatment and the material is still sent to an appropriate TSD facility for treatment, then the activity is not considered treatment (i.e., intent of the consolidation/bulking is not to conduct treatment).

When evaluating hazardous waste for consolidation/bulking, the pre-acceptance analyses is used to determine the acceptability of each waste stream. Additional analysis for heat value may be required for materials destined for supplemental fuels, depending on the regulatory status of the potential receiving BIF(s), to evaluate sham-recycling restrictions. For materials destined for incineration, or other processes this analysis is not necessary.

In-process analyses may be performed to assure the aggregation / bulking of wastes is within the receiving facility's specifications, if any. This is necessary because acceptance criteria for the USEI facility may be different than the receiving facility's specifications, which are based upon that facility's permits, regulations, or other needs. For example, if the receiving facility has a minimum requirement for heat value and a maximum requirement for chlorides, then the bulked material requirements will be a function of the receiving facility's requirements for both parameters.

Post-consolidation analyses may consist of tests necessary to confirm that the bulked material is suitable for offsite disposal. Consolidation activities will occur in the CMU's as described in Section D.1.

C.8.3 Treatment Technologies

USEI utilizes several different treatment technologies in order to meet the applicable land disposal restriction (LDR) or other standard as applicable. USEI utilizes the term "stabilization" throughout this document in a generic sense to mean the treatment of a waste material to make it physically and chemically stable. In this sense, it consists of those processes, which make the material pass applicable LDR standards or other applicable standard(s).

In this process, waste is treated to meet land disposal restrictions (e.g., elimination of free liquids, chemical and/or physical stabilization to remove or immobilize hazardous constituents, micro-encapsulation, macro-encapsulation, etc) or to meet other appropriate requirements (e.g., permit or regulatory requirements). IDAPA 58.01.05.011 {40 CFR §268.42} provides specific definitions for several potentially distinct treatment technologies including Stabilization, Chemical Oxidation, Chemical Reduction, Deactivation, Macro/Micro Encapsulation, Neutralization, Adsorption, Bio-remediation, Evaporation, and Precipitation. Although the above treatment technologies may be considered distinct processes, the stabilization process is defined in the more generic sense due to the overlap of the associated treatment technologies and methods.

Pre-treatment analyses consist of tests necessary to insure the wastes can be treated to meet the applicable treatment requirement. In-process analyses are generally not required. Post-treatment analyses are performed, as necessary, to ensure restricted wastes meet applicable treatment standards.

The following technologies, defined as "stabilization" within this WAP and associated documents are utilized by USEI:

C.8.3.1 Stabilization

Stabilization is defined by IDAPA 58.01.05.011 {40 CFR §268.42} as stabilization with the following reagents (or waste reagents) or combinations of reagents (1) Portland Cement; or (2) lime/pozzolans (e.g., fly ash and cement kiln dust) – this does not preclude the addition of reagents (e.g., iron salts, silicates, and clays) designed to enhance the set/cure time and/or compressive strength, or to overall reduce the leachability of the metal or organic. Stabilization is the treatment of appropriate waste streams by use of pozolonic materials or wastes with pozolonic properties to reduce the leachability of organic, inorganic or metals of concern. Appropriate use of this treatment technology is determined during the approval process. A mix design is developed prior to the treatment of a waste stream. Stabilization may be performed within Mix Bin Tanks, or Containers. Treatment locations may be the Stabilization portion of the Containment Building, the Debris portion of the Containment Building or the Stabilization Facility. Treatment is performed to meet applicable LDR standards. Sampling, analysis verification of the treatment effectiveness and frequency of testing follows the guidelines presented in this WAP.

C.8.3.2 Chemical Oxidation

Chemical oxidation is a treatment process targeted primarily at organic constituents, (e.g., toluene and benzene) but may be used for inorganic constituents as well (e.g., cyanides and heavy metals such as mercury). An organic or inorganic species is oxidized when its respective chemical oxidation number increases (i.e., loses electrons). Consistent with IDAPA 58.01.05.011 {40 CFR 268.42}, the following oxidation reagents (or waste reagents) may be used in part or whole: (1) Hypochlorite (e.g. bleach); (2) chlorine; (3) chlorine dioxide; (4) ozone or UV (ultraviolet light) assisted ozone; (5) peroxides; (6) persulfates; (7) perchlorates; (8) permanganates; and/or (9) other oxidizing reagents of equivalent efficiency. An approved mix design is formulated and tested prior to treatment.

Chemical oxidation may be performed within Mix Bin Tanks or Containers. Treatment is performed to meet EPA LDR standards. Sampling, analysis verification of the treatment effectiveness and frequency of testing follows the guidelines presented in this WAP.

C.8.3.3 Chemical Reduction

Chemical reduction or redox occurs when the targeted component/constituent atoms change as a resultant transfer of electrons from one chemical species to another. The chemical oxidation number for the targeted components decreases (i.e., gains electrons) when the target constituents are reduced. Conversely, the reducing reagents used in this process lose electrons or become oxidized. Derived from IDAPA 58.01.05.011 {40 CFR 268.42}, the following reducing reagents (or waste reagents) may be used in whole or part: (1) Sulfur dioxide; (2) sodium, potassium, (salts), or other alkali salts or sulfites, bisulfites, metabisulfites and polyethylene glycols (e.g., NaPEG and KPEG); (3) sodium hydrosulfide; (4) ferrous salts; and/or (5) other reducing reagents of equivalent efficiency. An approved mix design is formulated and tested prior to treatment.

Chemical reduction may be performed within Mix Bin Tanks or Containers. Treatment is performed to meet EPA LDR standards. Sampling, analysis verification of the treatment effectiveness and frequency of testing follows the guidelines presented in this WAP.

C.8.3.4 Deactivation

Deactivation is the treatment of those wastes that exhibit the characteristics of ignitability, corrosivity, and/or reactivity. Appropriate use of this treatment technology is determined during the pre-acceptance process. A mix design is developed prior to the treatment of the waste stream. Deactivation may be performed within Mix Bin Tanks, or Containers. Treatment is performed to meet applicable LDR standards. Sampling, analysis verification of the treatment effectiveness and frequency of testing follows the guidelines presented in this WAP.

C.8.3.5 Macro Encapsulation

Macro-encapsulation is a confining or immobilization technology used to treat all types of hazardous debris independent of the hazardous constituents involved (with the exception of cyanide-reactive debris). The macro-encapsulation process encases the debris to provide a physical barrier that prevents/minimizes potential leaching of hazardous constituents from the debris. The encapsulating barrier does not need to chemically bond to either the debris or hazardous constituents. Macro-encapsulation is defined in IDAPA 58.01.05.011 {40 CFR §268.42, Table 1} as the application of surface coating materials such as polymeric organics (e.g., resins, plastics) or use of a jacket of inert inorganic materials to substantially reduce surface exposure to potential leaching media. Inert non-waste material, or waste meeting appropriate LDRs, may be used for filler material.

Macro-encapsulation does not require specific testing for LDR constituent standards. This waste is treated at the facility to meet all requirements of the LDR treatment technology standard and is certified by USEI to meet these requirements prior to disposal. Macro-encapsulation may be performed at the Containment Building, CMU's: CSP # 4/5, Truck Unloading Aprons, and the RCRA/PCB Building.

The performance standard for the macro-encapsulation technology is described under IDAPA 58.01.05.011 {40 CFR Part §268.45, Table 1}, entitled "Alternative Treatment Standards for Hazardous Debris". This standard states that "Encapsulating material must completely encapsulate debris and be resistant to degradation by the debris and its contaminants and materials into which it may come into contact after placement (leachate, other wastes, microbes).

C.8.3.6 Micro Encapsulation

Micro-encapsulation is confining or immobilization technology that requires the stabilization of the debris with the following types of reagents (or waste reagents) such that the leachability of the hazardous contaminants is reduced: (1) Portland cement; or (2) lime/pozzolans (e.g., fly ash and cement kiln dust) (3) Additional reagents (e.g., iron salts, silicates, carbon, polymers or clays) as appropriate.

Micro encapsulation does not require specific testing for LDR constituent standards. Following the treatment process, the micro-encapsulated debris is visually inspected. Micro encapsulation may be conducted in tanks or containers. The performance standard for the micro-encapsulation technology is described under IDAPA 58.01.05.011 {40 CFR Part §268.45, Table 1} titled "Alternative Treatment Standards for Hazardous Debris". This standard states that "Leachability if contaminants must be reduced".

C.8.3.7 Neutralization

Neutralization is a treatment process designed to render corrosive matrices non-corrosive. According to IDAPA 58.01.05.011 {40 CFR 268.42}, the following reagents (or waste reagents) in part or whole may be used for neutralization: (1) Acids; (2) Bases; or (3) water (including wastewater's) resulting in a pH greater than 2 but less than 12.5 measured in the aqueous residuals. An approved mix design will be formulated and tested before waste is treated by neutralization.

Neutralization may be performed within Mix Bin Tanks or Containers. Treatment is performed to meet EPA LDR standards. Sampling, analysis verification of the treatment effectiveness and frequency of testing follows the guidelines presented in this WAP.

C.8.3.8 Precipitation.

Precipitation is the process by which regulated metals and/or inorganics are precipitated out as insoluble precipitates of oxides, hydroxides, carbonates, sulfates, chlorides, fluorides, or phosphates. This process entails adjusting the pH of the waste matrix between 9 and 11. This pH range is ideal for hydroxide precipitation. An alternative to this common standard practice is sulfide precipitation. Sulfide precipitates are less soluble and non-amphoteric (less pH dependent than hydroxyl precipitates). However, caution must be employed to ensure hydrogen sulfide is not released at harmful levels by maintaining a pH greater than 8 throughout the treatment process. Based on IDAPA 58.01.05.011 {40 CFR 268.42}, the following reagents (or waste reagents) are typically used alone or in combination: (1) Lime (i.e., containing oxides and/or hydroxides of calcium and/or magnesium; (2) caustic (i.e., sodium and/or potassium hydroxides; (3) soda ash (i.e., sodium carbonate); (4) sodium sulfide; (5) ferric sulfate or ferric chloride; (6) alum; or (7) sodium sulfate. Additional flocculating, coagulation or similar reagents/processes that pertain to precipitation are not precluded from use. An approved mix design will be tested prior to treatment.

Precipitation may be performed within Mix Bin Tanks or Containers. Treatment is performed to meet EPA LDR standards. Sampling, analysis verification of the treatment effectiveness and frequency of testing follows the guidelines presented in this WAP.

C.8.3.9 Adsorption

Adsorption is the use of an appropriate reagent (e.g. activated carbon or treated clay) to remove chemical components from aqueous or compressed gas waste streams. It is most commonly employed for the removal of organic compounds, although some inorganic constituents are effectively removed as well. This process is achieved through physical, chemical, and electrostatic interactions between the waste material and the adsorbent media. Pursuant with IDAPA 58.01.05.011 {40 CFR 268.42}, Total Organic Carbon can be used as an indicator parameter for the adsorption of many organic constituents that cannot be directly analyzed in wastewater residues.

Adsorption primarily occurs in the Tanks 1, 2, 3 and 4, however it may be performed within Mix Bins, Tanks or Containers. Treatment is performed to meet EPA LDR standards. Sampling, analysis verification of the treatment effectiveness and frequency of testing follows the guidelines presented in this WAP and Appendix D.2.5 (for on-site generated waste).

C.8.3.10 Evaporation.

Evaporation of wastes primarily occurs within the Evaporation Pond. Non-hazardous liquids and hazardous liquids meeting applicable LDR's that meet the conditions of this WAP are placed in the Evaporation Pond for evaporation. The USEI facility has a net evaporation rate of approximately 53 inches per year, which allows for evaporation of liquids using solar energy. Waste liquids selected for evaporation must meet Evaporation Pond Parameters set forth in this WAP before being placed in the pond.

C.8.3.11 Bio-remediation.

Bio-remediation is the use of biological mechanisms to destroy, transform, or immobilize environmental contaminants. Bio-remediation is normally conducted in-situ, however, there may be scenarios where it would be conducted at an alternate facility such as a TSDF. Bio-remediation would be performed within tanks or containers.

Certain wastes are treated on-site to meet specified treatment standards. Typically, USEI requires a representative sample of the waste prior to on-site management. The waste sample is then mixed with various types of reagents[2] to determine an acceptable mix design (recipe) by which the waste is treated (separately or along with other wastes) to pass the required standard(s).

C.8.4 Acceptance and Management of Corrective Active Management Unit (CAMU) Wastes

The Permittee is authorized to accept, manage, and dispose of CAMU-eligible wastes, as defined in IDAPA 58.01.05.008 [40 CFR § 264.552(a)(1) & (2).]

For each CAMU remediation waste proposed for acceptance, the Permittee must submit a CAMU-eligible waste stream information package for review by the Director unless exempted as provided below. The information package will document that:

1. The designation of CAMU-eligible waste has been performed by a duly authorized agency,
2. Principal hazardous constituents have been identified and are required to be treated to meet any of the standards referenced in 40 CFR §264.555 (a) (2),
3. The CAMU-eligible waste designating authority provided a public notice and an opportunity for public comment for both the CAMU designation and the placement of the CAMU in an off-site permitted hazardous waste landfill,
4. The approval is specific to a single remediation,
5. All information provided by the person seeking approval (the waste generator) to the duly authorized agency making the CAMU-eligible waste designation has been included in the information package.

For each CAMU-eligible waste proposed for acceptance, the Director and persons on the Permittee's mailing list will be notified of the Permittee's intent to receive CAMU-eligible wastes. This notification shall include the source of the remediation waste, the principal hazardous constituents in the waste, and the treatment requirements. The mailing list notice will be sent within 7 days of the request to the Director and will state that comments or objections to receipt of the waste may be submitted to the Director within 15 days of the notice. Proof of the mailing list notification will be submitted to the Director within seven (7) days of completion.

The Permittee must comply with 40 CFR § 268.7(b)(4) except the certification must state the CAMU wastes meet the referenced treatment requirements at 40 CFR § 264.555(a)(2). The Permittee must dispose of all CAMU-eligible wastes in Permitted landfill cells only. Prior to disposal, all CAMU-eligible wastes must meet one of the standards as discussed in 40 CFR § 264.555(a)(2)(i), (ii), or (iii).

The Permittee may not receive any CAMU-eligible waste until written approval is received from the Director. The Director may take a 30-day review period, with an optional 30-day extension, from the date of receipt of the request from the Permittee.

---

[2] Typical reagents utilized on-site include fly ash, portland cement, cement kiln dust, lime, gypsum, water, clays, and carbon, although many other treatment reagents may be utilized, including other wastes with characteristics appropriate for treatment.

The Director may object to the Permittee's acceptance of any specific CAMU-eligible waste stream. If such written objection is issued, the Permittee may not receive the specific CAMU-eligible waste stream. If at the end of the review period the Director has not notified the Permittee that he or she has chosen not to object, the Permittee may not receive the specific CAMU-eligible waste stream until the objection has been resolved, or the Permittee obtains a permit modification specifically authorizing receipt of the specific CAMU-eligible waste stream.

As part of the permit modification process, the Director may modify, reduce, or eliminate the notification requirements described in this section of the WAP as they apply to specific categories of CAMU-eligible waste, based on minimal risk.

C.8.5 Wastes Meeting the Treatment or Technology Standard upon Arrival

USEI receives waste meeting applicable treatment standards that either has been treated by the generator, a treatment facility, or meets the standard as initially generated. These shipments must be accompanied by a proper notification and certification or, if determined to meet the standard by USEI, USEI may complete the certification. Wastes in this category may be analyzed for conformance with the treatment standards during the pre-acceptance review, during the load acceptance review, or when USEI believes the waste may no longer meet the standard.

Wastes received meeting a technology-based treatment standard will not be tested for LDR constituent standards. The only LDR required analysis for this type of waste is that it is properly certified, in full or in part, to have been treated by the appropriate technology for the waste codes applied.

C.8.6 Treating Wastes Containing Free Liquids

In this process, wastes not otherwise restricted are treated solely to stabilize (solidify) free liquids. Pre-treatment analyses consist of the Fingerprint Analyses performed on incoming shipments unless freestanding liquids are observed (in which case USEI can conclude the waste has free liquids without the analytical test). If free standing liquids are present, they are either removed, stabilized by either placing a stabilization agent in the container or placing the contents into a stabilization unit, or by shredding the container and its contents and, if necessary, stabilizing the shredded material. If freestanding liquids are not observed and process specific criteria are met, (e.g., paint filter test) then the waste may be landfilled directly. If free liquids are decanted, any remaining material containing free liquids will be stabilized using appropriate reagents prior to landfilling, if necessary. Bulk loads, which otherwise do not contain significant quantities of free standing liquids may be "spot stabilized" in order to meet the requirements of IDAPA 58.01.05.008 {40 CFR §264.314(a)(2)} as is sometimes necessary for otherwise dry wastes which have received precipitation during transportation.

In addition, Supplemental Analyses may be requested by USEI to further evaluate the waste. Stabilized wastes will be tested using the Paint Filter Liquids test if the presence of free liquids is still suspected. Figure C.8 provides a flow chart for potential decanting techniques, if necessary.

C.8.7 Treating Wastes to an Approved Delisting Requirement

USEI successfully petitioned the IDEQ to implement its patented treatment technology for the delisting of K061 waste. Wastes treated to an approved delisting requirement shall be sampled and analyzed in accordance with the specific delisting requirements outlined in IDAPA 58.01.05.005.01. This includes specific verification testing and delisting levels.

C.8.8 Landfill Disposal

USEI's sampling & analyses program is an integral part of this phase of operation as the results serve to evaluate compliance with permit constraints, land disposal restrictions, and determine safety constraints. Landfill disposal operations require only pre-disposal analyses. Wastes to be landfilled are subject to the Fingerprint Analyses for pre-acceptance samples and incoming waste shipments, unless otherwise specified.

C.8.9 Solar Evaporation

The Evaporation Pond is used to reduce the volume of waste by solar evaporation of the liquid components of waste. There are three other permitted surface impoundments (Collection Pond Nos. 1, 2, and 3) at the facility which collect surface runoff from active portions of the facility. This water may also be stabilized prior to disposal/evaporation or may be used in the stabilization process as an additive. The end use of the collected runoff depends on its quantity and composition. The runoff is evaluated prior to transfer from the collection ponds to confirm that it is suitable for the intended use.

Pre-acceptance evaluation and waste receipt control requirements are discussed in Section C.6. These control requirements are also used as part of the waste process controls. Wastes designated for placement in the Evaporation Pond are also subjected to the balance of process control parameter analyses as presented in Table C.6 to verify that the waste is amenable to Evaporation Pond treatment. Figure C.9 shows the process control procedures used for the Evaporation Pond.

The wastes to be placed in the Evaporation Pond consist of aqueous wastes. They have relatively low concentrations of total or suspended solids, relatively non-aggressive corrosive characteristics (pH of 2 to 12.5), low concentrations of organic compounds, and no visible oil phase separation, which would impede evaporation.

No hazardous waste subject to IDAPA 58.01.05.008 {40 CFR Part 264} Subpart CC management requirements is accepted for placement into the Evaporation Pond. Waste/liner compatibility and waste/waste compatibility are established in the pre-acceptance evaluation.

USEI's sampling & analyses program is also an integral part of the Evaporation Pond as the results serve to evaluate compliance with permit constraints, land disposal restrictions, and determine safety constraints. Evaporation operations require only pre-disposal analyses. Wastes to be evaporated are typically subject to the Fingerprint Analyses for pre-acceptance samples and incoming waste shipments. Figure C.9 provides a flow chart of process control parameters for evaporation activities.

C.8.10 Wastes Treated On-site

Certain wastes are treated on-site to meet specific treatment standards. Typically, USEI requires a representative sample of the waste prior to on-site management. The waste sample is then mixed with various types of reagents to determine an acceptable mix-design (recipe) by which the waste is treated (separately or along with other wastes) to pass the required LDR standard(s).

A mix design is chosen by USEI, which will meet LDR standard(s). Waste shipments of that particular waste are then treated according to the treatment identified as capable of meeting the applicable treatment standard(s). A treatment certification will be made for each batch treated. In some cases, it may be appropriate to create mix designs after acceptance, but prior to treatment (e.g., batches of mixed wastes streams, etc.), or perhaps during or after treatment (if an approximate recipe is first determined and in-process analysis aids in further mix design development).

Debris, as defined in IDAPA 58.01.05.08 (40 CFR §268.45) may be treated by micro-encapsulation or macro-encapsulation.

C.8.11 LDR and CAMU Verification

The treatment standards are verified prior to ultimate disposal per the requirements of this WAP. LDR or CAMU conformational testing is conducted on waste stabilized at the facility or the CAMU remediation site to verify applicable treatment standards, except alternate treatment standards (e.g.; macro- & micro-encapsulation). Samples are collected from the first two batches of each hazardous waste streams treated at the facility, and at least once a year thereafter. In order to perform verification testing on batches of wastes exceeding 50yds.^{3} treated in MBT-3 or MBT-4 in the Containment Building – Debris Portion, samples will be collected from each truckload of treated waste removed from the tank(s) in accordance with the procedures described in Section C.4. Batches of treated waste less than or equal to 50yds.^{3} will be sampled in the same manner as MBT-1 and MBT-2 in the Containment Building – Stabilization Portion. The sampling frequency may be increased on waste stream that exhibit significant variable characteristics, as determined necessary by the technical reviewers.

Since treated wastes are treated based on an established recipe, they are assumed to meet the applicable treatment standard(s) and may be staged pending verification analyses, if applicable. Additional samples may be collected as necessary while performing verification analyses. Resampling associated with interim Processing Piles is discussed in more detail in Section C.11.5.

Macro-encapsulation does not require specific testing for LDR constituent standards. The performance standard for the macro-encapsulation technology is described under IDAPA 58.01.05.011 {40 CFR Part §268.45, Table 1}, entitled “Alternative Treatment Standards for Hazardous Debris”. This standard states that “Encapsulating material must completely encapsulate debris and be resistant to degradation by the debris and its contaminants and materials into which it may come into contact after placement (leachate, other wastes, microbes).

Additionally, micro-encapsulation does not require specific testing for LDR constituent standards. Following the treatment process, the micro-encapsulated debris is visually inspected. Micro encapsulation may be conducted in tanks or containers. The performance standard for the micro-encapsulation technology is described under IDAPA 58.01.05.011 {40 CFR Part §268.45, Table 1} titled “Alternative Treatment Standards for Hazardous Debris”. This standard states that “Leachability of contaminants must be reduced”.

C.9 WASTE MANAGEMENT UNITS

Section D provides detailed process information associated with all waste management units. The following sections describe the types of treatment conducted in the various waste management units available at the facility.

C.9.1 Containment Building

This Section provides information for the Containment Building. Further detail is provided in Section D.9. The Containment Building (Stabilization and Debris portions) is designed, and operated to meet the criteria for containment buildings described under IDAPA 58.01.05.008 {40 CFR 264 Subpart DD - Containment Buildings}. Operations occur as follows:

- Physical Treatment, including stabilization; and
- Mechanical Processing, including sorting/size reduction/crushing (Misc. Unit – Subpart X).

The Containment Building is used to store and treat non-bulk and bulk containers with or without free liquids anywhere within the unit, including in the oversized debris bin and/or on the sort floors. Also, non-containerized bulk materials with or without free liquids may be stored and treated in limited amounts on the unit floor. Treatment methods for hazardous waste include the following:

- Stabilization[3];
- Chemical Oxidation;
- Chemical Reduction;
- Neutralization;
- Deactivation;
- Macro Encapsulation;
- Micro Encapsulation;
- Adsorption (clay, carbon, etc.);
- Precipitation;

[3] The term "stabilization" is defined by the EPA under 40 CFR 268.42 as "Stabilization with the following reagents (or waste reagents) or combinations of reagents (1) Portland Cement; or (2) lime/pozzolans (e.g., fly ash and cement kiln dust) – this does not preclude the addition of reagents (e.g., iron salts, silicates, and clays) designed to enhance the set/cure time and/or compressive strength, or to overall reduce the leachability of the metal or organic. USEI uses the term Stabilization in a more generic sense to mean the treatment of a waste material to make it physically and chemically stable. In this sense, it consists of those processes, which make the material conform to applicable LDR treatment standards or other applicable standard(s).

- Bio-remediation;
- Mechanical Processing, including sorting/size reduction/crushing; and
- Decanting.

To facilitate treatment, a crushing system is also located inside the Containment Building as described in D.9. The location of the crusher in the Containment Building is shown on Drawing #D2020-A02, -R07 and -R08. The crushing system is physically located within the Containment Building to provide containment for any material spills or release of fugitive dust emissions, for protection from the weather, and to minimize the potential for release of waste constituents.

Additionally, the Containment Building is used to store and treat non-bulk and bulk containers with or without free liquids anywhere within the unit, including the Mixing Bin Tanks. Also, non-containerized bulk materials with or without free liquids may be stored and treated in limited amounts on the unit floor (e.g. frozen material within load).

C.9.1.1 Truck Unloading Apron #1 and #2

Truck Unloading Aprons #1 & #2, contiguous with the Stabilization Facility, are existing, unenclosed storage, processing, and receiving areas for containers with or without free liquids. The aprons consist of individual reinforced concrete slabs with underlying 80 mil HDPE liners for containment.

C.9.1.2 Truck Unloading Apron #3

Truck Unloading Apron #3, contiguous with the Containment Building, is an existing, unenclosed, subdivided storage, processing, and receiving area for containers with or without free liquids. The apron consists of three (3) curbed, reinforced concrete slabs with underlying 80 mil HDPE primary and secondary liners for containment.

C.9.1.3 Mixing Bin Tanks (Stabilization Portion)

The Stabilization Portion’s stationary Mixing Bin Tanks are internally lined with steel wear plates that do not act as the primary containment. The wear plates protect the primary containment structures during the mixing of wastes, which is performed with an excavator. Each Mixing Bin Tank is provided with a primary barrier and a secondary system equipped with collection sumps. The concrete slab floor area inside the Containment Building is provided with a primary barrier, also equipped with monitoring and collection sumps, that comply with the requirements of IDAPA 58.01.05.008 {40 CFR §264.193(e)(1)(i)}. Secondary and primary volume calculations are provided in Appendix D.2.7. Further detailed information concerning the Containment Building and the mix bin Tanks is found in Section D.9. This system is designed to manage both solid and liquid type waste streams that require treatment prior to landfill disposal.

C.9.1.4 Mixing Bin Tanks (Debris Portion)

The Debris Portion’s stationary Mixing Bin Tanks are constructed of steel and will be placed on top of the existing floor in the containment building. Since the tanks are constructed of steel, wear plates will not be installed in the Mixing Bin Tanks. The Mixing Bin Tanks will provide primary containment. The existing floor of the Debris portion of the Containment Building will provide secondary containment for each Mixing Bin Tank. This is the same surface which provides primary containment for the Containment Building. The Containment Building is provided with a primary barrier and a secondary system equipped with collection sumps. The concrete slab floor area inside the Containment Building is provided with a primary barrier, also equipped with monitoring and collection sumps, that comply with the requirements of IDAPA 58.01.05.008 {40 CFR §264.193(e)(1)(i)}. Primary and secondary volume calculations are provided in Attachment 14a, Tables D-2a, D-2b, and D-2c. Further detailed information concerning the Containment Building and the Mixing Bin Tanks is found in Section D.9. This system is designed to manage both solid and liquid type waste streams that require treatment prior to landfill disposal.

C.9.2 Stabilization Facility

Stabilization in the Stabilization Facility is conducted in Mixing Bins (i.e., containers) (See Section D, Figure D-2 for the Process Flow Diagram). Further information is provided in Section D, Section D.9 and D.10. Empty Mixing Bins are loaded onto one of two parallel tracks located on the South Side of the Stabilization Facility. The Mixing Bins are then pulled towards the Access Ramps where they are loaded with solid, sludge, and liquid wastes via elevated Access Ramps located on both sides of the Stabilization Facility (east and west sides).

After waste has been loaded into the Mixing Bin, the bins continue northward towards the reagent silos where the appropriate amounts of treatment material are added. Reagents are added to the Mixing Bins via a series of bulk material handling systems or a front-end loader, dump truck, or other appropriate equipment. Water is added directly into the mix bin at the mixing areas.
After the required reagents have been introduced to the mix bin(s), the bins are moved to the mixing area on western portion of the facility. Excavators, located on mixing platforms above the mix bins, thoroughly mix the contents of the bins.

After the reagents have been thoroughly mixed, the mix bins are indexed to the sampling area where if appropriate, waste process control samples are collected and analyzed as discussed in Sections C.10, and C.11.4. The Mixing Bins are can then be reprocessed, emptied into another container or pile for additional on and/or off-site treatment or disposal, taken to an appropriate storage area, or taken to the landfill for disposal.

C.9.3 Drum Pads 4 and 5 (CSP #4 & 5)

CSP #4 is an existing, unenclosed, subdivided storage, processing, and receiving area for containers with or without free liquids. It is curbed and constructed of reinforced concrete and sealed with an epoxy coating for containment. Drawing #PRMI-R11 shows the locations, dimensions and designations of the subdivided storage areas used for segregating incompatible wastes; this drawing also shows the locations and design of the containment systems, including slope and drainage information.

CSP #5 is an existing, unenclosed, subdivided storage, processing, and receiving area for containers with or without free liquids. It is curbed and constructed of reinforced concrete and sealed with an epoxy coating for containment. Drawing #PRMI-R11, -C12, and -C13 show the locations, dimensions, and designations of the subdivided storage areas used for segregating incompatible wastes; these drawings also show the locations and design of the containment systems, including slope and drainage information.
Further details for these storage pads are provided in Section D, Section D.1.

C.9.4 Container Storage Area No. 1 (CSA #1)

CSA #1 is an unlined storage pad primarily constructed of native compacted soils. CSA #1 is sloped to the North to Northeast to drainage collection points. Diversion channels are located South and Southwest of the unit to control run-on (Drawing PRMI-R15). Only solid materials are managed in CSA #1.

Solid wastes in non-bulk containers (e.g. bags, boxes and drums, etc.) placed into storage at CSA #1 will be elevated or otherwise protected from contact with potentially accumulated liquid (IDAPA 58.01.05.008 and 40 CFR §264.175(c)). Bulk containers are stored with a minimum of 24 in. between individual containers. Additionally, a minimum of four feet wide aisle is located between every two rows of bulk containers to allow emergency equipment access. A typical storage arrangement for bulk containers in CSA #1 is shown on Drawing # PRMI-R15.

C.9.5 RCRA/PCB Storage Building

The RCRA/PCB Storage Building is an existing, enclosed storage, processing, and receiving area for containers. Part of the building consists of a curbed, welded steel floor for containment within a steel framed building. Drawing #PRMI-R21 and PRMI-R22 show the location, dimensions, and designation of the storage area; these drawings also show the locations and design of the containment systems, including slope and drainage information. The RCRA portion (earthen floor) is for storage of solid wastes that do not contain free liquids. Storage of liquid wastes are permitted within the PCB portion of the building equipped with secondary containment.

C.9.6 Surface Impoundments

A total of four (4) surface impoundments are located at the facility. The Evaporation Pond is utilized to handle onsite or offsite generated liquid wastes, including landfill leachate that may be effectively reduced by evaporation. Three other ponds (Collection Pond Nos. 1, 2, and 3) are utilized to collect surface water runoff and, if necessary, liquids from the Evaporation Pond on a contingency basis. Acceptable wastes are either placed in the appropriate tanks pending transfer to the Evaporation Pond or unloaded directly into the Evaporation Pond.

C.9.7 Waste Water Treatment Tank System

Four (4) above ground tanks are currently used for storage and treatment of RCRA hazardous wastes at the facility designated as Tanks #1, #2, #3 & #4 and are located within secondary containment, adjacent to the southeast corner of CSP #4 as shown on Drawing # PRMI-R11, PRMI-C11, -C12, and -C13. Tank Certifications are provided in Appendix D.2.2.

The four (4) tanks are constructed of 3/8 inch welded carbon steel. Specific components of these tanks are listed in Table D-2.

All (4) tanks are vertical, shell mounted, uniformly structurally supported and anchored on concrete foundations satisfying the requirements of the American Concrete Institute Building Code 318 (ACI 318). Tanks are equipped with either a 16 in. or 24 in. manhole, a conservation breather vent, a liquid level indicator, inlet and outlet valves, and spare valves. Each tank is equipped with a fixed roof and is vented through a closed vent system to a carbon adsorption canister to remove potential volatile organic vapors.

The flow diagram shown on Drawing # 720C-P02, illustrates how the Tanks are integrated into the facility's RCRA operations and provide instrumentation details for each tank. Drawing # 720C-P01 and Appendix D.2.4 provide information on the leachate piping. The tanks are operated under ambient temperature and pressure conditions and are heat traced to prevent freezing in the winter.

Leachate Piping is either placed directly on the ground surface to facilitate regular inspection or consists of double walled pipe. The specification for this piping is included in Appendix D.2.4. The leachate piping system is operated such that it is essentially empty when not in use. The system is designed to drain back towards the leachate risers to prevent the potential for freezing. Pipe culverts have been constructed at all road crossings to protect the pipes from vehicle traffic.

C.10 QUALITY ASSURANCE/QUALITY CONTROL

The following quality assurance/quality control (QA/QC or "quality") information is utilized to ensure adequate quality assurance and quality control during waste management activities. The following documents were utilized during the development of USEI's QA/QC procedures:

1. *Test Methods for Evaluating Solid Waste: Physical/Chemical Methods, SW-846*, Third Edition, Final Update I, U.S. EPA, Office of Solid Waste, Washington, DC, July 1992, Section One, as updated

2. Handbook for analytical Quality Control in Water and Wastewater laboratories, EPA 600/4-79-019, March 1979, US Environmental Protection Agency (USEPA), Environmental Monitoring and Support Laboratory (EMSL), Cincinnati, OH.

Quality protocols are applicable to both sampling and analytical techniques. The following sections provide general QA/QC procedures USEI utilizes during the collection, transfer, storage and analysis.

The objective of the Quality Assurance/Quality Control (QA/QC) program is to ensure that operational decisions result in the proper treatment, storage and disposal of the hazardous wastes handled at the facility. An additional aspect of this program is to ensure that hazardous wastes, which are restricted from disposal at the facility, are adequately screened prior to acceptance of waste shipments. The principal components of this program are listed as follows for the routine acceptance, treatment, and disposal of hazardous waste.

- Pre-acceptance review to screen and classify waste;

- Review and cross-check of shipping and manifest documentation for each shipment as it arrives at the facility;

- Second review of pre-acceptance information, classification, and shipping documentation prior to any storage, treatment, or disposal activity;

- Field inspections, item counts, and other physical verification of shipment contents performed independently by technical personnel;

- Sampling performed by trained personnel using accepted procedures;

- Fingerprint analysis performed by qualified technical personnel;

- Comparison of field data, fingerprint data, and pre-acceptance information for consistency prior to QC release of waste for disposal; and

- Treatment determination study of process capabilities for stabilization of hazardous constituents by demonstration and analysis during the pre-acceptance review process.

C.10.1 Sampling QC

Personnel involved in the sampling of waste are given formalized training. This consists of a presentation of the theoretical aspects of random sampling and the practical considerations of sample collection and sampling handling. Documentation is maintained in the employee's personnel file to reflect the nature and content of the training per the requirements of Section H of this Document.

C.10.1.1 Fingerprint Analysis

Fingerprint analysis performed in the routine acceptance of waste shipments provides qualitative confirmation that the waste actually received on-site is consistent with the more rigorous pre-acceptance criteria. For personnel and equipment involved with this analysis, personnel receive training in the types and methods involved in the physical characterization of waste and specific factors of concern. Notations of non-conforming physical characteristics and other fingerprint parameters may be recorded on the ICF and/or other pertinent documentation associated with the processing of the waste for disposal.

C.10.1.2 General Sample Handling

Hazardous waste samples, sample containers, and sampling equipment are handled in a manner that is consistent with the required analytical procedures. Samples are sealed and transported to the laboratory as soon as practical after collection. The seal normally consists of a bottle cap or other closure that prevents spillage. The outside of the sample container is cleaned prior to being removed from the sampling location to limit the potential spread of any contamination. This is accomplished by wiping the sample container with a dry or dampened cloth. In some cases, rinsing with water or other solvents may be appropriate.

C.10.1.3 Sample Identification and Documentation

Hazardous waste samples collected under the requirements of this WAP are currently numbered by one of two systems (or equivalent), depending on whether the samples are from routine waste or non-routine wastes. If the sample is from waste routinely received for disposal, it has an associated Internal Control Form (ICF)/load number assigned. The sample identification number consists of that ICF/load number followed by the ICF item number and a specific container designator.

Non-routine samples (those with no associated ICF number) are consecutively numbered based upon yearly sequential numbers as follows:

03-0001

"03" indicates the calendar year the sample is collected.

"0001" is a consecutive number that progresses upwards until the end of the year.

The following information is placed on all sample labels:

- Essential information;

- Sample Identification Number;
- Date the sample was collected; and
- Initials or name of sample collector.

Additional information (to be provided as requested):

- Generator's name;
- Description of waste, including shipping name, identification numbers, container type, etc.;
- Location of sampling site/grid;
- Waste Stream Identification (WSID) Number; and
- Analysis requested.

Records of all samples collected under the requirements of this WAP are kept by the facility. For all ICF/load related samples, these records include information on physical characteristics (e.g., liquid, solid, etc.), item count, discrepancies/problems, and other related data.

Incoming samples are recorded in the sample logs and/or electronically by the facility. ICF-related samples have a completed WPQ that outlines the required fingerprint parameters and expected results. The specific tracking system is dependent on the current database tracking system, which is periodically updated, as necessary. The above outline provides an example of how a tracking system is organized.

Chain-of-custody procedures are used when deemed necessary to document sample possession from time of collection through transfer to other facilities. Normally, these procedures are used when outside laboratories are utilized and/or there is legal reason to document the chain of possession of the sample. Samples are stored in a secure and controlled location. An example of a chain-of-custody form is shown in Figure C.10.

C.10.1.4 Sample Storage and Preservation

Samples are properly preserved, stored, and analyzed as soon as practical after they are collected. Refrigeration is a part of most sample storage/preservation techniques; however, some sample constituents, such as metal cations, which may precipitate into a salt that will not readily re-dissolve, may be adversely affected by refrigeration.

Chemical preservation is used for specific constituents because of the potential reaction of the preservative with other possible constituents. Where a sample is needed for multiple constituents, several separate sample bottles may be required for proper preservation. For those samples required to be sent to an off-site laboratory, the normal procedure is to contact the off-site laboratory for type of container (e.g. plastic, glass etc.), preservative requirement, required volume, and storage time limitations associated with the analytical method and the requested analysis.

Routine samples for receipt and process control purposes are not usually preserved because analysis is begun shortly after sample collection.

C.10.2 QC for Other Analytical Procedures

The facility maintains a substantial amount of analytical capacity above that required performing routine fingerprint analysis. In order to maintain a high level of confidence in the data generated from the use of the analytical procedures, the QC provisions cited in these procedures are followed as appropriate based on the need for information. For example, if a procedure is run for the purpose of confirmation of analytical information supplied from an outside source, the QC considerations may be relaxed somewhat as opposed to the same procedure run for the precise quantification of a chemical species. The facility may, from time to time, determine the need to incorporate additional analytical procedures for various reasons. As these are adopted for use, appropriate QC provisions are also implemented consistent with the confidence levels associated with the need for additional information.

C.10.3 Additional Laboratory QC Provisions

Additional components of the laboratory QC program are as follows:

- Instrumentation and equipment are maintained in serviceable condition as determined by manufacturers recommendations and by the facility's internally determined need for analytical capability.
- All volumetric glassware is designated as Class "A" as defined by the National Bureau of Standards, if required by the analytical methodology.
- All chemicals and reagents used in any fingerprint test or other analytical procedure are of sufficient purity to be non-interfering with the results desired. In those tests and procedures where minimum purity levels are specified, such as "ACS Reagent Grade", or equivalent are used, as appropriate.

C.10.4 Laboratory and Sampling Quality Assurance Program

The basis for obtaining reliable data consistent with the identified needs of the facility rests with the equipment, procedures, and personnel involved. The methods for maintaining high standards of performance in these areas lie in the detection of deviations from established protocols or the appearance of previously undetected or procedural interference's. In the first case, the assurance of quality is based on observations derived from daily observations and periodic internal compliance audits. In the second case, numerical information is required from the analysis of blanks, spikes, surrogates, and other known quantities. Documentation of the QC activities associated with and required by the sample collection and analyses procedures are maintained.

C.10.4.1 Sampling Program

Sampling procedures are described in Section C.4 of this WAP. The selection of the sample collection device depends on the type of sample, the sample container, the sampling location and the nature and distribution of the waste components. In general, the methodologies used for specific materials correspond to those referenced in IDAPA 58.01.05.005 {40 CFR Part 261, Appendix I}. The selection and use of the sampling device is supervised or performed by a person thoroughly familiar with the sampling requirements. Sampling equipment is constructed of non-reactive materials such as glass, PVC plastic, aluminum, or stainless steel. Care is taken in the selection of the sampling device to prevent contamination of the sample and to ensure compatibility of materials. For example, glass bottles are not used to collect hydrofluoric acid wastes.

Individual container samples that are related may be composited prior to analysis as described in Section C.4.3.

C.10.4.2 Analytical Program

USEI has developed a program of analytical quality practices and procedures to ensure that precision and accuracy are maintained. These programs include the use of control standards, duplicates, spikes, and blanks. Non-company laboratories employed by the company demonstrate quality control practices that are comparable to USEI's practices.

C.11 GENERAL CONSIDERATIONS

In the operation of a hazardous waste management facility a number of issues become apparent, which are not necessarily anticipated in the regulations and may present unique management methods. Below are sections addressing several issues of this nature and other unique situations. It is USEI's intention to address these issues in this forum to provide insight into the technique development.

C.11.1 Disposition of Samples

Samples of waste streams are commonly disposed in the same fashion as the waste stream itself. If, for example, a waste is approved for stabilization and landfilling, the sample may be stabilized (e.g.; in the lab, in containers, or mix bins) and subsequently disposed. Samples received, which are unauthorized for management on-site, are returned to the generator (or representative) or aggregated (under the provisions of IDAPA 58.01.05.006 and 40 CFR §262.34) and sent off-site to an authorized facility for subsequent management. To facilitate sample management, samples approved for the same management processes may be consolidated (e.g.; in tanks or containers) and managed under the provisions of IDAPA 58.01.05.006 {40 CFR §262.34}. Should samples arrive on-site from an identified generator, but without proper waste identification, USEI will attempt to contact the generator to identify the associated waste and appropriate hazardous waste codes, if any. If a sample identity cannot be resolved with a generator, or if the generator of the waste sample cannot be determined, USEI will attempt to identify the generator and send it back or such samples may be managed as on-site generated waste and subject to classification as characteristic wastes (D001 through D043) for the characteristics / contaminants reasonably expected to be in the waste.

C.11.1.1 Frozen Samples

Samples of frozen loads are defrosted prior to analysis (Note: to speed up fingerprinting, samples may be heated under the vent hood). In some cases, it may be necessary to defrost entire loads or, for drum loads, 10% of the load, to facilitate sampling or to inspect for free standing liquids. As an alternative, and if conditions warrant (e.g., anticipated freezing conditions) a sample of waste being delivered may be taken at the point of generation for the purpose of satisfying the requirements of this plan. Such samples will be taken from either the load or place of generation or accumulation. If this procedure is utilized, the load will also be visually inspected on-site for Physical Appearance to check against obvious differences in waste type.

C.11.2 Sampling Safety Precautions

Sampling personnel wear personal protective equipment (PPE) (e.g.; eye, foot, hand, head & respiratory protection & protective clothing), as necessary. Load receipt personnel check the manifest or other shipping or pre-acceptance information to be familiar with the material and ensure necessary precautions are taken. Specific safety precautions are outlined in USEI's Health and Safety Plan.

C.11.3 Remote Project Sampling and/or Analysis

In cases where USEI directs off-site sampling (e.g.; at USEI's Rail Transfer Station) or analysis for the purpose of having that sample or analysis meet the requirements of the USEI provisions (e.g., Fingerprint Testing, etc.), USEI will instruct an on-site representative in the requirements of this WAP or a USEI representative will be at the project site to ensure compliance with the provisions of this WAP including the applicable QA/QC requirements.

C.11.4 Sampling of LDR Waste and CAMU Waste

When waste is treated on-site for the purpose of meeting LDR or CAMU treatment standards or, for LDR or CAMU-eligible waste confirmation testing, samples are taken on a grab sample basis. EPA has promulgated compliance of concentration based treatment standards for all non-wastewaters based on grab samples as stated in IDAPA 58.01.05.011 {40 CFR §268.40(b)}. USEI follows this sampling methodology for waste treated on-site. Any grab sample must pass the treatment standards in order for compliance to be assured. When there is any uncertainty in achievement of treatment standards, the sample should be re-sampled and/or re-analyzed as necessary.

C.11.5 Interim Processing Loads

Following treatment, the treated waste is sent to the landfill for final disposal and “staged” in the landfill while applicable verification testing is performed as described in Section C.6. Up to 50 batches may be staged at any point in time. Staged material will be staged for up to 10 working days.

USEI may submit an extension request to the IDEQ if additional time is needed to verify treatment due to unique verification sampling and analysis requirements (e.g., samples need to be sent offsite for analysis).

C.11.5.1 Re-Sampling of Interim Processing Piles

Wastes treated on or off-site and “staged” at one of the interim processing pile in the landfill that result in a failure of applicable standards (from an initial sample) may need re-sampling for verification analyses. If the re-sampling indicates the waste meets treatment standards the waste may be released for disposal. If re-sampling indicates the material does not meet applicable treatment standards the waste will be redirected for further treatment, as necessary.

C.11.6 Lab Packs

Lab Packs are managed in accordance with IDAPA 58.01.05.008 {40 CFR §264.316}. Lab Packs are not sampled. Lab packs must be packaged in non-leaking inside containers and must be over packed in an open head metal container with less than 110 gallon capacity and surrounded by a sufficient quantity of non-biodegradable sorbent material capable of absorbing the liquid contents of the container. The sorbent material must not be capable of reacting dangerously with, being decomposed by, or being ignited by the contents of the lab pack. Reactive wastes, other than cyanide or sulfide bearing waste (as defined by IDAPA 58.01.05.005 and 40 CFR §261.23(a)(5)) must be treated or rendered non-reactive prior to packaging. Lab pack material is accepted subject to a contents and packaging review. Lab pack materials which are proposed to be treated, stored, or disposed are inventoried, and the inventories are sent to the facility for review. The inventories are reviewed for incompatibility of contained materials, land disposal restrictions, and utilization of appropriate packing materials. Since lab packs contain many small quantities of individual materials, they are not sampled, but are inspected to ensure adequate packing material is present and the drum is at least 90% full (if destined for direct landfilling). If necessary, sorbent material may be added until the lab pack is 90% full.

C.11.7 Management of Residues[4]

Management of waste residues and other miscellaneous equipment or debris originating from on-site management areas or activities may be managed as on-site generated wastes and classified according to their hazardous waste characteristics, if any. However, where an on-site generated waste is derived from one or more wastes, it will be managed in accordance with the approved management conditions for that waste(s) (e.g.; a spill of F002 material may be managed as F002), or if precluded by permit, regulation, or operational conditions, it may be subject to alternative management, as appropriate. Stabilization residues and other treatment residues will carry the waste code(s) and will be managed in the same manner as the last waste stream in the unit. For example, sludge's removed from a stabilization mix bin which last received K061 wastes would carry the K061 code and must meet appropriate treatment standards for K061 before being land disposed on-site, if that were the selected disposal option. Residues from waste treatment units will carry the waste codes and be managed consistent with the waste last managed in the unit. The applicable waste codes and corresponding waste management methods will be based upon the "First In, First Out" principle and the estimated resident time. Residues from truck cleaning, Containment Building, Stabilization Facility, or in other waste management units are managed either with the like materials being managed at those locations or as on-site generated waste. Residues in "RCRA Empty" containers are not subject to this WAP since they are not solid or hazardous wastes per IDAPA 58.01.05.005 {40 CFR §261.7}.

C.11.8 Rejected Load or Rejected Partial-Load, and Re-Manifesting Procedures

Manifest discrepancies are resolved, if possible, by contacting the generator or its representative to obtain the needed information. There are many cases where entire loads or portions of loads may be rejected (e.g., a bulk load contains un-profiled or unacceptable[5] materials). The regulations (IDAPA 58.01.05.008 and 40 CFR Parts 264, Subpart E – *Manifest System, Recordkeeping, and Reporting*) do not give instructions on how materials are rejected or re-manifested. The exact manifesting procedures will be determined considering the variables associated with any particular rejection, but, in general, the following is a summary of the typical considerations associated with rejecting materials.

Two options are available for rejecting some or all of a load. The 1st option includes sending material out on the original manifest noting in Block 19 that the load is being rejected back to the point of origination or the alternate facility designated on the manifest or verbally designated by

---

[4] Residues is used to mean solids and liquids contained or generated in sumps, truck & equipment washing, tank cleaning, boiler cleaning, evaporator cleaning, distillation unit cleaning, equipment maintenance, repair, or replacement, pipes, valves, filters, filter media, miscellaneous samples, and personal protective equipment.
[5] The material may be "unacceptable" for many reasons, of which only some are due to permit constraints. The term "unacceptable" is not meant to mean unacceptable due to permit constraints, but to also cover those materials for which the facility has not developed the appropriate management procedures or process in managing the waste and for other causes.

the generator. If the manifest has not already been signed, the original manifest may be utilized by either striking through the original TSDF destination and inserting the new (alternate) destination or by simply noting in block 19 the new destination. If the manifest has been signed, an additional line may be struck through USEI's signature on the manifest.

A 2nd option is to generate a new manifest. This procedure is less preferable since USEI must complete the Generator's section of the manifest and, in this case, language may be inserted in blocks J, K, or 15 indicating USEI is the generator for shipping purposes only and referencing the original manifest. This option is often useful for bulk loads for which a portion is being rejected in containers (e.g.; aerosol cans removed from a bulk load may be sent back to the generator packaged in DOT shipping containers) and for rejecting or forwarding on a portion of a container shipment. In either case, USEI will copy the generator notifications and/or certifications for that shipment and attach a copy to the outgoing manifest(s) rather than altering the notifications and/or certifications made by the generator.

Although not required for entire load rejections, USEI will usually keep a copy of the manifest(s), subsequently generated manifest(s), and notifications and/or certifications. In cases where the waste is being manifested back to the generator, USEI does not need to complete the LDR Notifications or Certifications since the waste is not being sent for land disposal.

C.11.9 Restricted Waste

Certain wastes are restricted from on-site disposal at the facility. Table C.8 provides the list of on-site disposal restricted waste.

C.11.10 Brokerage of Non-Hazardous and Hazardous Waste

Wastes accepted for management may be subsequently sent to an alternate facility for disposal and or other management, if necessary. At times, USEI may elect to send waste to an alternate TSDF due to scheduling, economic, and/or operational complications associated with the waste in question. Alternatively, some waste streams may have a specific technology code (IDAPA 58.01.05.011 {40 CFR §268.40} Treatment Standards) that requires a type of treatment not offered by USEI. Other undefined reasons my result in the decision to send waste offsite for disposal. As a result, these wastes will be brokered for further treatment at an appropriate facility, as necessary. Examples of wastes that may require brokering include:

- Wastes greater than 260 mg/kg total mercury;
- Specific customer requests;
- Flammable liquids;
- Wastes with specific technology codes not offered by USEI;
- Certain wastes regulated under Subpart CC.

Brokered wastes will be managed under the same management methods, procedures and restrictions outlined within this WAP. For example, USEI will utilize appropriate waste determination/characterization, sampling, pre-acceptance, receiving, and storage requirements as outlined in this WAP. Wastes my also be consolidated or bulked as necessary for off-site shipment.

Additionally, material that will be brokered for offsite disposal will be designated as such by placing a red dot on the top of the drum or other visible location. Specific markings for brokered waste will facilitate tracking of brokered material as described in Section D.1.b.

C.11.10.1 Storage of Brokered Waste

Waste that will be brokered for offsite shipment will conform to the same management requirements outlined in this WAP including associated compatibility requirements. Section D.1.b provides more detailed storage requirements.

C.11.11 Non-Hazardous Wastes (NHW)

USEI accepts wastes, which are not hazardous as defined under RCRA or are exempt from RCRA regulations (e.g., household hazardous waste, etc.). USEI utilizes this WAP and the procedures contained herein to review non-hazardous wastes, however, depending on the specific waste, specific sections of this WAP may not be applicable (e.g., manifesting provisions, sampling requirements, LDR verification of treated wastes, etc.).

Each load of NHW arriving for on-site treatment or disposal will be visually inspected in order to verify waste conformance and/or acceptability. If applicable, NHW liquids will be solidified prior to disposal and will follow the requirements of IDAPA 58.01.05.008 {40 CFR §264.314}.

C.11.12 Protectively-Characterized Wastes

Generators occasionally “protectively” (overly)-characterize[6] wastes sent to off-site TSDFs for a variety of reasons (including public relations, legal reasons, financial incentives, lack of characterization experience, or lack of specific analytical information). USEI has analytical resources and technical personnel trained and experienced in proper regulatory/waste classification and who are capable of detecting protective-classification. Examples of protective-characterization include remedial projects where soils are classified according to a specific waste characteristic (e.g., D008 – lead), but where any specific load(s) do not fail the TCLP analysis for the specific waste characteristic as a “protective” measure. USEI, where it possesses specific analytical data, process knowledge, or regulatory knowledge may properly characterize waste during the pre-acceptance or load-arrival process. The primary criteria for re-classifying hazardous waste are analytical data (e.g., TCLP test as described above) unless the re-classification is a result of a regulatory exemption and/or other criteria. Prior to disposal, USEI will complete an appropriate Notification and/or an appropriate LDR Certification, as required.

---

[6] “Over-characterization” means the practice of applying waste codes or UHCs to a waste which do not apply and/or to the practice of not applying appropriate LDT Notifications or Certifications.

C.11.13 Standard Profiles

"Standard profiles" may be used for waste streams which are 1) similar in physical or chemical characteristics or 2) generated by similar industries or processes. This profile designation is consistent with EPA's approach of assigning a listed waste code to similar process wastes. All the wastes within a standard profile are usually managed at USEI using the same treatment process.

USEI may develop standard profiles based on information from waste streams targeted for this process. USEI reviews the generator provided information to evaluate whether an individual waste stream is sufficiently similar in physical and/or chemical characteristics to an established standard profile. A specific waste stream may be identified as conforming to an approved standard profile by evaluating the individual waste stream information against the standard profile. The specific waste stream information must fall within the standard profile representative ranges in order to incorporate that waste stream into the standard profile.

Specific candidate waste streams, which, upon review, are identified as conforming to an existing approved standard profile, will be managed under the existing waste management decision specific for that standard profile.

C.11.14 RCRA/PCB Waste

The USEI facility is a fully permitted RCRA and TSCA facility. Often, material is accepted that is both a characteristic/listed RCRA waste and a PCB contaminated TSCA waste. When this occurs, the material is managed as a RCRA waste since the PCB component is managed as a UHC under the RCRA regulations. In this manner, the material is not a PCB waste but a RCRA waste subject to RCRA regulations. If the material in question is not characteristic/listed under RCRA and does have a PCB component (i.e., regulated under TSCA) then the waste will be managed as a TSCA waste as described by USEI's TSCA permit. This distinction provides important guidance as the two sets of regulations are not always the same and it is necessary that the material be managed under clear and consistent regulations.

C.12 CONCLUSION

The aforementioned sampling and analytical quality practices help ensure the data obtained are precise and accurate for the waste stream being sampled. The analytical results are used by facility management to decide whether or not to accept a particular waste and, upon acceptance, to determine the appropriate method of treatment, storage, and disposal. Results are also important to ensure that wastes are managed properly by the facility and that incompatible wastes are not inadvertently combined. The quality of these results is as important as the results themselves. Thus, the quality of the analytical data, the thoroughness and care with which the sampling and analyses are performed and reported, provides an important basis for day-to-day operational decisions.

Dear Mr. Takacs:

SUBJECT: Hazardous Waste Management Facility Expansion Operating License (License); Wayne Disposal, Inc. (WDI), Belleville, Michigan; MID 048 090 633

The Department of Environmental Quality (DEQ), Resource Management Division (RMD), has completed its review of the License application from WDI. Based on that review and the results of the public hearing held on March 12, 2012, the DEQ has issued the License to WDI pursuant to Part 111, Hazardous Waste Management, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended. The License application review and the public participation procedures were conducted in accordance with Part 111.

Enclosed are copies of the License, Response to Comments, and Notice of Final Decision. The license attachments that were previously provided with the draft License have not changed, so they can be included with this final License. If you have any questions or comments, please contact Mr. Peter Quackenbush, Hazardous Waste Section, RMD, at 517-373-7397; quackenbushp@michigan.gov; or DEQ, P.O. Box 30241, Lansing, Michigan 48909-7741.

Sincerely,

Liane J. Shekter Smith, P.E., Chief
Resource Management Division
517-373-9523

HAZARDOUS WASTE MANAGEMENT FACILITY EXPANSION OPERATING LICENSE

NAME OF LICENSEE: Wayne Disposal, Inc.

NAME OF FACILITY OWNER: EQ – The Environmental Quality Company

NAME OF FACILITY OPERATOR: Wayne Disposal, Inc.

NAME OF TITLEHOLDER OF LAND: Wayne Disposal, Inc.

FACILITY NAME: Wayne Disposal, Inc.

FACILITY LOCATION: 49350 North I-94 Service Drive
Belleville, Michigan 48111

EPA IDENTIFICATION (ID) NUMBER: MID 048 090 633 EFFECTIVE DATE: May 4, 2012

REAPPLICATION DATE: November 5, 2021 EXPIRATION DATE: May 4, 2022

AUTHORIZED ACTIVITIES

Pursuant to Part 111, Hazardous Waste Management, of Michigan's Natural Resources and Environmental Protection Act, 1994 PA 451, as amended (Act 451), being §§324.11101 to 324.11153 of the Michigan Compiled Laws, and the hazardous waste management administrative rules (hereafter called the "rules") promulgated thereunder, being R 299.9101 *et. seq.* of the Michigan Administrative Code, by the Department of Environmental Quality (DEQ), an operating license (hereafter called the "license") is issued to Wayne Disposal, Inc. (hereafter called the "licensee"), to operate a hazardous waste management facility (hereafter called the "facility") located at latitude 42° 13' 30" N and longitude 83° 31' 00" W. The licensee is authorized to conduct the following hazardous waste management activities:

- ☒ STORAGE
  - ☐ Container
  - ☒ Tank
  - ☐ Waste Pile
  - ☐ Surface Impoundment
  - ☐ Drip Pad
- ☐ TREATMENT
  - ☐ Container
  - ☐ Tank
  - ☐ Surface Impoundment
  - ☐ Incinerator
  - ☐ Other:
- ☒ DISPOSAL
  - ☒ Landfill
  - ☐ Land Application
  - ☐ Surface Impoundment
- ☒ POSTCLOSURE
  - ☐ Tank
  - ☐ Surface Impoundment
  - ☒ Landfill
  - ☐ Waste Pile

APPLICABLE REGULATIONS AND LICENSE APPROVAL

The conditions of this license were developed in accordance with the applicable provisions of the rules, effective March 17, 2008. The licensee shall comply with all terms and conditions of this license. This license consists of the 32 pages of conditions attached hereto (along with those in Attachments 1 through 16) and the applicable regulations contained in R 299.9101 through R 299.11008, as specified in the license. For purposes of compliance with this license, applicable rules are those that are in effect on the date of issuance of this license in accordance with R 299.9521(3)(a).

This license is based on the information in the license application submitted on March 4, 2011, and any subsequent amendments (hereafter referred to as "the application"). Pursuant to R 299.9519(11)(c), the license may be revoked if the licensee fails, in the application or during the license issuance process, to disclose fully all relevant facts or, at any time, misrepresents any relevant facts. As specified in R 299.9519(1), the facility shall be constructed, operated, and maintained in accordance with Part 111 of Act 451, as amended on December 22, 2010; the rules; and this license.

This license is effective on the date of issuance and shall remain in effect for 10 years from the date of issuance, unless revoked pursuant to R 299.9519 or continued in effect as provided by the Michigan Administrative Procedures Act, 1969 PA 306, as amended (Act 306). Pursuant to R 299.9516, this license shall be reviewed by the DEQ 5 years after the date of issuance and shall be modified as necessary in accordance with the provisions of R 299.9519 and R 299.9520.

Issued this 4th day of May, 2012

by ______________________________
Liane J. Shekter Smith, P.E., Chief
Resource Management Division

PART I
STANDARD CONDITIONS

A. TERMINOLOGY AND REFERENCES

Throughout this license, the term "Division" means the Resource Management Division within the DEQ responsible for administering Part 111 of Act 451 and the rules. Throughout this license, "Director" means the Director of the DEQ or the Director's duly authorized designee such as the Division Chief. All of the provisions of Title 40 of the Code of Federal Regulations (CFR) referenced in this license are adopted by reference in R 299.11003.

B. EFFECT OF LICENSE

Except as otherwise provided by law, any treatment, storage, or disposal of hazardous waste not specifically authorized in this license is prohibited. Issuance of this license does not authorize any injury to persons or property, any invasion of other private rights, or any infringement of federal, state, or local law or regulations {R 299.9516(8)}; nor does it obviate the necessity of obtaining such permits or approvals from other units of government as may be required by law. Compliance with the terms of this license does not constitute a warranty or representation of any kind by the DEQ, nor does the DEQ intend that compliance with this license constitutes a defense to any order issued or any action brought under Act 451 or any other applicable state statute or §106(a) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) {Title 42 of the United States Code (U.S.C.) §9606(a)}, the Resource Conservation and Recovery Act of 1976, as amended (RCRA), and its rules, or any other applicable federal statute. The licensee, however, does not represent that it will not argue that compliance with the terms of this license may be a defense to such future regulatory actions. Each attachment to this license is a part of, and is incorporated into, this license and is deemed an enforceable part of the license.

C. SEVERABILITY

The provisions of this license are severable, and if any provision of this license, or the application of any provision of this license to any circumstance, is held invalid, the application of such provision to other circumstances and the remainder of this license shall not be affected thereby.

D. RESPONSIBILITIES

1. The licensee shall comply with Part 111 of Act 451, the rules, and all conditions of this license, except to the extent authorized by the DEQ pursuant to the terms of an emergency operating license. Any license noncompliance, except to the extent authorized by the DEQ pursuant to the terms of an emergency operating license, constitutes a violation of Part 111 of Act 451 and is grounds for enforcement action, license revocation, license modification, or denial of a license renewal application. {R 299.9521(1)(a) and (c) and (3)(a) and (b) and 40 CFR §270.30(a)}

2. If the licensee wishes to continue an activity regulated by this license after the expiration date of this license, the licensee shall submit a complete application for a new license to the Division Chief at least 180 days before this license expires, November 5, 2021, unless an extension is granted pursuant to R 299.9510(5). To the extent the licensee makes a timely and sufficient application for renewal of this license, this license and all conditions herein will remain in effect beyond the license expiration date and shall not expire until a decision on the application is finally made by the DEQ, and if the application is denied or the terms of the new license are limited, until the last day for applying for judicial review of the new license or a later date fixed by order of the reviewing court consistent with §91(2) of Act 306. {R 299.9521(1)(a) and (c) and (3)(a) and 40 CFR §270.30(b)}

3. The licensee shall comply with the conditions specified in R 299.9521(1)(b)(i) to (iii) and 40 CFR §270.30(c) through (k), (l)(2), (3), (5), (7), and (11), and (m). {§§11123(3), 11146(1) and (2), and 11148(1) of Act 451 and R 299.9501(1), R 299.9516, R 299.9519, R 299.9521(1)(a) and (b) and (3)(a) and (b), R 299.9522, and R 299.9525}

4. The licensee shall give notice to the Division Chief as soon as possible prior to any planned physical alterations or additions to the licensed facility.

E. **SUBMITTAL DEADLINES**

When the deadline for submittals required under this license falls on a weekend or legal state holiday, the deadline shall be extended to the next regular business day. This extension does not apply to the deadline for financial mechanisms and associated renewals, replacements, and extensions of financial mechanisms required under this license. The licensee may request extension of the deadlines for submittals required under this license. The licensee shall submit such requests at least five business days prior to the existing deadline for review and approval by the Division Chief. Written extension requests shall include justification for each extension. {R 299.9521(3)(a)}

PART II
GENERAL OPERATING CONDITIONS

A. GENERAL WASTE ANALYSIS

The licensee shall ensure that any waste managed at the facility has been properly characterized pursuant to R 299.9302 and comply with the procedures described in the attached Waste Analysis Plan, Attachment 1, of this license. {R 299.9605(1) and 40 CFR §264.13}

B. SECURITY

The licensee shall comply with the barrier, surveillance, and signage requirements of R 299.9605(1) and 40 CFR §264.14.

C. GENERAL INSPECTION REQUIREMENTS

1. The licensee shall inspect the facility in accordance with the Inspection Schedule, Attachment 2, of this license and comply with the inspection requirements of R 299.9605(1) and 40 CFR §264.15.

2. The licensee shall implement the procedure to ensure compliance with the requirements of R 299.9605(2) regarding transport vehicles and other containers leaving the facility.

D. PERSONNEL TRAINING

The licensee shall comply with the personnel training requirements of R 299.9605 and 40 CFR §264.16. The Personnel Training Program, Attachment 3, of this license shall, at a minimum, cover all items in R 299.9605 and 40 CFR §264.16.

E. PREPAREDNESS AND PREVENTION

The licensee shall comply with the preparedness and prevention requirements of R 299.9606 and 40 CFR Part 264, Subpart C.

F. CONTINGENCY PLAN

The licensee shall comply with the contingency plan requirements of R 299.9607 and 40 CFR Part 264, Subpart D. The Contingency Plan, Attachment 4, of this license, and the prescribed emergency procedures shall be immediately implemented by the licensee whenever there is a fire, explosion, or other release of hazardous waste or hazardous waste constituents that threatens or could threaten human health or the environment, or if the licensee has knowledge that a spill has reached surface water or groundwater.

G. DUTY TO MITIGATE

Upon notification from the Division Chief or his or her designee that an activity at the facility may present an imminent and substantial endangerment to human health or the environment, the licensee shall immediately comply with an order issued by the Division Chief to halt such activity and conduct other activities as required by the Division Chief to eliminate the said endangerment. The licensee shall not resume the halted activity without the prior written approval from the Division Chief. {§11148 of Act 451 and R 299.9521(3)(b)}

H. **MANIFEST SYSTEM**

The licensee shall comply with the manifest requirements of R 299.9304, R 299.9305, and R 299.9608.

I. **RECORD KEEPING AND REPORTING**

1. The licensee shall comply with the written operating record and monthly operating report (EQP 5142 form) requirements of R 299.9609 and 40 CFR §264.73 and Part 264, Appendix I, and R 299.9610(3), respectively. The monthly operating report shall be submitted on EQP 5142 form provided by the Division Chief, or an equivalent form that has been approved by the Division Chief.

2. The licensee shall comply with the biennial report requirements of R 299.9610. {R 299.9521(1)(a) and 40 CFR §270.30(l)(9)}

3. The licensee shall submit the results of all environmental monitoring required by this license and any additional environmental sampling or analysis conducted beyond that required by this license, in the form of an Environmental Monitoring Report to the Division Chief within 60 days after any sample collection. Such increased frequency shall be indicated in the Environmental Monitoring Report. {R 299.9521(1)(a) and R 299.9521(3)(b) and 40 CFR §270.30(l)(4)}

4. The licensee shall provide environmental monitoring information or data that is required pursuant to this license, to an authorized representative of an environmental or emergency response department of the Van Buren Charter Township or Wayne County who requests such information or data and that has jurisdiction over the facility. Such information or data shall be made available on the same day the licensee forwards this information to the Division Chief. {R 299.9521(3)(b)}

5. The licensee shall immediately report to the Division Chief any noncompliance with the license that may endanger human health or the environment by doing both of the following:

   (a) The licensee shall immediately notify the Division Chief at 517-335-2690, if the noncompliance occurs Monday through Friday during the period of 8:00 a.m. to 5:00 p.m., except state holidays, or by calling the DEQ Pollution Emergency Alerting System (PEAS) at 1-800-292-4706 during all other times. This notice shall include the following:

      (i) Information concerning the fire, explosion, release, or discharge of any hazardous waste or hazardous waste constituent that could threaten human health or the environment, that has reached surface water or groundwater, or that may endanger public drinking water supplies or the environment; and

      (ii) A description of the occurrence and its cause, including all of the information outlined in R 299.9607(2)(a)-(i).

   (b) The licensee shall also follow up the verbal notice by providing a written report to the Division Chief within five days of the time the licensee becomes aware of the circumstances. The written report shall contain all of the information in Condition II.I.5.(a)(i)-(ii) of this license along with a description of the noncompliance and its cause; the periods of noncompliance (including exact dates and times); whether the noncompliance has been corrected and, if not, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent recurrence of the noncompliance and when those activities occurred or will occur. The Division Chief may waive the five-day written notice requirement if the licensee submits a written report containing this information within 15 days of the time the licensee becomes aware of the circumstances.

{R 299.9521(1)(a) and R 299.9607 and 40 CFR §270.30(l)(6)}

6. The licensee shall report all other instances of noncompliance with this license, Part 111 of Act 451, the rules, and any other applicable environmental laws or rules that apply to the licensed facility, at the time monitoring reports required by this license are submitted or within 30 days, whichever is sooner. The reports shall contain the information listed in Condition II.I.5. of this license. {R 299.9521(1)(a) and 40 CFR §270.30(l)(10)}

7. The licensee may make minor modifications to the forms contained in the attachments to this license. The modifications may include changing the format, updating existing references and information, adding necessary information, and changing certification and notification information in accordance with Part 111 of Act 451 and its rules and RCRA and its regulations. The licensee shall submit the modifications to the Division Chief prior to implementing the use of the modified form(s). If the Division Chief does not reject or require revision of the modified form(s) within 14 days of receipt, the licensee shall implement use of the modified form(s) and the form(s) shall be incorporated into this license as a replacement for the existing form(s).

J. **CLOSURE**

The licensee shall comply with the closure requirements of R 299.9613. The licensee shall close the facility in accordance with the Closure Plan, Attachment 5, of this license, all other applicable requirements of this license, and all other applicable laws. {R 299.9613 and 40 CFR Part 264, Subpart G, except 40 CFR §§264.112(d)(1), 264.115, and 264.120}

K. **POSTCLOSURE**

The licensee shall comply with the postclosure monitoring requirements of R 299.9613 and monitor and maintain the facility in accordance with the Postclosure Plan, Attachment 6, of this license. The licensee shall submit a certification of postclosure in accordance with R 299.9613(5). {R 299.9613 and 40 CFR §§264.116 through 264.119}]

L. **FINANCIAL ASSURANCE FOR CLOSURE**

1. On the effective date of this license, the facility closure cost estimate is $8,975,765. The licensee shall keep this estimate current as required under R 299.9702 and 40 CFR §264.142.

2. The licensee shall continuously maintain financial assurance for the current closure cost estimate as required under R 299.9703.

M. **FINANCIAL ASSURANCE FOR POSTCLOSURE**

1. On the effective date of this license, the facility postclosure cost estimate is $9,791,490. The licensee shall keep this estimate current as required under R 299.9702 and 40 CFR §264.144.

2. The licensee shall continuously maintain financial assurance for the current postclosure cost estimate as required under R 299.9703.

N. **FINANCIAL ASSURANCE FOR CORRECTIVE ACTION**

On the effective date of this license, the cost of performing any corrective action at the facility is currently unknown. If at any time during the operation or postclosure of the facility it is determined that corrective action work is needed, then at each phase of the corrective action process as defined in Part VI of this License, the facility must develop and maintain current financial assurance for corrective action as required under R 299.9712 and R 299.9713.

O. **FINANCIAL REPSONSIBILITY FOR LIABILITY COVERAGE**

The licensee shall continuously maintain liability coverage for sudden and accidental occurrences and nonsudden accidental occurrences, as required by R 299.9710.

P. **WASTE MINIMIZATION**

The licensee shall certify, at least annually, that the licensee has a hazardous waste minimization program in place. {R 299.9609(1)(a), 40 CFR §264.73(b)(9) and §3005(h) of RCRA, and 42 U.S.C. §6925(h)}

Q. **LAND DISPOSAL RESTRICTIONS**

The licensee shall comply with all of the requirements of 40 CFR Part 268. {R 299.9627 and 40 CFR Part 268}

R. **AIR EMISSION STANDARDS**

The licensee shall notify the Division Chief of any waste management units that become subject to the requirements of 40 CFR Part 264, Subparts AA, BB, and/or CC within 30 days of the start of the regulated activity.

{R 299.9630, R 299.9631, and R 299.9634 and 40 CFR Part 264, Subparts AA, BB, and CC}

S. **DOCUMENTS TO BE MAINTAINED AT THE FACILITY**

The licensee shall maintain at the facility the following documents and amendments required by this license, until closure/postclosure is completed and certified by an independent registered professional engineer, and the facility is released from financial assurance requirements for closure/postclosure by the Director:

1. Waste Analysis Plan, including Quality Assurance/Quality Control (QA/QC) Plans.
2. Inspection Schedules and records.
3. Personnel Training Program documents and records.
4. Contingency Plan.
5. Closure and Postclosure Plans.
6. Cost estimates for facility closure, postclosure, and copies of related financial assurance documents.
7. Operating record.
8. Site Security Plan.
9. Facility engineering plans and specifications.
10. Record keeping procedures.
11. Environmental monitoring plans, including Sampling and Analysis Plans and QA/QC Plans.
12. Environmental monitoring data and statistical records.

13. Preventative procedures (Personnel Protection Plan).
14. Hazardous waste minimization program certification.
15. Standard Operating Procedures

{R 299.9521(3)(a)}

T. ENGINEERING PLANS AND CONSTRUCTION

1. The licensee shall construct, operate, and maintain the facility in accordance with the Engineering Plans, Attachment 7, of this license, and any modifications to those plans shall be made in accordance with this license.

2. Within 90 days of the effective date of this license, the licensee shall submit engineering plans for the design of the new haul road from the unloading tank to Master Cells (MC) VI F and G for review and approval. Upon approval the plans will become part of Attachment 7.

3. The licensee shall provide quarterly progress reports during construction regarding the engineering plans and specifications approved under this license to the Division Chief. The first report shall be submitted within 90 days of issuance of this license and then every 90 days thereafter until submission of the final as-built plans and construction certification documents. The licensee shall provide documentation regarding completion of the engineering modifications approved under this license, including a report, as-built drawings, equipment specifications, and updated certifications of construction and capability, to the Division Chief for review and approval in accordance with Condition IV.C. of this license. {R 299.9521(3)(b)}

PART III
TANK SYSTEM STORAGE CONDITIONS

A. COVERAGE OF LICENSE

The hazardous waste unloading tank system storage area at the facility shown in Drawings C-100 through C-106 is covered by this license. Any expansion or enlargement beyond the facility boundary or beyond the 1,000 cubic yards tank system storage design capacity requires a new expansion license from the Director. Drawings C-100 through C-106 are incorporated into this license as part of Attachment 7. {R 299.9521(1)(b)}

B. WASTE IDENTIFICATION AND QUANTITY

The licensee may store no more than a total volume of 1,000 cubic yards of the hazardous wastes listed in the Acceptable Wastes Types, Attachment 8, of this license in the tank system identified as Transfer Box in Attachment 7, subject to the terms of this license. {R 299.9521(2)(d)}

C. DESIGN, CONTAINMENT, AND ASSESSMENT OF TANK SYSTEMS

The licensee shall construct, operate, and maintain all tank systems in accordance with the applicable requirements of R 299.9615, 40 CFR §§264.192, 264.193, and 264.194, and in accordance with the attached plans and specifications in Attachment 7 of this license.

D. MANAGEMENT OF TANK SYSTEMS

The licensee shall label and manage the tank systems in accordance with the requirements of R 299.9615 and R 299.9627, 40 CFR §§264.194, 264.196, and 268.50(a)(2)(ii), and R 29.4101 to R 29.4504 pursuant to the provisions of the Fire Prevention Act, 1941 PA 207, as amended, National Fire Protection Association (NFPA) Standard No. 704. The licensee may add non-biodegradable sorbent, cement kiln dust, or lime in the unloading tank to improve the structural consistency of received waste that is not optimum for placement and compaction in the landfill.

E. PROHIBITION ON STORING IGNITABLE OR REACTIVE WASTES OR MATERIALS

The licensee is prohibited from storing ignitable or reactive wastes or materials in tank systems at the facility. {R 299.9521(2)(d) and (3)(b)}]

F. PROHIBITION ON STORAGE OF INCOMPATIBLE WASTES OR MATERIALS

The licensee shall not place incompatible wastes, or incompatible wastes and materials, in the same tank system or place hazardous waste in a tank system that has not been decontaminated and that previously held an incompatible waste or material {R 299.9609 and R 299.9615 and 40 CFR §§264.17(c), 264.73(b)(3), and 264.199}

G. DISPOSITION OF ACCUMULATED LIQUIDS

The licensee shall remove spilled or leaked waste and accumulated precipitation from the tank system within 24 hours of detection and manage it in accordance with the requirements of Part 111 of Act 451 and the rules. {R 299.9521(3)(b) and R 299.9615 and 40 CFR §264.193(c)(4)}

PART IV
LANDFILL DISPOSAL CONDITIONS

A. COVERAGE OF LICENSE

The hazardous waste landfill and related appurtenances (piping, pumps, operation and maintenance buildings, etc.) at the facility shown in General Site Plan Drawing 02 are covered by this license. The capacity of the currently constructed landfill is 10.72 million cubic yards and the proposed additional capacity is 11.73 million cubic yards. Any expansion or enlargement beyond the total design capacity of 22.45 million cubic yards or beyond the area shown in General Site Plan Drawing 02 requires a new expansion license from the Director. General Site Plan Drawing 02 and the attached plans and specifications are incorporated into this license as Attachment 7. {R 299.9521(1)(b)}

B. WASTE IDENTIFICATION AND QUANTITY

1. The licensee, except to the extent prohibited under Condition IV.B.3. below, may dispose a total volume of 22.45 million cubic yards of hazardous and compatible nonhazardous waste in the landfill, subject to the terms of this license. The license shall not dispose of any hazardous waste not listed in Attachment 8 of this license, unless the Division Chief approves the disposal of such waste types through an amendment to this license. {R 299.9521(2)(d)}

2. The licensee, except to the extent prohibited under Condition IV.B.3., below, may dispose of polychlorinated biphenyl (PCB) wastes listed in Attachment 8 of this license. This license constitutes authorization pursuant to Part 147, PCB Compounds, of Act 451 to dispose of PCB wastes. The licensee must also obtain written approval from the U.S. Environmental Protection Agency (U.S. EPA) pursuant to the federal Toxic Substances Control Act (TSCA) prior to disposing of any PCB waste in MCs VI F and G of the landfill.

3. The licensee shall not accept for disposal any hazardous waste not listed in Attachment 8 of this license or any incompatible nonhazardous wastes or materials that meet any of the following criteria {R 299.9521(2)(d)}:

   (a) Ignitable wastes as described in R 299.9212(1). {R 299.9619}

   (b) Reactive wastes as described in R 299.9212(3). {R 299.9619}

   (c) Bulk or noncontainerized liquid waste or waste containing free liquids. {R 299.9619(2) and 40 CFR §264.314(b)}

   (d) Containers holding free liquids. {R 299.9619(5) and 40 CFR §264.314(d)}

   (e) Waste that will:

      (i) Adversely affect the permeability of the clay liner. {R 299.9521(3)(b), R 299.9619, and R 299.9620 and 40 CFR §264.301}

      (ii) Produce a leachate that is incompatible with the clay liner, leachate collection system piping, or the off-site sewer system. {R 299.9521(3)(b), R 299.9619, and R 299.9620(3) and 40 CFR §264.301}

      (iii) Generate gases that will adversely affect the permeability of the clay cap or create a violation of Part 55, Air Pollution Control, of Act 451. {R 299.9602 and R 299.9619(5)(c)}

R 299.9619(5)(c)}

4. The licensee shall provide a written notification to the transportation companies that deliver to the facility that:

   (a) Wastes shipped to the facility must be placed in closed containers or otherwise totally contained or covered during transportation.

   (b) All trucks transporting hazardous waste to or from the facility shall use Rawsonville Road to enter and exit the facility.

   (c) Trucks transporting hazardous waste to or from the facility shall not park or stand on the I-94 Service Drive.

5. All containers on site shall be closed or otherwise totally contained or covered unless they are being sampled and/or visually inspected or in the process of being filled or emptied. {R 299.9521(3)(b)}

C. **DESIGN, CONSTRUCTION, AND RUN-ON, RUNOFF, AND CONTAMINANT CONTROL**

1. The licensee shall construct and maintain a liner system in accordance with the engineering plans and specifications in Attachment 7 of this license and R 299.9619, R 299.9620, R 299.9621, and R 299.9622. {R 299.9619, R 299.9620, R 299.9621, and R 299.9622 and 40 CFR §§264.301 and 264.303}

2. The licensee shall submit a certification for each phase of the construction of MCs VI F and G. No waste shall be placed in a newly-constructed portion of MCs VI F and G until the certification is approved by the Chief of the Hazardous Waste Section.

3. The licensee shall submit post construction documentation to the Division Chief following construction of each phase of the expanded facility pursuant to § 11125 of Part 111 of Act 451, as amended.

3. The licensee shall insure that all uncovered portions of the constructed liners, leak detection systems, and leachate collection systems are adequately protected from vegetation, desiccation, clogging, freeze-thaw effects, weathering, and all other deterioration processes. {R 299.9619 and R 299.9620 and 40 CFR §§264.301 and 264.303}

4. The licensee shall have a licensed professional engineer inspect any portions of the natural or recompacted clay not protected from weathering for more than 90 days and the leachate collection system not protected from clogging and weathering for more than 90 days. If repair is necessary the engineer shall specify repair of any areas in accordance with the approved plans and specifications where he or she determines by visual inspection that desiccation, erosion, clogging, or weathering has occurred to the extent that the design specifications are no longer met. The results of these inspections shall be maintained in accordance with Condition II.I. of this license. {R 299.9619, R 299.9620, R 299.9621, and R 299.9622 and 40 CFR §§264.301 and 264.303}

5. All areas repaired in accordance with Condition IV.C.4. of this license must be recertified by a licensed professional engineer. The licensee shall submit the recertification to the Division Chief. {R 299.9619, R 299.9620, R 299.9621, and R 299.9622 and 40 CFR §§264.301 and 264.303}

6. The licensee shall operate and maintain a run-on control system capable of preventing storm water flow onto the active portions of the landfill during peak discharge from at least a 24-hour, 25-year storm, as specified in the approved Storm Water Management System Evaluation Report and in accordance with the Storm Water Management Standard Operating Procedure (SOP) approved by the Hazardous Waste Section Chief and as depicted in Figures 2A and 2B of that report. {R 299.9604(1)(a)}

7. The licensee shall operate and maintain a runoff management system to collect and control the storm water volume resulting from at least a 24-hour, 100-year storm, as specified in the approved Storm Water Management System Evaluation Report and in accordance with the Storm Water Management SOP approved by the Hazardous Waste Section Chief and as depicted in Figures 2A and 2B of that report. {R 299.9604(1)(a)}

8. The licensee may not install interim and final cover and other structures authorized by the Division Chief in the course of normal landfill operations until receiving:

   (a) A license modification authorizing a change or changes in the storm water runoff management system; or

   (b) Division Chief approval of a closure plan report submitted pursuant to this license that demonstrates that all detectable levels of PCBs in soil and/or sediments have been removed from Area A (Figure 1 of Attachment 11 of this license) and paved areas; that demonstrates that PCBs in soils and/or sediments in Area A have been remediated to meet an approved site specific cleanup criteria established by the licensee pursuant to Part 201, Environmental Remediation, of Act 451 and that all detectable levels of PCBs have been removed from paved areas; or that the untreated discharge of storm water from Area A and paved areas at the facility comply with Part 31, Water Resources Protection, of Act 451. {R 299.9602 and R 299.9604}

9. The licensee shall maintain an effective National Pollutant Discharge Elimination System (NPDES) permit for the storm water discharge that requires the treatment of Area A and Area B (Figure 1 of Attachment 11 of this license) storm water to remove any PCBs prior to discharge to Quirk Drain. The licensee shall notify the Division Chief at least 60 days in advance of any proposal to remove the requirement to treat the Area A and/or Area B storm water to remove any PCBs prior to discharge to Quirk Drain. Concurrently, the licensee shall submit a license modification to the Division Chief establishing alternate systems to prevent PCBs from the Area A and/or Area B watersheds from being discharged uncontrolled to off-site surface waters. Nothing in this license should be construed by the licensee to authorize any violation of Part 31 of Act 451.

10. The licensee shall notify the Division Chief at least 60 days in advance of any proposal to remove any sediment or surface water sampling locations from the Pollution Minimization Plan (PMP) enforceable under the effective NPDES permit. Concurrently, the licensee shall submit a license modification to the Division Chief requesting that the license be revised to incorporate any sampling locations removed from the PMP into the appropriate monitoring programs of this license as a minor modification.

11. The licensee shall expeditiously empty or otherwise manage collection and holding facilities (e.g., tanks or catch basins) associated with run-on and runoff control systems after storms to maintain the design capacity of the system. {R 299.9619 and 40 CFR §264.301(h)}

12. The licensee shall cover or otherwise manage the landfill to control dispersal of particulate matter in accordance with a Fugitive Dust SOP approved by the Hazardous Waste Section Chief. The daily cover shall consist of ConCover 180, at least 15 centimeters of clean soil, or an equivalent other material approved by the Division Chief. {R 299.9619 and 40 CFR §264.301(i)}

13. The licensee shall monitor wind speed and direct the placement of waste in accordance with a Wind Speed SOP approved by the Hazardous Waste Section Chief.

14. The licensee shall operate and maintain a vehicle wash facility. The licensee shall ensure that all vehicles traveling on active portions of the site are cleaned and decontaminated at this facility before leaving the active area. {R 299.9521(3)(b)}

15. The licensee shall operate all vehicles in a manner that will minimize the contamination of internal haul roads in accordance with a Trackout SOP approved by the Hazardous Waste Section Chief. {R 299.9521(3)(b) and R 299.9604(1)(c)}

16. The licensee shall operate and maintain a leachate collection and removal system in accordance with R 299.9619, 40 CFR §264.301(a)(2), and the plans and specifications in Attachment 7 of this license. The leachate captured by this system shall be treated as necessary and discharged to the municipal sewer system in accordance with the applicable pretreatment standards. The licensee shall request a minor modification in accordance with R 299.9519 for any equipment replacement or upgrading with functionally equivalent elements of the system that is not being performed as part of routine maintenance of the system.

17. The licensee shall operate and maintain a contact water collection and removal system in accordance with the plans and specifications in Attachment 7 of this license. The contact water captured by this system shall be treated as necessary and discharged to the municipal sewer system in accordance with the applicable pretreatment standards. The licensee shall request a minor modification in accordance with R 299.9519 for any equipment replacement or upgrading with functionally equivalent elements of the system that is not being performed as part of routine maintenance of the system.

18. The licensee shall operate and maintain the leachate and contact water collection and removal systems in MC VI-ESE in accordance with a 6E-SE Leachate and Contact Water System SOP approved by the Hazardous Waste Section Chief.

19. The licensee shall conduct all construction and maintenance activities in accordance with an Earthwork Clearance SOP approved by the Hazardous Waste Section Chief.

20. The licensee shall maintain the leak detection and collection system (LDCRS) in accordance with a LDCRS Riser Maintenance SOP approved by the Hazardous Waste Section Chief.

21. With the initiation of construction on each new phase of MCs VI F and G, or more frequently if necessary, the licensee shall evaluate each of the following SOPs to determine if they require revisions to reflect the current landfill operation; Stormwater Management, Fugitive Dust, Wind Speed, Trackout, Contact Water System, LDCRS Riser Maintenance, and Earthwork Clearance. If revision of any of the SOPs is required they shall be submitted within 60 days of the initiation of that construction to the Hazardous Waste Section Chief for approval.

D. **WASTE PLACEMENT**

1. The licensee shall ensure that the placement of all hazardous waste in the landfill is conducted in accordance with 40 CFR §§264.17(b), 264.313, 264.315, and 264.316. If containers of hazardous waste are crushed at the facility, the containers shall be crushed only inside the active landfill cell. {R 299.9521(2)(d) and (3)(b) and R 299.9619}

2. The licensee shall record the contents, quantity, and location of each daily waste deposit and place this documentation in the operating record. This information shall be recorded on a map or diagram of the landfill and shall include cross references to specific manifest document numbers, if the waste was accompanied by a manifest. {R 299.9609 and R 299.9619 and 40 CFR §§264.73(b)(2) and 264.309}

3. After waste placement reaches the grade of the perimeter of the active landfill cell, the licensee shall annually survey and record the elevations of waste in the cell to insure that final grades as shown in Drawing 7 in Attachment 7 of this license are not exceeded. The results of the survey shall be submitted to the Division Chief within 30 days of completion of the survey. {R 299.9521(1)(b) and (3)(a)}

4. The licensee shall only place macroencapsulated waste in the landfill in accordance with "special burial" procedures approved in writing by the Division Chief.

E. **CLOSURE**

1. The licensee shall complete closure in accordance with the engineering plans and specifications and the construction quality assurance plan in the approved Closure Plan, Attachment 5, of this license. {R 299.9613 and R 299.9619(1) and (5) and 40 CFR §264.310}

2. The licensee shall notify Division, Southeast Michigan District staff, and Lansing Hazardous Waste Section staff, at least one week in advance of key events, to enable staff to be present to observe and/or take samples during the final cover placement activities. Key events include test fill construction, placement of clay liner, placement and seaming of synthetic liner, and placement of drainage media and topsoil. {R 299.9521(1)(a) and (3)(a) and 40 CFR §270.30(i)}

3. The licensee shall construct the clay component of the final cover by using the same materials, equipment, and methods used in constructing the test fill. If the materials, equipment, or methods change significantly, a new test fill shall be constructed. {R 299.9521(3)(a) and (b), R 299.9619(5), R 299.9620, and R 299.9621}

4. After completion of the final cover, the licensee shall survey the benchmarks and final cover once every two years. A contour map of the final cover shall be submitted to the Division within 30 days of the completion of the survey. {R 299.9619 and 40 CFR §264.310(b)(1), (5), and (6)}

F. **ADDITIONAL REPORTING**

The licensee shall submit an annual inspection and maintenance summary report to the Division by March 1st of each year during the active life of the landfill and the postclosure care period. The annual inspection and maintenance report shall include a summary of all maintenance activities performed by the licensee to maintain the integrity of the active landfill and the final cover of closed cells such as mowing, fertilization, and liming and a copy of the associated inspection logs.

{R 299.9521(2)(a) and (b) and 40 CFR §270.31}

PART V
ENVIRONMENTAL MONITORING CONDITIONS

A. GROUNDWATER MONITORING PROGRAM

1. The licensee shall conduct a detection monitoring program in the glacial sand and bedrock aquifers for primary, secondary, tertiary, and field monitoring parameters. Under this program, the licensee shall operate and maintain a groundwater monitoring system in accordance with the Groundwater Monitoring Program Sampling and Analysis Plan (GWMP SAP), Attachment 9, of this license. {R 299.9611(2)(a) and (b), R 299.9612, and R 299.9629 and 40 CFR Part 264, Subpart F, excluding 40 CFR §§264.94(a)(2) and (3), 264.94(b) and (c), 264.100, and 264.101}

2. With the initiation of construction on each new phase of MCs VI F and G, or more frequently if necessary, the licensee shall evaluate the monitoring locations specified in the GWMP SAP to determine if any additional monitoring wells are required to be installed or any existing monitoring wells need to be decommissioned. If revision of the GWMP SAP is required it shall be submitted within 60 days of the initiation of that construction to the Hazardous Waste Section Chief for approval as a minor license modification.

3. All new monitoring wells shall be installed and constructed in accordance with American Society of Testing and Materials (ASTM) standard D5092-90 or a plan approved by the Director. Any monitoring well that must be decommissioned shall be done in accordance with ASTM standard D5299-92 or a plan approved by the Director. {R 299.9612(1)(b)}

4. Water removed from each monitoring well shall be managed as specified in Section VI of Attachment 9 of this license. {R 299.9521(3)(b)}

5. The licensee shall submit an annual groundwater report to the Division Chief no later than March 1st of each year for the previous calendar year's activities. At a minimum, the report shall include the following information:

   (a) A narrative summary of the previous calendar year's sampling events, including sampling event dates, the identification of any significant problems with respect to GWMP SAP procedures, a summary of newly-installed and/or decommissioned monitoring wells, and copies of field log sheets.

   (b) A determination of the groundwater flow rate and direction in the monitored zones (drift aquifer, and bedrock aquifer), including the preparation of a groundwater level contour map from this data.

   (c) A summary evaluation of groundwater quality data results, including narrative, tabular, and graphical summaries of results and trends of primary, secondary, and tertiary parameters, and a summary of current background concentrations of applicable parameters.

   (d) A presentation of the statistical analysis of the data and the identification of any statistically significant increases (and/or pH decreases) pursuant to Condition V.A.7 of this license.

   (e) An analysis and discussion of laboratory and field related QA/QC information. This shall include results of equipment, field, and trip blanks and a discussion and evaluation of the adequacy of the data with respect to the GWMP SAP specifications and requirements.

{R 299.9521(3)(b) and R 299.9612(1) and 40 CFR, §264.97(j)}

6. The licensee shall establish background groundwater quality values at monitoring wells as specified in Section 3.0 of Attachment L of Attachment 9 of this license. {R 299.9612(1)(c), (d), and (e) and 40 CFR §264.97(a) and (g)}

7. Within 60 days after each sampling of each monitoring well, the licensee shall determine if a statistically significant increase (or change in pH) has occurred compared to background levels for each primary and secondary parameter listed in Attachment H of Attachment 9 of this license. For the primary parameters, any occurrence above the laboratory detection limit(s) for the parameters shall be considered statistically significant. {R 299.9612(1)(c) and (e) and 40 CFR §264.97(h) and (i)}

8. If a statistically significant increase (or change in pH) is detected for any primary or secondary parameter, the licensee shall notify the Division, Hazardous Waste Section, Permit and Corrective Action Unit, by telephone within one working day and arrange a resampling as soon as possible to confirm if a statistically significant increase (or change in pH) exists. Resampling must include not less than four replicate samples at the affected well(s) for the parameter(s) in question. For the primary and any other nonnaturally occurring parameters, a statistically significant increase shall be confirmed if at least two of the four resample results are detected above the laboratory detection limit(s) for the parameter(s), or if at least one of the resample results is detected at five times the laboratory detection limit. For the naturally occurring secondary parameters, a statistically significant increase shall be confirmed using the average concentration of the four confirmation samples as the analytical result in the statistical procedures specified in Attachment L of Attachment 9 of this license. {R 299.9612 and 40 CFR §264.97(g)}

9. If the licensee determines pursuant to Conditions V.A.7. and V.A.8. of this license that a statistically significant increase has been confirmed for any primary parameter, the licensee shall address the increase in accordance with the requirements specified in R 299.9612 and 40 CFR §264.98(f) and (g). Additionally, the licensee shall:

   (a) Within 1 working day, notify the Division Chief or the appropriate Division Supervisor, or if unavailable, the DEQ Pollution Emergency Alerting System (PEAS) at 1-800-292-4706.

   (b) Immediately take steps to determine the cause of the contamination and eliminate the source of discharge.

   (c) Prior to a license modification requiring a compliance monitoring and corrective action, the licensee shall provide the Division Chief, or his or her designee, with weekly telephone updates and written reports every two weeks regarding the progress to date in determining the cause of contamination and eliminating the discharge. The written report shall include the results of all samples from environmental monitoring conducted by the licensee. {R 299.9521(3)(b)}

   (d) Within 90 days after the confirmation of a statistically significant increase, submit to the Division Chief an application for a license modification to establish a compliance monitoring or corrective action meeting the requirements of R 299.9612 and 40 CFR §264.98(g)(4).

(e) Within 180 days after the determination, submit to the Division Chief a detailed description of corrective actions that shall achieve compliance with applicable laws and rules, including a schedule of implementation. Corrective action shall also meet the requirements of R 299.9629 and include a plan for a groundwater monitoring program that shall demonstrate the effectiveness of the corrective action. Such a groundwater monitoring program may be based on a compliance monitoring program developed to meet the requirements of 40 CFR §264.99.

(f) If the licensee determines pursuant to Conditions V.A.7. and V.A.8. of this license that a statistically significant increase in primary parameters has been confirmed in groundwater, the licensee may demonstrate that a source other than the licensed facility or an error in sampling, analysis, or evaluation solely caused the identification of a statistically significant increase. While the licensee may make a demonstration under this condition in addition to, or in lieu of, submitting a license modification application and implementing corrective action within the time specified in Conditions V.A.9.(d) and V.A.9.(e) of this license, the licensee is not relieved of the requirement to submit a license modification application and implement corrective action within the time specified, unless the DEQ finds that the demonstration made under this condition successfully shows that a source other than the licensed facility caused the statistically significant increase or that the statistically significant increase resulted from an error in sampling, analysis, or evaluation. In making a demonstration under this condition, the licensee shall:

(i) Notify the Division Chief in writing within 7 days of determining a statistically significant increase pursuant to Condition V.A.9. of this license that it intends to make a demonstration under this condition.

(ii) Within 60 days after determining that a statistically significant increase has occurred pursuant to Conditions V.A.7. and V.A.8. of this license, submit a report to the Division Chief that demonstrates a source other than the licensed facility solely caused the statistically significant increase, or that the statistically significant increase was caused by an error in sampling, analysis, or evaluation.

(iii) Continue to monitor groundwater in compliance with this license.

10. If the licensee determines pursuant to Conditions V.A.7. and V.A.8. of this license that a statistically significant increase (or change in pH) has occurred for any secondary parameter, the licensee shall address the increase (or change in pH) in accordance with the requirements specified in R 299.9612. Additionally, the licensee shall:

(a) Immediately take steps to determine the cause of contamination and eliminate the source of the discharge.

(b) Within 60 days after the determination, submit to the Division Chief a detailed report that explains the chronology of events, investigative methods, all laboratory analyses, calculations, field activities, and findings related to this determination.

(c) The licensee may demonstrate that a source other than the licensed facility or an error in sampling, analysis, or evaluation solely caused the identification of a statistically significant increase. In making a demonstration under this condition, the licensee shall:

(i) Notify the Division Chief in writing within 7 days of determining a statistically significant increase pursuant to Condition V.A.9. of this license that it intends to make a demonstration under this condition.

(ii) Within 60 days after determining that a statistically significant increase has occurred pursuant to Conditions V.A.9. and V.A.8. of this license, submit a report to the Division Chief that demonstrates a source other than the licensed facility solely caused the statistically significant increase, or that the statistically significant increase was caused by an error in sampling, analysis, or evaluation.

(iii) Continue to monitor groundwater in compliance with this license.

11. In the event that the Division Chief determines from the findings of Conditions V.A.7 and V.A.8 of this license that a statistically significant increase (or change in pH) in hazardous constituents has occurred in the groundwater, and the Director finds, in accordance with § 11148 of Act 451, that the increase (or change in pH) may present an imminent and substantial hazard to the health of persons or to the natural resources, or is endangering or causing damage to public health or the environment, the licensee shall immediately comply with an order issued by the Director pursuant to § 11148(1) of Act 451 to cease waste receipt, storage, and treatment at the affected units and conduct other activities as required by the Director to eliminate the said endangerment. {R 299.9612(1)(g)}

12. The licensee shall report all groundwater detection monitoring and hydraulic monitoring results as required by Condition II.I.3 of this license. This information shall be signed and certified in accordance with Condition I.D.3. of this license.

B. **AMBIENT AIR MONITORING PROGRAM**

1. The licensee shall conduct ambient air monitoring in accordance with the program specified in the Ambient Air Monitoring Program Sampling and Analysis Plan, Attachment 10, of this license. {R 299.9611(2)(c)}

2. The licensee shall report ambient air monitoring results as required by Condition II.I.3. of this license. This information shall be signed and certified in accordance with Condition I.D.3. of this license.

C. **SOIL MONITORING PROGRAM**

1. The licensee shall conduct a semiannual corrective action soil monitoring program for PCBs in Area A and a detection soil monitoring program for PCBs in Area B as specified in the Soil Monitoring Program Sampling and Analysis Plan (SM SAP), Attachment 11, of this license.

2. With the initiation of construction on each new phase of MCs VI F and G, or more frequently if necessary, the licensee shall evaluate the soil monitoring locations specified in the SM SAP to determine if any additional soil monitoring locations are required to be added or removed. If revision of the SM SAP is required it shall be submitted within 60 days of the initiation of that construction to the Hazardous Waste Section Chief for approval as a minor license modification. {R 299.9611(2)(d)}

3. Within 60 days of each soil sampling event, the licensee shall determine if an apparent threshold limit exceedance (ATLE) for PCBs has occurred as specified in Section 7.0 of

3. If an ATLE for PCBs is detected, the licensee shall verbally notify the Division, Hazardous Waste Section, Permit and Corrective Action Unit, within 1 working day and collect verification samples within 7 working days to determine if a confirmed threshold limit exceedance (CTLE) for PCBs has occurred as specified in Section 8.0 of Attachment 11 of this license.

4. If it is determined that a CTLE for PCBs has occurred pursuant to Conditions V.C.3. and V.C.4. of this license, the licensee shall:

   (a) Take immediate steps to eliminate the source of the contamination and prevent further releases.

   (b) Within 1 working day after the determination, verbally notify the Division, Hazardous Waste Section, Permit and Corrective Action Unit.

   (c) Within 5 days after the determination, submit a written report to the Division, Hazardous Waste Section, Permit and Corrective Action Unit, that includes the findings from the resampling and a map showing the proposed locations for collecting delineation phase samples as specified in Section 8.0 of Attachment 11 of the license.

   (d) Within 14 days after the determination, collect the first phase of delineation samples to determine the extent of the areas exceeding the CTLE as specified in Section 8.0 of Attachment 11 of this license.

   (e) Within 14 days after receiving the delineation phase sampling results, evaluate the data and submit a plan to remove soils/sediments and to determine the source(s) or expected source(s) of the PCBs to the Division, Hazardous Waste Section, Permit and Corrective Action Unit, as specified in Section 8.0 of Attachment 11 of this License.

   (f) Contaminated soils/sediments shall be properly characterized and managed as waste in accordance with Part 3 of the Part 111 Rules, and cleanup to the levels specified in Section 7.0 of Attachment 11 of this License shall be verified by soil sampling. Any nonhazardous soils/sediments containing 5 parts per million (ppm) or less of PCBs shall be disposed of at a licensed solid waste disposal facility or in a WDI licensed hazardous waste cell. Any soils/sediments containing more than 5 ppm of PCBs or that are hazardous waste shall be disposed of at a licensed hazardous waste facility. Any soil/sediments containing more than 50 ppm of PCBs shall be disposed at a TSCA authorized facility. The waste characterization records shall be maintained for a minimum of 3 years from the date of disposal. The licensee shall maintain a log at the facility for any soil/sediments that are disposed of in the WDI hazardous waste disposal cell providing the date and amount excavated, the date and location within the cell where they were disposed, and sufficient information to locate the waste characterization data maintained by the licensee.

   (g) Within 60 calendar days after determining that a CTLE has occurred, implement the plan required in Condition V.C.5(e) and submit a final report to the Division, Hazardous Waste Section, Permit and Corrective Action Unit that includes:

      (i) The chronology of events.

      (ii) Investigative methods.

(iii) All laboratory analyses.

(iv) Calculations.

(v) Field activities related to the determination.

(vi) The corrective measures/remedies.

5. The licensee shall report all soil monitoring results as required by Condition II.I.3 of this license. This information shall be signed and certified in accordance with Condition I.D.3. of this license.

D. **SURFACE WATER MONITORING PROGRAM**

1. The licensee shall conduct a quarterly surface water detection monitoring program as described in the Surface Water Monitoring Program Sampling and Analysis Plan (SW SAP), Attachment 12, of this license.

2. With the initiation of construction on each new phase of MCs VI F and G, or more frequently if necessary, the licensee shall evaluate the surface water monitoring locations specified in the SW SAP to determine if any additional surface water monitoring locations are required to be added or removed. If revision of the SW SAP is required it shall be submitted within 60 days of the initiation of that construction to the Hazardous Waste Section Chief for approval as a minor license modification. {R 299.9611(5)}

3. Within 60 days of each sampling event, the licensee shall determine if an apparent statistically significant increase (ASSI) has occurred as specified in Section 7.0 of Attachment 12 of this license.

4. Duplicate samples shall be collected at each sampling location for volatile organics, PCBs, and metals. Initially, the licensee is required to analyze only one of the two samples. The licensee shall hold the duplicate sample pending the results of the initial sample. The duplicate sample for PCBs shall be extracted when it arrives at the laboratory and the extract held in case a confirmation analysis is required. If a statistically significant increase is detected in a monitoring parameter(s), the duplicate sample/sample extract shall be analyzed for confirmation purposes.

5. If an ASSI is detected, the licensee shall verbally notify the Division, Hazardous Waste Section, Permit and Corrective Action Unit, within one working day and determine if a confirmed statistically significant increase (CSSI) has occurred as specified in Section 8.0 of Attachment 12 of this license.

6. Within 30 days of a determination that a CSSI has occurred pursuant to Conditions V.D.3. and V.D.5. of this license, the licensee shall determine whether a discharge of hazardous waste and/or hazardous waste constituents to off-site surface waters is occurring, determine the source, and take immediate steps to eliminate and prevent any such discharge. If a discharge of PCBs to off-site surface water occurs the licensee shall implement the Contingency Plan, Attachment 4, of this license, unless the discharge is specifically authorized by and is in compliance with the effective NPDES permit for the facility.

7. Within 60 days of a determination that a CSSI has occurred pursuant to Conditions V.D.3. and V.D.5. of this license, the licensee shall submit a written report to the Division Chief documenting the investigation, response, and any proposed actions to prevent future releases.

8. The licensee shall report surface water monitoring results as required by Condition II.I.3. of this license. This information shall be signed and certified in accordance with Condition I.D.3. of this license.

{R 299.9521(3)(a) and (b) and R 299.9611(5)}

E. **LEACHATE MONITORING PROGRAM**

1. With the construction on each new phase of MCs VI F and G, the licensee shall include additional leachate monitoring locations as defined in the Leachate Monitoring Program Sampling and Analysis Plan (LMP SAP) as new cells are certified and approved for disposal by the Hazardous Waste Section Chief. The revision of the LMP SAP shall be submitted at the time of the construction certification to the Hazardous Waste Section Chief for approval as a minor license modification.

2. The licensee shall measure the leachate level in each collection sump on a weekly basis and verify that the leachate pump and flow meter are operating properly during that field event. The procedures for conducting the inspection are specified in Section 3.0 of the LMP SAP, Attachment 13, of this license.

3. The licensee shall inspect the leachate collection sumps on a weekly basis for deterioration and/or damage and monitor the total monthly volume of leachate pumped from each collection sump and record this information on the operating record for the facility. {R 299.9609(1)(b) and R 299.9619(4)(c)(iii)}

4. The licensee shall jet out the leachate collection system through the leachate clean-out pipes once every two years, or more frequently if needed, to minimize blockage that could cause leachate to build up on the base of the disposal cells.

5. The licensee shall conduct an annual leachate monitoring program on each of the constructed and certified leachate collection sumps within MCs V, VI, and VII as described in the LMP SAP, Attachment 13, of this license.

    (a) Samples shall be collected in accordance with the procedures specified in the LMP SAP, Attachment 13, of this license, and they shall be analyzed for the parameters listed on Figure 7 of Attachment 13 of this license.

    (b) In addition to monitoring the leachate for the parameters identified in Condition V.E.5.(a), above, the licensee shall collect annual samples from two of the constructed and certified sump locations in MCs V, VI, and VII and analyze the samples for a modified 40 CFR Appendix IX parameters specified in Figure 8 of the Attachment 13 of this license. Following completion of the initial approximately 8-year cycle, the Appendix IX sampling shall continue on this schedule for each open cell.

    (c) If, based on the results of the modified Appendix IX monitoring required by Condition V.E.5.(b), it is determined that the leachate contains organic constituents other than those that are routinely monitored under Condition V.E.5.(a) of this license, the licensee shall submit a written report to the Division stating whether or not the parameter should be added to the leachate program. If, upon review of the report, the Division determines that the parameter is present in significant concentrations in the leachate and/or may pose a serious environmental hazard due to the nature of the constituent, the licensee shall be required to add the parameter to the annual leachate monitoring list, and it shall become a routine leachate indicator. In addition, any such parameters shall also be added to the groundwater, lysimeter, surface water, and leak detection monitoring programs as specified in Condition V.E.6.(b), below.

6. The licensee shall submit an annual leachate monitoring report to the Division by March 1st of each year during the active life of the landfill and the postclosure care period.

   (a) The annual leachate monitoring report shall be signed and certified in accordance with Condition I.D.3. of this license.

   (b) During the active life of the landfill, the annual leachate monitoring report shall summarize the results of the leachate analytical data that was collected at the facility and recommend any refinements deemed necessary to the leachate and the groundwater and leak detection/lysimeter monitoring programs. If the licensee determines that organic chemicals are newly present or present at increased concentrations in the leachate and a determination is made to add the parameter(s) to the leachate monitoring program, the parameters shall also be added to the groundwater and the leak detection monitoring programs, and they shall be sampled on at least an annual basis.

   (c) During the active life of the landfill and during the postclosure care period, the annual leachate monitoring report shall include:

      (i) Leachate volume calculations.

      (ii) A graphical presentation of the monthly and yearly quantities of leachate being generated and pumped from each leachate sump at the landfill.

      (iii) A graphical comparison between leachate quantities pumped/generated at each leachate sump during the reported year and the leachate quantities pumped/generated from previous years.

      (iv) Reasons for increases/decreases in leachate quantities at each leachate sump. If there is an increase in leachate quantities, the source shall be indicated in the leachate monitoring report.

7. The licensee shall report leachate monitoring results as required by Condition II.I.3. of this license. This information shall be signed and certified in accordance with Condition I.D.3. of this license.

{R 299.9521(3)(a) and (b) and R 299.9611(5)}

F. LEAK DETECTION SYSTEM MONITORING PROGRAM

1. With the construction on each new phase of MCs VI F and G, the licensee shall include additional leak detection monitoring locations as defined in the Leak Detection Monitoring Program Sampling and Analysis Plan (LDMP SAP) as new cells are certified and approved for disposal by the Hazardous Waste Section Chief. The revision of the LDMP SAP shall be submitted at the time of the construction certification to the Hazardous Waste Section Chief for approval as a minor license modification..

2. The licensee shall conduct a quarterly leak detection monitoring program as specified in the LDMP SAP, Attachment 14, of this license. In addition, the licensee shall:

   (a) Inspect each of the constructed and certified leak detection system sumps in MC VI on a weekly basis to confirm that the pump system is operating properly and that there is no evidence of damage or tampering that could allow waste or waste constituents to have entered the system. Information from this inspection shall be reported on the weekly/after storm inspection form required by Condition II.C.1. of this license.

   (b) Record the volume of liquid withdrawn from each of the constructed and certified leak detection system sumps in MC VI on a weekly frequency and analyze in the field the liquid from each of the leak detection system sumps in MC VI on a monthly frequency for pH and specific conductivity. This information shall be reported on the form that is included as Attachment C of Attachment 14 of this license.

   (c) If any sump yields volume measurements above the maximum expected volume, calculated as per Section 7.1 in Attachment 14 of this license, or conductance values exceed the mean plus three standard deviations, as calculated from the last eight conductance values, samples shall be collected from the affected sump and analyzed as soon as practicable for the full list of quarterly parameters specified in Condition V.F.3. of this license.

3. The licensee shall collect samples from the constructed and certified sump locations in MC VI on a quarterly basis and analyze the samples for the parameters listed in Attachment E of Attachment 14 of this license.

4. The background statistical value for the organic monitoring parameters is defined as the reported detection limit specified in Attachment E of Attachment 14 of this license.

5. If additional parameters must be added to the leak detection monitoring program in accordance with Condition V.E.5.(c) of this license, the licensee must provide written notification to the Division Chief requesting modification to the program. If background has not already been established for these additional parameters, the notification must include a proposed plan to determine background for these constituents on an accelerated schedule.

6. The licensee shall provide written notification to the Division Chief requesting any changes that need to be made to the approved LDMP SAP, Attachment 14, of this license and obtain written approval prior to implementation.

7. The licensee shall, within 60 calendar days of the sampling, report in writing to the Division Chief the laboratory data and the results from the statistical evaluation performed in accordance with Attachment 14 of this license.

8. If a statistically significant increase is detected in any of the monitored parameters, the licensee shall immediately notify the Division that this situation has occurred and arrange for a resampling as soon as possible to confirm if the statistical increase exists. If adequate water can be obtained from the system, confirmation samples shall be collected in quadruplicate.

9. If the licensee confirms that a statistically significant increase in a monitored parameter has occurred, the following actions must be taken:

   a. Immediately notify the Director by calling the Division Chief or the Division Southeast Michigan District Supervisor, in accordance with Condition II.I.5. of this license.

b. Provide follow-up notification to the Division Chief in writing within 5 calendar days of the telephone call in accordance with Condition II.I.6.(b) of this license.

c. Begin immediate action to implement the current Contingency Plan, as appropriate.

d. Determine, within 30 calendar days of notification, whether a failure in the liner system has occurred.

e. Provide the Division Chief, or his or her designee, with weekly telephone updates and written reports every two weeks regarding the progress to date in determining the cause of contamination and the results of all samples from environmental monitoring conducted by the licensee.

10. If the determinations made pursuant to Condition V.F.9.(d) of this license indicate a release of contaminants from the MC VI primary liner system, the licensee shall do either of the following:

a. Begin immediate action to repair failures in the liner system or otherwise correct the problem and demonstrate to the Division Chief within 72 hours that the action being taken will contain the release of contaminants and maintain the capability of the system to detect contaminants that may enter the leak detection system. The licensee shall complete the repair and corrective activities pursuant to a schedule approved by the Division Chief and shall obtain the certification of a registered professional engineer that, to the best of his or her knowledge or opinion, the remedial actions have been completed. If the Division Chief determines that the failure cannot be corrected on a schedule that insures the protection of human health and the environment, the licensee shall comply with Condition V.F.10.(b) of this license.

b. Cease placing waste into the affected area in MC VI and take action to prevent the migration of hazardous waste and hazardous waste constituents from the area on a schedule approved by the Division Chief, and propose a plan to address any environmental damages that may have occurred as a result of the failure.

11. If the licensee determines pursuant to Conditions V.F.8. and V.F.9. of this license that a statistically significant increase in hazardous constituents has occurred in the leak detection system, it may demonstrate that a source other than the licensed facility caused the increase or that the increase resulted from error in sampling, analysis, or evaluation. In making a demonstration under this condition, the licensee shall:

a. Notify the Division Chief within 7 days of the determination that it intends to make a demonstration under this condition.

b. Within 90 days of the determination, submit a report to the Division Chief that demonstrates that a source other than the licensed facility solely caused the increase or that the increase was caused by error in sampling, analysis, or evaluation. The report shall be signed and certified in accordance with Condition I.D.3. of this license.

c. Continue to monitor the leak detection system in compliance with this license.

12. The licensee shall report leak detection monitoring results as required by Condition II.I.3. of this license. In addition to these requirements, the licensee shall provide the Division Chief with a written annual report by March 1st of each year summarizing the data and the monitoring program results from the previous calendar year. The annual report shall include graphical

presentations summarizing volume pumped from each leak detection system sump per month and volume pumped from the leak detection system versus volume pumped from the leachate collection system. The annual report shall reference and be part of the annual leachate monitoring report required in Condition V.E.6. of this license. All monitoring reports shall be signed and certified in accordance with the requirements in Condition I.D.3. of this license.

13. The licensee shall report leak detection monitoring results as required by Condition II.I.3. of this license. This information shall be signed and certified in accordance with Condition I.D.3. of this license.

{R 299.9521(3)(a) and (b) and R 299.9611(5)}

G. **LYSIMETER MONITORING PROGRAM**

1. The licensee shall conduct a semiannual detection monitoring program as specified in the Lysimeter Monitoring Program Sampling and Analysis Plan (LM SAP), Attachment 15, of this license.

2. The background statistical value for the organic monitoring parameters is defined as the reported detection limit specified in Figure 3 of Attachment 15 of this license.

3. If additional parameters must be added to the lysimeter monitoring program in accordance with Condition V.E.5.(c) of this license, the licensee must provide written notification to the Division Chief requesting modification to the program. If background has not already been established for these additional parameters, the notification must include a proposed plan to determine background for these constituents on an accelerated schedule.

4. The licensee shall provide written notification to the Division Chief requesting any changes that need to be made to the approved LM SAP, Attachment 15, of this license and obtain written approval prior to implementation.

5. The licensee shall, within 60 calendar days of the sampling, report in writing to the Division Chief the laboratory data and the results from the statistical evaluation performed in accordance with Attachment 15 of this license.

6. If a statistically significant increase is detected in any of the monitored parameters, the licensee shall immediately notify the Division that this situation has occurred and arrange for a resampling as soon as possible to confirm if the statistical increase exists. If adequate water can be obtained from the system, confirmation samples shall be collected in quadruplicate.

7. If the licensee confirms that a statistically significant increase in a monitored parameter has occurred, the following actions must be taken:

   (a) Immediately notify the Director by calling the Division Chief or the Division Southeast Michigan District Supervisor, in accordance with Condition II.I.5. of this license.

   (b) Provide follow-up notification to the Division Chief in writing within 5 calendar days of the telephone call in accordance with Condition II.I.5.(b) of this license.

   (c) Begin immediate action to implement the current Contingency Plan, as appropriate.

   (d) Determine, within 30 calendar days of notification, whether a failure in the liner system has occurred.

(e) Provide the Division Chief, or his or her designee, with weekly telephone updates and written reports every two weeks regarding the progress to date in determining the cause of contamination and the results of all samples from environmental monitoring conducted by the licensee.

8. If the determinations made pursuant to Condition V.G.7.(d) of this license indicate a release of contaminants from MCs V or VII, the licensee shall do the following:

   Begin immediate action to repair or otherwise correct the problem and demonstrate to the Division Chief within 72 hours that the action being taken will correct the release of contaminants and clean up contaminants that may have leaked from the system. The licensee shall complete the repair and cleanup activities pursuant to a schedule approved by the Division Chief and shall obtain the certification of a registered professional engineer that, to the best of his or her knowledge or opinion, the remedial actions have been completed.

9. If the licensee determines pursuant to Conditions V.G.7. and V.G.8. of this license that a statistically significant increase in hazardous constituents has occurred in the lysimeter monitoring program, it may demonstrate that a source other than the licensed facility caused the increase or that the increase resulted from error in sampling, analysis, or evaluation. In making a demonstration under this condition, the licensee shall:

   (a) Notify the Division Chief within 7 days of the determination that it intends to make a demonstration under this condition.

   (b) Within 90 days of the determination, submit a report to the Division Chief that demonstrates that a source other than the licensed facility solely caused the increase or that the increase was caused by error in sampling, analysis, or evaluation. The report shall be signed and certified in accordance with Condition I.D.3. of this license.

   (c) Continue to monitor the lysimeter system in compliance with this license.

10. The licensee shall report lysimeter monitoring results as required by Condition II.I.3 of this license. In addition to these requirements, the licensee shall provide the Division Chief with a written annual report by March 1st of each year summarizing the data and the monitoring program results from the previous calendar year. The annual report shall reference and be part of the annual leachate monitoring report required in Condition V.E.6. of this license. All monitoring reports shall be signed and certified in accordance with the requirements in Condition I.D.3. of this license.

11. The licensee shall report lysimeter monitoring results as required by Condition II.I.3 of this license. This information shall be signed and certified in accordance with Condition I.D.3. of this license.

{R 299.9521(3)(a) and (b) and R 299.9611(5)}

H. **SEDIMENTATION BASIN MONITORING PROGRAM**

1. The licensee shall conduct an annual sedimentation basin monitoring program for the north sedimentation basin (NSB), south sedimentation basin (SSB), and the northwest sedimentation basin (NWSB) as specified in the Sedimentation Basin Monitoring Program Sampling and Analysis Plan (SB SAP), Attachment 16, of this license.

2. Within 60 days of each sampling, the licensee shall determine if an ASSI has occurred as specified in Section 7.0 of Attachment 16 of this license.

3. If an ASSI is detected, the licensee shall verbally notify the Division, Hazardous Waste Section, Permit and Corrective Action Unit, within one working day and collect verification samples within seven working days to determine if a CSSI has occurred as specified in Attachment 16 of this license.

4. If the licensee determines pursuant to Conditions V.H.2. and V.H.3. of this license that a CSSI has occurred, the licensee shall:

   (a) Take immediate steps to eliminate the source of the contamination and prevent further releases.

   (b) Within 1 working day after the determination, verbally notify the Division, Hazardous Waste Section, Permit and Corrective Action Unit.

   (c) Within 5 calendar days after the determination, submit written notification of the CSSI to the Division, Hazardous Waste Section, Permit and Corrective Action Unit. The notification shall be signed and certified in accordance with Condition I.D.3. of this license.

   (d) In addition, within 30 days after the determination, implement the response actions defined in Section 8.0 of Attachment 16 of this license depending upon the CSSI location and parameter.

5. The licensee shall report sedimentation basin monitoring results as required by Condition II.I.3. of this license and as specified in Section 9.0. of Attachment 16 of this license. This information shall be signed and certified in accordance with Condition I.D.3. of this license.

{R 299.9521(3)(a) and (b) and R 299.9611(5)}

PART VI
CORRECTIVE ACTION CONDITIONS

A. CORRECTIVE ACTION AT THE FACILITY

1. The licensee shall implement corrective action for all releases of a contaminant from any waste management unit (WMU) at the facility, regardless of when the contaminant may have been placed in or released from the WMU. For the purposes of this license, the term "corrective action" means an action determined by the Division Chief to be necessary to protect the public health, safety, welfare, or the environment, and includes, but is not limited to, investigation, evaluation, cleanup, removal, remediation, monitoring, containment, isolation, treatment, storage, management, temporary relocation of people, and provision of alternative water supplies, or any corrective action allowed under Title II of the federal Solid Waste Disposal Act, PL 89-272, as amended, or regulations promulgated pursuant to that act. For the purposes of this license, the process outlined in Part 111 of Act 451 and the environmental protection standards adopted in R 299.9629 shall be used to satisfy the corrective action obligations under this license. {§§11102 and 11115a of Act 451 and R 299.9629}

2. To the extent that a release of a hazardous substance, as defined in §20101(t) of Act 451, that is not also a contaminant, as defined in §11102(2) of Act 451, is discovered while performing corrective action under this license, the licensee shall take concurrent actions as necessary to address the Part 201 of Act 451 remedial obligations for that release. {R 299.9521(3)(b)}

B. CORRECTIVE ACTION BEYOND THE FACILITY BOUNDARY

The licensee shall implement corrective action beyond the facility in accordance with §11115a of Act 451 and R 299.9629(2).

C. IDENTIFICATION OF WASTE MANAGEMENT UNITS

The WMUs at the facility are identified below and shown in Drawing 1 in Attachment 7 of this license.

1. The following WMU, identified in the Draft Report on RCRA Facility Investigation Release Assessment for Wayne Disposal Site # 1 Landfill, October 7, 1992, requires further corrective action at this time that includes, at a minimum, further investigation to determine if a release of a contaminant has occurred and, if a release has occurred, the nature and extent of the release.

   (a) WMU 1 — Site # 1 Landfill

2. The following WMUs, identified in the RCRA Corrective Action Plan RFI Phase 1 Environmental Monitoring Report for Wayne Disposal Site # 2 Landfill, July 17, 1990, do not require corrective action at this time based on the design of the units and available information that indicates that no known or suspected releases of contaminants from the units have occurred.

   (b) WMU 2 — Site # 2 Landfill

{§§11102 and 11115a of Act 451 and R 299.9521(3)(b) and R 299.9629}

3. Within 30 days of discovery of a new WMU or a release of a contaminant from a new WMU, the licensee shall provide written notification to the Division Chief. The written notification shall include all of the following information:

   (a) The location of the unit on the facility topographic map.

   (b) The designation of the type of unit.

   (c) The general dimensions and structural description, including any available drawings of the unit.

   (d) The date the unit was operated.

   (e) Specification of all waste(s) that have been managed in the unit.

   (f) All available information pertaining to any release of a contaminant from the unit.

4. Based on a review of all of the information provided in Condition VI.C.3. of this license, the Division Chief may require corrective action for the newly-identified WMU. The licensee shall submit a written remedial investigation (RI) Work Plan to the Division Chief within 60 days of written notification by the Division Chief that corrective action for the unit is required.

{§§11102 and 11115a of Act 451 and R 299.9504(1), R 299.9508(1)(b), and R 299.9629 and 40 CFR §270.14(d)}

D. **CORRECTIVE ACTION INVESTIGATION**

Within 60 days of the licensee's receipt of the Division's comments on the review of the Draft Report on Corrective Action Investigation (CAI) Release Assessment for Wayne Disposal Site # 1 Landfill, October 7, 1992, which was submitted to the U.S. EPA, the licensee shall submit a CAI Work Plan to conduct additional investigation to determine if a release of a contaminant(s) from of the WMU 1 identified in Condition VI.C. of this license has occurred and, if a release(s) has occurred, evaluate the nature and extent of the release(s). The licensee shall submit a written CAI Work Plan, CAI Final Report documenting compliance with the approved CAI Work Plan and supporting further corrective action at the facility, and CAI progress reports to the Division Chief for review and approval in accordance with Condition VI.K. of this license. The Division Chief will approve, modify and approve, or provide a Notice of Deficiency (NOD) for the CAI Work Plan and CAI Final Report. Upon approval, the CAI Work Plan and CAI Final Report become enforceable conditions of this license. {§§11102 and 11115a of Act 451 and R 299.9629}

E. **INTERIM MEASURES**

The licensee shall conduct interim measures (IM) at the facility, if determined necessary by the licensee or the Division Chief, to clean up or remove a released contaminant or to take other actions, prior to the implementation of a remedial action, as may be necessary to prevent, minimize, or mitigate injury to the public health, safety, or welfare, or to the environment. The licensee shall submit a written IM Work Plan, IM Final Report documenting compliance with the approved IM Work Plan and supporting further corrective action at the facility, and IM progress reports to the Division Chief for review and approval in accordance with Condition VI.K. of this license. The Division Chief will approve, modify and approve, or provide an NOD for the IM Work Plan and IM Final Report. Upon approval, the IM Work Plan and IM Final Report become enforceable conditions of this license.

{§§11102 and 11115a of Act 451 and R 299.9629}

F. **DETERMINATION OF NO FURTHER ACTION**

1. The licensee shall continue corrective action measures to the extent necessary to ensure that the applicable environmental protection standards established under Part 201 of Act 451, as adopted in Part 111 of Act 451, are met, if the limits are not less stringent than allowed pursuant to the provisions of RCRA.

2. Based on the results of the CAI and other relevant information, the licensee shall submit a written request for a license minor modification to the Division Chief if the licensee wishes to terminate corrective action for a specific WMU identified in Condition VI.C. of this license. The licensee must demonstrate that there have been no releases of a contaminant(s) from the WMU and that the WMU does not pose a threat to public health, safety, welfare, or the environment.

3. Based on the results of the CAI and other relevant information, the licensee shall submit a written request for a license major modification to the Division Chief if the licensee wishes to terminate facility-wide corrective action. The licensee must conclusively demonstrate that there have been no releases of a contaminant(s) from any of the WMUs at the facility and that none of the WMUs pose a threat to public health, safety, welfare, or the environment.

4. If, based upon a review of the licensee's request for a license modification pursuant to Condition VI.F.2. or VI.F.3. of this license, the results of the completed CAI, and other relevant information, the Division Chief determines that the releases or suspected releases of a contaminant(s) do not exist and that the WMU(s) do not pose a threat to public health, safety, welfare, or the environment, the Division Chief will approve the requested modification.

5. A determination of no further action shall not preclude the Division Chief from requiring continued or periodic monitoring of air, soil, groundwater, or surface water, if necessary to protect public health, safety, welfare, or the environment, when facility-specific circumstances indicate that potential or actual releases of a contaminant(s) may occur.

6. A determination of no further action shall not preclude the Division Chief from requiring further corrective action at a later date, if new information or subsequent analysis indicates that a release or potential release of a contaminant(s) from a WMU at the facility may pose a threat to public health, safety, welfare, or the environment. The Division Chief will initiate the necessary license modifications if further corrective action is required at a later date.

{§§11102 and 11115a of Act 451 and R 299.9629(2)}

G. **CORRECTIVE MEASURES STUDY**

If the Division Chief determines, based on the results of the CAI and other relevant information, that remedial activities are necessary, the Division Chief will notify the licensee in writing that a Corrective Measures Study (CMS) is required. If required by the Division Chief, the licensee shall conduct a CMS to develop and evaluate the corrective measures alternative(s) necessary to address the release(s) of a contaminant(s) or hazardous substances and the WMU(s) that are identified in the approved CAI Final Report as requiring final remedial activities. The licensee shall submit a written CMS Work Plan, a CMS Final Report documenting compliance with the approved CMS Work Plan and supporting further corrective action at the facility, and CMS progress reports to the Division Chief for review and approval in accordance with Condition VI.K. of this license. The Division Chief will approve, modify and approve, or provide an NOD for the CMS Work Plan and CMS Final Report. Upon approval, the CMS Work Plan and CMS Final Report become enforceable conditions of this license {§§11102 and 11115a of Act 451 and R 299.9629}

H. **CORRECTIVE MEASURES IMPLEMENTATION**

1. The licensee shall conduct final corrective measures based on the CMS Final Report approved by the Division Chief. The licensee shall submit a written Corrective Measures Implementation (CMI) Work Plan to the Division Chief for review and approval. The licensee shall also submit a written CMI Final Report documenting the compliance with the approved CMI Work Plan and providing justification that the corrective actions may cease, and CMI progress reports to the Division Chief for review and approval in accordance with Condition VI.K. of this license. The Division Chief will approve, modify and approve, or provide an NOD for the CMI Work Plan and CMI Final Report. Upon approval, the CMI Work Plan and CMI Final Report become enforceable conditions of this license.

2. The Division will provide notice of its draft decision on the CMI Work Plan to persons on the facility mailing list and an opportunity for a public hearing.

3. The licensee shall implement the approved CMI Work Plan within 60 days of receipt of the Division Chief's written approval of the CMI Work Plan.

{§§11102 and 11115a of Act 451 and R 299.9629}

I. **CORRECTIVE ACTION MANAGEMENT UNITS**

If applicable, the licensee shall comply with the requirements of R 299.9635 in order to designate an area at the facility as a corrective action management unit for implementation of response activities. {R 299.9521(3)(a)}

J. **TEMPORARY UNITS**

If applicable, the licensee shall comply with the requirements of R 299.9636 in order to designate tank or container storage units used for the treatment or storage of remediation wastes as temporary units for implementation of response activities. {R 299.9521(3)(a)}

K. **SUMMARY OF CORRECTIVE ACTION SUBMITTALS**

The licensee shall submit the required corrective action documents in accordance with Conditions II.N., VI.D., VI.E., VI.G., and VI.H. of this license and the schedule below.

CORRECTIVE ACTION DOCUMENT	SUBMITTAL DEADLINE
Written notification of a new release of a contaminant from an existing WMU, a new WMU, or a release of a contaminant from a new WMU	Within 30 days of discovery
CAI Work Plan for a newly-identified release of a contaminant from an existing WMU, a new WMU, or a release of a contaminant from a new WMU	Within 60 days of receipt of written notification that response activity is required
CAI Work Plan for existing WMU 1	Within 60 days of approval of the Draft Report on RCRA Facility Investigation Release Assessment for Wayne Disposal Site # 1 Landfill,
Revised CAI Work Plan for WMU 1	Within 45 days of receipt of CAI Work Plan NOD
CAI progress reports	Within 30 days of initiation of the CAI and every 30 days thereafter
CAI Final Report for WMUs and contaminant releases	Within 60 days of completion of CAI
Revised CAI Final Report for WMUs and contaminant releases	Within 45 days of receipt of CAI Final Report NOD
IM Work Plan for WMUs and contaminant releases	Within 60 days of receipt of notification that IM Work Plan is required
Revised IM Work Plan for WMUs and contaminant releases	Within 30 days of receipt of IM Work Plan NOD
IM progress reports	Within 30 days of initiation of the IM and every 30 days thereafter
IM Final Report for WMUs and contaminant releases	Within 60 days of completion of the IM
Revised IM Work Plan for WMUs and contaminant releases	Within 45 days of receipt of IM Final Report NOD
CMS Work Plan for WMUs and contaminant releases	Within 60 days of receipt of notification that CMS is required
Revised CMS Work Plan for WMUs and contaminant releases	Within 45 days of receipt of CMS Work Plan NOD
CMS progress reports	Within 30 days of initiation of the CMS and every 30 days thereafter

CORRECTIVE ACTION DOCUMENT	SUBMITTAL DEADLINE
CMS Final Report for WMUs and contaminant releases	Within 60 days of completion of the CMS
Revised CMS Final Report for WMUs and contaminant releases	Within 45 days of receipt of CMS Final Report NOD
CMI for WMUs and contaminant releases	Within 90 days of approval of the CMS Final Report
Revised CMI for WMUs and contaminant releases	Within 45 days of receipt of CMI NOD
CMI progress reports	Within 60 days of implementation of the CMI and every 30 days thereafter, unless otherwise approved
Completion Report for remediated WMUs and contaminant releases	Within 60 days of the remedial actions have been completed and cleanup criteria have been met
Revised Completion Report for WMUs and contaminant releases	Within 45 days of receipt of Completion Report NOD

L. **CORRECTIVE ACTION DOCUMENTS RETENTION**

The licensee shall maintain all corrective action documents required by this license at the facility. The documents shall be maintained for the operating life of the facility or until the facility is released from financial assurance requirements for corrective action by the Director, whichever is longer. The licensee shall offer such documents to the Division Chief prior to discarding those documents. {§§11102 and 11115a of Act 451 and R 299.9521(3)(b) and R 299.9629}

WAP – Table of Contents

1.0 INTRODUCTION

The purpose of this Waste Analysis Plan (WAP) is to identify and document the overall operational procedures, analytical techniques, and the necessary sampling methodologies which are undertaken for hazardous wastes that are received by the **Michigan Disposal Waste Treatment Plant (MDWTP)** for treatment and/or storage and Wayne Disposal, Inc (WDI) for disposal as required by Part 111 of Act 451 of the Public Acts of 1994, the Natural Resources and Environmental Protection Act (NREPA), Administrative Rule 299.9504(1)(c).

Per 40 CFR 264.73, the required information will be kept as part of the operating record.

The forms referenced within this WAP are typical forms currently used by the facility. These forms will periodically require updating based upon changes in regulations, customer needs, operations, or as company policy dictates.

2.0 FACILITY DESCRIPTION

2.1 Description of General Processes

Wayne Disposal, Inc. (WDI)

The Wayne Disposal Site #2 Hazardous Waste Landfill (WDI) operations include the landfill disposal of hazardous and non-hazardous wastes permitted by the MDEQ under the facility operating license and the USEPA under a Resource Conservation and Recovery Act (RCRA) permit (MID 048 090 633).

The specific routine operations and work areas include:

- Waste receiving and Quality Control (QC);
- Waste unloading;
- Container staging; and
- Hazardous waste landfill and related appurtenances (pipings, pumps, operation and maintenance, truck wheel wash buildings located within the area bounded by North Interstate 94 (I-94) Service Drive and Willow Run Airport).

The landfill is currently permitted with a design capacity of 11,000,000 cubic yards (cy) of in-place waste.

The requirements for operations in these areas are defined in and regulated by the operating license and permit. Non-hazardous wastes are managed in accordance with Part 115. The Wayne Disposal Site #2 Hazardous Waste Landfill (WDI) - MID 048 090 633) is co-located at the same site as the Michigan Disposal Waste Treatment Plant (MDWTP) – MID 000 724 831. The WDI operations are supported by the MDWTP office/laboratory and waste receiving, storage, and treatment operations located near the entrance to the facility. These operations assist to control and evaluate shipments received for conformance with pre-approval information regarding the specific properties, treatment, and documentation requirements. The WDI waste analysis records are maintained at the receiving building and laboratory areas.

Michigan Disposal Waste Treatment Plant (MDWTP)

The MDWTP operations include receiving, storage, and treatment of hazardous wastes permitted by the MDEQ under the facility operating license and the USEPA under a Resource Conservation and Recovery Act (RCRA) permit (MID 000 724 831). The routine operations and work areas include:

- Waste receiving and Quality Control (QC);
- Waste loading and unloading;
- Reagent unloading and tank storage;
- Waste storage in tanks;
- Waste treatment in tanks;
- Container staging/storage; and
- Shipment of wastes off-site to treatment, storage, and disposal facilities (TSDFs).

Non-hazardous wastes are managed in accordance with the Solid Waste Processing and Transfer Facility Operating License issued under Part 115 of Act 451 of 1994, the Natural Resources and Environmental Protection Act (NREPA).

2.2 Waste Identification and Classification

The waste types acceptable for treatment and storage at MDWTP or disposal at WDI are defined in Appendix A of this WAP.

In addition, at WDI the following waste types **NOT ACCEPTABLE** for disposal:

- Ignitable wastes as described in R299.9212(1);
- Reactive wastes as described in R299.9212(3);
- Bulk or non-containerized liquid waste or waste containing free liquids;
- Containers holding free liquids, including laboratory packs;
- Wastes which will:
    a. Adversely affect the permeability of the clay liner;
    b. Produce a leachate that is incompatible with the synthetic liner, leachate collection system (LCS), discharge piping, and the off-site sewer system;
    c. Generate gases which will adversely affect the permeability of the clay cap; and
    d. Create a violation of 1975 PA 348 and rules promulgated thereunder;
- Waste which are banned from landfilling by regulations promulgated under 40 Code of Federal Regulations (CFR) Part 268 unless the wastes meet the applicable Land Disposal Restriction (LDR) treatment standards or a variance has been obtained from the USEPA.

2.3 Description of Waste Management Units

Wayne Disposal, Inc. (WDI)

The Wayne Disposal Site #2 Hazardous Waste Landfill includes a permitted hazardous waste landfill with primary and secondary liner systems, a leachate collection and removal system, and a leak detection, collection and removal system. The landfill operations also include run-on, run-off, and contaminant control systems including a vehicle wash facility and other landfill-related appurtenances and support buildings. When placed in the landfill, containers are at least 90-percent full or crushed, shredded, or similarly reduced in volume before burial in the landfill.

Michigan Disposal Waste Treatment Plant (MDWTP)

The MDWTP is a liquid and solid hazardous waste storage and treatment facility. Containerized wastes may be staged/stored on-site before and after treatment in one of the following areas:

- East Container Staging Area (ECSA)
- North Container Storage Area (NCSA)
- East and West Loading/Unloading Bays
- Southeast Container Storage Area (SECSA)

Wastes are placed directly into the waste treatment tanks, and mixed, with modifiers for deactivation, neutralization, chemical oxidation, and chemical reduction or stabilization reagents, as required for the specific wastes being treated. The facility currently uses a backhoe shear attachment to size solid containers. Prior to being sized over and into a treatment tank the containers are staged on the paved floor in front of the treatment tanks.

Liquid hazardous wastes to be treated in the pozzolanic stabilization process may be stored in four, 20,000-gallon, vertical storage tanks (16 through 19) or placed directly into treatment tanks A – H (formerly tanks 7A, 7B, 8A, 8B, 9A, 9B, 10A and 10B respectively). Liquid reagents are stored in two, 20,000-gallon vertical tanks (25 and 27).

Dry flowable bulk solid hazardous wastes may be stored in three 100 cubic yard (CY) silos (2, 3 and 6). Lime kiln flue dust, cement kiln flue dust, lime and fly ash are also used for stabilization and may be stored in all six silos (1 through 6). The dusts are fed from the silos to the closest pugmill and treatment tank at a controlled rate to effect treatment of liquid and solid wastes. Other reagents, such as ferrous sulfate, may be added directly to the tanks in bag, container, or bulk quantities.

Hazardous waste and non-hazardous waste are stored and treated in treatment tanks A, B, C, D, E, F, G and H (formerly treatment tanks 7A, 7B, 8A, 8B, 9A, 9B, 10A and 10B respectively) and Pugmills 14 and 15. Treatment consists of blending the wastes and treatment reagents in the storage/treatment tanks.

Tanks will be decontaminated if changed from the storage/treatment of listed wastes to characteristic wastes. Decontamination consists of water washing and/or dry decontaminating the tank. The rinse waters and/or dry decontamination material is directed to a listed batch tank (containing a compatible waste). The decontamination step is noted on the Batch Ticket for the tank receiving the rinse waters and/or dry decontamination material.

Containerized hazardous waste and non-hazardous wastes are staged/stored on concrete pads at the East Container Staging Area (ECSA), North Container Storage Area (NCSA), Southeast Container Storage Area (SECSA) and inside the bays the East and West Treatment Buildings at MDWTP prior to placement in one of the tanks. Drainage trenches/sumps are constructed within the NCSA and ECSA to contain and control liquid runoff. Containers are handled by removing the tops or bungs and emptying the contents with a vacuum truck or directly into one of the treatment tanks using a forklift, or pump.

The following wastes are stored in closed containers (such as drums) and/or in tarped bulk (such as roll-off boxes or trailers):	NCSA	ECSA	SECSA (see Section 2.d.1 of the Container Storage Attachment)	East and/or West Bays Temp Storage (< 8 hrs) -
Untreated hazardous waste	Yes	Yes	Yes	Yes
Untreated solid hazardous waste bulked into roll-offs boxes or trailers (see Section 3.5)	Yes	No	No	Yes
Treated hazardous waste awaiting analytical results	Yes	No	No	Yes
Decharacterized waste awaiting analytical results	Yes	No	No	Yes
Decharacterized waste with analytical data demonstrating compliance with LDRs	Yes	Yes	Yes	Yes

3.0 OPERATIONAL PROCEDURES

3.1 Pre-Approval Procedures

3.1.1 Generator-Supplied Information – MDWTP/WDI

The pre-approval process is a waste evaluation procedure that takes place prior to receiving hazardous and non-hazardous wastes at the MDWTP for storage or treatment and WDI for disposal. The initial step of the waste stream approval process is a review of the waste characterization as prepared by the generator.

The facility requires that the generator characterize their waste stream, in order to comply with 40 CFR Parts 261 and 268.

For the purposes of compliance with 40 CFR Part 268 or if the waste is not listed in Subpart D of 40 CFR Part 261 (R299.9213), per 40 CFR 262.11, the generators must determine whether their waste is identified in Subpart C of 40 CFR Part 261 (R299.9212) by either:

- Testing the waste according to the methods set forth in Subpart C (of 40 CFR Part 261) or according to an equivalent method approved by the Director of the MDEQ; or
- Applying knowledge of the hazard characteristic in light of the materials or processes used. Material Safety Data Sheets (MSDS) of products in combination with information provided by the generator on the GWCR are acceptable to properly characterize the waste stream.

The generator must complete a Generator Waste Characterization Report (GWCR) or equivalent form. The facility will accept other forms of documentation of waste characterization than the GWCR as long as all pertinent information is included. GWCRs are supplied to the generators in hard copy or online at www.eqonline.com. The elements of the GWCR include:

- Generator name, address, and telephone number;
- USEPA ID Number;
- Description of Generating Process;
- USEPA and/or Michigan Hazardous Waste Codes;
- Hazardous & Toxicity Characteristics;

- Actual &/or Potential Constituents;
- Fingerprint parameters as described in this WAP; and
- Generator's Written or Electronic Signature or a signed statement from the generator giving permission to a 3rd party to act on their behalf.

The GWCR, with the supporting analytical data where required, forms the basis of information upon which the facility determines if the waste can be accepted for disposal at WDI or storage, transshipment and treatment at MDWTP. Waste streams are also reviewed with respect to the Land Disposal Restrictions (LDR) requirements in 40 CFR Part 268. The analytical data, waste type, process description, waste chemical and physical characteristics, or a representative sample provide the facility with sufficient information to decide if the waste can be accepted or if additional data is required before a decision can be reached. If the generator does not provide sufficient information, the generator or their representative is contacted and requested to provide further information before the approval process will continue.

3.1.2 Special Conditions –MDWTP/WDI

Exceptions for the requirement of a sample of waste for acceptance at the facility (WDI/MDWTP) include the following waste types:

- Articles, equipment, clothing (such as personal protective equipment (PPE)) contaminated with chemicals;
- Empty containers which once held waste, commercial chemical products, or chemicals (small tanks, containers, bags, boxes, liners, cans, pails, etc.). Containers are considered "empty" according to the criteria specified in R299.9207;
- Asbestos-containing waste from cleaning or demolition activities that is properly bagged/containerized;
- Spent activated carbon, filters from inside tanks, ion-exchange resins, molecular sieves, filters/ cartridges;
- Hazardous contaminated debris and demolition wastes (40 CFR 268);

- Chemical-containing devices/articles, such as cathode ray tubes (CRTs), fluorescent lights, batteries;
- Discarded, off-specification, or out-dated commercial products. A MSDS will be provided or made available for review;
- Wastes from food or animal processing;
- Animal feces
- Selected wastes from medical, veterinarian, taxidermy, or mortuary facilities;
- Septage or sewer treatment plant sludge from domestic users; and
- Tanks (whole or cut);
- Equipment, machinery, pumps, piping, etc.; and
- Waste streams approved by MDEQ on a case-by-case basis.

For wastes from which no samples will be taken prior to disposal, a visual inspection will be performed to determine if the waste resembles the description provided in the approval. Double contained asbestos waste <u>will not be opened</u> for visual inspection. However, during the pre-approval process, the generator must verify that the asbestos contains no free liquids and it is so stipulated on the GWCR for that waste stream.

3.1.3 Special Wastes

3.1.3.1 Source Material, NORM or TENORM – MDWTP/WDI

Waste streams containing NORM, TENORM, and exempted radioactive material may be managed at the facility (MDWTP/WDI) provided the following steps are taken:

1. During the facility pre-approval process, obtain a radiochemical analysis and/or other appropriate radiological information on each (NORM, TENORM, and exempted radioactive material) proposed waste stream as well as any other information required by this WAP including the WCR. No material classified as low-level radioactive waste pursuant to Title 42 of the United States Code, Chapter 23, Development and Control of Atomic Energy, Section 2021b, Definitions, is allowed at the site.

2. The radiochemical analysis and appropriate information are evaluated to determine if they can be accepted at the site. All material accepted at the site shall be in at least one of the following categories:

State of Michigan regulated materials

a. Exempt concentrations: IRR Rule 65
b. Exempt quantities: IRR Rule 74(1)
c. NORM: The DNRE's *Cleanup and Disposal Guidelines for Sites Contaminated with Radium-226* (EQC 1602)
d. Other material as specifically approved.

Note: For the purposes of interpreting the State of Michigan's *Ionizing Radiation Rules (IRR) Governing Radioactive Material,* refer to the definitions contained in IRR Rules 3 thru 20.

U.S. Nuclear Regulatory Commission (NRC) regulated materials

a. Exempt concentrations: 10 CFR parts 30.14 and 40.13
b. Exempt quantities: 10 CFR part 30.18
c. Specific exemptions: 10 CFR parts 20.2005, 30.11, 30.15, 30.16, 30.19, 30.20, 30.21, and 40.14

Note: For the purposes of interpreting title 10 of the U.S. Code of Regulations (10 CFR), refer to the definitions contained in 10 CFR parts 20.1003, 30.4, and 40.4.

Disclaimer: This in no way represents approval or authorization for receipt of NRC regulated material. If you have questions about radioactive material regulated by the NRC, contact the NRC regional office at 630-829-9500.

3. A sample is obtained from the generator, if appropriate, to determine if the level of radioactivity, based on a gamma radiation reading, will be above Site 2's background limit. The reading will be recorded for that (NORM, TENORM, and exempted radioactive material) EQ waste stream.

4. WDI and/or MDWTP may approve for receipt each (NORM, TENORM, and exempted radioactive material) proposed waste stream that meets the above criteria.

5. A (NORM, TENORM, and exempted radioactive material) waste stream may not be received by the facility (WDI and/or MDWTP) until steps 1-4, above, have been followed.

Questions about radioactive material regulated by the State of Michigan should be directed to the DEQ.

3.1.3.2 Asbestos Waste Containing PCBs and/or RCRA Hazardous Waste - WDI

Asbestos containing waste that also contains PCBs and/or is also a RCRA hazardous waste is exempt from the requirement of a sample of waste for review and acceptance and visual inspection at the facility if all of the following conditions are met:

- The waste contains ≥ 1% asbestos;
- The waste is properly bagged/containerized;
- Bulk asbestos waste will be handled in such a manner as to not cause any visual emissions;
- The generator verifies that the asbestos containing waste contains no free liquids and it is so stipulated on the approval.

3.1.4 Generator Waste Characterization Report (GWCR) Review – MDWTP/WDI

After the generator-supplied information is received, trained personnel (which may include, but is not limited to, the Laboratory Manager, Technical Support Manager, Approvals staff and facility (Operations Management & Supervisors or their designee) review the information then determine if additional information or analyses are required.

"Trained personnel" refers to those persons authorized to do a task based on the ISO Job Descriptions maintained on-site. These ISO Job Descriptions are considered living documents will be updated as needed and maintained at the facility and can be reviewed upon request at the facility.

Representative samples of waste may be provided by the generator, may be subject to the fingerprint analysis (see Sections 4.0, 5.0 and Table 3), except where noted in Section 3.1.2. Supplemental analysis (indicated with a "O" in Table 3) may also be performed at the direction of trained personnel based upon the available information provided by the generator, USEPA, or Michigan hazardous waste numbers and the facility's operating requirements.

If, during the review, trained personnel determine that the waste characteristics do not conform to the information provided on the GWCR, the generator or their representative is notified in order to attempt to resolve the discrepancy. If the inconsistency is not resolved, the waste will be rejected and not approved.

3.1.5 Treatment, Storage, and Disposal Approval – MDWTP/WDI

When it is determined that a waste stream can be safely handled at the facility in accordance with the operating license requirements, it is assigned a unique approval number. An approval letter is sent to the generator, serving as notification that the waste as represented may be shipped to the facility, and that the facility has the appropriate permit(s) to accept the waste. All approval files are maintained in the facility operating record in a paper or other archival form. Approval files with no shipments before expiration will not be kept in the facility operating record.

Section 4 details the testing procedures and criteria utilized by trained personnel to evaluate waste as part of the pre-approval process. Once the generator has received the approval to ship, the generator or their representative arranges for transportation and delivery by a licensed waste transporter.

3.1.6 Waste Approval Re-Evaluation – MDWTP/WDI

The facility requires that the GWCR, supporting information, and/or documentation be updated whenever any one of the following occur:

- There has been a change in the process generating the waste;
- Inspection of a waste shipment reveals that the waste does not meet the description/classification of the current approval record for the waste; or
- One year has passed since the last approval of the waste.

3.2. Incoming Load Pre-Acceptance Procedures

The procedures for incoming wastes are designed to assure that loads received for treatment and/or storage have been previously approved for acceptance, and are representative and consistent with the information submitted with the GWCR.

3.2.1 Inbound Load Procedure – MDWTP/WDI

When a shipment of waste arrives at the facility, the following step-wise procedure is followed:

- The driver proceeds to the inbound scale where the weight and truck number are recorded. The driver then proceeds to the sampling station (for containerized loads, this step may be omitted);
- The driver presents the manifest and any other shipping documents to trained personnel in the Receiving Building; and
- Trained personnel examine the manifest and other shipping documents, for manifests discrepancies, completeness and to ensure that the shipment was intended for treatment and/or storage at MDWTP and/or disposal at WDI.

3.2.2 Waste Inspection and Sampling

After reviewing the documents and determining that the waste stream has been approved, trained personnel check the computer or manual records for any notes or special handling instructions for the shipment and create a Post-Inspection Form (PIF). For bulk shipments, the sampler visually examines the load, pulls a sample, and submits the sample for testing.

For container loads, the driver is given a copy of each manifest and corresponding lab worksheet, PIF and drum log. For MDWTP, the vehicle is directed to the container truck dock where the containers are removed from the vehicle and placed into the staging/storage area(s). Trained personnel visually examine the load, pull a sample, and then submit the samples for testing. All waste streams are sampled as described under "Sampling Methodologies" in Section 6.0.

For WDI, container loads are delivered to the container unloading area at the waste transfer box. Here each container is opened, inspected and sampled in accordance with a standard operating procedure for non-bulk waste unloading. At least 10% of the containers must be sampled. The containers can only be left in the unloading area for the time it takes to clear or reject the load for disposal.

3.2.3 TSDF Evaluation and Approval

Trained personnel conduct the analytical tests and required observations specified for the particular waste stream as described in Section 5.1. If the results of the pre-acceptance fingerprint testing and observations agree with the pre-approval screening data, the waste load is approved for receipt. If the results fall outside the profiled range of variability, the procedures in Section 3.3.1 – Off- Specification and Rejected Load Procedures are followed.

For bulk shipments, the designated treatment and/or storage location is stamped on the PIF, it is handed to the driver, and then the vehicle is directed to the assigned tank located at the MDWTP East or West Treatment Buildings. For container loads, the PIF is handed to the driver at the Receiving Building, then the vehicle is directed to MDWTP and the load can be accepted.

3.2.4 Off-Site Inspection and Sampling - WDI

For some projects, it may be necessary to conduct the weight measurement (or volume estimate), waste inspection (section 3.2.2) and/or fingerprinting tests (section 3.2.3) at an off-site location, such as the site of generation. These activities must be performed by properly trained (by EQ) personnel using the methods and forms in the WAP. The results of the inspection and testing must be transmitted to the Receiving Department prior to the waste being accepted by WDI (i.e. with the waste shipment or before). For these projects, a description of the off-site testing must be submitted to MDEQ for review and approval prior to the start of the project. The description must include a summary of the project, how the sampling/testing will be conducted, post sampling waste security measures (if necessary) and a discussion of the paperwork flow.

3.3 Procedure for Unloaded Trucks – MDWTP/WDI

After unloading, vehicles are directed through the Truck Wash. Containerized loads wait in the holding area until cleared to leave. Bulk shipments proceed to the outbound scale. The driver returns the completed PIF to the Receiving Building and the outbound weight and truck number are recorded.

The manifest is signed, dated, disassembled, and the driver is given the "Transporter" copy. Remaining copies of the manifest are placed in a holding file for later distribution according to the instruction on the manifest form. In the event an electronic manifest is used, the established electronic manifest procedures are followed.

3.3.1 Off-Specification and Rejected Load Procedures – MDWTP/WDI

The facility will follow 40 CFR 264, Subpart E in determining if a significant discrepancy exists.

Discrepancies that do not fall within these criteria are considered to be "minor" and are not subject to a re-characterization review unless the facility has reason to believe that the variation is a continuing deviation and that a particular waste stream is indeed different from the waste approved. Significant inconsistencies in waste type, as defined in 40 CFR 264 Subpart E, result in re-characterization if the inconsistency cannot be reconciled with the generator or the facility has reason to believe that the waste composition has changed.

If a significant discrepancy is revealed during the incoming load procedure, the generator or their representative is contacted to resolve the problem. If the discrepancy is reconciled, the load may be received and the details of the reconciliation are recorded. If the discrepancy is not resolved, the shipment is rejected per 40 CFR 264, Subpart E. The appropriate manifest documents are then returned to the driver.

3.4. Storage - MDWTP

Stored containerized liquid and solid wastes are segregated following USDOT segregation and separation requirements (see Table 1). Liquid wastes, which are transferred from containers, portable tanks or tank trucks, may be transferred to storage tanks prior to subsequent treatment.

Prior to wastes being placed in any storage unit, facility (MDWTP) personnel will determine the compatibility of the waste with the storage unit materials of construction and with wastes already stored therein. The evaluation is based upon vendor/engineering data, materials of construction, and knowledge of the waste and its characteristics from the GWCR. If such data are not available, compatibility testing will be performed prior to storage.

3.4.1 Container Storage - MDWTP

Containerized wastes in storage are segregated according to 49 CFR Subpart C—Segregation and Separation Chart of Hazardous Materials segregation rules. (See Table 1) Based on the hazard assessment of the waste, the containerized waste is organized into segregated storage areas within the NCSA, ECSA, SECSA and the East and West Loading/Unloading Bays.

3.4.2 Tank Storage - MDWTP

Wastes to be stored in tanks will undergo the fingerprint analyses, including a waste compatibility test. Additional testing will be based on the targeted treatment or disposal requirements.

Liquid wastes, delivered in bulk form by tank trucks or decanted from containers or portable tanks, are placed in bulk storage tanks or directly into treatment/storage tanks prior to treatment.

3.4.3 Lab Compatibility Test - MDWTP

Prior to transferring any wastes into a storage tank, the compatibility of the waste, with the material already in the tank, will be determined by mixing in a "mock tank" a waste sample from the tank with samples of waste to be added to the tank. Following the preliminary screening and compatibility testing, specific storage and process compatibility will be determined. The current version of the Work Plan for the Lab Compatibility Test is maintained on-site. The parameters used to determine compatibility are briefly outlined below

- Gas Evolution - Materials that upon mixing, appear to liberate significant amounts of vapors, fumes, or mists, will not be combined.
- Heat Generation - Materials that, upon mixing, would generate excessive amounts of heat will not be combined.
- Adverse Reactions - Materials that, upon mixing, result in the formation of a large amount of sludge, or solidify or gel may not be combined if this causes a removal or subsequent handling problem.

When a bulk shipment is to be unloaded into a tank, a representative sample will be collected from the tank into which the waste is to be unloaded. The sample will be evaluated for the compatibility characteristics listed above. If it is determined that the mixture is incompatible, the waste will not be placed into that receiving tank. If the waste is determined to be incompatible with the tank materials of construction or with the tank contents, the procedure will be repeated, as needed, until a compatible tank is available. If no compatible tank is available, the load may be rejected and returned to the generator or transshipped off-site to another TSDF.

3.5 Waste Bulking and/or Consolidation - MDWTP

Wastes that are bulked and mixed, (excluding empty containers, site generated debris or closed and intact containers of non-hazardous waste), are subjected to the same compatibility and waste code evaluations as applied to wastes that are mixed in the treatment tanks. The following includes a list of items that may be bulked or consolidated.

- Empty Containers – as defined in Part 111, under Specific Conditions and are bulked in a roll-off container.
- Site Generated Debris – includes articles, equipment, clothing (such as personal protection equipment); ringbolts and rings from containers; pallets and pieces of pallets, etc., which are bulked in a roll-off container.
- Closed and intact containers of non-hazardous waste –non-hazardous solid waste in which all openings on the containers are closed.
- Liquid or solid hazardous waste containers being consolidated into larger or fewer containers (not for treatment at MDWTP)
    - I. Containers may need to be combined into larger or fuller containers (such as prior to transshipment)
    - II. If Roll-off containers or trailers will be used for consolidation, a liner will be utilized when bulking listed hazardous waste to prevent contamination from listed wastes to characteristic wastes.
    - III. All of the waste consolidated into a different container will only be done in the NCSA, the East Bay or West Bay.
    - IV. <u>Compatibility</u> - Waste to be consolidated will be from the same waste stream or will be evaluated to ensure that the waste being consolidated is compatible. If not from the same waste stream, samples will be added to a mock tank for compatibility prior to being consolidated.

V. The following waste streams will not be consolidated: reactives, ignitables, cyanides, incompatibles and odorous.

- Solid (non-liquid) hazardous waste containers being bulked into a batch for treatment at MDWTP

    I. All of the waste bulked into a roll-off or trailer will only be done in the NCSA, the East Bay or West Bay.

    II. The roll-off or trailer will utilize a liner when bulking listed hazardous waste to prevent contamination from listed wastes to characteristic wastes.

    III. The containerized waste to be bulked in a roll-off or trailer will be pre-assigned to batch.

    IV. <u>Compatibility</u> - Samples from the containers will be added to a mock tank for compatibility prior to being bulked into a roll-off or trailer.

    V. After all of the containers assigned to that batch are bulked, the batch in the roll-off or trailer will be transferred to an assigned storage/treatment tank for treatment.

    VI. The following waste streams will not be bulked: reactives, ignitables, cyanides, incompatibles and odorous.

3.6 Procedures for Ignitable, Reactive, and Incompatible Wastes

The facility (WDI/MDWTP) utilizes waste characterization data provided by the generator as well as analytical screening and testing procedures to obtain information regarding waste ignitability, reactivity, or incompatibility prior to treatment and/or storage. MDWTP also evaluates this information relative to waste compatibility with the facility equipment and treatment processes. Containerized wastes are segregated for storage following the DOT Segregation Chart (See Table 1 of the WAP). Wastes that are incompatible will not be stored adjacent to each other.

MDWTP does not accept for treatment ignitable wastes having a flashpoint less than 90°F. Ignitability data for wastes is obtained through process knowledge and/or performing flashpoint or ignitability screening tests, as described in Section 4. Ignitable wastes with a flash point less than 90°F may be received and subsequently transshipped. Containers accepted at MDWTP for transshipment are uniquely marked so that they can easily visually identified as a transship waste stream.

MDWTP does not accept for treatment wastes exhibiting the characteristic of reactivity. D003 (deactivated) waste may be accepted for treatment. Reactive wastes identified in R299.9212(3)(b-e) may be received for storage in the NCSA and subsequently transshipped. Reactive wastes identified in R299.9212(3)(a, f, g, h) are prohibited. MDWTP evaluates potential reactivity characteristics through the use of process knowledge and for potential cyanide (CN) or sulfide-containing wastes, through analysis for total, amenable and reactive CN, and reactive sulfide. To evaluate the potential for incompatibility of wastes with the facility equipment, treatment processes, or with other wastes upon mixing/blending, MDWTP uses process knowledge, and compatibility testing described in Sections 3.4.1 – Container Storage, 3.4.2 – Tank Storage and 3.4.3 – Lab Compatibility Test. If the review of the waste characterization data and/or compatibility testing indicates a potential for incompatibility and unacceptability at the MDWTP, the wastes will be either rejected and returned to the generator or transferred to another permitted TSDF capable of managing the waste in accordance with the procedure outlined in Section 3.3.1 – Off-Specification and Rejected Load Procedures.

The Vertical Liquid Tanks are equipped with combination pressure relief valves/flash arrestors on top and high temperature cut-off valves at the bottom. These tanks are constructed and located in compliance with NFPA Chapter 30 regulations for flammable liquids, or in the vicinity of loading flammable liquids.

Wastes received in containers will be staged and stored in accordance with DOT Separation Requirements. Containers remain closed during storage except for during sampling. In addition to being physically separated from incompatible waste, containerized ignitable waste will not be stored within 50 feet of the property line, and will be stored in such a manner as to prevent fires or explosions. Reactive wastes received for transship to another facility will be physically separated from incompatible wastes and stored in a manner as to prevent fires, explosions, or release of toxic fumes, dusts, or gases that could threaten human health.

Smoking is allowed at the facility (MDWTP/WDI) only at a few designated areas. Maintenance work done at MDWTP follows the same standards described above for operation work. Hot Work Permit will be granted in advance and air monitoring testing will go on to prevent a flammable atmosphere before any operation goes underway.

3.7 Waste Treatment Technologies - MDWTP

3.7.1 Chemical Stabilization - MDWTP

The facility (MDWTP) treats wastes that require treatment to comply with the LDRs through chemical stabilization using a pozzolanic-type process incorporating CKD, lime, and other select reagents. Certain wastes may require more than one type of treatment, including neutralization, deactivation, chemical oxidation, and/or chemical reduction using reagents such as lime, oxidizing or reducing agents, to convert selected waste constituents into a physical or chemical form that is less soluble, less hazardous and/or more suitable for subsequent stabilization.

3.7.2 Chemical Oxidation - MDWTP

Hazardous wastes containing organic constituents above the LDR levels are chemically oxidized at the facility (MDWTP). The chemical oxidation process is described below and detailed in Figure 2. Chemical oxidation is also discussed as one of the Best Demonstrated Available Technologies (BDAT) for managing organic contaminated waste in 40 CFR 268.42 and Appendix VI.

Oxidation is the process in which an atom or compound acquires electrons (the oxidizing agent or oxidant) and reduction is the process in which an atom or compound loses electrons (the reducing agent or reducant). The two processes always occur simultaneously with one compound acting as the oxidant and the other the reductant.

For the treatment of hazardous organic containing waste, the facility (MDWTP) typically uses a sodium hypochlorite solution as the oxidizing agent. While sodium hypochlorite is the predominant oxidant used, the facility (MDWTP) may occasionally use other oxidizing agents, including but not limited to hydrogen peroxide and potassium permanganate. In the oxidation process, electrons are stripped from the organic molecules to the extent that the carbon-to-carbon bonds are broken and carbon dioxide, sodium chloride and water are formed. Organic compounds are destroyed in this mildly exothermic reaction.

The amount of oxidant used in the treatment is determined by trained personnel and is a function of 1) the concentration of all organics in the waste, or 2) the treatability study run on the waste, and/or 3) the trained personnel's previous experience with the waste. Batches treated by chemical oxidation must be solidified by chemical stabilization before landfilling and must also be determined to pass the LDR standards as described in Section 3.8.

3.7.3 Treatability Studies (see Table 2, Table 3 & Section 4) - MDWTP

The pre-approval analyses for specific wastes to be treated to meet the applicable LDR(s) are specified in Table 3 and Section 4 – Waste Analysis Parameters. A bench-scale treatability study is performed to verify acceptability with the facility (MDWTP) treatment process and the treatment "recipe" required to meet the applicable treatment standards. The treated waste samples are analyzed as specified in Table 2, Table 3 and Section 4.

These pre-approval treatability studies are used to adjust the treatment processes for specific waste types and batches. Example treatment approaches for typical hazardous waste types are presented on Figures 1 through 4.

These treatment operations may combine several wastes or shipments from various generators to facilitate operational efficiency and utilization of available processing capacity. Batch treatment of multiple wastes and/or shipments will be based on chemical compatibility, USEPA hazardous waste numbers, and treatment requirements.

Post-treatment analyses, includes the TCLP and, where applicable, specific constituent analyses are performed on each batch of hazardous waste prior to landfill disposal. This post-treatment analysis is used to demonstrate that the treatment residue meets the LDRs. (See Table 2 and Table 3)

The facility (MDWTP) conducts treatability testing to ensure that wastes can be treated to the required LDR levels prior to acceptance of the waste. Examples of possible triggers for a treatability study are listed below:

- The waste type not previously treated at MDWTP
- The waste is generated by a process not previously treated at MDWTP
- The waste has levels of constituents outside the range normally treated at MDWTP
- The waste codes or constituents not previously treated at MDWTP

Tables 2 and 3 are provided to assist in guiding the chemists and technicians in determining if a treatability test is needed.

The treatability test involves simply mixing waste and treatment reagents in a ratio developed by the laboratory. Measured volumes of the waste are mixed with the treatment agents. Mixing is designed to emulate retention time in the pugmill mixer and mixing time per unit of waste in the treatment tanks. After mixing, a sample of the waste is collected for analysis for the constituents of concern. A treatability report is then prepared showing the after treatment concentrations of the constituents of concern. This report is placed into the waste stream technical approval file prior to acceptance of the waste.

To successfully treat certain waste streams, a modification of the standard process may be required. Modified treatments are first verified in the laboratory, and then implemented at the plant once the waste is received. Modified treatments are considered Confidential Business Information. It is important to note that all treatments are verified through actual post treatment analysis of treatment residue, prior to disposal of the waste.

3.7.4 Mixing, Blending, & Commingling of Wastes for Treatment - MDWTP

As part of the treatment and storage process, various individual waste streams are mixed, blended, and/or commingled. The blending operations are conducted by the facility (MDWTP) Operations personnel under the direction and careful supervision of the facility's laboratory and treatment chemists.

3.7.5 Authorization to Mix or Blend - MDWTP

See Section 3.4.3, "Lab Compatibility" for a detailed discussion.

3.8 Land Disposal Restrictions (LDRs)

3.8.1 Waste Not Subject to the LDRs - MDWTP

The MDWTP stabilization process will also be utilized to treat wastes not subject to the LDRs, to solidify free liquids and render the waste more suitable for handling and landfill disposal.

The post-treatment analyses will include a visual observation, to ensure no free liquid is present. A paint filter test may be performed on selected loads when determined necessary by visual inspection.

3.8.2 Wastes Meeting the LDRs

Wastes that are certified, through analysis, to meet the LDRs specified in 40 CFR 268 may be directly landfilled at WDI or another off-site TSDF. The LDR certification and notification, and analytical documentation will be provided for each waste stream disposed of at WDI or shipped to another TSDF. Per 40 CFR 264.73, the required information will be kept as part of the operating record.

3.8.3 Wastes Requiring Treatment & LDRs - MDWTP

Wastes requiring deactivation, chemical oxidation, chemical reduction, and/or stabilization at the facility (MDWTP) will be treated in batch operations. Each batch may contain multiple USEPA hazardous waste numbers and treatment standards. The treated batches will be held in the treatment/storage tanks or in roll-off boxes or trailers while testing is performed prior to disposal (see Section 2.3). Treatment batch residues will be sampled and analyzed to determine whether the batch meets the applicable treatment standards defined in 40 CFR 268. Treatment batch residues, resulting from the treatment operations that exceed the applicable LDRs, will be reevaluated. Options include re-testing after additional cure time, retreating on-site until the LDRs are achieved or sent off-site for further treatment to meet the LDRs. Any off-site shipments will be accompanied by the LDR notification, a manifest, and data for the waste for the off-site TSDF in accordance with 40 CFR 268.7(a)(1).

Treatment residues that meet the applicable LDRs, will be disposed at WDI or another TSDF. The LDR certification, notification and analytical documentation will be provided for each waste disposed of at WDI or shipments to another TSDF. Per 40 CFR 264,73, the required information will be kept as part of the operating record.

3.8.4 Characteristic Wastes & LDRs

Characteristic wastes, which are batch-treated separately from listed wastes, may be disposed of in a solid waste/Subtitle D landfill, if it is determined that the LDRs have been achieved and the treatment residue no longer exhibits the characteristics of hazardous waste and all applicable underlying hazardous constituents (UHCs), have been treated in accordance with the Universal Treatment Standards (UTS) at 40 CFR 268.

3.8.5 Hazardous Debris & LDRs

As stated in 40 CFR 268.45, Hazardous debris (>60mm) must be treated prior to land disposal, unless the debris is no longer contaminated with hazardous waste or the debris is treated to the waste-specific treatment standards specified in 40 CFR 268.45 using technologies identified in Table 1 of 268.45. MDWTP will ensure that debris requiring treatment to the waste specific treatment standards is treated to those standards or that the technology standard is met. MDWTP anticipates receiving hazardous debris that may be contaminated with any code or codes identified in Appendix A of the WAP.

Characteristic ignitable or corrosive hazardous debris will be deactivated at MDWTP during the micro-encapsulation process prior to landfill disposal. If immobilization, such as micro-encapsulation or macro-encapsulation, is used in a treatment train, it will be the last treatment technology applied. This requirement also will apply to debris contaminated with two or more contaminants subject to treatment. Hazardous debris will be treated for each contaminant, subject to treatment as specified by 40 CFR 268.45(b) for toxicity characteristic debris and debris contaminated with listed wastes. CN reactive debris will not be accepted by MDWTP.

MDWTP uses the micro- and macro-encapsulation immobilization technologies listed in 40 CFR 268.45 to achieve the performance standard of reduced leachability of the hazardous contaminants, in the case of micro-encapsulation, and completely encapsulates debris with a material(s) that is resistant to degradation by the debris and its contaminants and the material into which it may come into contact after placement (leachate, other waste, microbes), in the case of macro-encapsulation.

Treated hazardous debris will be managed as specified in 40 CFR 268.45. When treating debris in accordance with the alternative treatment standards for debris, the MDWTP uses only the immobilization technologies of micro and macro-encapsulation. Hazardous debris contaminated with listed or characteristic waste that is treated by micro or macro-encapsulation at the MDWTP are properly disposed in licensed Subtitle C landfills and are accompanied by an LDR notification and certification form in accordance with 40 CFR 268.7(b)(5). Treatment of debris using one of the technology specific immobilization treatment standards at 40 CFR 268.45, constitutes compliance with the LDRs and no testing after treatment is required prior to disposal.

3.9 Macro-encapsulation

3.9.1 Description of the Macro-encapsulation Unit

The macro-encapsulation unit is made of approximately one-inch thick polyethylene using an injection molding process to create a rigid, one-piece "tub" that fits within a roll-off or is self-supporting. The macro-encapsulation units can be manufactured in any size but are most commonly manufactured to fit within a 20-yard roll-off. To seal the unit, a sheet of the same polyethylene in approximately the same thickness is screwed onto the lip of the tub using approximately 120 self-tapping screws. Screwing the down the lid provides a watertight seal that may be augmented with caulking or glue.

Debris placed within the macro-encapsulation units are jacketed within the polyethylene in an inert, durable, watertight material that will substantially reduce surface exposure to potential leaching media. The inert polyethylene material will completely encapsulate the debris and is resistant to degradation by the debris and debris contaminants managed by MDWTP and the wastes, leachate, or microbes with which it will contact once landfilled in a licensed hazardous waste cell.

3.9.2 Description of the Macro-encapsulation Process

Macro-encapsulation will be performed as follows:

1) Debris will be placed into one of the treatment tanks, Tanks A – H (formerly tanks 7A, 7B, 8A, 8B, 9A, 9B, 10A, 10B), or directly into a macro-encapsulation unit.
2) In the treatment tank, the debris is mixed, as needed, with an inert, finely divided material to fill the void spaces when encapsulated and to provide cushioning material. The inert filler includes cement kiln dust, sand, solidified non-hazardous waste, waste treated to the LDRs, or other non-biodegradable sorbent or fixation media. Fill material is also added directly to the macro-encapsulation units.
3) The debris is lifted from the tank with a backhoe and placed into a macro-encapsulation unit or is placed directly into the unit. As with dump trailers and dump trucks currently loaded with treated waste within MDWTP, the macroencapsulation units are also loaded within MDWTP.
4) The lid is screwed into place on the macroencapsulation unit.
5) Macroencapsulation approvals will specify "special burial" in the licensed hazardous waste cell. The special burial designation will ensure that the macroencapsulation units are carefully placed in the cell to ensure that they are not ruptured during placement or after placement. For macroencapsulated debris shipped to other permitted TSDF, guidance will be provided, to extent needed so that the macroencapsulation unit can be unloaded without rupturing.

3.9.3 Macro-encapsulation Capacity

Macro-encapsulation treatment capacity is a function of available tank space. Macro-encapsulation of hazardous debris will be counted against the permitted treatment capacity of the MDWTP on a daily basis as are all other hazardous wastes treated in the tanks. All permitted tank treatment methods, including micro- and macro-encapsulation, are performed within the state license and federal permit capacity limitations as stipulated in Section A-1 of this application.

4.0 WASTE ANALYSIS PARAMETERS

4.1 Criteria for Parameter Selection and Rationale – MDWTP/WDI

The parameters selected for analysis of wastes managed by the facility and the rationale for their selection is based on the physical/chemical characteristics of the waste, the regulatory and operating license requirements for treatment and/or storage of the waste at MDWTP or disposal at WDI, the information and analytical data supplied to the facility by the waste generator and the process control data necessary to manage the waste by the MDWTP's treatment and/or storage operations or disposal at WDI. The waste analysis used by the facility to manage wastes for treatment and/or storage include the following:

4.1.1 Fingerprint Analyses – MDWTP/WDI

These analyses may be performed on generator samples for pre-approval of the waste for management at the facility and are also performed on samples of each waste load prior to load acceptance, except for those listed in section 3.1.2. These analyses may also be performed if the generator or the facility determines that there is a change in the process generating the waste. The fingerprint analyses include screening procedures to provide data regarding the general physical and chemical characteristics of the waste. Table 3 indicates which tests will be used and under which conditions.

4.1.2 Supplemental Analyses (indicated with a "O" in Table 3) – MDWTP/WDI

These analyses are generally waste-specific based on the physical/chemical characteristics of the waste, the USEPA or Michigan hazardous waste number (determined by the generator), the process generating the waste, treatment, storage, or disposal process control requirements, and regulatory treatment requirements (such as the LDR or facility operating license conditions).

These analyses may be performed to supplement the generator-supplied information regarding the waste and the fingerprint analyses and include standard analytical USEPA and/or American Society for Testing and Materials (ASTM) methods.

Waste characterization data is provided by the generator using the GWCR, as described in Section 3.1.1. The generator data and analyses provide the facility with the information needed to properly manage a waste and ensure that the waste shipment received matches the identity and characteristics of the waste approved and designated on the accompanying Hazardous Waste Manifest (manifest) or shipping papers.

4.2 Analytical Parameter Descriptions – MDWTP/WDI
(Pre-Approval/Re-Approval, Pre-Acceptance & Post-Treatment)

The analytical parameters used to manage wastes for treatment, storage and disposal include the fingerprint analyses or supplemental analyses (if necessary) are described below. Table 3 indicates which tests will be used and under which conditions.

Color	This procedure evaluates the color of waste samples/information presented for pre-approval and compares the color of incoming loads of waste.
Consistency	A comparison of the incoming wastes consistency of originally approved material. Consistency descriptors are as follows: Dust, Solid, Semi-Solid, Sludge, Liquid and debris.
Compatibility Test	The procedures will be followed as outlined in the current version of the Work Plan for the Lab Compatibility Test that is maintained on-site.
Cyanide	A determination that the waste does not meet the criteria set forth in 40 CFR 261.23(a)(5). The test method to be used is the Total and Amenable Cyanide Method 9010, found in SW-846 or Method 7.3.3.2 for Reactive CN. Untreated waste containing more than 250 ppm of reactive or releasable CN is not accepted for treatment but may be stored in containers and transshipped.

Flashpoint / Ignitability	Used to determine the flash point of a liquid to verify approval under limits of acceptable only above 90°F flashpoint. **Test Methods for Liquids:** a. Setaflash Closed Cup Tester - American Society for Testing and Materials (ASTM) Standard D-3278-78 b. Pensky-Martin Closed Cup Tester - ASTM D-93-79 or D-93-80 **Test Methods for Sludges / Solids:** 5 plus or minus (≠) 1 grams of waste is placed in a small container. Ignition is attempted with a match for 5 seconds. If ignition occurs and the waste burns vigorously and persistently, the waste is not acceptable for treatment but may be stored prior to transshipment.
Hexavalent Chromium	The waste is screened using either a Hach® type chromate test kit or equivalent, or USEPA Method 7196. This method is used to screen for the presence or absence of hexavalent chromium (Cr^{+6}).
Hydrogen Sulfide	A test to determine if the specific rate of release of hydrogen sulfide in waste is above 500 ppm upon contact with an aqueous acid. (SW-846, Section 7.3.4.2).
Odor (Incidental)	Potentially problematic odors detected in the routine laboratory handling of a sample may result in rejection of the load unless the waste can be managed in such a way as to minimize odor emissions.
Oxidizer	No method for the oxidizer screen was provided in USEPA SW-846. The procedure used is as follows: Potassium iodide starch (KI) indicator paper is used to determine the presence of organic peroxides or other oxygen donors in aqueous wastes. A sample is considered an oxidizer if a reaction occurs when the addition of concentrated sulfuric acid produces orange gas (NOX). A SOP called "Screening of Possible Oxidizers (as defined by 40 CFR 173.151)" is used by the facility laboratory in performing this test. The current version of this SOP is maintained on-site.
Paint Filter Test	This method (USEPA 9095) may be used to determine if free liquid is present in a waste, if this is not apparent by visual inspection.
PCBs	This method (SW-846 8082) is used to detect Polychlorinated Biphenyls (PCBs). PCB analysis will be conducted on all wastes that contain oily residue, or are suspected of containing PCBs. Oily residue is defined as waste streams containing over 50 percent oil, no matter the origin.
pH	A comparison of the pH of the incoming waste with the pH range of the originally approved material is performed. pH methods used include SW-846 9040B, 9041A, 9045C.

Radiation Screen	A sample is passed near the detector window of a geiger counter, and the reading of the meter is noted and compared to the background reading. (See Section 3.1.3 Special Wastes; Section 3.1.3.1 Source Material, NORM or TENORM)
Reactivity - Water	A determination that the waste does not react violently with water during processing. In the course of this test water reactivity is addressed. The test method is as follows: Approximately ten milliliters (mls) or equal volume of waste is mixed rapidly with approximately ten mls of water solution in a beaker, the waste is compatible with the process if no incompatible waste reaction occurs as defined in 40 Code of Federal Regulations (CFR) 264, Appendix B, paragraph 1. The testing materials are identified water reactivity.
Reactivity – Acid	Standard Method 2310 (current Edition) is used to measure the acid content in waste in either mg/L (for aqueous samples) or mg/kg (for solid samples). Acidity is determined by potentiometric titration.
Suspended Solids	Is used to determine suspended solid content of aqueous wastes or sludge for the purpose of determining wastewater or non-wastewater categories under 40 CFR Part 268. This is performed using generator-provided information / analysis or from data obtained from the preparation of TCLP extracts (Method 1311).
TCLP	A Toxicity Characteristic Leachate Procedure (TCLP) test is used to determine if a solid waste meets or exceeds the maximum concentrations extractable of contaminants listed in 40 CFR 261.24, Table I. The test methods to be used are described in 40 CFR Part 261, Appendix II, Method 1311. Equivalent methods must be approved by the Director. (See Section 3.0)
Total Metals	A test to determine the total metal (i.e., constituent concentration in waste) content of wastes (USEPA SW-846 Methods 6000, 7000).
VOCs	This SW-846 (USEPA) analytical method (8260, 8021B or 8015BA) is used to determine the total concentration of volatile organic compounds (VOCs) in waste matrices. Only the constituents identified for a particular waste stream are analyzed.

40 CFR Part 261, Appendix VII	The hazardous constituents for which a waste is listed. The Appendix VII constituents are presumed to be present by facility personnel, and the waste handled accordingly. Specific information on a particular waste stream is normally supplied by the generator, based either on analysis or from the 40 CFR 261 background documents, which describe the basis of listing in accordance with 264.13(a)(2). If analysis is performed by the facility (on-site or by contract laboratory), one of the methods listed below is used, depending on the constituent of interest. These methods are provided in US EPA's "Test Methods for Evaluating Solid Waste," SW-846 (current Update). - Total Semi Volatiles (8100, 8060, 8270) - Total Volatiles (8260, 8021, 8015) - Total Metals (6000,6010,7000 series) - Total Herbicides (8151A) - Total Pesticides (8081)

4.3 Receiving - MDWTP/WDI

The analytical parameters used for pre-acceptance may include fingerprint and/or supplemental analyses for each incoming shipment of wastes arriving at the facility are indicated in Table 3. Supplemental analyses performed, is a function of the designated USEPA or Michigan hazardous waste numbers and waste characteristics. The analytical parameters performed for receiving incoming shipments of waste -are indicated in Table 3 except as noted in Section 3.1.2.

4.4 Post-Treatment - MDWTP

The analytical parameters that are used for post-treatment may include fingerprint and/or supplemental analyses. These parameters are defined by the waste codes and UHC associated with the waste in process and are summarized in Tables 2 and 3. Post treatment testing will not be performed on micro or macro-encapsulated debris.

5.0 ANALYTICAL TEST METHODOLOGIES

5.1 Fingerprint Parameters and Methods – MDWTP/WDI

The "fingerprint" parameters include screening procedures and test methods that have been developed within the waste management industry to provide a general identification of specific physical and chemical characteristics of wastes handled. These parameters are presented in Table 3 and are described above in Section 4.2.

5.2 Supplemental Parameters and Methods (indicated with a "O" in Table 3) – MDWTP/WDI

The additional parameters include commonly accepted standard analytical methods developed by the USEPA, ASTM, or as a standard waste management industry procedure. These parameters, presented in Table 3 and described above in Section 4, are used, as necessary, for additional characterization of the waste and determination of specific properties and/or constituents to ensure proper treatment, and/or storage in accordance with current regulations and the operating license.

Fingerprint analysis and additional analyses (if necessary) are used to ensure that restricted wastes are not accepted by the facility and that incompatible wastes are not commingled. Specific analyses may be used for various waste matrices.

5.3 Laboratory Capabilities – MDWTP/WDI

An analytical laboratory is maintained on-site for the purpose of conducting the analytical procedures associated with this WAP to evaluate, approve, and monitor the characteristics of waste received from their customers and managed by the facility. The laboratory utilizes modern analytical equipment and facilities in the analysis of waste samples. In addition, trained chemists are employed (individuals that possess educational and/or work experience qualifications necessary to be proficient in performing waste analysis) who utilize standardized procedures for maintaining quality assurance (QA) and quality control (QC) requirements associated with the analytical procedures.

The laboratory is currently capable of performing the fingerprint analyses, as described in this WAP, as well as standard USEPA and ASTM methodologies for analyses of a variety of parameters in the following general categories:

1) Water quality parameters/inorganics, non-metallics;
2) RCRA hazardous waste characteristics;
3) Organic Constituents:
    (a) VOCs;
    (b) Semi-VOCs;
    (c) Pesticides, herbicides; and
    (d) PCBs.
4) Metals.

The Laboratory's capabilities may be subject to change as necessitated by regulations, operating requirements, or advances in analytical methodologies and equipment.

5.4 Quality Control/Quality Assurance – MDWTP/WDI

The Laboratories maintain a Laboratory Quality Assurance Program (LQAP) to insure the accuracy, precision, and reliability of the laboratory results produced for our customers, or at the request of regulatory or accrediting bodies. Management, administrative, statistical, investigative, preventive, and corrective techniques are employed to maximize the reliability of the analytical data.

This LQAP establishes the policies and procedures regarding:

- Glassware preparation;
- Reagents, solvents, gases, and standards;
- Samples and sampling;
- Instrument calibration procedures;
- Analytical procedures;
- QC checks;
- Data handling and reporting;
- Preventative maintenance;
- Corrective actions;
- Orientation and training;
- Performance and system audits; and
- Subcontracted laboratories.

The Laboratory uses standard analytical procedures developed by the USEPA and ASTM. The Laboratory equipment maintained on-site is calibrated within acceptable limits, according to USEPA and ASTM or the manufacturer specifications prior to use. The Laboratory instruments are periodically inspected, maintained, and serviced according to manufacturer specifications. Reference standards and QC samples (i.e., checks, spikes, laboratory blanks, duplicates, and splits) are used to determine the accuracy and precision of procedures, instruments, and operators. Quality assurance/quality control (QA/QC) data is recorded with the test results. Records of all pertinent laboratory calibration, analytical, and QC activities and data are maintained by the laboratory.

The laboratory QA/QC procedures used by the facility assist in assuring that the data obtained are precise, accurate, and representative of the waste stream analyzed.

The analytical QA/QC procedures follow the method-specific requirements specified in "Test Methods for Evaluating Solid Waste: Physical Chemical Methods," SW-846, where applicable.

6.0 SAMPLING METHODOLOGIES

6.1 General Methodologies

Each incoming shipment of non-hazardous and hazardous waste is inspected and sampled, except those listed in section 3.1.2, to ensure that the waste received for matches the waste reviewed during the pre-approval process. The sampling techniques described herein are performed in accordance with the techniques outlined in USEPA's SW-846.

6.2 Sampling Program and Equipment

USEPA SW-846 will be followed, whenever possible, when choosing sampling equipment and methodologies. If a method is not provided in USEPA SW-846, then a different method will be used as outlined in Section 4.2. The person sampling is trained in the selection and use of the sampling device and is thoroughly familiar with the sampling requirements.

Sampling equipment is constructed of non-reactive materials such as glass, polyvinyl chloride (PVC) plastic, aluminum, or stainless steel. Care is taken in the selection of the sampler to prevent cross-contamination of the sample and to ensure compatibility of materials.

Sampling is performed for each waste in a manner that ensures the samples are as representative as possible under the conditions of the sampling event. All bulk and containerized hazardous waste loads will be sampled prior to acceptance, except for waste specified in Section 3.1.2. All samples must be appropriately labeled. The following information is included on the label:

Type of Sample	**Label Requirements:**
Bulk Loads	Transporter Name Truck #
Container Loads	Waste Code Manifest # Approval # Drum # and/or barcode
Treatment Tanks	Batch ID # Date Time Sampler

Observations or unusual conditions during sampling are noted as comments on the label. No chain-of-custody (COC) form is used with samples on-site, since the samples are relinquished directly to the on-site Laboratory. A COC will accompany any sample being sent to an off-site Laboratory.

6.3 Specific Sampling Procedures

6.3.1 Containerized Waste – MDWTP/WDI

Each incoming stream of waste in containers (non-hazardous/hazardous) will be sampled, except those listed in section 3.1.2, and the parameters according to Table 3 performed on each sample.

The containers are labeled with an EQ identification label, which numbers each container per manifest line item. Alternately, the numbers will be spray painted on each container. Once numbered, the containers to be sampled will be determined using www.random.org or an equivalent method listed in SW-846. Each hazardous waste stream will be sampled at 10-percent of the total number of containers.

The separate samples collected will be composited by waste stream in the facility laboratory to form a single sample for analysis. Individual samples that are visually dissimilar will not be composited.

Samples will be collected from containers by utilizing the sampling equipment recommended by the USEPA in USEPA, SW-846 and Section 6.2. Facility personnel will usually utilize container thieves or coliwasas to sample aqueous waste (MWTP only) and trier or scoops to sample granular or solid, sludge matrices (MDWTP/WDI).

6.3.2 Bulk Waste – MDWTP/WDI

Each incoming stream of waste received at the facility in a bulk form, except those listed in Section 3.1.2 will have a sample collected and analyzed for the fingerprint parameters in Table 3. Samples will be collected from each vehicle. A clean carbon steel, stainless steel auger or disposable PVC trier will be utilized to collect solid samples. Bulk aqueous tankers will be grab sampled utilizing a thief or coliwasa-type sampler to collect the sample from varying depths for analysis.

6.3.3 Treatment/Storage Tanks - MDWTP

Treated, stabilized waste will be sampled from the MDWTP treatment tanks in order to verify that the waste meets the LDRs prior to land disposal with the exception of microencapsulated and macroencapsulated debris. Samples of treated, stabilized waste will be collected from random vertical and horizontal locations.

A grab sample will be collected from a random vertical and horizontal location using a backhoe to reach the selected sampling point, collecting the sample from the backhoe bucket with a disposable scoop or cup. The sample is then taken to the laboratory for analysis. The location from which the random grab sample is taken will be marked in a grid in the Batch packet.

6.3.4 Transshipped Wastes - MDWTP

Any waste to be transshipped off-site to other permitted TSDF's will be received under a valid MDWTP approval and management will comply with this WAP.

6.3.5 Waste Materials Utilized as Treatment Reagents - MDWTP

MDWTP will obtain a chemical assay of waste materials such as lime or cement kiln dust (CKD) from the material source/vendor for evaluation prior to approval for use at MDWTP.

6.4 Equipment Decontamination

All equipment used in the collection of waste samples will either be disposable (e.g., scoops or container thieves) or sufficiently cleaned to remove observable contamination prior to sampling.

6.5 Sample Preservation and Storage

- Hazardous waste samples are generally not amenable to preservation;
- Samples for volatile organics are refrigerated at 4-degrees Celsius (°C) until analyzed and must be analyzed within seven days;
- Samples for semi-volatiles, if necessary, must be extracted within seven days and analyzed within 40 days;
- Aqueous samples for total organic carbon (TOC) analyses are refrigerated at 4°C until analysis and aliquots for metals analysis are preserved by the addition of HNO_3 to pH <2; and
- Samples are stored in the laboratory refrigeration unit.

6.6 Quality Control/Quality Assurance

Sampling QA/QC policies are found in the QA/QC manual, which is maintained by the Laboratory.

6.7 Health and Safety Protocols

During sampling and laboratory-related activities, personnel will utilize precaution to reduce the potential for incidents, injuries, or accidents. The facility has established a Hazardous Waste Operations (HAZWOPER) Facility Health and Safety Plan (HSP) in accordance with Michigan Occupational Safety and Health Administration (MIOSHA) Act 154 and R325.52129 for operations at TSDFs.

Facility personnel are HAZWOPER trained in accordance with the provisions of R325.52129(8) and follow health and safety (H&S) requirements, including PPE requirements specified in the facilities' standard operating procedures (SOPs).

FIGURE 1

TECHNOLOGY NAME
Deactivation (DEACT)

APPLICABLE WASTE TYPES
Wastes exhibiting the characteristics of Ignitability, Corrosivity, or Reactivity such as D001, D002, and D003 hazardous waste numbers.

PRE-TREATMENT REQUIREMENTS
Waste Specific

CRITICAL DESIGN PARAMETERS
- Dependent on which characteristic is exhibited.
- Deactivation technologies include those recommended in 40CFR Part 268 Appendix VI.

WASTE CHARACTERISTICS AFFECTING PERFORMANCE

- STATE - solid, liquid, or sludge
- ALKALINITY, ACIDITY, AND pH
- FLASH POINT
- CONCENTRATION OF OTHER CONSTITUENTS PRESENT.
- DEACTIVATION BY-PRODUCTS.

NOTE: MDWTP DOES NOT ACCEPT REACTIVE WASTES

UNDERLYING PRINCIPLE OF OPERATION

The treatment standard for many subcategories of characteristic hazardous D001, D002, and D003 wastes remove the characteristic of Ignitability, Corrosivity, or Reactivity. EPA has determined that many technologies such as those listed below, when used alone or in combination can achieve the treatment standard. Example deactivation technologies include:

Stabilization (STABL)
Neutralization (NEUTR)

FIGURE 2

TECHNOLOGY NAME

Chemical Oxidation (CHOXD)

APPLICABLE WASTE TYPES

Wastes containing organics, organo-metallics, cyanides, or sulfides. Oxidize arsenic to insoluble form in waste waters or inorganic sludges from metal plating/finishing. Typical hazardous waste numbers include F006, F007, F008, F009, F011, F012, F010, F019, F001-F005, D018-D043.

PRE-TREATMENT REQUIREMENTS

Frequently requires raising pH to alkaline range.

CRITICAL DESIGN PARAMETERS

- Oxidation/reduction potential.
- Residence time.
- Amount and type of oxidizing agent - add excess and monitor ORP.
- Degree of mixing.
- pH - optimize (moderately alkaline ~10-11.5).
- Oxidation temperature.
- Amount and type of any catalyst.
- TOC may be used as surrogate parameter for organics.

WASTE CHARACTERISTICS AFFECTING PERFORMANCE

- CONCENTRATION OF OTHER OXIDIZABLE COMPOUNDS. Increases demand in reagent; high sulfide may require additional reagent.
- CONCENTRATION OF METAL SALTS (especially Pb and Ag) Can cause excess consumption of reagent. Metal-cyanide complexes are more difficult to oxidize.

UNDERLYING PRINCIPLE OF OPERATION

The basic principle of chemical oxidation is that inorganic cyanides, selected dissolved organic compounds and sulfides can be chemically oxidized to yield carbon dioxide, nitrogen, water, salts, simple organic acids and in the case of sulfides, sulfates. Typical oxidants and reactions using sodium hypochlorite are:

Cyanide

$CN^- + NaOCl$ --- $OCN^- + NaCl$

$2OCN^- + 3NaOCl$ --- $CO_3^{-2} + CO_2 + N_2 + 3NaCl$

Phenol

$C_6H_5OH + 14NaOCl$ --- $6CO_2 + 3H_2O + 14NaCl$

Sulfide

$S^{-2} + 4NaOCl$ --- $SO_4^{-2} + 4NaCl$

FIGURE 3

TECHNOLOGY NAME
Chemical Reduction (CHRED)

APPLICABLE WASTE TYPES
Reduce hexavalent chromium and selenate ions. Treat oxidizing wastes containing reducible organics, inorganic oxidizers from plating, metal finishing, chromium pigments, mining, ore processing, or chemical manufacturing. Typical hazardous waste numbers include D007, D010, F006-F009, F011, F012, and F019.

PRE-TREATMENT REQUIREMENTS
Frequently requires lowering pH to acidic range.

CRITICAL DESIGN PARAMETERS
- Oxidation/reduction potential.
- Residence time.
- Amount and type of reducing agent - add excess and monitor ORP.
- Degree of mixing
- pH - usually at lower pH; <4.
- Reduction temperature.

WASTE CHARACTERISTICS AFFECTING PERFORMANCE

- CONCENTRATION OF OTHER REDUCIBLE COMPOUNDS. Increases demand in reagent. If TOC or inorganic oxidizer concentration is high, may not be applicable technology.
- CONCENTRATION OF OIL AND GREASE. Causes monitoring problems/fouling. If high, may not be applicable technology.

UNDERLYING PRINCIPLE OF OPERATION

The basic principle of chemical reduction is to reduce the valence of oxidizers and other constituents such as metals through oxidation-reduction reactions. Reducing agents such as ferrous sulfate or sodium sulfite are used to reduce specific constituents such as hexavalent chromium:

$$H_2(Cr^{+6})_2O_7+3Na_2SO_3+3H_2SO_4 \text{ ---- } (Cr^{+3})_2(SO_4)_3+3Na_2SO_4+4H_20$$

FIGURE 4

TECHNOLOGY NAME

Stabilization (STABL) / Microencapsulation (MICRO)

APPLICABLE WASTE TYPES

Wastes and hazardous debris containing leachable metals, high filterable solids content, low total organic content,

and low oil and grease content. These include residuals from treatment of electroplating waste waters, characteristic and listed metal wastes.

Typical hazardous waste numbers include D004-D011, F006-F009, F011, F012, F019, K061, F001-F005, and D018-D043.

PRE-TREATMENT REQUIREMENTS

- May require reducing or oxidizing metals to lower solubility states.
- May require reducing oil and grease or organic content.

CRITICAL DESIGN PARAMETERS

- Amount and type of stabilizing agent and additives.
- Degree of mixing.
- Residence time.
- Temperature and humidity
- Form of metals
- Oxidation state.
- Solubility.

WASTE CHARACTERISTICS AFFECTING PERFORMANCE

- CONCENTRATION OF FINE PARTICLES.

Very FINE particles (<No. 200 mesh) may weaken chemical bonds and increase leachability.

- CONCENTRATION OF OIL AND GREASE.

High OIL AND grease content coat particles, weaken chemical bonding, and increase leachability.

- CONCENTRATION OF ORGANIC COMPOUNDS.

High ORGANIC content (TOC) and organic compounds can inhibit curing and increase leachability.

- CONCENTRATION OF SULFATE AND CHLORIDE COMPOUNDS.

High sulfate or chloride content may interfere with chemical reactions, weaken bond strength, affect cure time, strength, and increase leachability.

- SOLUBILITY OF METAL COMPOUNDS. Metals should be present in most insoluble form.

UNDERLYING PRINCIPLE OF OPERATION

The basic principle of operation for stabilization is that leachable metals and low levels of selected organics are immobilized by the addition of stabilization reagents. The leachability is reduced by the formation of a lattice structure and/or chemical bonds that bind the contaminants into a solid matrix thereby limiting the concentrations of contaminants that can be leached when water contacts the waste material. Stabilization of metals is most effective when the metal is in its least soluble state. Typical stabilization reagents include Portland cement, lime and cement kiln dust. Micro encapsulation involves stabilization of hazardous debris such that the leachability of hazardous contaminants are reduced.

APPENDIX A

MDWTP - MID 000724831
Waste Types Acceptable for Storage, Treatment &/or Transshipment

Special Notes Regarding Permitted Waste Types (see Section 3.7)
The following Waste Code List includes all United States Environmental Protection Agency (USEPA) and Michigan Department of Environmental Quality (MDEQ) hazardous waste codes, with the following exceptions:

Ignitability –
Waste accepted for Treatment - Flash point of all wastes shall be > (greater than) = 90 °F.

Waste accepted for Storage and Transshipment - Flash point of all wastes shall be > (greater than), < (less than), or = 90 °F. Containers accepted at MDWTP for transshipment are uniquely marked so that they can easily visually identified as a transship waste stream.

Reactive wastes - (D003, K027, K044, K047, K161, and K045)
D003 (deactivated) waste may be accepted for storage, treatment and/or transshipment. These D003 deactivated waste (that may retain the code) will only be received as certified treatment residues, contaminated soil, contaminated debris, or spill residues that do not exhibit the characteristic of reactivity.

Reactive wastes identified in R299.9212 (3)(b-e) may be received for storage in the NCSA will be uniquely marked and subsequently transshipped. Reactive wastes identified in R299.9212 (3)(a, f, g, h) are prohibited.

Dioxin-containing wastes - (F020-F023, F026-F028, K043, and K099)
Dioxin-containing wastes shall not be accepted.

LDR –
Any waste codes that have a Land Disposal Restriction (LDR) technology-based treatment standard, other than Deactivation (DEACT), Chemical Reduction (CHRED), Chemical Oxidation (CHOXD), or Stabilization (STABL) cannot currently be treated by the facility, except as certified treatment residues. Hazardous waste debris may be treated as a waste stream or by micro-encapsulation or macro-encapsulation.

Attachment 2

Inspection Schedule

<u>GENERAL INSPECTION SCHEDULE</u>

40 CFR 264.15b

AND

NREPA 451, Part 111 R504(1)c

WAYNE DISPOSAL SITE #2 LANDFILL

GENERAL INSPECTION SCHEDULE

.40 CFR 270.14(b)(5) and MI Act 64 R504(1)c

Purpose:

The employees designated by the Owner or Operator as the Inspector(s) will inspect the facility for malfunctions and deterioration, operator errors, and discharges which may be causing -- or may lead to -- (1) release of hazardous waste constituents to the environment or (2) a threat to human health. The Inspector conducts these inspections often enough to identify problems in time to correct them before they harm human health or the environment.

Inspection Categories:

The Operator has developed and the Inspector follows a written schedule for inspecting:

1) Monitoring equipment;

2) Safety and emergency equipment;

3) Security devices; and

4) Operating and structural equipment important to preventing, detecting, or responding to environmental or human health hazards.

The inspection schedule is kept at the facility. The inspections are to be conducted at the times indicated below:

1. Annual - May of each year.
2. Quarterly - May, August, November, February.
3. Weekly - Monday or Tuesday of each week.
4. Daily - Each day the facility is handling hazardous waste.
5. After Storm - Within 24 hours following 0.5" precipitation.

Inspection Frequency:

The frequency of inspection is based on the rate of possible deterioration of the equipment and the probability of an environmental or human health incident if the deterioration, or malfunction, or any operator error goes undetected between inspections.

Inspection Requirements for Waste Handling Areas:

As applicable to the facility, the inspection schedule meets the following requirements:

Areas subject to spills: (40 CFR 264.15) Areas subject to spills, such as loading and unloading areas, are inspected daily when in use.

Inspection Requirements for Landfills:

As applicable to the facility, the inspection schedule meets the following requirements for all landfill units storing hazardous wastes:

In accordance with 40 CFR 264.303(b), while a landfill is in operation, it must be inspected weekly and after storms to detect evidence of any of the following:

(1) Deterioration, malfunctions or improper operation of run-on and run-off control systems. These systems are designed to control the volume of water from a 24-hour, 100 year storm. Associated collection and holding facilities must be emptied after storms to maintain design capacity of the system;

(2) Proper functioning of wind dispersal control systems;

(3) The presence of leachate in and proper functioning of leachate collection and removal systems. The design of each sump and removal system must provide a method for measuring and recording the volume of liquids present in the sump and of liquids removed. Ensure that leachate depth over the liner does not exceed 30 cm. (one foot).

In accordance with 40 CFR 264.303(c), a landfill with a leak detection system must:

(1) Record the amount of liquids removed from each leak detection system sump at least once a week during the active life and closure period.

(2)After the final cover is installed, the amount of liquids removed from each leak detection sump must be recorded at least monthly. If the liquid level in the sump stays below the pump operating level for two consecutive months, the amount of liquids in the sumps must be recorded at least quarterly. If the liquid level in the sump stays below the pump operating level for two consecutive quarters, the amount of liquids in the sumps must be recorded at least semiannually. If at any time during the post-closure operating period the pump operating level is exceeded at units on quarterly or semiannual recording schedules, the owner or operator must return to monthly recording of amounts of liquids removed from each sump until the level again stays below the pump operating level for two consecutive months.

Inspection Records:

The Inspector records inspections in an Inspection Log or Summary by compiling all completed Inspection Report forms into a binder kept on-site. These records are kept for at least three years from the date of inspection. These records, at a minimum, include the date and time of the inspection, the name of the inspector, a notation of the observations made, and the date and nature of any repairs or other remedial actions.

The following Inspection Report Forms are currently in use at the facility:

1) Daily Inspection Report (Form LOM-FM-002-BEL)
2) Weekly / After Storm Inspection Report (Form LOM-FM-003-BEL)
3) Quarterly / Annual Post-Closure Inspection Report (Form LOM-FM-008-BEL)
4) Quarterly/Annual Inspection Report (Form LOM-FM-006-BEL)
5) Storm Water SOP Inspection Form (Form LOM-FM-009-BEL)
6) Weekly Inspection Checklist for Leachate Collection System (Form QES-FM-005-BEL)

7) Waste Transfer Tank Inspection Report (LOM-FM-XXX-BEL)

These Inspection Report forms list and describe items to be examined at a specific frequency. On the notes on each form (bottom or reverse side of the form), the inspection items and acceptable or unacceptable conditions for each inspection item are identified. Some parts of each report form may not be applicable during the course of an inspection. For example, the weekly report includes a number of specific items that must be evaluated only in the event of a storm. If no storm has occurred the status of that item would be not applicable (N/A).

In addition to the inspection forms, the following SOPs are in place that include operating, inspection and training requirements:

1) Standard Operating Procedure for Storm Water Management (LOM-OP-011-BEL)
2) Standard Operating Procedure for Track-out Management (LOM-OP-012-BEL)
3) Standard Operating Procedure for Fugitive Dust Management (LOM-OP-009-BEL)
4) Standard Operating Procedure for Wind Speed Monitoring (LOM-OP-013-BEL)
5) Earthwork Clearance Permit (ECP) Procedure (LOM-OP-003-BEL)
6) LDCRS Riser Maintenance Procedure (LOM-OP-010-BEL)

These SOPs in some cases have associated forms and instructions for record keeping. The SOPs may also refer to the stand alone forms listed above.

Groundwater monitoring equipment will be inspected during sampling events, which may not coincide with this schedule. When this occurs the information is recorded on the Quarterly / Annual Inspection Report form closest in time to the actual inspection.

A revised or improved version of any Inspection Report form may be implemented upon proper administrative change notification to Michigan Department of Environmental Quality, Waste & Hazardous Materials Division.

Inspection Response and Corrective Action:

The Operator remedies any deterioration or malfunction of equipment or structures, which the inspection reveals on a schedule which ensures that the problem does not lead to an environmental or human health hazard. Where a hazard is imminent or has already occurred, remedial action is taken immediately.

If an unacceptable condition is detected, the Inspector reports it to the facility manager in charge at that time. The facility manager assigns responsibility for corrective action and a deadline by which corrective action has to be taken on the condition.

On subsequent daily inspections, the Inspector monitors the condition until the situation is completely rectified. Once it is rectified, the Inspector notes the date and time that the correction was made on all previous Reports mentioning the defect.

WAYNE DISPOSAL, INC. SITE #2
ACTIVE HAZARDOUS WASTE LANDFILL OPERATIONS
DAILY INSPECTION REPORT

Item	Description	Yes	No	If "No" is checked, state required corrective action	Completed
1	Daily cover properly applied to new waste at end of work day and to previously covered areas where re-cover necessary due to weathering? Integrity of daily cover acceptable in all areas?[1]				
2	Perimeter fence, gates and locks intact and secure?[2]				
3	No spilled or tracked waste in area around transfer station?[3]				
4	After-Hours Waste Transfer Log is up to date?				
5	Wind speed monitoring equipment is on and properly functioning?				
6	Wind Speed Monitoring Equipment Downtime Log is up to date?				
7	Wind speed sensor is no more than 10 ft below the elevation at which waste is currently being placed in the landfill, is located on the southwest slope of Master Cell VI, and is approximately vertical?				
8	Is each Radio / Telephone operational: Security, Receiving, Lab, MDWTP Spotter's Shack & WDI Spotter's Shack				
9	Is the Wheel Wash Operational?				
10	Is the Wash Building equipped for decontamination of material?				
11	Is the Landfill Fire Extinguisher present and charged?				
12	Is the Sweeper or Water Truck operational?				
13	Is the South Sedimentation Basin gate valve operational?				
14	Is there sufficient silt fencing equipment available on site?				
15	Is there sufficient spill absorbent materials available on site (1 pallet minimum)				

Signature of operator responsible for Item 1: ______________________

Operating date: ______________________

Date and time cover application completed for specified operating date: ______________________

____

Signature of Inspector for Items 2-7 (Landfill Manager or designated alternate): ______________________

Date of inspection for Items 2-7: ______________________

Time of inspection for items 2-7: ______________________

[1]Daily cover is ConCover or 6 inches of soil. ConCover application in accordance with manufacturer's specification and of sufficient thickness and coverage to control dust emissions. New waste covered at end of each day. Previously covered waste that is becoming exposed due to weathering of cover material must be re-covered to required specification.

[2]Inspect for vandalism, deterioration, or damage that could result in unauthorized entry to the active disposal area. Verify gates are locked.

[3]Inspect for proper housekeeping around the truck transfer area (sweeping and shoveling of any waste material that may have fallen from truck bed onto the ground surface). Site personnel shall also follow the Track-out Management SOP (LOM-OP-012-BEL) and the Bulk Waste Unloading SOP (LOM-OP-001-BEL) to minimize or eliminate spillage/track-out.

WAYNE DISPOSAL, INC. SITE #2
ACTIVE HAZARDOUS WASTE LANDFILL OPERATIONS
WEEKLY AND AFTER-STORM INSPECTION REPORT

Description	Yes	No	If "No", Explain. State Corrective Action.
Is this a WEEKLY inspection?			If yes, complete ENTIRE FORM
Is this an AFTER-STORM inspection?			If yes, complete ONLY Sections C & D

A. Leachate and Contact Water Collection Systems			**Section A Inspected By:** ______ **Date:** ______
Leachate collection sump riser covers present and properly seated (if applicable)?			
Condition of leachate collection sump risers acceptable?			
Leachate depths in each collection sump in compliance?			
Pumps functioning properly?			
Condition of flow meters acceptable?			
Secondary containment monitoring sumps for leachate and contact water force mains free of liquid?			

B. Leak Detection, Collection, and Removal System			**Section B Inspected By:** ______ **Date:** ______
Sump riser caps present and properly seated?			
Condition of sump risers acceptable?			
No evidence of tampering?			
Is the top of the riser and sample port protected from direct contact with waste?			
Motor controller condition acceptable? Protected from weathering?			

C. Storm Water Structural Controls			**Section C Inspected By:** ______ **Date:** ______
Contact water pumps and pump controls are properly functioning?			
Contact water high level alarms are functional?			
Contact water loss of power alarms are functional?			
Backup batteries for contact water alarm systems have proper voltage?			
Contact water is contained in the cell by separator berms and condition of berms is acceptable?			

D. Dike and Interim Cover Systems			**Section D Inspected By:** ______ **Date:** ______
Interim cover free of signs of erosion which could leave waste exposed?			
Condition of perimeter dike acceptable? Able to prevent run-on into cell and runoff out of cell?			
Is the perimeter free of signs of waste outside of the active cell?			
Is the visual boundary around the active cell in tact?			

Specify Type of Inspection

Check yes for the appropriate type of inspection (i.e. a weekly or an after-storm inspection).

For weekly Inspections, complete all sections.

If it is an after-storm inspection, complete Sections C & D only.

A. Leachate and Contact Water Collection Systems

Top cover is required only if riser rim is low enough to be a fall hazard. If present, verify that cover is properly seated.

Inspect aboveground exterior and visible interior portions of risers for damage, stress (buckling) and deterioration.

Measure depth to leachate in each collection sump. If leachate head is non-compliant, immediately notify the Landfill Manager (or designee).

Inspect flow meters for damage or malfunction. Report meter readings to Landfill Manager (or designee).

Check for liquid in the secondary containment monitoring sumps for both the leachate and contact water force mains. If liquid is present, determine whether it is condensate, groundwater or leachate/contact water. If condensate, no action required. If groundwater, there is a leak in the secondary pipe. If leachate or contact water, there is a leak in the primary pipe. Any leaks must be reported to the Landfill Manager immediately and repaired.

B. Leak Detection, Collection, and Removal System

Caps required at all times to prevent contaminants from entering the sumps. Check that caps are present and properly seated.

Inspect aboveground exterior of sump risers for damage, buckling and deterioration.

Note if there is any evidence of tampering that could introduce contamination into the sump.

Waste must not be in contact with the sample port or in the vicinity of the riser opening.

If present, the pump control box must be closed and protected from weathering. If not in use the controller should be moved indoors.

C. Storm Water Structural Controls

Inspect containment berms for damage and wear that could result in failure to contain runoff either due to leakage, permeation, spillage over, or slope failure. Immediately report to the Landfill Manager (or designee) erosion, soil displacement, equipment-induced damage, cracks, wet soil during dry weather, etc.

D. Dike and Interim Cover Systems

Inspect interim cover soil for erosion which could lead to waste exposure.

Inspect the perimeter dike for erosion and vehicle/equipment damage that could weaken the dike and/or allow runon into the cell or runoff out of the cell. Report any exposed geosynthetics. Report tire rutting which may have damaged underlying geosynthetics.

Inspect the perimeter of the active cell for debris that has blown outside of containment. Collect immediately and return to landfill.

Verify visual boundary around the active cell is intact.

WAYNE DISPOSAL, INC. SITE #2 CELLS V, VII, AND IX
QUARTERLY/ANNUAL POST-CLOSURE INSPECTION CHECKLIST

Month (Feb, May, Aug, or Nov) and Year: ______________________

Names of Inspectors: ______________________

Inspection Dates	Inspection Item	TRUE	FALSE***
	Security System		
Feb/May/Aug/Nov (Quarterly)	Gates and Perimeter fence secure and intact		
Feb/May/Aug/Nov (Quarterly)	All warning signs present and legible		
	Clay Dike and Perimeter Dewatering Tile System		
Feb/May/Aug/Nov (Quarterly)	No surface evidence of damage / deterioration		
Feb/May/Aug/Nov (Quarterly)	Free-flowing conditions exist at both discharge outlets		
May Only (Annual)	No damage / deterioration or evidence of tile blockage in manholes. Water levels and flow conditions in manholes acceptable.		
	Final Cover System		
Feb/May/Aug/Nov (Quarterly)	No significant erosion		
Feb/May/Aug/Nov (Quarterly)	No settling or water ponding		
Feb/May/Aug/Nov (Quarterly)	Cover properly vegetated		
Feb/May/Aug/Nov (Quarterly)	No rodent holes		
Feb/May/Aug/Nov (Quarterly)	Cover drain pipes intact, no flow obstructions		
Feb/May/Aug/Nov (Quarterly)	No evidence of leachate seeps (if seeps observed, immediate corrective action required)		
	Leachate Collection System		
Feb/May/Aug/Nov (Quarterly)	Standpipes/manholes/covers present, secure, and undamaged		
Feb/May/Aug/Nov (Quarterly)	Water column in each subcell collection sump acceptable		
Feb/May/Aug/Nov (Quarterly)	Pump systems (electrical, meters, pumps, piping) operational and undamaged		
Feb/May/Aug/Nov (Quarterly)	No surface evidence of damage to leachate discharge lines		
Feb/May/Aug/Nov (Quarterly)	No liquid in leachate force main secondary containment monitoring sumps		
	Monitoring Wells		
May and Nov Only (Semi-annual)	Well security devices present and undamaged		
May and Nov Only (Semi-annual)	Aboveground portion of well casings intact, properly seated, and undamaged.		
May and Nov Only (Semi-annual)	Grout seal and concrete pad a base of wells intact, no evidence of water infiltration		
May and Nov Only (Semi-annual)	No ponded water around well heads		
May and Nov Only (Semi-annual)	Conditions of lysimeters acceptable (MC V and VII only)		
	Gas Venting System (Cells V and VII only)		
Feb/May/Aug/Nov (Quarterly)	Vent pipes undamaged and properly seated in cell covers		
Feb/May/Aug/Nov (Quarterly)	Positive pressure exists at vent outlets.		
	Benchmarks		
May Only (Annual)	Monuments undisturbed. Manholes centered over monuments.		

*** If "false" is entered for any inspection item, list the required corrective action in the Maintenance Log.

	Perimeter Edge Drain					
Annually	Manhole Covers -- Security					
Annually	Manhole Covers -- Integrity					
Annually	Manhole Sections -- Integrity					
Annually	Sumps -- Integrity					

INSPECTION CRITERIA

I. Monitoring Equipment

Groundwater

Inspect individual well security devices (caps, covers, locks) for malfunctions, deterioration, vandalism, or damage.
Inspect observable portion of well casing for deterioration or damage such as cracks, casing alignment (damage from vehicle contact), insect, or animal infestation.
Check grout at base of casing for proper seal to prevent surface water infiltration down on the side of the casing.
Inspect/operate pump and pump control unit for damage deterioration and malfunction.

Perimeter Edge Drain

Verify manhole covers are in-place and are not damaged or have deteriorated to a point that would allow for accidental entry.
Inspect above ground portion and interior for evidence of damage or deterioration such as cracking or spauling that would lead to sediment infiltration.
Inspect sump for excessive sediment build-up that could result in flow blockage. Inspect for line blockage, i.e., water accumulating above pipe elevation.

WAYNE DISPOSAL SITE #2 LANDFILL
WASTE TRANSFER TANK INSPECTION REPORT

Daily ☐ Weekly ☐ Annual ☐

Date: ______________________
Time: ______________________
Inspector: ______________________

INTERVAL	DESCRIPTION	ACCEPTABLE?		CORRECTIVE ACTION (Who, What)	COMPLETED (When)
		Yes	No		
Daily	Cement Floor				
	Steel Walls				
	Sump				
Weekly	Leak Detection Observation Well				
	Run-on Control				
	Retaining Wall				
	Integrity of Contact Water Piping				
Annually	Cement Thickness				
	Steel Thickness				

INSPECTION CRITERIA

Daily

Cement Floor - Check for cracks, gaps, or damage to integrity of concrete surface.
Steel Walls - Check for damage to steel, loose bolts, and displacement along seams.
Sump - Check for water in sump. If water present, pump to contact water pond.

Weekly

Leak Detection Observation Well - Check for presence of water in leak detection well with electronic sounding device.
Run-on Control - Check curbs, gutters, speed bumps, and asphalt surface for damage or obstructions.
Retaining Wall - Check for erosion of earth or displacement of seams.
Integrity of Contact Water Piping - Check for water discharge within the contact water sump at the transition of the double-contained HDPE conveyance piping to the primary pump discharge pipe.

Annual

Cement Floor Thickness - Survey floor to determine how much wear has occurred, at 4-inches of wear the surface should be repaired.
Steel Thickness - Measure thickness to determine degree of degradation. Replace if less than two-thirds of the original plate thickness.

Training and Amendment of Inspection Checklists and SOPs:

All of the inspection checklists included in this section cannot be revised without the revisions being submitted to and approved by the MDEQ. This also holds for many of the SOPs listed in this document. Each SOP will contain a requirement for regulatory approval if necessary. The checklists and SOPs need to be reviewed to determine if modification is warranted any time there a new disposal area is constructed or any major change is made to the site infrastructure that are subject to inspection. When modifications to any checklist or SOP are made and approved, training of relevant personnel must be conducted before implementation

Attachment 3

Personnel Training Program

SITE 2 (MDWTP/WDI) PERSONNEL TRAINING PROGRAM

PERSONNEL TRAINING FOR SAFE FACILITY OPERATION AND MAINTENANCE

40 CFR 270.14(b)(12), 40 CFR 264.16, and Part 111

CORPORATE OBJECTIVES TARGET SAFETY AND COMPLIANCE

EQ completes all required compliance training for associates in a timely manner. In order to accomplish this a comprehensive training plan is followed which encompasses safety, compliance with environmental standards, and job-specific training such as adherence to the waste analysis plan (WAP). One module found within this training plan is the training required under RCRA for persons who work at a hazardous waste facility. The requirements in 40 CFR 264.16 state that workers will be given a baseline awareness of potential hazards at the facility and how to respond to an incident involving the release of waste following the site Contingency Plan. This training program, the RCRA Contingency Plan and Emergency Response Procedures is described below.

THE RCRA CONTINGENCY PLAN AND EMERGENCY RESPONSE PROCEDURES

This section provides an outline of both introductory and continuing training programs provided by the facility owners and operators to prepare persons to operate or maintain the Hazardous Waste Management facility in a safe manner as required to demonstrate compliance with 40 CFR 264.16. The title of this training program is RCRA Contingency Plan and Emergency Response Procedures. This training is designed to meet actual job tasks in accordance with RCRA regulatory requirements in 40 CFR 264.16(a)(3).

GENERAL METHOD AND CONTENT OF TRAINING

Facility personnel shall successfully complete a program of classroom instruction and on-the-job training that teaches them to perform their duties in a way that ensures the facility's compliance with the requirements of this part. The curriculum includes all the elements to fulfill both introductory and continuing training that will be given to each person filling a position related to hazardous waste management at the facility. An associate who is trained in hazardous waste management procedures, normally the Regulatory or Health & Safety Representative, directs this training.

Each manager is responsible for identifying the initial and continuing training needs of his/her employees to ensure facility compliance with RCRA. This information is communicated to the Regulatory or Health & Safety Representative who registers the employee into training classes. The manager also provides instruction on job-related standard operating procedures and other on-the-job training. This program includes instruction, which teaches facility personnel hazardous waste management procedures, including contingency plan implementation relevant to the position in which they are employed.

A. TRAINING CURRICULUM:

The training program is designed to ensure that facility personnel are able to respond effectively to emergencies by familiarizing them with emergency procedures, emergency equipment, emergency systems including;

(i) Procedures for using, inspecting, repairing, and replacing facility emergency and monitoring equipment;

(ii) Communications or alarm systems;

(iii) Responses to fires or explosions;

(iv) Responses to spill incidents; and

(v) Shutdown of operations

B.TRAINING TIMING AND FREQUENCY

Each affected person completes the program within six months after the effective date of these regulations or six months after the date of their employment or assignment to a facility, or to a new position at a facility, which ever is later. Employees hired after the effective date of these regulations must not work in unsupervised positions until they have completed the training requirements of the RCRA Contingency Plan and Emergency Response Procedures.

C. ANNUAL REVIEW

All facility personnel take part in an annual RCRA Contingency Plan and Emergency Response Procedures review.

D. DOCUMENTATION AND RECORD KEEPING:

The owner or operator maintains the following documents and records at the facility:

(1) Job Title and Employee List:

The job title for each position at the facility related to waste management, and the name of each employee filling each job; - per 40 CFR 264.16(d)(1)

(2) Job Description:

A written job description is provided for each position is listed above. This description may be consistent in its degree of specificity with descriptions for other similar positions in the same company location or bargaining unit, u must include the requisite skill, education, or other qualifications, and duties of employees assigned to each position; - per 40 CFR 264.16(d)(2) –

(3) Training Requirements:

A written description of the type and amount of both introductory and continuing training that will be given to each person filling a position listed; - per 40 CFR 266.16(d)(3)

(4) Records;

Records that document the RCRA Contingency Plan and Emergency Response Procedure training or job experience has to be given to, and completed by, facility personnel; - per 40 CFR 264.16(d)(4)

E. RECORD MANAGEMENT

Training records on current personnel are kept until closure of the facility. Training records on former employees are kept for at least three years from the date the employee last worked at the facility. Such records are maintained on-site.

Personnel training records may accompany personnel transferred within the same company to another facility.

Contingency Plan

EQ -- THE ENVIRONMENTAL QUALITY COMPANY

PRESENTS

RCRA CONTINGENCY PLAN

AND

EMERGENCY PROCEDURES

FOR

MICHIGAN DISPOSAL WASTE TREATMENT PLANT

&

WAYNE DISPOSAL, INC. SITE #2

AT

BELLEVILLE, MICHIGAN

As revised February 2011
(Discard all previous versions)

RCRA CONTINGENCY PLAN PURPOSE

"Contingency Plan" means document that sets out an organized, planned, and coordinated course of action to be followed in case of a fire, explosion, or release of hazardous waste or hazardous waste constituents that could threaten human health or the environment." (R299.9102(p), 40 CFR 260.10)

The contingency plan has been designed to minimize hazards to human health or the environment from fires, explosions, or any unplanned sudden or non-sudden release of hazardous waste or hazardous waste constituents to air, soil, or surface water.

The provisions of the plan are to be carried out immediately whenever there is a fire, explosion, or release of hazardous waste or hazardous waste constituents which could threaten human health or the environment(40 CFR 264.51(b))

TABLE OF CONTENTS

A1. Description of Operations - Michigan Disposal Waste Treatment Plant (MDWTP)

The MDWTP operations include receiving, storage, and treatment of hazardous wastes permitted by the MDEQ under the facility operating license and the USEPA under a Resource Conservation and Recovery Act (RCRA) permit (MID 000 724 831).

The specific routine operations and work areas for MDWTP include:

- Waste receiving & quality control(QC)
- Waste loading/unloading
- Reagent unloading & tank storage
- Waste storage in tanks
- Waste treatment in tanks
- Container staging & storage and
- Shipment of waste off-site to permitted treatment, storage, and disposal facilities (TSDFs)

The requirements for operations in these areas are defined in and regulated by the facility operating license.

Waste Identification and Classification - MDWTP

The waste types acceptable for treatment and storage at the facility are defined in Part 111 of Michigan's Natural Resources and Environmental Protection Act, 1994 PA 451 (Act 451) and 40 CFR regulations at part 261. The wastes acceptable for treatment listed in Appendix A of MDWTP's WAP.

Description of Waste Management Units - MDWTP

The MDWTP facility is a liquid and solid hazardous & non-hazardous waste storage and treatment facility. Containerized wastes may be stored on-site before and after treatment in one of five hazardous waste storage areas: the North Container Storage Area (NCSA), the East Container

Storage Area (ECSA), the Southeast Container Storage Area (SECSA) and the East and West Treatment Building Bays. The facility is equipped with pollution control systems for particulate, odor, and emission control.

Liquid hazardous wastes to be treated in the pozzolanic stabilization process may be stored in four, 20,000 gallon and vertical storage tanks (T-16 through T-19). Liquid reagents are stored in two, 15,000 gallon vertical tanks (T-25 and T-27).

Hazardous Waste dust may be stored in three 100 cubic yard (cy) silos of the plant. Lime kiln flue dust, cement kiln flue dust, and lime are also used for stabilization and may be used in all six silos (T-1 through T-6). The dusts are fed from the silos to the closest pugmill and treatment tank at a controlled rate to effect treatment of liquid and solid wastes. Other reagents, such as ferrous sulfate, may be added directly to the tanks in bag or bulk quantities.

Listed and characteristic hazardous wastes are stored and treated in sludge receiving tanks, sludge storage tanks, and pugmills on the west side of the plant and similarly stored and treated on the east side of the plant. In both cases, treatment consists of blending the waste in sludge feed tanks prior to treatment in the pugmills or mixing and treatment directly in the sludge storage/treatment tanks. Other chemical reagents may be selectively added in drum or bulk quantities.

Containerized hazardous waste and non-hazardous wastes are staged and stored on concrete pads at the NCSA, ECSA, SECSA and the East and West Treatment Building Bays. Drainage trenches constructed within the containment areas contain and control liquid runoff. Drums are transported from the pad into the plant using a barrel forklift. Then they are opened by carefully removing the tops or bungs and immediately emptying the contents with a vacuum truck or pouring contents directly into the sludge boxes or treatment tanks using the barrel forklift. The empty drums are placed into a roll-off box or other similar container for subsequent disposal.

The disposal operations are supported and directed from the office/lab and waste receiving site located near the entrance to the facility. These support operations assist to control and evaluate shipments received for conformance with pre-approval information regarding the specific properties, treatment, and documentation requirements. The facility waste characterization and analysis records are maintained on-site.

A2. Description of Operations - Wayne Disposal, Inc. Site #2 (WDI)

The WDI operations include the landfill disposal of hazardous and non-hazardous wastes permitted by the MDEQ under the facility operating license USEPA under a Resource Conservation and Recovery Act (RCRA) permit (MID 048 090 633).

The specific routine operations and work areas for WDI include:

- Waste receiving and quality control
- Waste unloading
- Hazardous waste landfill and related appurtenances (piping, pumps, operation and maintenance, truck wheel wash buildings located within the area bounded by North Interstate 94 (I-94) Service Drive and Willow Run Airport)

Work areas are shown in Figure 4.

The landfill is currently permitted with a design capacity of 11,000,000 cubic yards (cy) of in-place waste. The requirements for operations in these areas are defined in and regulated by the Hazardous Waste Treatment, Storage and Disposal Facility operating license. Non-hazardous wastes are managed in accordance with the facility's Part 115 of Michigan's Natural Resources and Environmental Protection Act, 1994 PA 451 (Act 451). The WDI landfill is-located at the same site as the MDWTP treatment and storage facility (MID 000 724 831). The WDI landfill disposal operations are supported by the MDWTP office/lab and waste receiving, storage, and treatment operations located near the entrance of the facility. These operations assist to control and evaluate shipments received for conformance with pre-approval information regarding the specific properties, treatment, and documentation requirements. The WDI facility waste analysis records are maintained on-site.

Waste Identification and Classification - WDI

The waste types acceptable for treatment and storage at the facility are defined in Parts 111 and 115 of Michigan's Natural Resources and Environmental Protection Act, 1994 PA 451 (Act 451) and 40

CFR Regulations at Part 261. Acceptable hazardous waste codes are identified in Section 8 of the Hazardous Waste Treatment, Storage and Disposal Facility Operating License.

The facility (WDI) license has specific restrictions regarding the following waste types NOT ACCEPTABLE for disposal:

- Ignitable wastes as described in Michigan Act 451 rule R 299.9212
- Reactive wastes as described in Michigan Act 451 rule R 299.9212
- Bulk or noncontainerized liquid waste or waste containing free liquids
- Containers holding free liquids, including laboratory packs
- Wastes which are banned from landfilling by regulations promulgated under 40 Code of Federal Regulations (CFR) Part 268 unless the wastes meet the applicable Land Disposal Restriction (LDR) treatment standards or a variance has been obtained from the USEPA
- Waste which will:
  (1) Adversely affect the permeability of the clay liner.
  (2) Produce a leachate that is incompatible with the clay liner, leachate collection system piping, or the off-site sewer system.
  (3) Generate gases that will adversely affect the permeability of the clay cap or create a violation of the air pollution control requirements of Part 55 of Act 451.

<u>Description of Waste Management Units - WDI</u>

The WDI facility includes a permitted hazardous waste landfill with primary and secondary liner systems, a leachate collection and removal system, and a leak detection, collection and removal system. The landfill operations also include run-on, run-off, and contaminant control systems including a vehicle wash facility and other landfill-related appurtenances and support buildings. When placed in the landfill, containers are at least 90% full or crushed, shredded, or similarly reduced in volume before burial in the landfill. The waste management units are identified in Figure 4.

PLAN SCOPE (264.52)

264.52(a). Emergency Response Actions--All Personnel

All MDWTP and WDI personnel are instructed to respond, in case of emergency, as follows:

1. Alert the shift supervisor or the emergency coodinator of the hazard(s).
2. If any persons in the immediate area are potentially endangered, advise them to leave immediately.
3. If any person has been seriously injured call 911 for EMT support.
4. Contact the Emergency Coordinator(s) in person, as necessary, by radio or phone (See Section 264.52(d), page 15 for the list of Emergency Coordinators).
5. Indicate nature of emergency and stand by to receive instructions from Emergency Coordinator or evacuate.
6. Shut down, as necessary, all processing and ancillary equipment per manufacturers instructions, associated with the incident.

The Emergency Coordinator will direct actions of all facility personnel to:

1. Identify hazards and assess extent of potential harm to human health or the environment.
2. Notify, as necessary, the appropriate Emergency Response Contacts listed in this Plan.
3. Respond in cooperation with outside agencies to minimize hazards.
4. Follow up response actions with required reports (verbal and written). This includes internal incident reports and providing information to regulatory staff to prepare the incident report(s).

If there is a fire, explosion, or other release of hazardous waste or hazardous waste constituents that could threaten human health or the environment, or a spill that reached surface water or ground water, then immediately notify the DEQ's pollution emergency altering system (PEAS) - telephone number

800-292-4706 if after hours, and the DEQ directly if between 8-5. The notification shall include all of the following information:

(a) The name and telephone number of the person who is reporting the incident.

(b) The name, address, telephone number, and EPA Identification No. of the facility.

(c) The name, address, and telephone number of the owner or operator.

(d) The date, time, and type of incident.

(e) The name and quantity of the material or materials involved and released.

(f) The extent of injuries, if any.

(g) The estimated quantity and disposition of recovered material that resulted from the incident.

(h) An assessment of actual or potential hazards to human health or the environment.

(i) The immediate response action taken.

264.52(b). Emergency Response Planning

This RCRA Contingency Plan is a part of the overall effort at the facility to predict, prevent, and properly respond to incidents. The RCRA Contingency Plan satisfies RCRA requirements for responses to emergencies involving hazardous waste.

264.52(c). Arrangements with Emergency Response Agencies

(a) The following are arrangements agreed to by local fire departments, police, hospitals, contractors, state and local emergency response teams to coordinate emergency services.

1) Local police, fire departments, and emergency response teams are made familiar with the layout of the facility (by independent review of copy of this contingency plan and upon response by ER contact and tours of the facility), properties of hazardous waste handled at the facility and associated hazards, places where facility personnel would normally be working, entrances to and roads inside the facility, and possible evacuation routes.

2) The Primary emergency authority of the local police and fire department is set forth by state and local law or ordinance. The Van Buren Fire Department is deemed the primary emergency contact for situations related to this site's operations. The Van Buren Fire Department will make other emergency team contacts at their discretion, usually asking for the assistance of the Van Buren Police Department/Michigan State Police. This, of course does not preclude MDWTP and WDI personnel from exercising the option of contacting additional emergency units depending on the circumstances (A list of Emergency Response Contacts is provided in this section). Any others providing support to the primary emergency authority will follow the direction of the local police and fire departments.

3) All necessary support by emergency response teams, emergency response contractors, and equipment suppliers has been documented in this Plan.

4) Information to familiarize hospital staff with the properties of wastes involved in an injuries, incident, or illness resulting from fires, explosions, or releases will be provided at the time of response to an incident.

5) EQ is continuing to work with the Van Buren Township (VBT) Fire Department to further develop and maintain emergency response activities (i.e. joint training, periodic drills and evacuation planning with local emergency response agencies) and better communication.

(b) No state and local authorities have declined to enter into such arrangements; if such refusal occurs it would be documented.

	Ken Weber WWTP Mgr	Office: Cell: Home:	(734) 699-6280 (734) 576-0153 (734) 464-0310

264.52(e). Emergency and Decontamination Equipment

The Health and Safety Manager ensures that the Emergency and Decontamination Equipment on-site is maintained. Locations of emergency and decontamination equipment are shown in Figures 1, 2 and 3. Some of this equipment may be serviced and/or monitored by an outside contractor. Routine training is provided to appropriate EQ Personnel on the operation and use of certain emergency equipment.

264.52(f). <u>Evacuation Plan Clearing Immediate Area</u>

If any employee in the active hazardous waste treatment area or waste reception area encounters an emergency situation which they believe to present an imminent threat to human health or the environment, the individual employee is authorized to leave the area immediately and tell others to leave the area immediately.

Any available route away from the hazard may be used either on foot or by vehicle. The employee should proceed out the main gate to the service drive or out Denton Road to the service drive and notify security to contact the Emergency Coordinator. If security has been disabled use radio or first available phone to contact the Emergency Coordinator.

<u>Evacuation of Entire Facility</u>

Evacuation Signal: If in the opinion of the Emergency Coordinator a general evacuation of the entire site is warranted, he will notify all persons on-site by radio and PA systems. All employees work under supervision of a supervisor in public address system range or direct radio contact with the Emergency Coordinators. Evacuation notice will be given verbally to these employees.

Primary Evacuation Route:

Upon receiving the evacuation order by radio, all employees, including persons in the non-hazardous areas, must immediately proceed out Denton Road to the service drive and congregate at that point. The security guards' list of persons on-site will be used for roll call.

Alternate Evacuation Route:

If wind direction and location of hazard blocks the Denton Road gate, the employees must exit the main gate to service drive and congregate east of the entrance. The security guards' list of persons on-site will be used for roll call.

Return to Site:

Employees should not return to the site until instructed to do so by the Emergency Coordinator, or until a general all clear signal is given over the radio/PA system.

264.53. Plan Distribution

1. On-Site Copy Locations: Official Copies of the Contingency plan can be found in the following locations on-site:
   a) MDWTP/WDI Spotter's Shed
   b) Guard Office
   c) Safety Office
   d) Administrative Building
   e) Receiving Building
   f) Lunchroom/Training Center
2. Off-Site Copy Locations: Official Copies of the Contingency Plan have been sent to the following agencies off-site:
   a) EQ Main Office (Wayne, MI)
   b) Each of the Emergency Response Contacts with addresses listed in section 264.52(c) of this plan.

264.54. Plan Revision

The contingency plan must be reviewed, and immediately amended, if necessary, whenever:

(a) The facility permit is revised;

(b) The plan fails in an emergency;

(c) The facility changes - in its design, construction, operation, maintenance, or other circumstances - in a way that materially increases the potential for fires, explosions, or releases of hazardous waste or hazardous waste constituents, or changes the response necessary in an emergency;

(d) The list of Emergency Coordinators changes; or

(e) The list of emergency equipment changes.

The Emergency Coordinator(s) will coordinate with the Quality Environmental Health & Safety Department (QEHS) to initiate an update of the Contingency Plan whenever it becomes outdated.

Whenever the Contingency Plan is modified, the Emergency Coordinator(s) must provide the emergency response agencies with a copy of the modified plan. Send these copies with a letter of transmittal, by certified mail, with instructions to destroy all previous copies.

264.55. Responsibility, Qualifications and Authority of Emergency Coordinator

At all times there is at least one employee, either on the facility premises or on call and within reasonable travel distance of the facility, with the responsibility for coordinating all emergency response measures. These personnel are known as on-site Emergency Coordinator(s). They must be fully qualified for this responsibility and be knowledgeable of this Contingency Plan, the facility's operations and activities, and how these operations and activities are impacted by RCRA obligations." They must also be knowledgeable of the location and characteristics of waste handled, the location of all records within the facility, and the facility layout.

The Emergency Coordinator must be contacted immediately in the occurrence of any situation that may result in potential or actual threats to human health or the environment. The Emergency Coordinator must implement this plan whenever there is a fire, explosion, or release of hazardous waste or hazardous waste constituents that could threaten human health or the environment. The Emergency Coordinator is authorized to commit any necessary resources of the company that may be needed to carry out this Contingency Plan.

264.56. Emergency Response Procedures by the Emergency Coordinator

264.56(a). At Tine of Incident

Whenever there is an imminent or actual emergency situation, the Emergency Coordinator (or his designee) immediately:

(1) Activates internal communication systems (Radio/ PA System) to notify all facility personnel; and

(2) Notifies appropriate state or local agencies with designated response roles if their help is needed.

264.56(b). In the Event of Release, Fire or Explosion

The Emergency Coordinator must coordinate with QEHS to immediately identify the character, exact source, amount and extent of any released materials. They may do this by observation and/or review of the facility records or manifests, and if necessary, by chemical analysis.

264.56(c). Assessment of Possible Hazards

The Emergency Coordinator must assess possible hazards to human health or the environment that may result from the release, fire, or explosion. This assessment must consider both direct and indirect effects of the release, fire, or explosion (e.g., the effects of any toxic, irritating, or asphyxiating gases that are generated, or the effects of any hazardous surface water run-off from water or chemical agents used to control fire and heat-induced explosions). Should the release, fire or explosion present a significant **off-site** risk, SOP QES-OP-010-BEL (an MDNRE approved SOP) must be implemented to provide a timely assessment of off-site risk.

Sudden Release (Spill) Control, Containment, Cleanup, and Disposal

In the event of a spill or release which could threaten human health or the environment, the following steps should be taken:

1. Contact the Emergency Coordinator for instructions.

2. The Emergency Coordinator shall give directions to:

a) Isolate the area of the spill to prevent contact with any personnel.

b) Determine whether the spilled material may enter or is entering the sedimentation basin, and if the potential exists, the discharge point from the sedimentation basin to the Quirk Drain must be closed.

c) Determine the characteristics of the spilled waste for any special handling requirements. If feasible and safe, stop the release at the source of the flow by overpacking or uprighting containers, using valves, shut off switches, patches, lids or other mechanical devices. Drains or sumps may be sealed using visqueen and a weight such as a bag of absorbent.

d) Vacuum any available spilled waste with the vacuum truck. Any remaining residue should be contained with absorbents and shoveled into containers in preparation for disposal. Solid wastes may be front-end loaded into containers or waste hauling vehicles.

e) If the spill occurred in a paved area, the pavement should be cleaned with water and detergent solution, under high pressure and then rinsed twice with clean water, being sure to collect all spent cleaning and rinsing solutions with the vacuum truck. After the spill has been cleaned up, the spill area will be inspected for cracks, fissures or any other imperfection that might allow the spilled material to reach the subsoil. In the event that any cracks or fissures are found, three one-inch holes will be drilled through the concrete. The holes will be along the cracks or fissures and spaced to represent the area. A thin wall tube will be pounded at least six inches into the soil. The soil collected in the tube will be analyzed for the spilled constituents. If hazardous levels of spill constituents are detected, the concrete in the area should be removed and the area remediated as though the spill had occurred in an unpaved area. When completed, the new replacement concrete should include water stop. If hazardous levels of spill constituents are not detected, the holes should be filled with Emanco T-430 or equivalent in accordance with manufacturer's instructions.

f) In the event the spill occurs in an unpaved area, all visible contamination should be removed. At least six inches of "clean" soils surrounding the contaminated area should also be removed. Samples should then be taken for chemical analysis to confirm the absence of any contaminants from the spilled waste.

g) Containers of Hazardous Waste are properly labeled and marked and managed in generation accumulation areas. They are properly characterized and disposed of at a properly licensed waste management facility. A properly completed manifest is used if transport of liquids or hazardous waste to an off site destination is necessary.

3. The Emergency Coordinator shall assist QEHS in the preparation of the appropriate reports described below.

264.56(d). Notification of Regional Authorities If the Emergency Coordinator determines the facility has had a release, fire, or explosion which could threaten human health or the environment outside the facility, he will report such findings and act as follows:

1. If the Emergency Coordinator suspects that the evacuation of surrounding local areas is advisable, he will inform Van Buren Fire Department, or Van Buren Police Department or MI State Police and assist the appropriate officials in deciding whether evacuation is necessary and, if so, assist in determining what areas should be evacuated. According to R 299.9607 and 40 CFR 264.56(d), the decision making authority to evacuate the local areas belongs to the appropriate local authorities (i.e. Van Buren Township) based on the EQ's assessment of the release.
2. In the event of fire, the Emergency Coordinator gives special consideration to potential impact of smoke or fumes on I-94 freeway traffic.

3. If there is a fire, explosion, or other release of hazardous waste that could threaten human health or the environment, or a spill that reached surface water or ground water, the Emergency Coordinator will immediately notify the DEQ's pollution emergency alerting system (PEAS) - telephone number 800-292-4706. The notification shall include all of the following information:

(a) The name and telephone number of the person who is reporting the incident;

(b) The name, address, telephone number, and EPA Identification No. of the facility;

(c) The name, address, and telephone number of the owner or operator;

(d) The date, time, and type of incident;

(e) The name and quantity of the material or materials involved and released;

(f) The extent of injuries, if any;

(g) The estimated quantity and disposition of recovered material that resulted from the incident, if any;

(h) An assessment of actual or potential hazards to human health or the environment;

(i) The immediate response action taken.

If any threat to human health or to the environment extends **off-site**, the Emergency Coordinator will also contact the National Response Center (800-424-8802) and report the following:

1. Name and phone number of reporter;
2. Name and address of facility;
3. Time and type of incident;
4. Name and quantity of material involved, to the extent known;
5. The extent of injuries, if any;
6. Possible hazards to human health or the environment outside the facility.

264.56(e). Preventing the Spread of Hazards

During an emergency, the Emergency Coordinator must take all reasonable measures necessary to ensure that fires, explosions, and releases do not occur, recur, or spread to other hazardous waste at the facility. These measures must include, where applicable, stopping processes and operations, collecting and containing released waste, and removing or isolating containers.

264.56(f). Response to Fire, Explosion or Release

If the facility stops operations in response to a fire, explosion, or release, the Emergency Coordinator must monitor for leaks, pressure buildup, gas generation, or ruptures in valves, pipes or other equipment, whenever this is appropriate.

264.56(g). Provision for treatment, storage, and disposal of waste generated in emergencies

Immediately after an emergency, the Emergency Coordinator must provide for treating, storing, or disposing of recovered waste, contaminated soil or surface water, or any other material that results from a release, fire, or explosion at the facility.

[Comment: Unless the owner or operator can demonstrate, in accordance with Section 261.3(c) or (d) of 40 CFR, that the recovered material is not a hazardous waste, the owner or operator becomes a generator of hazardous waste and must manage it in accordance with all applicable requirements of Parts 262, 263, and 264 of 40 CFR.]

264.56(h). Prevention of and Preparation for future incidents

The Emergency Coordinator must ensure that, in the affected area(s) of the facility:

(1) No waste that may be incompatible with the released material is treated, stored, or disposed of until cleanup procedures are completed; and

(2) All emergency equipment listed in the contingency plan is cleaned and fit for its intended use before operations are resumed in the affected area(s) of the facility.

(3) EQ is continuing to work with the Van Buren Township (VBT) Fire Department to further develop and maintain emergency response activities (i.e. joint training, periodic drills and evacuation planning with local emergency response agencies) and better communication.

264.56(i). Notification of Compliance with section 264.56(h)

Notification must be given to the Regional Administrator, and appropriate state and local authorities, that the facility has taken the necessary steps to prevent and prepare for future incidents (as described in 40 CFR 264.56(h)) before operations are resumed in the affected area(s) of the facility.

264.56(j). Post Emergency Documentation and Reporting

Documentation:

The Emergency Coordinator will note in the Operating Record the time, date, and details of any incident that requires implementing the Contingency Plan. The Operating Record is maintained at the Wayne Disposal, Inc. Site No. 2 facility in Belleville, Michigan.

Reporting:

Within **15 days** of any situation requiring implementation of the Contingency Plan, the Emergency Coordinator shall prepare a report to be submitted to the Regional Administrator (EPA) and DEQ District Supervisor, Waste Management Division, SE Michigan District (Warren). At a minimum, the report shall detail the following:

1. Name, address and phone number of the operator;
2. Name, address, and telephone number of the facility;
3. Date, time, and type of incident (e.g. fire, explosion);

4. Name and quantity of material(s) involved;
5. The extent of injuries, if any;
6. An assessment of actual or potential hazards to human health or the environment, where this is applicable; and
7. Estimated quantity and disposition of recovered material that resulted from the incident.

WAYNE DISPOSAL, INC.

October 6, 2011

Dr. John McCabe
St. Joseph Mercy Hospital
5301 E. Huron River Drive
Ann Arbor, MI 48106

Re: Contingency Plan
Wayne Disposal, Inc.

Dear Dr. McCabe:

As a listed member of an Emergency Response Agency enclosed please find an updated Contingency Plan for Wayne Disposal, Inc.'s Hazardous Waste Facility in Belleville, Michigan. The updated plan is being sent to all listed Emergency Response Agencies to ensure that up to date information is contained in all files.

Please dispose of any earlier copies of this plan that you may possess and if you have any questions please contact me at (734) 699-6286.

Sincerely,

Michael J. Takacs
Environmental Manager

Closure Plan

CLOSURE PLAN

40 CFR 270.14b (13) & PART 111, R504(1)c

CLOSURE PLAN

40 CFR 270.14(b)(13)
Part 111 R504(1)c
TABLE OF CONTENTS

CLOSURE PLAN

40 CFR 270.14(b)(13)

I. INTRODUCTION

A. Facility Conditions

Originally Wayne Disposal, Inc. Site #2 was a 427 acre facility with approximately 360 acres available for co-disposal of both hazardous and non-hazardous waste via landfill.

Wayne Disposal Site#2 Landfill has set aside Master Cells (MC) V, VI and VII for hazardous waste disposal. The hazardous waste boundary which circumscribes MC V, VI and VII contains 120 acres of which 105.6 are actual disposal area. Since the Fall of 1982, the co-disposal of hazardous and non-hazardous waste has been discontinued, with the remaining capacity in MCs V, VI, and VII reserved for hazardous waste.

All hazardous waste cells have leachate collection and removal systems. MC V and MC VII have been closed with multilayer final cover systems. This closure plan was developed to describe closure activities for cells VI-AS through VI-E. Cells VI-F and VI-G, which have not been constructed, must be incorporated into this Plan incrementally as each phase is constructed and licensed. Updates to the closure plan must include an updated sampling plan based on the configuration of the landfill licensed at the time. The updated closure plan and closure cost estimate must be submitted to MDEQ along with the construction certification for each phase. Financial assurance must also be adjusted at this time.

The base of the existing portions of the disposal area, as licensed under Michigan Natural Resources and Environmental Protection Act, (Act 451) of 1994, consist of clay soils with an average permeability of less than 5 X 10^{-8} cm/sec, underlain in most areas by varying thickness of CL-ML or ML soil with permeabilities in the 10^{-6} to 10^{-7} range, followed by a water bearing sand formation.

B. Scope

This document is the Closure Plan for the cells of the Wayne Disposal, Inc. Site #2, Van Buren Township, Michigan, EPA facility ID number MID048090633. It is organized to address 40 CFR Subpart G: Closure and Post-closure, and 40 CFR 264.310: Closure and Post-closure Care for Landfills.

The plan describes activities related to construction of the cover system, decontamination of remaining facility areas and equipment, and long term monitoring, inspection and maintenance activities required during post-closure. The plan is intended to satisfy the requirements for closure of the cells in accordance with State and Federal regulations.

II. CLOSURE PERFORMANCE STANDARD (40 CFR 264.111)

The Closure Plan for the cells is designed to ensure that after closure, minimum maintenance and controls will be required. The plan is also designed to minimize or eliminate threats to human health and the environment by preventing release of hazardous waste or hazardous waste constituents into the ground, groundwater, surface water, or air.

III. CLOSURE PLAN ACTIVITIES (40 CFR 264.112 (b))

The Closure Plan for the cells requires that completed areas be finished with final cover, topsoil, and vegetative growth. The Closure Plan minimizes the need for further maintenance. This reduces the potential for contamination and allows a monitoring record to be established before post-closure monitoring begins. The plan identifies the steps that will be necessary to close the cells at the facility.

IV. SITE PREPARATION (40 CFR 264.112 (b))

The cells to be closed will be prepared for clay capping by shaping and grading to meet the desired subgrade profile. The existing clay dike will be located before grading and shaping. The dike will serve as the baseline and starting point for constructing the clay cap. Surveyors will place corner stakes to mark the dike initially. All subsequent field stakes will be placed by Wayne Disposal, Inc. Site #2. Wayne Disposal, Inc. Site #2 will shape and grade an area capable of being capped with the FML foundation layer.

V. FINAL COVER (40 CFR 264.310 (a))

A. Purpose

The purposes for the final cover are (1) to provide long-term minimization of percolation from precipitation into the waste, (2) to function with a minimum level of maintenance, (3) to promote drainage while minimizing erosion, (4) to maintain integrity in the event of limited settlement of the waste surface, and (5) to achieve a permeability less than or equal to the bottom liner system or natural subsoils present.

B. Design Elements

The final cover system must consist of the following elements as approved by the Michigan Department of Environmental Quality (MDEQ), Waste and Hazardous Materials Division on June 4, 2004:

1. A leveling layer over the waste shall be installed per the Engineering Plans and Report on Basis of Design for Master Cell VI Cover Design Modification (11/20/02, with comment response of 4/27/04). This layer shall be installed above the surface of the waste consisting of a minimum of 12-inches of silt, clayey silt, or silty clay with a classification of ML, CL-ML, or CL as determined by ASTM Method D2487-83. This layer shall be installed in general accordance with section VI.A. of this plan;
2. A geosynthetic clay layer (GCL), placed directly over the leveling layer, consisting of a layer of sodium bentonite encapsulated between two geotextiles at least one of which shall be non-woven, and shall meet the requirements of Table 7.1 of the approved Engineering Plans and Report on Basis of Design for Master Cell VI Cover Design Modification. The lower and upper geotextiles should be either stitch bonded or needle punched together to provide stability. The manufacturers recommended overlap distance shall be marked on the GCL;
3. A 40-mil thick high density polyethylene (HDPE), very low density polyethylene (VLDPE), or linear low density polyethylene (LLDPE) flexible membrane liner (FML) installed per section VI C;
4. A double-bonded geocomposite drainage layer as specified in section VI D. of this plan;
5. A general soils layer, placed directly over the drainage blanket layer, consisting of a minimum of 30 inches of soil as described in section VI E. of this plan;
6. A layer of topsoil, placed directly over the compacted clay layer, consisting of a minimum of 6 inches of loamy sand as described in section VI F. of this plan;

7. A vegetative crop to be established per section VI G. of this plan.

C. Final Contours - Erosion Prevention (40 CFR 264.310 (b)(5))

The final contours of the constructed final cover will result in slopes between 4% and 25% and must conform to the topography for Master Cell VI as shown on Sheet 7 of the Engineering Plans for Design Modification, November 2002. Deviations from the elevations are permitted to the extent they are necessitated by complying with the thickness requirements stipulated for the clay liner, general soils and topsoil in sections VI B., VI E. and VI F. of this plan.

D. Gas Vents

At the time of closure Wayne Disposal, Inc. will develop a procedure to ensure that landfill cell(s) to be final capped will be evaluated to determine if a landfill gas collection system should be installed. Should the evaluation indicate that a landfill gas collection system is required; Wayne Disposal, Inc. will submit the evaluation and an updated landfill gas system design for MDEQ approval. However, if the evaluation indicates that the landfill gas collection system is not necessary the passive gas vents, as currently approved in the Design Modification, will be installed at the appropriate locations.

VI. CONSTRUCTION SPECIFICATIONS FOR FINAL COVER OF MASTER CELL VI

A. Construction of Intermediate Cover Layer

1. The layer upon which the geosynthetic clay liner is to be placed must consist of a minimum of 12-inches of compacted silt, clayey silt, or silty clay with an ASTM Method D2487-83 classification of ML, CL-ML or CL.

2. The CQAC or WDI will confirm the slope and correct elevations for the leveling layer surface by survey at a rate of at least once per half-acre over the entire master cell area. This survey, combined with a previous survey of top of waste elevations, will be used to confirm the thickness of the leveling layer and to determine if additional leveling osils are required. Alternatively, the required thickness of the leveling layer will be confirmed by soil borings conducted on a frequency of at least one per half-acre of final cover to be constructed. The thickness of the leveling layer shall not be less than one (1) foot.
3. The CQAC will confirm the classification of the leveling layer. A sample will be taken for every 25,000 cubic yards placed or change in borrow soil character and classified by the USCS (ASTM D2487). Additionally, the sample will be tested for gain size distribution by sieve analysis and hydrometer (ASTM D4222), and for Atterberg Limits (ASTM D4318). A test result not meeting those requirements will be reported immediately to the CQA officer.
4. The leveling layer will be smooth drum rolled in the presence of the CQAC to identify areas of excessive deflection and to prepare the surface for placmement of the GCL.

B. Installation of Geosynthetic Clay Liner (GCL)

1. The CQAC and the geosynthetics installer shall visually inspect the finished leveling layer surface and document unsuitable conditions such as soft or wet spots, large clay clods, and sharp rocks or other objects that could puncture or otherwise damage the GCL.
2. The geosynthetics installer shall supply and install the GCL in accordance with Section 7 of the approved CQA Plan.

C. Synthetic Liner

1. Introduction

The top of the geosynthetic clay liner (GCL) serves as the foundation for the synthetic liner and will be finished to the required elevations.

The synthetic liner will be a 40 mil (minimum) HDPE, VLDPE, or LLDPE.

The 40 mil (minimum) synthetic liner is placed upon the foundation materials. The individual sections of synthetic liner are welded together to form one continuous liner. During the installation of the synthetic liner, the seams will be tested with non-destructive methods.

2. Pre-Testing

Test seams shall be made on fragment pieces of geomembrane liner to verify that seaming conditions are adequate. Test seams shall also be made at the beginning of each seaming period, at the Inspector's discretion, and at least once each 4 hours, for each piece of seaming apparatus used that day.

The test seam sample shall be at least 2 feet long by 1 foot wide with the seam centered lengthwise. Two specimens 1 inch wide shall be cut from opposite ends of the test seam by the Contractor. These specimens shall be field tested by the contractor for shear and peel strength using a tensometer. If a test seam fails, the test shall be repeated in its entirety. If the additional test seam fails, the seaming apparatus or seamer shall not be accepted and shall not be used for seaming until the deficiencies are corrected and two consecutive successful full test seams are achieved.

3. Non-Destructive Seam Testing

The Contractor shall non-destructively test all field seams over their full length using a vacuum test unit. Continuity of testing shall be done as the seaming work progresses, not at the completion of all field seaming.

a. Air Vacuum Testing Process Equipment

- A vacuum box assembly consisting of a rigid housing, a transparent viewing window, a soft neoprene gasket attached to the bottom, port hole or valve assembly, and a vacuum gauge.
- A steel vacuum tank and pump assembly equipped with a pressure controller and pipe connections.
- A rubber pressure/vacuum hose with fittings and connections.
- An air pressurized solution spraying apparatus.
- A soapy solution.

b. Air Vacuum Testing Procedure

- Energize the vacuum pump and reduce the tank pressure to approximately -5 psi (gauge pressure).
- Wet a strip of geomembrane approximately 12 inches by 96 inches with the soapy solution.
- Place the box over the wetted area and compress.
- Close the bleed valve and open the vacuum valve.

- Ensure that a leak tight seal is created between the FML and neoprene gasket.
- Examine the geomembrane through the viewing window for the presence of soap bubbles.
- If no bubble(s) appear after a leak tight seal is formed, close the vacuum valve and open the bleed valve, move the box over the next adjoining area with a minimum 3 inches overlap and repeat the process.
- All areas where soap bubbles appear shall be marked and repaired and then retested.

The following procedures shall apply to situations where seams cannot be non-destructively tested, as determined by the Inspector:

- All such seams shall be cap-stripped with the same geomembrane where possible.
- If the cap strip is accessible to testing equipment, the seam shall be non-destructively tested.
- If the cap strip seam is not accessible for testing, the seaming and cap-stripping operations shall be observed by the Inspector for uniformity and completeness.

4. <u>Destructive Seam Testing</u>

a. <u>Location and Frequency</u>

The Contractor shall conduct a minimum of one destructive test per 500 feet of seam length. The Contractor shall not be informed in advance of the locations where the seam samples will be taken.

b. Sampling Procedure

Samples shall be cut by the Contractor at times and locations designated by the Inspector as the seaming progresses in order to obtain test results prior to completion of liner installation. The Inspector must witness the procurement of all field test samples and the Contractor shall mark all samples with that location and sample number. The Contractor shall also record in written form the date, time, location, sample number, ambient temperature, number of seaming unit, name of seamer, welding apparatus temperatures and pressures, and pass or fail description, and attach a copy of each sample portion.

All holes in the geomembrane resulting from obtaining the seam samples shall be immediately repaired in accordance with repair procedures. The integrity of the new seams in the repaired area shall be tested.

c. Size and Disposition of Samples

The samples shall be 12 inches wide by 24 inches long with the seam centered lengthwise. The sample shall be cut into two equal length pieces, half to be retained by the Contractor and the other half to be given to the Owner's Representative for archive storage and/or independent testing

d. Field Testing

The Contractor shall cut five 1-inch wide replicate specimens from his sample and these shall be tested by the Contractor. The Contractor shall test the five specimens from the seam sample for seam shear and peel, in accordance with the specified material tests and procedures. To be acceptable, four out of the five replicate test results must pass the material specification requirements. The results of these tests shall be provided to the Inspector by the conclusion of the second work day following the procurement of the field seam sample.

e. Independent Laboratory Testing

The Owner's Representative will require the Inspector to package and ship at least two seam samples received from the Installer to an independent laboratory for determination of seam shear and peel. Four of five specimens per sample must pass the material specifications requirements for the installation to be acceptable.

5. Procedures In The Event Of Destructive Test Failure

The following procedures shall apply whenever a sample fails the field destructive test. The Contractor shall have two options:

(a) The Installer can reconstruct the seam between the failed location and any passed test location.

(b) The Installer can retrace the welding path to an intermediate location (at 10 feet minimum from the location of the failed test) and take a small sample for an additional field test. If this additional sample passes the test, then the seam is reconstructed between that location and the original failed location. If this sample fails, then the process is repeated.

The Installer shall determine the length of seam failure to the satisfaction of the Inspector by additional tests or assume the seam is unacceptable between the two successful test locations, which bracket the test failure.

Over the length of seam failure, the Installer shall either cut out the old seam, reposition the panel and reseam or add a cap strip, as approved by the Inspector.

After reseaming or placement of the cap strip, one additional destructive test shall be taken within the reseamed area, and if test results are not acceptable, this process shall be repeated until the reseamed length is judged satisfactory by the Inspector.

In any case, all acceptable seams must be bounded by two passed test locations (i.e., the above procedures shall be followed in both directions from the original failed location), and one successful test must be obtained within the reconstructed area.

The Inspector shall document all actions taken in conjunction with destructive test failures.

Patches shall be round or oval in shape, made of the same geomembrane, and extend a minimum of 6 inches beyond the edge of defects.

Patches shall be applied using approved methods only. Small patches (less than 6 inches in least dimension) will require a cooling period after extruded welding half of the patch to prevent a burn through the liner before welding the second half of the patch.

6. Defects And Repairs

a. Identification

All seams and non-seam areas of the geomembrane shall be inspected by the Inspector for identification of defects, holes, blisters, undispersed raw materials and any sign of contamination by foreign matter. Because light reflected by the geomembrane helps detect defects, the surface of the geomembrane shall be clean at the time of inspection. The geomembrane surface shall be brushed, blown or washed by the Installer if the amount of dust or mud inhibits inspection.

b. Evaluation

Each suspect location in seam and non-seam areas shall be non-destructively tested. Each location which fails the non-destructive testing will be marked by the Contractor.

Where extrudate surface drifting occurs beyond 25 percent of the seam width, the affected seam length will be cap stripped as required by the Inspector. Reseaming over an existing seam will not be permitted, as it may be conducive to capillary leakage.

c. Repair Procedures

- Defective seams shall be restarted/re-seamed.
- Small holes shall be repaired by extrusion cap welding. If the hole is larger than ¼ inch, it must be patched.
- Blisters, larger holes, undispersed raw materials, and contamination by foreign matter shall be repaired by patches.

Surfaces of FML, which are to be patched, shall be abraded and cleaned no more than one hour prior to the repair.

7. Restart/Re-seaming Procedures

Restart of the extrusion welding process shall be achieved by grinding the existing seam and rewelding a new seam 2 inches from the termination of the previous seam and commencing at the start of grinding.

Re-seaming for the fusion welding process shall be achieved by cutting out the existing seam and welding in a replacement strip or if possible, cut the sheet next to the failed seam, move the panel over and seam with a single seam.

a. Verification of Repairs

Each repair shall be non-destructively tested using the methods described. Repairs which pass the non-destructive test shall be taken as an indication of an adequate repair. Failed tests shall indicate that the repair shall be redone and retested until a passing test results.

b. Record of the Results

Daily documentation of all non-destructive and destructive testing shall be provided to the Inspector by the Installer.. This documentation shall identify all seams which initially failed the test and include evidence that these seams were repaired and retested successfully.

D. Construction of the FML Protection/Drainage Blanket Layer

1. The drainage layer must be a double-bonded geocomposite with a transmissivity of at least 1×10^{-5} m^2/sec when tested at a gradient of 25% under a normal load of 1,000 lbs/ft^2.
2. The perimeter drain pipe must consist of 4 inch diameter corrugated perforated pipe and 4 inch diameter non-perforated outlet pipe placed as shown in Sheet 13 of the Engineering Plans.
3. The perimeter drain pipe must be wrapped with geotextile filter material possessing an equivalent opening size of #70 standard sieve.
4. The double-bonded geocomposite comprising the layer must be placed on the FML in a manner that does not damage it or the drainage pipe system.
5. Initial double-bonded geocomposite placement must be done by placing the material at the toe of the lined slope and pushing the material up the side slope with appropriate equipment.

6. The full design thickness of the double-bonded geocomposite layer must be maintained when spreading the material and for any construction traffic on the layer.

7. Wayne Disposal, Inc. Site #2 must obtain direct layer thickness measurements at a rate of at least once per every half acre verify conformance with design requirements.

E. Construction of General Soil Layer

1. A layer of general soils a minimum of 30 inches in thickness must be placed over the granular material described in section VI D. of this plan.

2. General soils will consist primarily of inorganic soil constituents free of stumps, large roots, and other deleterious materials.

3. General soils shall not be compacted and shall be placed in such a manner as to cause minimum disturbance to the granular layer.

4. No frozen soil may be used in any lift, nor may any soil be placed on frozen base.

5. Wayne Disposal, Inc. Site #2 must obtain direct layer thickness measurements at a rate of at least once per every half-acre to verify conformance with design requirements.

F. Topsoil Specifications

- A layer of topsoil at least 6 inches thick after grading must be placed over the general soil layer described in section VI E of this plan.

- The topsoil must be a loamy sand, and confirmed by grain size analyses conducted according to ASTM Method D 422-63 at least once per 3,000 cubic yards to be placed.
- The top ½ inch of the topsoil layer must be loosely packed to provide an acceptable seed bed.
- Wayne Disposal, Inc. Site #2 must obtain direct measurements of topsoil thickness at the rate of at least once per half-acre to verify conformance with F1.

G. Vegetative Cover Specifications

1. The topsoil described in VI F. must be fertilized with 12-12-12 N-P-K at the rate which provides approximately 240 pounds per acre of total available nutrients, i.e. 80 pounds. per acre of available nitrogen, phosphoric acid, and potash, or an equivalent.
2. The following seed mix must be sown into the topsoil:

Seed	Percent by Weight
a. perennial rye	20 to 30
b. common creeping red fescue	20 to 30
c. common Kentucky bluegrass	5 to 10
d. Kentucky 31 tall fescue	100 to (a+b+c)

3. The seed mix must have a germination rate of at least 80%.
4. The seed mix must be applied at the rate of not less than 100 pounds per acre.
5. The seedbed must be rolled during or immediately after seed application unless a hydroseeding method is used to apply the seed.

6. Straw mulch/hay must be applied to the seedbed at the even rate of not less than 1.5 tons per acre in a manner that will minimize subsequent displacement by wind.

VII. <u>FINAL COVER DESIGN BASIS</u> (40 CFR 270.21(e))

The following is an evaluation of the proposed final cover to be used for the disposal cells in the hazardous waste management area at Wayne Disposal, Inc. Site #2. This evaluation is required under provision of 40 CFR 270.14(b)(13) and 270.21(e). Provisions relating to the cover requirements are included in 40 CFR 264.310(a). The proposed final cover is evaluated herein with respect to its ability to 1) provide long-term minimization of percolation into the landfilled waste, 2) function with a minimum of maintenance, 3) promote drainage while minimizing erosion, and 4) maintain integrity despite settlement of the landfilled waste surface. Additionally, 40 CFR 264.310 (a) requires that the cover possess a permeability less than or equal to the permeability of the leachate containment system at the base of the landfill.

A. <u>Description of Design</u>

The proposed cover system, exclusive of the vegetative cover, is presented in Sheet 10 (Liner and Final Cover System Details) of the Engineering Plans. The proposed cover consists of six elements. From the ground surface downward, these are 1) a minimum of 6 inches of topsoil, 2) a minimum of 30 inches of general soil, 3) a drainage layer consisting of a double-bonded geocomposite material, 4) a flexible membrane liner 40 mils in thickness, 5) a geosynthetic clay liner (GCL), and 6) a leveling layer consisting of at least 12-inches of compacted silt, clayey silt, or silty clay possessing a Unified Soil Classification of ML, CL-ML, or CL. The proposed surface slopes will range generally from 4 to 15 percent. The proposed vegetative cover will include a mixture of rye, fescue and bluegrass.

Additionally, it is proposed that the drainage blanket layer placed above the flexible membrane liner will be drained at the master cell boundaries and at diversion berms located along the slope of the final cover. The geocomposite will daylight in the various diversion berms along the slope and that water will be conveyed to the associated spillway to the perimeter. The lowest slope section of geocomposite will daylight at the perimeter toe drain which will allow the water to be conveyed through the peastone to the perimeter surface water ditches. See Sheets 11 and 12 of the Engineering Plans.

B. <u>Function of System Components</u>

The function to be served by the topsoil is self evident. It will provide the medium for vegetative root establishment and nourishment. The vegetative cover which will be supported by the topsoil will be essential to minimize soil erosion. The general soils will provide protection for the deeper FML and will provide soil moisture storage for support of the vegetative cover. The geocomposite drainage blanket will serve to transmit water which has percolated through the general soil layer off the landfill cells into the surrounding surface drainage ditches. The FML will serve to interrupt downward percolating moisture so that the drainage blanket can transmit the moisture off the cell cover. The geosynthetic clay liner (GCL) beneath the FML will serve as a barrier layer to minimize percolation and serve as a compacted, stable bedding on which to place the FML. Lastly, the underlying fine-grained soil layer will provide a stable base for geosynthetics placement.

C. <u>Minimization of Percolation</u> (40 CFR 264.310(a)(1))

Percolation of precipitation into the landfill is minimized by three components of the proposed cover system. The general soil just beneath the topsoil will provide soil moisture storage for the vegetative cover. This general fill will therefore minimize the percolation of moisture into the drainage blanket beneath it. The FML which will lie beneath the drainage blanket will maximize runoff and serve to prevent the vertical migration of moisture which reaches the drainage blanket from above. Similarly, the geosynthetic clay liner will serve as an additional barrier to prevent the vertical migration of moisture. This system therefore combines the beneficial, low permeability aspects inherent in both the FML and the GCL.

Hence, the proposed cover system should provide for short and long term minimization of percolation. As will be discussed later, this conclusion is dependent upon proper installation and construction techniques, the establishment of the vegetative cover, and the diligent application of a long term inspection and maintenance program.

D. <u>Maintenance</u> (40 CFR 264.310 (a)(2))

The proposed system will require regular maintenance only insofar as the vegetative cover is concerned. Proposed maintenance of the vegetative cover will be performed to minimize the establishment of native, undesirable species such as deep rooted, woody plants. Other potential efforts might include occasional mowing, fertilization, or even reseeding if determined to be necessary as described below.

Maintenance efforts will generally be limited to careful, periodic inspections (condition surveys) and repair of any problems identified during these inspections. Proposed inspections will specifically be directed toward the identification of: invasion by undesirable plant species; deterioration of the vegetative cover; areas of surface erosion; soft, or unstable areas of the cover; damage to the dikes; obstructions, erosion or deterioration of the surface drainage ditches; obstructions or damage to the discharge pipes for the drainage layer; burrowing by animals; or surface disturbance due to unwarranted vehicle traffic.

Detection of problems such as those presented above will require remedial efforts. The proposed remedial efforts will be undertaken to bring the cover back to the original designed condition insofar as possible.

E. Drainage and Erosion (40 CFR 264.310(a)(3))

Generally uniform slopes are planned for the proposed cover system. These slopes will range from approximately 4 percent to 25 percent. Slopes should be no less than 3 percent in order to minimize the impact of surface irregularities. The use of FML beneath the general soil and topsoil will promote runoff. Control and discharge of any runoff through ditches is described elsewhere in the permit application of which this report is a part.

Establishment and maintenance of a vegetative cover will serve to minimize erosion due to both runoff and wind. It is proposed that this vegetative cover will consist of a hardy grass mixture which will require a minimum of effort to maintain in full, thick growth on the entire cover surface. Deep rooted woody plants will not be used and their future establishment will be discouraged through a long term inspection and maintenance program. As previously discussed, placement of topsoil for the establishment of the vegetative cover is planned.

The universal soil loss equation has been applied to the proposed cover system. The analysis is presented in Appendix A of the Engineering Report on Basis of Design, MCVI Design Modification, March 2001. The analysis resulted in an estimate of soil erosion due to rainfall runoff of less than 2 tons per acre per year.

F. <u>Cover Integrity During Settlement</u> (40 CFR 264.310 (a)(4))

A large portion of the fill settlement will occur before cell closure. Nevertheless, the analysis attached herein provides an estimate that the maximum post-closure settlement of the final cover should be approximately 8 to 15 feet. This settlement will be greatest beneath the highest portions of the cover surface. Hence, some surface slopes may be reduced to approximately 3%. The cover will be inspected during the condition surveys discussed above to detect areas where the uniform surface grade may be disrupted, possibly impending surface drainage. Such a condition will be corrected by placing additional compacted clay fill (after stripping the topsoil) on the cover to restore the original grade insofar as necessary to reestablish proper drainage. Subsequent replacement of the topsoil and revegetation in the affected area will be undertaken.

The proposed cover system will have much more capability to maintain integrity during fill settlement than covers consisting of only compacted soil. This is because FML materials can withstand extensive elongation or strain (up to 700%) in comparison with soil materials. Nevertheless, it is intended that local differential settlements will be minimized by compaction during waste placement and prevention of major voids within the fill. It is anticipated that recommendations by the FML manufacturer will be followed regarding the provisions for sufficient excess material (slack) during placement of the FML.

The proposed final cover system is expected to accommodate settling and subsidence in a manner such that cover integrity is maintained, as required by 40 CFR 264.310 (a)(4).

G. <u>Cover Permeability</u> (40 CFR 264.310 (a)(5))

The use of membrane for one component of the cover system, if constructed properly, effectively reduces the potential leakage through the cover to a negligible level. As stated previously, 40 CFR 264.310 (a) requires that the cover possess a permeability less than or equal to the permeability of the leachate containment system at the base of the landfill. Since a synthetic membrane is proposed for use in both cases, the permeability of each can be considered roughly equivalent, as suggested in 40 CFR 264 Preamble (47 FR 32314). Further, the effective "leakage" rate through any barrier is related to the hydraulic gradient. The drainage blanket above the cover membrane and the leachate collection system on the base liner should both effectively reduce hydraulic gradients through the membranes to a negligible level.

The use of a flexible, synthetic membrane as one component of the cover system, if manufactured and installed properly, should effectively reduce the potential leakage through the cover system to a negligible level. There is a scarcity of hydraulic conductivity data for synthetic membrane materials. Gas transmission rates (specifically water vapor transmission rates) through these membrane materials nevertheless suggest that such materials possess equivalent hydraulic conductivities 4 or more orders of magnitude less than that of compacted clay soils. Therefore, polymeric membranes can be expected to be the controlling factors in liner or covers system permeability. Regardless of their hydraulic conductivities relative to each other, the polymeric membranes should effectively reduce the direct transmission of fluid through the cover and liner systems to a negligible level. Because of the low conductivity in these membranes, the prevention of membrane defects during manufacturing and installation is of relatively greater concern than direct fluid transmission through the polymeric materials. Hence, the quality control/assurance measures to be taken on this project will concentrate upon minimizing these defects.

H. Freeze-Thaw Effects (R299.9619(5)(a)(ii))

With regard to the potential depth of seasonal frost penetration and its effects upon the final cover, the proposed cover is expected to function as designed to provide long-term minimization of percolation with a minimum of maintenance. The expected depth of frost penetration in the region where the subject facility is located may be approximately 25 to 42 inches. The synthetic membrane and GCL layers in the cover system are both below this depth. Hence, neither will be directly subjected to seasonal frost.

The principal frost-heave effect which frost penetration may have upon a near-surface soil layer is through the formation of ice lenses. These lenses are caused by the tendency for capillarity to draw available moisture to the freezing front. Hence, ice lenses usually form parallel to this freezing front, i.e., horizontally. The direct effects of these lenses are generally horizontal zones of soil separation or increased porosity.

In order for these ice lenses to form, however, three conditions are necessary. These are a supply of moisture, freezing temperatures and a frost susceptible soil. With regard to the former, the moisture supply must generally be below the freezing front because moisture above this front will either be frozen and unavailable for capillary attraction or will be present because of thawing, i.e. freezing temperatures will not be present to create ice lenses.

The proposed cover system is designed with the purpose of eliminating the underlying supply of moisture available for ice lens formulation, thereby eliminating one of the fundamental, necessary conditions described above. As presented, the drainage blanket below the general soil layer will have more than sufficient capacity to transmit percolation off the cell in question. In addition, the geomembrane will serve as an effective barrier to upward moisture migration from the underlying soil and/or waste. Hence, the freezing front in the proposed final cover will be denied the moisture necessary for ice lens formation.

The proposed final cover which is expected to function as designed according to the requirements of 40 CFR 265.310 (a) and provide long-term minimization of percolation with a minimum of maintenance.

VIII. <u>EQUIPMENT DECONTAMINATION</u> (40 CFR 264.112 (a)(4))

All equipment used during the closure activity to install the leveling layer cover soils or other equipment that is in contact with hazardous waste will be thoroughly cleaned before being allowed to leave the facility. The cleaning will be conducted at the facility vehicle wash building using pressurized water. All equipment will be washed until visibly clean.

All wash water will be handled consistent with current wastewater discharge permits or transported to an appropriate hazardous waste treatment facility.

IX. DISPOSAL OR DECONTAMINATION OF EQUIPMENT, STRUCTURES, SOILS (40 CFR 264.114)

A. Access Road

This closure plan is intended to assess the impact that site operations may have had on the soils adjacent to the on-site haul/access roads. This plan is written to address the access roads currently utilized for waste operations. Should new access routes open to accommodate changes in operations, provisions in this plan must be expanded to include the new roads. These areas are not expected to be areas of significant contamination, as waste is only transported, not actively handled, on the road. Impact to soils around the access road would be limited to those caused by fugitive dust, small spills, etc. Metals and/or PCBs are the primary potential contaminants of concern. The sampling and data evaluation described in this plan will either be performed by Wayne Disposal, Inc. Site #2 staff or by a consultant retained by Wayne Disposal, Inc. Site #2. Analyses will be conducted by a qualified contract laboratory.

The first step in the closure of the access roads will be to wash the pavement to remove soil and dust. The transport road from the North I-94 Service Drive, through the reception area and to the Northwest corner of Master Cell VI will be thoroughly washed and swept with a wet vacuum sweeper. These paved roads will remain intact for post-closure activity access. The second step will be to sample soils adjacent to the paved roads. The procedures used to sample, analyze and evaluate soil data are described below.

Sampling Locations - The sampling locations have been chosen to identify the chemical characteristics of the surface soils in the shoulders of the on-site haul/access roads. There is approximately 2000 feet of roadway from the entrance to the waste unloading area at the northeast corner of Master Cell VI. The total length of roadway will be divided in 10 segments of approximately 200 foot intervals. Out of each 200 foot segment, three soil samples will bè collected from the shoulder of the roadway. At least one sample will be collected from each side of the roadway in each segment. On the side where one sample is collected, the sample will be collected in the approximate mid-point of segment. On the side where two samples are collected, the segment will be divided in half with one sample collected in each half of the segment. The proposed approximate sampling locations are shown on Figure 1.

Sampling Method - The upper 6 inches of the soil surface will be sampled using a small stainless steel trowel or shovel. Large stones (greater than 1 inch in diameter) and vegetative matter will be removed by hand at the time of sampling. The shovel will be carefully cleaned between each sampling location with a mild detergent followed by a distilled water rinse. All soil samples will be individually placed in specially prepared glass containers. These containers will be obtained from the laboratory and will remain unopened until used in the field. Each container will be marked with the sample number, date, and time immediately after receiving its sample. Each sample will be temporarily stored in the field in an iced cooler until the sample can be placed into an on-site refrigerator. All collected samples will be stored in a secure location until transfer/transport to the laboratory. A Chain-of Custody form will be maintained for all samples obtained under the monitoring program. The form will, at a minimum, identify the sample number, sampling location, date, time, sampling individual, and amount/type of sample. A record of the sample handling and shipment, including the transfer of custody from one individual and organization to another, will also be maintained on the form. Signatures of each individual directly involved in the chain-of-custody will complete the form.

Sample Analysis - Each soil sample collected will be analyzed for the metals, Total PCB, volatile and semi-volatile organic parameters listed on Table 1. Analyses will be performed using the procedures outlined on Table 1. Target reporting limits are also listed on the table. If the laboratory is unable to meet the target detection limits, rationale must be provided to MDEQ. Results will be reported on a dry weight basis in units of mg/kg. The analyses will be conducted in accordance with standard laboratory QA/QC protocols.

Data Evaluation - The volatile, semi-volatile organics and metals data from each of the samples will be compared to the Part 201 Generic Cleanup Criteria (GCC) to determine if any standard has been exceeded. Data will be compared with residential or commercial & industrial risk-based clean-up standards or whatever standards are in use at the time of closure depending on which standards are appropriate for the future land use at the facility. If the applicable Part 201GCC standard is exceeded for any metal, WDI can, at its discretion, demonstrate that the concentration is within the normal background concentration for soils at the site. If WDI elects to make this demonstration, a plan will be submitted to MDEQ that outlines the strategy for collecting and analyzing native background samples and for establishing a statistically valid range for background concentrations. If the concentrations are found to be within native background ranges, then no corrective action will be required. PCB analysis results will be compared to a non-detect standard and will be remediated to meet that standard at the time of landfill closure.

If the applicable standards for Volatile and semi-volatile compounds are exceeded and a site-specific background demonstration is either not successful or not possible, WDI will submit a plan to mitigate the contaminated area to MDEQ. The plan shall include a description of the apparent extent of the problem, a proposed remedy, and methods for demonstrating clean closure.

TABLE 1. SOIL MONITORING PARAMETERS

Parameter	Analytical Method	MDEQ Target Detection Limit (mg/kg)
Metals		
Arsenic	7061	0.5
Antimony	7041	N.A.
Barium	6010/6020	1.0
Cadmium	6010/6020	0.5

1,3-Dichlorobenzene	0.100	2-Nitrophenol	N.A.
1,4-Dichlorobenzene	0.100	4-Nitrophenol	N.A.
3,3'-Dichlorobenzene	N.A.	Pentachlorophenol	N.A.
Diethyl pthalate	0.100	Phenol	N.A.
Dimethyl pthalate	0.200	2,4,5-Trichlorophenol	N.A.
2,4-Dinitrotoluene	0.500	2,4,6-Trichlorophenol	N.A.
2,6-Dinitrotoluene	0.500		
Di-n-octyl phthalate	0.200		
Fluoranthene	0.100		
Fluorene	0.100		

Note: MDEQ target detection limits may not be attainable. At the time of closure; the analytical methods listed above, the detection limits, and provisions to use alternate detection limits must be negotiated with MDEQ based upon regulatory criteria in place at the time of closure. (N.A.) indicates no MDEQ target MDL for soils is available at this time.

B. <u>Vehicle Wheel Wash</u>

In the event that Michigan Disposal Waste Treatment Plant ceases operations at the same time or prior to final closure of the Wayne Disposal, Inc. Site #2, the wheel wash building will be spray washed until visibly clean. Wash water will be handled as stated in Section VIII above. Solids retained in the holding tank will be buried in the landfill. The structure and the cleaned equipment would remain on site pending a determination on its disposition.

After the wheel wash building has been spray washed until visibly clean, the building's holding tank and floor will be inspected at closure for cracks and other signs of deterioration. If there are visible impacts to the holding tank and/or floor that could potentially breach the containment of the building, then soil sampling shall be conducted. Soil sampling should be performed in accordance with current MDEQ guidance at the time of closure for VOCs, SVOCs, PCBs and metals similar to that provided in the discussion in Section IX.A of this closure plan. Field QA/QC procedures for these sample activities will be in accordance with the Soil Monitoring SAP previously approved by the MDEQ.

If Michigan Disposal Waste Treatment Plant continues hazardous waste activities after closure of the Wayne Disposal, Inc. Site #2 operation, cleaning of the wheel wash building and disposal of cleaning residues will be the responsibility of Michigan Disposal Waste Treatment Plant.

C. Lined Pond

In the event that Michigan Disposal Waste Treatment Plant ceases operations at the same time or prior to final closure of the Wayne Disposal, Inc. Site #2, the lined pond will be spray washed until visibly clean. Wash water will be handled as stated in Section VIII above. Solids retained in the lined pond will be buried in the landfill.

After the lined pond has been spray washed until visibly clean, the geosynthetic liner will be inspected for rips, tears, holes and other signs of deterioration. If there are visible impacts to the geosynthetics liner that could potentially breach the containment of the lined pond, then soil sampling shall be conducted. Soil sampling should be performed in accordance with current MDEQ guidance at the time of closure for VOCs, SVOCs, PCBs and metals similar to that provided in the discussion in Section IX.A of this closure plan

If Michigan Disposal Waste Treatment Plant continues hazardous waste activities after closure of the Wayne Disposal, Inc. Site #2 operation, cleaning of the lined pond and disposal of cleaning residues will be the responsibility of Michigan Disposal Waste Treatment Plant.

D. Area A Soils

At the time of closure, WDI will make a final assessment of the level of metals and PCBs in the soil within Area A. Also, ten percent (10%) of the soil samples analyzed for the Area A characterization will be analyzed for the same expanded parameter list as along the roadway (metals, PCBs, VOCs, and SVOCs). Area A is a section of WDI defined in the WDI Soil and Sediment Sampling and Analysis Plan approved by the Waste and Hazardous Materials Division of the Michigan Department of Environmental Quality (WHMD/MDEQ). Area A includes, among other areas, the shoulder of the haul road leading to the WDI transfer station, and sediment in the on-site surface water ditches and storm sewers. The purpose of this final assessment is to determine if there are areas where analytical concentrations exceed applicable cleanup criteria. The cleanup criteria will be non-detect concentrations, or statutory equivalent at the time of closure.

The sample location plan will be prepared in accordance with the relevant guidance at the time of closure and in consideration of historical soil monitoring data collected in accordance with the Soil and Sediment Sampling and Analysis Plan, which may provide data from which to develop a biased sampling strategy.

On-site areas exceeding applicable cleanup criteria will be remediated by removing the top six inches of soil and disposing of the soil on site in a licensed landfill before the final cell is closed. After removal, the area will be sampled again to ensure applicable cleanup criteria are no longer exceeded. If analytical concentrations are found that exceed applicable cleanup criteria, another six inches will be removed and so on until analytical concentrations are verified below the applicable cleanup criteria. Then, clean soils will replace the soil that was removed and the clean backfill revegetated.

The following assumptions were made in preparing the cost estimate for sampling, analysis and remediation:

1. At the time of closure Area A will be 141 acres including the shoulder of the haul road leading to the WDI transfer station.
2. A biased sampling program will be developed resulting in an estimated 150 samples.
3. Assessment and Verification samples for Area A will be analyzed for PCBs and metals, with ten percent (10%) also being analyzed for VOCs and SVOCs.

   Remediation of Area A will consist of excavating one acre, six inches deep, 807 bank cubic yards – about 1,290 tons.

E. Waste Transfer Box Decommission

This closure plan is intended to assess the impact that site operations may have had on the soils adjacent to the on-site waste transfer box. This plan is written to address the waste transfer box utilized for waste operations in a position outside the limits of the hazardous waste landfill boundary. Should alternate waste transfer box positions open to accommodate changes in operations, provisions in this plan must be expanded to include the new positions. Impact to soils around the waste transfer box positions would be limited to those caused by fugitive dust, small spills, etc. Metals, VOCs, SVOCs, and PCBs are the primary potential contaminants of concern. The sampling and data evaluation described in this plan will either be performed by Wayne Disposal, Inc. Site #2 staff or by a consultant retained by Wayne Disposal, Inc. Site #2. Analyses will be conducted by a qualified contract laboratory.

The first step in the closure of the waste transfer box will be demolition of the steel clad concrete walls and concrete floor of the receiving slab, and the demolition and removal of the tipping slab/access ramp. The soils, aggregate, and geosynthetics installed as part of the secondary containment structures for the receiving slab and access corridor between the waste transfer box and the landfill would be removed and disposed as part of the decommissioning of the waste transfer box. The secondary containment structure material will be cleaned of any visible liquids and the materials will be separated from the leachate collection system of Master Cell 6B at the anchor trench tie-in point. The remaining access pavement will be washed in a manner consistent with the wheel wash activities to remove soil and dust. The paved roads will remain intact for post-closure activity access. All demolition materials will be transported to the final active area of the hazardous waste landfill for disposal immediately prior to the landfill's final closure activities.

The second step will be to sample soils immediately adjacent to the paved surface and at a single point below the geomembrane of the secondary containment system. The procedures used to sample, analyze and evaluate soil data are described below and are similar in nature to the above referenced process for the paved roadway surfaces.

Sampling Locations - The sampling locations have been chosen to identify the chemical characteristics of the surface soils in the immediate vicinity of the waste transfer box. There is approximately 20,000 square feet of roadway from the tipping slab ramp to the actual waste transfer and unloading area. The proposed sampling locations would be along the east side of the tipping slab ramp at a point halfway between the roadway grade break to the actual push wall of the waste transfer box and just off the pavement. A second sample would be collected from the soils beneath the receiving slab of the waste transfer box after removal of the secondary containment geomembrane. The sample location will be beneath the collection sump and any additional samples would be collected, as necessary, wherever a potential crack or other breach was identified by inspection of the containment structures (floor and walls). These samples would only require collection and analysis if contaminated liquids were detected within the receiving slab secondary monitoring sump during the useful life of the structure.

Sampling Method - The upper 6 inches of the soil surface will be sampled using a small stainless steel trowel or shovel. Large stones (greater than 1 inch in diameter) and vegetative matter will be removed by hand at the time of sampling. The shovel will be carefully cleaned between each sampling location with a mild detergent followed by a distilled water rinse. All soil samples will be individually placed in specially prepared glass containers. These containers will be obtained from the laboratory and will remain unopened until used in the field. Each container will be marked with the sample number, date, and time immediately after receiving its sample. Each sample will be temporarily stored in the field in an iced cooler until the sample can be placed into an on-site refrigerator. All collected samples will be stored in a secure location until transfer/transport to the laboratory. A Chain-of Custody form will be maintained for all samples obtained under the monitoring program. The form will, at a minimum, identify the sample number, sampling location, date, time, sampling individual, and amount/type of sample. A record of the sample handling and shipment, including the transfer of custody from one individual and organization to another, will also be maintained on the form. Signatures of each individual directly involved in the chain-of-custody will complete the form. Field QA/QC procedures for these sample activities will be in accordance with the Soil Monitoring SAP previously approved by the MDEQ.

Sample Analysis - Each soil sample collected will be analyzed for the metals, the Total PCB, volatile and semi-volatile organic parameters listed on Table 1. Analyses will be performed using the procedures outlined on Table 1. Target reporting limits are also listed on the table. If the laboratory is unable to meet the target detection limits, rationale must be provided to MDEQ. Results will be reported on a dry weight basis in units of mg/kg. The analyses will be conducted in accordance with standard laboratory QA/QC protocols.

Data Evaluation - The volatile, semi-volatile organics and metals data from each of the samples will be compared to the Part 201 Generic Cleanup Criteria (GCC) to determine if any standard has been exceeded. Data will be compared with residential or commercial & industrial risk-based clean-up standards or whatever standards are in use at the time of closure depending on which standards are appropriate for the future land use at the facility. If the applicable Part 201GCC standard is exceeded for any metal, WDI can, at its discretion, demonstrate that the concentration is within the normal background concentration for soils at the site. If WDI elects to make this demonstration, a plan will be submitted to MDEQ that outlines the strategy for collecting and analyzing native background samples and for establishing a statistically valid range for background concentrations. If the concentrations are found to be within native background ranges, then no corrective action will be required. PCB analysis results will be compared to a non-detect standard and will be remediated to meet that standard at the time of landfill closure.

If the applicable standards for Volatile and semi-volatile compounds are exceeded and a site-specific background demonstration is either not successful or not possible, WDI will submit a plan to mitigate the contaminated area to MDEQ. The plan shall include a description of the apparent extent of the problem, a proposed remedy, and methods for demonstrating clean closure.

X. <u>MAXIMUM INVENTORY OF WASTES</u> (40 CFR 264 112(b)(3))

Waste is not stockpiled at the facility for future disposal. Waste is brought to the facility only after construction of the cell in which it is to be disposed is completed. No storage or treatment occurs at the facility.

The total volume of waste that will be placed in the cells will vary according to the size of the cells. All wastes placed in the landfill are recorded in the operating log.

XI. GROUNDWATER MONITORING, RUN-OFF CONTROL (40 CFR 264.112(b)(5))

1. Groundwater monitoring, in accordance with the permit, outlined for the active facility life will be continued through partial and final closure activities.

2. Leachate collection systems will be monitored and maintained as required during the active life of the facility, including the closure period.

3. Control of run-on and run-off will be monitored and maintained as required during the active life of the facility, including the closure period.

XII. GAS VENTING SYSTEM (R299.9619(3)(c))

The gas venting system is designed to prevent the accumulation of gas generated in closed cells. Details of the gas venting system are shown on Sheet 10 of the Engineering Plans for Design Modification, November 2002. These details show that the installation does not effect the permeability of the final cover system. Gases, if generated, can be collected and discharged through this system. If required under Part 111, gas emissions will be monitored, collected and treated.

XIII. ESTIMATED DATES OF CLOSURE ACTIVITY (40 CFR 264.112 (b)(7))

H.W. Unit	Type of Closure	Anticipated Closure Date
MC V	Partial	Closed
MC VII	Partial	Closed

*Closure schedule may change depending on usage rate.

XIV. ANTICIPATED FINAL/PARTIAL CLOSURE SCHEDULE (40 CFR 264.112(b)(6))

Activity	Time Required
1. Receive of Final Volume of Hazardous Waste	N/A
2. Decontaminate Haul Road, Area A, and demolition of the Waste Transfer Box	45 Days
3. Survey Benchmarks	Concurrent with #2 above
4. Construct Intermediate Cover	30 Days
5. Install Gas Vent System	Concurrent with #4 above
6. Decontamination of Equipment	5 Days
7. Construct Leveling Layer and Install GCL	108 Days
8. Install FML	54 Days
9. Construct Drainage Layer	54 Days
10. Construct General Soils Layer	54 Days
11. Place Top Soil	54 Days
12. Apply Vegetative Cover	27 Days
13. Complete Fence-Barrier around Perimeter of Hazardous Waste Management Area	27 Days
14. Complete and Submit Closure Certification	108 Days
TOTAL TIME	**566 Days**

XV. EXTENSION FOR CLOSURE TIME (40 CFR 264.113 (b))

It is anticipated that partial/final closure activities will exceed 180 days due to the substantial size of Master Cell VI and the uncertainty of the seasonal date when the final volumes of hazardous waste are received and the impact of that date on the sequencing of construction related closure activities. Therefore, the closure schedule assumes less than ideal conditions (see Section XIII). We therefore request an extension of the 180-day closure period. Steps necessary to prevent threats to human health and the environment from the unclosed but terminated hazardous waste management unit, including compliance with all applicable permit requirements, will be taken.

XVI. <u>CERTIFICATION OF CLOSURE</u> (40 CFR 264.115)

Within 60 days of the completion of final closure, certification will be submitted to the MDEQ Director by Wayne Disposal, Inc. Site #2 and an independent registered professional engineer that closure was completed in accordance with the specifications of this plan and Part 111 Rule 613 (3) and (4).

XVII. <u>CLOSURE COST ESTIMATE</u> (40 CFR 264.142, 264.112 (b)(2))

The closure cost estimate and associated information as presented is submitted in accordance with the requirements of 40 CFR 220.14 (b)(15), 264.142 and 264.143. These costs have been previously submitted and are updated each year using the Gross Nation Product (GNP) inflation factor and are presented in Section 39 "Financial Mechanism".

As identified in Section XIV, partial closure of Master Cell V and Master Cell VII is complete and final closure of Master Cell VI is expected in June 2015. Therefore the closure cost estimate includes the closure cost of MC VI, comprising 60.4 acres, and the final facility closure costs; i.e., haul road decontamination, Area A soil remediation, decommissioning of the Waste Transfer Box, and completion of hazardous boundary fencing, etc.

SECTION | PAGE

POST-CLOSURE PLAN

40 CFR 264.117, 40 CFR 270.14(b)(13), PART 111, R504(1)c

1.0 GENERAL INFORMATION

This Post-closure Plan is prepared pursuant to requirements under 40 CFR Part 264.117 and 40 CFR 270.14(b)(13). This plan addresses those activities necessary for the proper management of the facility during the 30-year post-closure period (40 CFR Part 264.117(a)(1)]. Should the post closure plan need to be revised, an amendment to the plan shall be requested according to the provisions of 40 CFR 264.118(d).

The primary areas of responsibility include monitoring, inspection, and maintenance activities and their frequencies. During post-closure, damaged or malfunctioning equipment or structures will be repaired or replaced as necessary to maintain the facility in proper condition.

Included in this Permit Application is the post-closure cost estimate, which details the expenses associated with the management and execution of the post-closure plan. In accordance with 40 CFR part 264.118(b)(3), the person to contact regarding Wayne Disposal Site #2 Landfill during the post-closure care period is:

David Lusk
Wayne Disposal, Inc.
Phone:(734) 329-8000
36255 Michigan Avenue
Wayne, MI 48184

In accordance with 40 CFR Part 264.120, no later than 60 days after the completion of the 30-year post-closure care period, Wayne Disposal Site #2 Landfill will submit to the MDEQ, by registered mail, a certification that the post-closure care activities were performed in accordance with this plan.

In accordance with 40 CFR Part 264.119(a), no later than 60 days after the certification of closure of each hazardous waste cell, WDI will submit to the MDEQ and Van Buren Township a record of the type, location, and quantity of hazardous waste disposed of within each cell.

2.0 INSPECTION ACTIVITIES AND FREQUENCIES

The post-closure inspections will be conducted using a grid system across the entire surface (final cover) of the landfill in order to discretize the area into specific regions. The approach will be conducted such that each master cell will be inspected and recorded on the Post Closure Inspection Checklist individually. The quarterly (1st & 3rd quarter) and the semi-annual (2nd quarter) inspections will be conducted on a quadrant grid system for each master cell. The annual inspection will be conducted on a 200 foot grid system (see attached Post-closure Inspection Grid Plan). Please refer to the attached Post-closure Inspection Report following this document for further information and inspection frequencies. When an identified problem is documented on the Post-Closure Inspection Report it shall be listed on the Maintenance Log Form. The purpose of this Maintenance Log Form is to track the items through completion of the repairs and to allow for a historical evaluation of any recurring items and locations.

The clay dikes and the perimeter dewatering tile system will be inspected for any surface evidence of deterioration or damage during each of the quarterly (1st and 3rd quarters), the semi-annual (2nd quarter), and the annual inspections. The two discharge points for the dewatering system will also be observed during each of these inspections to confirm that free-flowing conditions exist at the outlets. During each annual inspection, the manholes along the dewatering tile will be opened and the interiors inspected from the ground surface for evidence of deterioration, damage or tile blockage.

3.0 MAINTENANCE ACTIVITIES

In accordance with 40 CFR Part 264.118(b)(2) and 40 CFR Part 265.310(b), the following maintenance activities have been identified.

Security System

Signs will be replaced as they become illegible or if lost due to vandalism. In the event of fence or gate damage, those sections affecting site security will be repaired or replaced immediately.

Final Cover System

Periodic inspections are performed (refer to Subsection 2 of this Plan) to determine if and when additional maintenance is needed. Inspections of the final cover are specifically directed toward the identification of the following:

- Invasion of undesirable plant species
- Deterioration of vegetative cover
- Areas of surface erosion

- Soft or unstable areas of the cover
- Damage to the dikes
- Obstructions, erosion, or deterioration of the surface water drainage ditches
- Obstructions or damage to the discharge pipes for the drainage layer
- Burrowing by animals
- Surface disturbance due to unwarranted vehicle traffic

Detection of problems such as those presented above requires remedial efforts. The remedial efforts, including fertilizing and reseeding, are undertaken to bring the cover back to the original designed condition, as necessary. Documentation of these inspections is provided as shown in the Post-Closure Inspection Form following this document.

Erosion washouts will be repaired as soon as possible after detection. When cap integrity is in question, repair activities will begin immediately. Restoration of the vegetative cover will be performed during or at the end of the growing season.

In the event of localized subsidence that results in the ponding of surface water, repairs will involve building up the subsided area with soil to provide adequate surface water run-off. Based upon recommendations by the MDEQ; areas of localized subsidence must be evaluated prior to automatic application of surface soils to restore surface drainage. For relatively small areas of localized subsidence (i.e. no greater than 50 feet laterally and/or no greater than 12 inches vertically) soils may be added without notification to the MDEQ. However, larger areas must be evaluated and/or investigated, and shall require submittal of a Work Plan for WHMD approval prior to initiation of maintenance activities.

The vegetative cover is mowed to promote vegetative growth and surface water drainage, and to help improve the site's aesthetics. Vegetative cover that is lost or destroyed due to weathering is replaced in order to control erosion.

The maintenance of the vegetative cover also includes the elimination of undesirable trees or brush growth over the capped areas when apparent. Burrowing animals will be removed or exterminated immediately after being identified. In accordance with 40 CFR Part 264.310(a)(2), the Wayne Disposal Site #2 Landfill final cover functions with a minimum of maintenance.

Clay Dikes & Perimeter Dewatering Tile System

Periodic inspections of the clay dikes and the alignment of the perimeter dewatering tile systems are specifically directed toward the identification of the following:

- Deterioration of vegetative cover over the dikes
- Invasion of the dikes by deep-rooted, woody vegetation species
- Areas of dike surface erosion
- Soft or unstable conditions on dikes or along the tile system alignment
- Disturbance or damage to dikes or tile system manholes
- Blockage of the dewatering tile system outlets
- Excess fluid levels or non-flowing conditions in the dewatering tile system manholes

Vegetative deterioration or surface erosion on the clay dikes will be restored as soon as possible after detection. Vegetation restoration will be performed during or at the end of the growing season. When dike integrity is in question, repair activities will begin immediately.

Blockage at either outlet of the dewatering tile system will be cleared immediately after detection. Damage or disturbance of the concrete manholes on the dewatering tile system will be repaired as soon as possible after detection. Fluid levels in the concrete manholes which indicate partial or full blockage of the dewatering tile system will require jetting or cleaning of the blocked portion of the system as soon as possible after detection. Any surface evidence of collapse in the dewatering tile system will require investigation by sewer camera, open excavation, or other means. If partial or complete collapse has occurred, the affected portion of the system will be repaired and/or replaced as soon as possible after detection.

Leachate Collection System

The primary anticipated maintenance concerns will be pump operations. Should damage or failure occur to this system, repair or replacement of the defective equipment will be performed promptly.

The leachate collection piping will also be maintained by jetting or cleaning out the pipes interior as necessary.

Leak Detection, Collection, and Removal System

The primary anticipated maintenance concerns will be pump operations. Should damage or failure occur to this system, repair or replacement of the defective equipment will be performed promptly. Damaged surface pipes will also be repaired.

Drainage Structures

Ditches that have been damaged due to erosion will be properly repaired. Sediment buildup will be removed where necessary to allow free gravity drainage to the sedimentation basin. Removal of sediment buildup in the sedimentation basins will also be performed as needed to maintain adequate capacity for design flow conditions. The edge drain system may require occasional maintenance via sump clean-out & power-jetting to assure flow & reduce the hydraulic head against perimeter dikes to less than 5 feet of head.

Gas Venting System

Damaged gas venting risers will be repaired or replaced promptly after notification of needed repair. Dislodged gas venting risers will be reset.

Monitoring Wells

The primary anticipated maintenance concerns will be pump operation, security, and casing integrity. Should damage occur to the pumps, they will be repaired or replaced promptly. If damage is done to the locking system or the well casing, it will also be repaired.

Benchmarks

Should the benchmarks be removed or dislodged entirely, they will be reset or re-established at the original location and elevation.

4.0 MONITORING ACTIVITIES

In accordance with 40 CFR Part 264.310(b)(2). during the post-closure care period, the leachate collection and removal system will continue to be operated until leachate is no longer detected. In accordance with 40 CFR Part 264.310(b)(3), the groundwater monitoring system will be maintained and monitored throughout the post-closure period. The leak detection systems will also be maintained and monitored throughout the post-closure period. Refer to the environmental monitoring sections contained within this Permit Application for additional information regarding monitoring.

1. THE BASE MAP WAS CREATED USING AN AERIAL SURVEY TAKEN IN 2001 BY AIR-LAND SURVEY AND PROVIDED BY WDI, A SURVEY BY MCLLC IN OCTOBER 2007, AND A GROUND SURVEY BY WDI IN OCTOBER 2008.
2. THE UTILITY BASE MAP WAS PROVIDED BY MCLLC.
3. EXISTING UTILITIES (SUCH AS PIEZOMETERS, WELLS, GAS PIPING, LEACHATE FORCEMAIN, ELECTRICAL LINES, AND CLEANOUTS, ETC.) LOCATED INSIDE THE HAZARDOUS WASTE BOUNDARY ARE TO BE ABANDONED DURING CONSTRUCTION UNLESS MARKED TO REMAIN.
4. REFER TO CTI & ASSOCIATES DRAWING IN APPENDIX K OF THE BASIS OF DESIGN REPORT FOR MC I AND MC IV PROPOSED GAS MANAGEMENT SYSTEM.

1. THE BASE MAP WAS CREATED USING AN AERIAL SURVEY TAKEN IN 2001 BY AIR-LAND SURVEY AND PROVIDED BY WDI, A SURVEY BY MCLLC IN OCTOBER 2007, AND A GROUND SURVEY BY WDI IN OCTOBER 2008.
2. A MINIMUM OF 5 YEARS PRIOR TO CONSTRUCTING MC VI-G PHASES 3 TO 6, WDI SHALL INVESTIGATE THE DIKE LOCATIONS AND NEED FOR DEWATERING FOR THE EXISTING MC I TO CONFIRM THE ASSUMPTIONS USED IN THE DESIGN. WDI SHALL INFORM THE MDEQ OF THE RESULTS OF THIS INVESTIGATION AND REVISE THE DESIGN, IF NECESSARY. THE REVISED DESIGN SHALL BE APPROVED BY THE MDEQ PRIOR TO CONSTRUCTION OF MC VI-G PHASES 3 TO 6.

Geosynthetic Materials

Material	Location	Description	Product	Additional Requirements
80-mil Geomembrane	Primary and secondary liners	80-mil HDPE, textured both sides	GSE HD textured, or equivalent	Interface friction requirements in CQA Plan
40-mil Geomembrane	Final cover	40-mil HDPE, textured both sides	GSE HD textured, or equivalent	Interface friction requirements in CQA Plan
Geosynthetic Clay Liner	Final cover	Sodium bentonite encapsulated between two geotextiles that are needle punched or stitch bonded together	CETCO Bentomat ST, or equivalent	Internal shear strength requirements in CQA Plan
Geocomposite	LCS and LDCRS	200-mil HDPE, bonded top and bottom to geotextile meeting requirements below	GSE FABRINET, or equivalent	Transmissivity and interface friction requirements in CQA Plan
Cover Geocomposite	Final cover	200-mil HDPE, bonded top and bottom to geotextile meeting requirements below	GSE FABRINET, or equivalent	Transmissivity and interface friction requirements in CQA Plan
Geonet	LCS and LDCRS sumps, and LDCRS collectors	200-mil HDPE	GSE HYPERNET, or equivalent	Transmissivity requirements in CQA Plan
Geotextile	All geocomposites, gravel/geotextile envelopes for LCS, and final cover perimeter drain	Nominal 8 oz/yd2, needle-punched, nonwoven polypropylene	Amoco 4508, Synthetic Industries Geotex 801, or equivalent	AASHTO M288-98 requirements for Drainage Geotextile (Class 2)
Geogrid	Above Subgrade	Biaxial Polymeric Grid	Huesker Fortrac 80-80, or equivalent	None

LCS denotes leachate collection system
LDCRS denotes leak detection, collection, and removal system

TYPICAL PUMP STATION FOR CONTACT WATER POND (SEE NOTE 2) 6
NOT TO SCALE

NOTE:

1. TOPOGRAPHIC CONTOURS SHOWN WERE PROVIDED BY MIDWESTERN CONSULTANTS, INC; ANN ARBOR, MICHIGAN. DATE OF TOPO OUTSIDE LIMIT OF WASTE: SEPTEMBER 7, 2006 DATE OF TOPO INSIDE LIMIT OF WASTE: SEPTEMBER 4, 2008.
2. PUMPS IN CONTACT WATER POND G ARE CONTROLLED BY FLOATING SWITCH UNDER NORMAL OPERATION CONDITIONS. A HIGH LIQUID LEVEL SENSOR IS ALSO USED TO TRIGGER AN ALARM IF THE LIQUID LEVEL IS HIGHER THAN A PREDETERMINED LEVEL. AN AUTO DIALER WILL SEND THE ALARMING MESSAGE TO KEY PERSONNEL REMOTELY. IN ADDITION, THE ALARM WILL ALSO BE ACTIVATED IF THE POWER FOR THE PUMP IS INTERRUPTED. DURING THE WINTER OPERATION, THE PUMPS ARE CONTROLLED BY A PUMP PROTECTION CONTROLLER (COYOTE PUMP PROTECTORS OR EQUIVALENT). THE PUMP IS TURNED ON AT A PRESET INTERVAL AND WILL BE TURNED OFF WHEN IT IS RUNNING DRY.
3. THE MINIMUM REQUIRED PUMPING RATE (Q) DURING A 100-YEAR 24-HOUR STORM (4.36 INCHES) FOR CONTACT WATER PONDS ARE CALCULATED USING THE EQUATIONS LISTED IN THE FOLLOWING TABLE (LAST UPDATE OCT. 24, 2008):

POND NAME	WATERSHED AREA (SQ FT)	POND CAPACITY (GALLON)	RUNOFF OF 100 YR STORM (GALLON)	REQUIRED PUMPING RATE (GALLON PER MINUTE)
A	50,905	380,118	244,338	-
B	77,905	4,609,027	1,610,542*	-
E	70,298	234,820	215,511	-
F	261,165	743,228	708,777	-
G	514,700	287,000	1,388,817	1,544
H	475,450	6,020,200	1,282,148	-

* CALCULATED USING THE COMBINED WATERSHEDS FOR PONDS B AND Q

POND C IS REMOVED DUE TO THE INSTALLATION OF INTERMEDIATE COVER.
POND D IS REMOVED DUE TO THE WASTE REGRADING.

IF RUNOFF VOLUME > POND CAPACITY

$$Q = \frac{\text{RUNOFF VOLUME - POND CAPACITY}}{12 \text{ hrs} \times 60 \text{ minutes}}$$

IF RUNOFF VOLUME ≤ POND CAPACITY

$$Q = 0$$

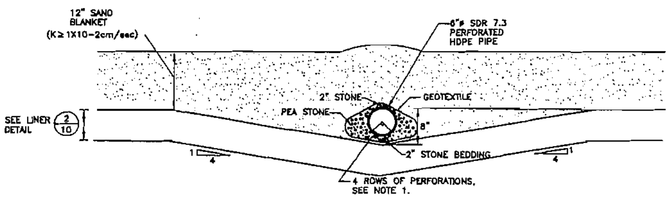
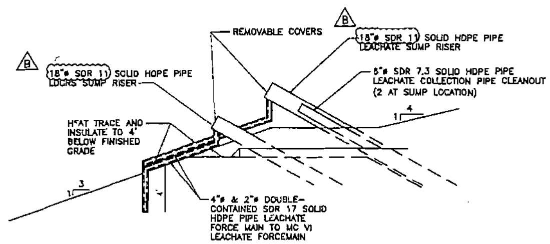
THE LCS AND LDS PUMP ELEVATIONS ARE:
1. LDS "PUMP-ON" ELEV= TOP OF LDS SUMP
2. LDS "PUMP-OFF" ELEV= 1 FOOT ABOVE LDS SUMP BOTTOM
3. LCS "PUMP-ON" ELEV= 0.67' BELOW TOP OF LCS SUMP
4. LCS "PUMP-OFF ELEV= 1 FOOT ABOVE LCS SUMP BOTTOM

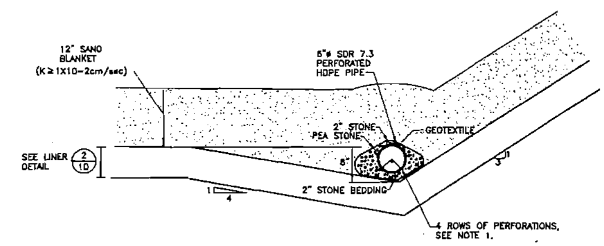
2/11 SUMP CROSS SECTION
N.T.S.



3/11 CELL FLOOR LEACHATE COLLECTION PIPE (TYP.)
N.T.S.



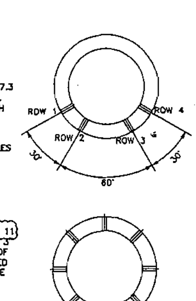
4/11 LCS AND LDCRS RISER DISCHARGE AFTER CLOSURE
N.T.S.



5/11 TOE OF SLOPE LEACHATE COLLECTION PIPE (TYP.)
N.T.S.

NOTES:
1. PIPE IS HDPE, 6" SDR 7.3 WITH 1/4" DIA. HOLES, 2" SPACING ALONG EACH OF (4) ROWS. ROWS SPACED AROUND CIRCUMFERENCE AS SHOWN. TOTAL 24 HOLES PER FOOT.

2. PIPE IS 18" HDPE SDR 11 WITH 3/8" DIA. HOLES. 3" SPACING ALONG EACH OF (8) ROWS. ROWS SPACED AROUND CIRCUMFERENCE AS SHOWN. TOTAL 32 HOLES PER FOOT.



Geosynthetic Materials

Material	Location	Description	Product	Additional Requirements
60-mil Geomembrane	Primary and secondary liners	60-mil HDPE, textured both sides	GSE HD textured, or equivalent	Interface friction requirements in CQA Plan
40-mil Geomembrane	Final cover	40-mil HDPE, textured both sides	GSE HD textured, or equivalent	Interface friction requirements in CQA Plan
Geosynthetic Clay Liner	Final cover	Sodium bentonite encapsulated between two geotextiles that are needle punched or stitch bonded together	CETCO Bentomat ST, or equivalent	Internal shear strength requirements in CQA Plan
Geocomposite	LCS and LDCRS	200-mil HDPE, bonded top and bottom to geotextile meeting requirements below	GSE FABRINET, or equivalent	Transmissivity and interface friction requirements in CQA Plan
Cover Geocomposite	Final cover	200-mil HDPE, bonded top and bottom to geotextile meeting requirements below	GSE FABRINET, or equivalent	Transmissivity and interface friction requirements in CQA Plan
Geonet	LCS and LDCRS sumps, LCS and LDCRS collectors	200-mil HDPE	GSE HYPERNET, or equivalent	Transmissivity requirements in CQA Plan
Geotextile	All geocomposites, gravel/geotextile envelopes for LCS, and final cover perimeter drain	Nominal 8 oz/yd2, needle-punched, nonwoven polypropylene	Amoco 4508, Synthetic Industries Geotex 801, or equivalent	AASHTO M288-96 requirements for Drainage Geotextile (Class 2)
Geogrid	Above Subgrade	Biaxial Polymeric Grid	Huesker Fortrac 60-80, or equivalent	None

LCS denotes leachate collection system
LDCRS denotes leak detection, collection, and removal system

Groundwater Monitoring Program Sampling and Analysis Plan

Section 27

Groundwater Sampling and Analysis Plan
Wayne Disposal Inc.

MID 048 090 633

I. INTRODUCTION

40 CFR, Part 264.97 requires the owner or operator of a hazardous waste facility to develop and follow a consistent program of groundwater sampling and analysis procedures. The program must include procedures and techniques for:

1) sample collection;
2) sample preservation and shipment;
3) analytical procedures; and
4) chain of custody control.

This document has been developed to direct the efforts of Wayne Disposal, Inc.'s (WDI) groundwater monitoring personnel and thereby meet the requirement of the rule referenced above.

II. GENERAL DESCRIPTION

The current groundwater monitoring system for WDI consists of 22 wells, numbered 18, 19R, 20 through 22, 23AR, 24, 25, 26A, 27A, 28 through 30, 31AR, 32, 34A, 35A, 36 through 39 AND 40R. Wells numbered 1A through 17, 26, 27, 31 and 41 through 47 also exist at the site but do not form a part of the groundwater monitoring sampling network for the hazardous waste management area of WDI. Wells OB-21, OB-23R, OB-24, OB 34R and OB-40R are also monitored under the Toxic Substances Control Act (TSCA) per conditions contained in 40CFR 761.75. Well locations are shown on Attachment A.

For Cell VI-F&G, a two-phase monitoring system will be implemented to supplement the current monitoring program. Construction of the MC VI-F&G area is expected to begin with the

Woodlot (MC VI-G Phase 1 and Phase 2) and then proceed into the northernmost cells (MC VI-F, Phase I and Phase 2). During this initial monitoring phase, a line of wells will be established south of the Woodlot (MC VI-G, Phase I and Phase 2, to monitor these cells. As shown on Attachment A, this initial set of wells has been designated as OB-48 through OB-52. -. Observation well W-1, which was installed as part of the hydrogeologic investigation, will be re-designated as OB-48. This initial set of wells will also include four new wells (OB-49, and OB-50 through OB-52). Three wells (OB-50, OB-51 and OB-52) will be installed to monitor the lower sand aquifer and one (OB-49) will be installed to monitor the bedrock. Note that existing wells OB-34A and OB-35A will also serve to monitor the MC VI-F area.

When the next phase of construction begins on the next cell further south (MC VI-G, Phase 3 through 6), the initial wells will be abandoned, and additional wells will be installed (or re-designated) at the downgradient (i.e., south) side of MC 1, which will be incorporated into the Part 111 groundwater monitoring program for MC VI-F&G. This second set of wells will include existing observation well W-10S (to be re-designated as OB-53), existing wells OB-6, OB-8, OB-12R, and OB-13 (to be re-designated as dual Part 111/115 monitoring wells), and four new monitoring wells (OB-54, OB-55, OB-58 and OB-59).

Proposed monitoring wells installed for the initial Phase I monitoring sequencing (OB-50, OB-51, and OB-52) are contingent upon identifying a suitable location along the MC 1 dike which does not go through the MC VI-G liner. Additionally, because the area in which these wells can be installed will be in the way during construction, installation will be completed following construction of the south slope of MC VI-G Phase I.

With the exception of wells OB-50, OB-51 and OB-52, well installation for each of the phase will be completed at least one year prior to the placement of waste so that "background sample collection" can be implemented. For wells OB-50, OB-51, and OB-52, the background sample collection may be completed on an excellerated schedule due to the need to install these wells post construction.

Copies of the well logs for all of WDI's wells are included in Attachment B. As new wells are added or abandoned, Attachment A and Attachment B must updated and the updates submitted to the MDEQ.

III. LABORATORY

Analyses of samples from the wells are conducted by a contract laboratory, TriMatrix Laboratories, Inc. (TriMatrix) of Grand Rapids, MI. Analytical arrangements and sample bottle preparation can be ordered in advance by calling TriMatrix. Request all analyses when calling for bottles so the laboratory personnel can properly prepare the containers.
If WDI decides to contract analysis of groundwater samples to another laboratory, the change will be made only after at least two concurrent sampling/analysis events show adequate correlation of analysis results of the existing and proposed contract laboratories.

IV. REQUIRED DOCUMENTATION

Documentation required for this monitoring program include:
a) A field notebook must be utilized to record all pertinent field data and sampling information during every sampling event. This must include the name(s) of sampling personnel, sample date, sample time, sample location, depth to standing water in the well, calculations for determining the volume of water to be purged from the well prior to sampling, results of any field measurements on groundwater samples and observations of sample characteristics or the sampling environment. Any odors, colors, sheens or other unusual characteristics of the samples must be described in detail. Copies of these field data notes must be included in reports sent to MDEQ.

b) During each sampling event, a Monitoring Well Inspection/Damage Report must be filled out and sent to the QEHS Department. A copy of this form is included as Attachment C-2. This report must be filled out to note any conditions of the monitoring wells or surrounding area that needs maintenance or repairs.

c) An equipment inventory, repair and calibration log is maintained in the Engineering field office. This log is used to list the inventory (by serial number) of all sampling apparatus and field measurement devices. Any changes of equipment or repairs to equipment must be noted in this log, as well as daily instrument calibrations, etc.

d) Also required for the sampling process are standard chain of custody forms from TriMatrix. A sample copy of this record is included herein as Attachment C-1. This sheet must be filled out fully for each sample submitted for analysis as described in Section X.

V. STANDING WATER LEVEL MEASUREMENTS

The sampling schedule for the uppermost aquifer wells is generally arranged such that the wells are sampled the month immediately following that in which Wells 1A through 17 are sampled. To obtain the best picture of static water levels for the site, 1) the levels must be obtained for all wells listed on Attachment E before any water is removed for purging or sampling, and 2) the levels must be obtained for all wells in as short a time as possible on the same day, due to barometric pressure effects. This means that static water levels for the wells are generally determined at least 30 days in advance of their sampling. This is the only case where purging and sampling does not immediately follow the water level observations.

The depth to standing water within the well casing is measured from the top of casing (TOC). The top of the well casing is exposed by removing the white plastic Well Wizard™ well heads. <u>The surveyed point on the casing is always at the edge on the north side of the casing</u>. Additionally, there is a permanent mark on the north side of the casing which marks the edge from which water levels are to be taken. The TOC elevations shall be surveyed at least once every two years to verify accuracy. Removal of the well head is necessary for determination of the standing water level. The depth to water is measured using an electric water level indicator. Attachment D describes the operating procedures for the water level indicator, which is used for this purpose.

When using the water level indicator, make certain that the probe and submersed portion of the cable are cleaned with distilled water and a clean cloth, followed by a distilled water rinse. This prevents cross contamination between wells. Lower the probe into the casing slowly while watching for the light. Carefully determine the water level by raising and lowering the probe at the water surface, and monitoring the light and buzzer. Record the distance from the point on the cable at TOC to the nearest marking on the cable within the well casing. The markings on the cable are scaled in 0.01 foot intervals. Record the measurement to the nearest 0.01 foot. The depth to standing water is then the distance from the probe tip at the water level to the marking on the cable. Record this depth in the field notebook.

VI. WELL PURGING

Before purging a well, it is necessary to determine the quantity of water contained within the well casing. This is done by subtracting the depth to standing water from the depth to the well screen. The depth to standing water must be determined just prior to beginning sample collection. The depth to the well screen for each existing well is listed on Attachment E. The difference between screen depth and water level depth is the height of water standing within the well. Multiply this height of water by 0.17 gallons per foot (for 2 inch diameter well casing). Multiply that product by 3, the number of standing volumes to be purged, which is the minimum recommended by MDEQ. The resultant product is the total quantity to be purged from the well, in gallons. Once again,

Amt. purged (in gallons) = (Ht. of standing water) x 0.17 x 3

Record these calculations in the field notebook.

The depth to the well screen should be confirmed every four years by removing the dedicated pump assemblies and lowering the water level indicator probe to the very bottom of the well casing for a determination of the clear depth of the well (make sure that the indicator cable is cleaned between each well). In addition, well depths should be checked if a change in well yield or sample appearance (i.e. turbidity) is noted. It is very important to ensure that the pump and tubing are kept clean when removed from the well (i.e. do not place equipment on ground, rather, wrap in plastic sheeting).

Once three standing well volumes have been removed, measure and record the pH and specific conductance of the water coming from the well. Continue to record these values at a rate of once every 10 minutes. After three values of pH and specific conductance have been obtained in this manner, compare the highest and lowest values. If the difference between the highest and lowest pH value is 0.07 su or less, then the well is considered stabilized with respect to pH. If the difference between the highest and lowest specific conductance values is 18 μmhos/cm or less, then well stabilization with respect to this parameter is considered complete. If the difference between the highest and lowest values for either parameter exceeds this criteria, pump the well another 10 minutes and recheck both parameters. Perform the comparison again, using only the last three monitored values of pH and specific conductance. Once the criteria are satisfied for any three consecutive monitored values of both pH and specific conductance, then consider the well fully stabilized and proceed with sampling. Measure and record well water temperature at this time as well. Record in the field notebook all the data obtained to establish well stabilization. In the cases where an individual well cannot be purged to stabilization in a manner described above because the well becomes fully dewatered, then sample the well after completely dewatering (evacuating) the well four times. For each sampling event, the second, third and fourth well evacuations should be performed within three days of the previous well evacuation. Sampling should be accomplished as soon after the fourth well evacuation as possible, depending upon the rate at which the water level in the well recovers. Measure and record pH, specific conductance and temperature in the field at the time the sample is obtained from such a well. Fully record in the field notebook all instances of well evacuation.

At Site II, we employ the "Well Wizard"™ system of dedicated pumps. This means that each well has a submersible pump within it, generally located at the well screen. The control unit and cylinders of compressed nitrogen are the other components that complete this system. Because sampling immediately follows the purging step in nearly all cases, the sampling box is always included during well purging. The sample box is discussed in greater detail in the Sample Collection portion of this document.

Prior to a sampling round for the wells, replace the sampling box discharge tube. To set up the Well Wizard™ system for operation, connect the nitrogen cylinder hose to the supply port on the controller unit. Connect one end of the coiled tubing within the controller unit to the Drive Air Out port on the unit, and the other end to the smaller of the two ports on the well head assembly. Connect the water sample line from the larger of the two well head ports to the back of the sampling box. Make certain that the valve on the rear of the box directs flow out of the box and through the discharge tube, until well purging is completed.

To initiate purging, begin the flow of nitrogen from the cylinder. Measure the quantity of water purged from the well using the graduated 3 gallon bucket kept with this equipment. Note that all purged water should be discharged on the ground away from the well. Do not allow the purged water to re-enter the well or the well protective casing nor should you allow ponding of the water around the well. Further background on Well Wizard™ operation can be gained by referring to Attachment F. Report any problems with equipment function to the Regulatory Affairs Department.

VII. SAMPLE COLLECTION

Upon completion of the well purging step, or upon return to a well which has been evacuated four times for purging, you are ready to take samples. Make sure each sample bottle for a given monitoring well has a label (affixed by the analytical laboratory personnel) which contains our facility name, the monitoring well number, the date and the sampler's initials. If a preservative has been included by the laboratory, such a note should appear on the label.

In the past sampling programs, it has been shown that airborne artifacts from disposal operations and engine exhaust can affect the number of detected constituents and their concentrations within groundwater samples. For this reason, a controlled-atmosphere sampling box was constructed for use in the collection of groundwater samples. Nitrogen, under positive pressure, is used as the sampling atmosphere within the box, thereby minimizing the probability of impacts to sample quality by airborne artifacts. All groundwater samples taken from WDI wells using dedicated pumps shall be taken within the sampling box.

In preparation for sampling, connect the nitrogen cylinder to the sampling box and purge the box atmosphere with nitrogen for 20 to 30 minutes. Make certain that all sample bottles to be used at a given location are placed within the box prior to purging the box atmosphere. Remove the caps from the bottles during the purging process to expose the interior of the bottles to the nitrogen environment. A new laboratory grade tygon tube connecting the wellhead to the sampling box must be used for the collection of samples from each location. When all is ready, turn the valve on the rear of the sampling box, diverting the flow of water from the discharge tube to the sampling tube within the box.

Samples for volatile organic compounds will be filled first. No headspace is permitted in the small glass vials. This may require several attempts but it can and must be done. Make certain not to touch the inside of bottle necks or caps with your hands. Next, fill the bottles for total organic carbon, total phenolics, metals and then other miscellaneous parameters, in this order. Fill each sample bottle to the very top and allow minimal headspace (air bubbles when capped and tipped) and take care not to spill any of the preservatives. Record the number and type of samples taken and the time of sampling on the chain of custody record.

Trip blanks (VOC vials filled with laboratory "clean" water) shall accompany the sample containers every day that samples are collected. A trip blank is provided by the laboratory for each batch of sample bottles (usually one for each cooler). These remain unopened throughout the sampling day and are submitted with the sample bottles. A field blank shall also be collected at each well sampled. A field blank is an empty (except for preservative) VOC vial that is opened in the nitrogen sampling box and filled with laboratory provided "clean" water while that well is being sampled. The purpose is to replicate the sampling environment in all ways except for the source of water in the container. Both kinds of blanks should be preserved, handled and shipped exactly as the well samples are. All of the trip blanks and a minimum of one field blank for each ten samples will be analyzed on a random basis for the primary parameters. However, if a positive result for any primary parameter is noted in a given well, the matching field blanks will immediately be analyzed for the offending parameter(s). A complete replicate sample shall be obtained from one well, chosen randomly, during each sampling round and will be analyzed for the same parameters as the sample it replicates.

VIII. SAMPLE PRESERVATION AND SHIPMENT

Attachment G is a tabulation of sample preservation procedures for TriMatrix. The samples must be preserved in accordance with the procedures outlined in this attachment. For all samples the laboratory provides clean, pre-preserved bottles (where necessary). Samples to be analyzed for dissolved metals must be field filtered with a 0.45 µm in-line filter cartridge and preserved with a couple of drops of reagent grade HNO_3 to a pH of less than 2. If the samples cannot be field filtered for any reason they must be filtered and preserved immediately upon delivery to the laboratory.

When the sample collection step is completed, open the sampling box, transfer all sample bottles to a cooler and pack the cooler with ice. Make sure that after each well sampling is completed that the tubing for the sampling box, is replaced with new tubing and the chain of custody record is completed.

All collected samples and blanks must be stored in a secure location until delivery to the contract laboratory personnel. This means within site of sampling personnel or locked in a secure location. Chain of custody records must accompany the samples at all times. The handling of these forms is covered in the Chain of Custody Control portion of this document.

IX. ANALYTICAL PROCEDURES

The parameters to be tested for as part of the monitoring program for the uppermost aquifer wells are shown in Attachment H.

Specific analytical procedures and target detection limits, consistent with the current WHMD Operational Memo Gen-8, and used by TriMatrix for this monitoring program are tabulated in Attachment I. However, when changes to analytical methods or to the detection limits contained within MDEQ WHMD Operational Memo Gen-8 are published and made available, the contents of Attachment I must be updated accordingly. Further, this attachment should be reviewed periodically to determine if the laboratory has made changes that should be reflected in the attachment. QA/QC frequencies, and precision and accuracy calculations are included in Trimatrix's QA/QC manual. Changes made to detection limits, analytical methods or QA/QC in response to regulatory requirements can be utilized in this monitoring program without changing the plan, but must be included in updated sampling and analysis plans.

Field measurements of specific conductance, pH and temperature will be performed using the equipment and procedures described in Attachment J. The instruments must be calibrated prior to each day of use and the appropriate notation made in the Equipment Inventory, Repair and Calibration Log described in Section IV.

TriMatrix's Quality Assurance Manual is included as Attachment K. This manual describes the internal policies, guidelines and procedures of TriMatrix. This manual is not intended to describe the specific details of this particular monitoring program. Rather, we are to use this document as a guideline in evaluating TriMatrix's QA/QC and standard operating procedures to ensure that generally acceptable practices are employed.

X. CHAIN OF CUSTODY CONTROL

Chain of Custody refers to the record of individuals and external conditions of sample handling through the time of laboratory analysis. The chain of custody record included as Attachment C is the principal document of this record. These sheets must be fully filled in with sampling information as well as the persons involved and shipment conditions during transport to the analytical laboratory. These sheets must accompany the samples to the laboratory.

When the samples are surrendered at the laboratory, each chain of custody record must be signed by the person transporting the samples as well as a representative of the receiving laboratory. The lab will make a copy of each sheet for us and keep the originals. The copy must be maintained in the files. Upon completion of a full round of sampling, transmit depth to standing water information, field monitoring data and all chain of custody records to the EQ Quality Environmental Health & Safety (QEHS) Department.

XI. EQUIPMENT AND WELL MAINTENANCE

Equipment used for the collection and analysis of groundwater samples must be maintained in working order and replaced or repaired promptly when necessary. Electrodes for pH and specific conductance should be replaced annually, or sooner if they become difficult to calibrate or appear to malfunction. The dedicated Well Wizard™ pumps and associated equipment require no routine maintenance but should be promptly replaced or repaired in the event of a malfunction. Any pump removed from a well should be thoroughly cleaned before replacement. Tubing removed from the well should be packaged and stored to prevent contamination or replaced. As outlined in Section IV, records of instrument calibration and any equipment replacement or repair must be kept in the Equipment Log maintained at the Engineering field office.

The well casings, protective covers, and Well Wizard™ pump heads should be inspected for damage at the time of each well sampling. Any damage should be noted in the field notebook and a Monitoring Well Inspection/Damage Report must be filled out and sent to the Regulatory Affairs Department. A copy of this form is included as Attachment C-2. Also note any surface erosion, standing water at the well or evidence of a damaged grout seal around the well.

In the event any damage requiring well repair becomes necessary, a Damage Incident Report will be prepared by the QEHS Department. A copy of this report will be placed in the site Operating Log and the Groundwater Monitoring Operating Log. A proposed method of well repair will be prepared and submitted to the MDEQ for approval. Repair efforts will be undertaken after approval by the MDEQ is received. The MDEQ shall then be notified at least 24 hours prior to initiating the repair efforts. Following completion of the well repairs, as-built documentation of the repair efforts will be prepared. A copy of this will be placed in the site Operating Log and the Groundwater Monitoring Operating Log. A copy will also be sent to the MDEQ.

XII. Statistical Evaluation and Reporting Requirements

All ground water analyses for the uppermost aquifer wells must be analyzed for evidence of statistically significant increases in concentrations of all primary and secondary monitoring parameters as described in Attachment L

The analytical reports, the records of the field procedures and a report of the statistical analyses (narrative and tubular) must be submitted to the MDEQ within 60 days after each calendar quarter. This report will also include a summary of the review of QA/QC data, a narrative of the sampling event including dates and sampling personnel, and a description of any unusual events or conditions encountered. Copies of the analysis and report must be maintained in designated files at the administration office at the site. In addition, an annual report summarizing the results of groundwater monitoring results and which evaluates groundwater flow directions and rates for the uppermost aquifer must be submitted to MDEQ by March 1 of the following year.

Operating Procedures for the Water Level Indicator

INSTRUCTION MANUAL

ET-89

ELECTRIC TAPE

Attachment D

KECK INSTRUMENTS, INC

KECK TAPE GUARD

The Keck "Tape Guard" was developed to protect instrumentation, tapes and sample tubing from the wearing edges of well casing. Made of smooth flexible polystyrene, the "Tape Guard" easily adapts to any 2" or 4" well.

Instructions

Simply compress the "Tape Guard" and insert into the opening of any 2" to 4" well pipe. Allo instrumentation, tubing or tape to ride on th smooth surface of the "Tape Guard" to pre wear.

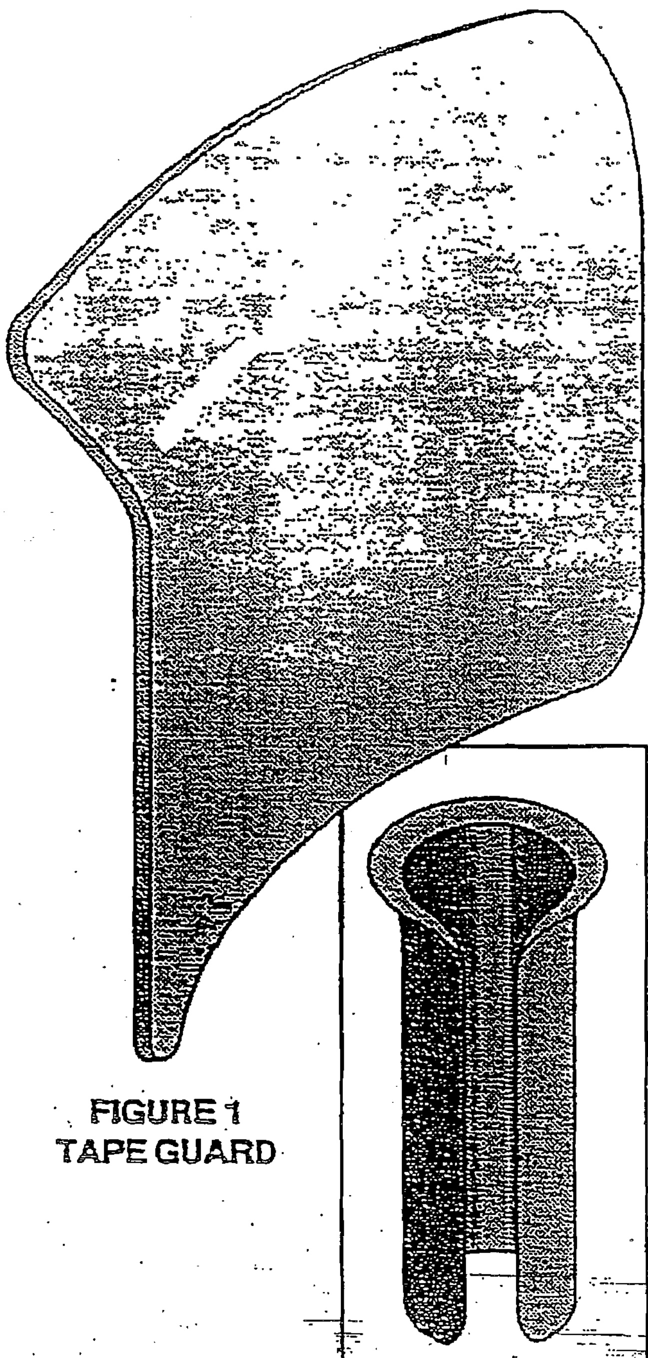

FIGURE 1
TAPE GUARD

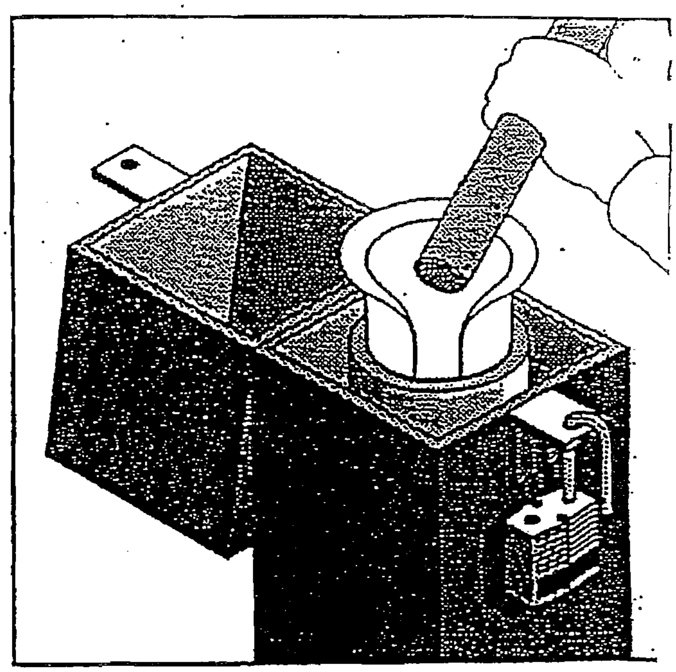

FIGURE 2
TAPE GUARD USAGE

The Keck Instruments ET-89 is a portable reel mounted device used to accurately measure water levels in a borehole. Water levels are detected by a 5/8" O.D. stainless steel probe attached to a 100 FT. Tefzel coated engineer's tape. The tape is graduated in 100ths of a foot with metric divisions on the reverse side. The ET-89 relies on fluid conductivity to determine the presence of water and emits on audible signal with light. Controls include a sensitivity adjustment to eliminate false readings due to cascading water or casing effect and a battery test switch.

Operational Procedure

1. Turn the instrument "On" and check the battery voltage by pressing the "Batt Test" button. A dim red light indicates a low battery and should be replaced.
2. Lower the probe down the well to the water surface, the light and buzzer should be activated. At this point adjust the probe sensitivity counter-clockwise until the light and buzzer turn off.
3. With the probe still in contact with the water, adjust the probe sensitivity until the light and buzzer barely activate. In this setting the probe will detect water level and not be effected by condensation from the casing well.
4. Water level measurements can now be taken from the top of the casing.
5. After completion of water level measurements the device should be properly stored.

Maintenance and Cleaning Procedures

1. Remove the three faceplate screws.
2. Release the faceplate using the sensitivity knob to pull the components out of the reel.
3. Make note of the battery location on the circuit board and the position in reel cavity.
4. Remove the 9 volt battery from the connector by grasping the battery and the black connector. Replace with new battery.
5. Position the battery in the notch of the circuit board and align the battery with the recessed slot in the reel.
6. Place the faceplate in the reel and replace the three retaining screws. Do not over tighten these screws.

Decontamination and Cleaning

The ET-89 can be cleaned with any detergent or lab soap such as Liquinox that does not effect polypropylene. The reel should not be submerged at any time but can be wiped with a damp cloth.

Please call our technical staff if further assistance is required at 1-800-542-5681.

Statistical Procedures for Ground Water Monitoring Program
Wayne Disposal, Inc

1.0 Introduction

The following statistical procedures are used to analyze the statistical significance of measured concentrations of ground water monitoring parameters at Wayne Disposal, Inc (WDI). This program was developed in accordance to meet the requirements of 40 CFR 264.97 and Rule 506 of the Administrative Rules for Part 111, Hazardous Waste Management, of the Natural Resources and Environmental Protection Act, 1995 PA 451, as amended.

2.0 Overview of Statistical Procedures

The statistical evaluation program for WDI is designed to signal statistically significant concentrations of monitoring parameters measured in samples collected quarterly or semi-annually from the wells in the monitoring well network. Different statistical techniques are used for different monitoring parameters depending on the nature of the data. The statistical comparisons are either intrawell (each well is compared to its own background) or based on the detection limit, which is generally the standard laboratory detection limit. When intrawell statistical comparisons are used, the statistical procedure is selected based on the degree that the background data are censored.

The monitoring parameters measured during each analysis are divided into four categories: primary parameters, secondary parameters, tertiary parameters, and field parameters (see Figure 1). The list of primary parameters is comprised of volatile organic compounds that are known to present within the waste. As these compounds do not generally occur in nature at measurable concentrations, a confirmed concentration above a statistically based detection limit for any single parameter will result in a statistically significant increase as defined by the operating license.

The secondary monitoring parameters are mainly inorganic parameters that are found in elevated concentrations within the leachate. As these parameters are naturally occurring, their presence in ground water may or may not be an indication of a release and it is often necessary to determine the significance of changes in concentration relative to estimates of the true background concentrations. In this program secondary parameters are used to detect a possible release in the following ways. First, a confirmed statistically significant change in the concentration of any two (or more) secondary parameters in a single well will result in a statistically significant increase as defined by the operating license. This approach is designed to detect relatively subtle changes in ground water quality as evidenced by several parameters at once. In addition, a confirmed, order of magnitude increase (10 times the background concentration) in the concentration any single parameter will also result in a statistically significant increase. This will ensure that a large increase in one secondary parameter is appropriately investigated.

The tertiary parameters are those parameters for which background has already been established. The tertiary parameters in this program are further subdivided into two groups: parameters that have an already established background but will not be measured during detection monitoring, and parameters that will continue to be measured during detection monitoring but will not be subjected to the statistical analyses described below. The former group is not being analyzed because they do not appear to be useful monitoring parameters. The analytical results from the latter group will be used to evaluate potential non-release related ground water quality changes, such as might be caused by well corrosion and grout contamination. These parameters will not be analyzed statistically because they are poor indicators of a release.

Field parameters are those parameters measured in the field during sample collection, mainly for the purpose of showing that ground water quality has stabilized during well purging. These parameters will not be analyzed statistically.

3.0 Description of Statistics for Detection Monitoring

The statistical tests to be used for all detection monitoring events are described in the following section. This section includes the definition and procedures for calculating "background", and the procedures for conducting the statistical analyses.

3.1 Parameters

The parameter list for the ground water monitoring program is presented on Figure 1. The following descriptions of background calculation and statistical analyses are presented separately for the primary and secondary parameters, respectively.

3.2 Background

The background statistics for all monitoring parameters are to be calculated using the methods described below. The recalculation of the moving background for secondary parameters, as described below, will also follow these procedures. For new wells, or replacement wells that cannot utilize the data from the replaced well, an interim background as defined in section 3.3 will be used for applicable secondary parameters until eight samples are collected. Then the background described below will apply.

Primary Parameters - The decision of whether or not there is a statistically significant increase in a primary parameter is essentially the decision of whether or not the parameter is present in the ground water. For all of the primary parameters the occurrence of the parameter above the laboratory's reported detection limit is considered to be a statistically significant event and re-sampling must be initiated to confirm or refute the occurrence.

Secondary Parameters - Determination of the initial intrawell background statistics was completed utilizing the first eight sampling events beginning in 1988. However, beginning at the end of 1995, each time four new analyses were completed, the oldest four measurements have been dropped from the database, the next four added, and the background statistics recomputed. This is repeated each year keeping about a six year lag between the background period and the detection monitoring samples.

If the program moves to semi-annual monitoring (such as in post-closure), the background will be updated every year until the moving background reaches the point where years with semi-annual sampling are to be included. Then the background will be updated every two years (after four new samples have been collected) and thus the moving background window will continue to lag at least six years behind.

The nature of the background statistics and the method of calculation of these statistics for the secondary parameters is based on the degree of censorship of each parameter at each well. The secondary parameter list includes parameters which are highly censored (at least half of the values are below detection limits), those which are moderately censored (more than half the values are above detection) and those which are essentially all above method detection limits (the method detection limits are defined in the operating license). Some parameters exhibit varying degrees of censorship at different wells.

If the background data for a parameter contains at least five detectable background values, but contains some non-detects, the non-detects will be alternately assigned values of zero and the detection limit. If all of the background values are above detection, the background statistics will be calculated from the background data as is. The mean and standard deviations will be calculated using the standard statistical equations for these quantities and the data will be analyzed using control charts as described below. In no case will a standard deviation of less than 10 percent of the mean be used in a statistical test. If the calculated background standard deviation is less than 10 percent of the mean, then 10 percent of the mean will be substituted for the background standard deviation.

If half or more of the intrawell background measurements are below detection limits (4 or more BDL values), then the background statistics will be calculated based on the proportion of values above method detection limits. This quantity will be used to conduct a test of proportions as described below.

3.3 Performance of Statistical Tests

The methods to be used for statistical analyses of all primary and secondary parameters that have a background as defined in Section 3.2 are described below. For new wells, the primary parameters will be evaluated as described below but the secondary parameters will be evaluated using the "interim" statistical procedures contained in Appendix A. For replacement wells, a decision must be made as to whether the existing background from the well replaced is appropriate for the new well. If it is, such as might be expected when a damaged well is replaced by a well screened in the same stratum, then the existing background can be used with the statistical tests described below. If the replacement well can not be placed in the same strata, or the old well is believed to have yielded unrepresentative results, then the replacement well is considered a new well for the purposes of statistical analyses and will be handled as described above.

Primary Parameters - For the primary parameters, any measured concentration of any parameter which is above the laboratory reported detection limit will initiate quadruplicate re-sampling for confirmation of the affected parameter(s), in accordance with the operating license. If the statistical failure is repeated, then a statistically significant increase is confirmed. If the apparent increase is not confirmed, then normal detection monitoring will be resumed.

Secondary Parameters - The statistical analysis of secondary parameters will be conducted by one of two statistical tests depending on the degree that the intrawell background data are censored. If more than half the data are above method detection limits then a control chart approach will be used. If at least half the background data are below detection limits, a test of proportions will be used to analyze the data. There is also a default provision to investigate a dramatic increase in any single parameter regardless of the results of outcome of the statistics.

If there are statistically significant increases for any two secondary parameters at any single well, and the increases represent less than a ten-fold increase over background, then WDI shall undertake the procedures identified in the operating license, including re-sampling in quadruplicate. In this case, both failures must be verified by re-sampling in order to confirm the statistical increase. If any single secondary parameter exhibits a ten-fold increase over background, then this occurrence must be verified by quadruplicate re-sampling. If the increase is confirmed then a statistically significant increase has occurred.

The statistical evaluation of moderately censored or uncensored secondary parameters will be conducted using intrawell statistical comparisons via a control chart approach. The combined Shewhart-CUSUM control chart will be used to analyze the statistical significance of the measured concentrations of secondary parameters. This approach consists of two statistical tests designed to detect different types of evidence of a release. The Shewhart limit is designed to detect a sharp increase in the concentration of a monitoring parameter in a single sample. The CUSUM limit is designed to detect gradual increases in the concentration of a parameter over time. The two techniques will be used as separate statistical tests. That is, failure of either test alone (or both) will signal a statistically significant increase for a given parameter. Therefore, if one parameter fails the CUSUM test and another exceeds the Shewhart limit, then an apparent statistically significant increase will have occurred and confirmation of both failures must be undertaken. Confirmation of an apparent failure of one of the two tests must be confirmed by an additional failure of that particular test.

The Shewhart control chart compares a detection monitoring concentration of a parameter to the intrawell background mean plus a selected number of standard deviations. The test is performed by calculating the standardized mean, Z, for the detection monitoring concentration. As individual samples are collected during each detection monitoring event, the standardized mean for each measured parameter is calculated by:

$$Z = (x_m - x_b)/s_b$$

where: x_b is the intrawell background mean

x_m is the measured concentration during detection monitoring

s_b is the standard deviation of the intrawell background

The value of Z is then simply compared to a selected value, U, which represents the number of standard deviations from the intrawell mean. The Shewhart limit (U), or upper control limit will be 4.5, as recommended in the Interim Final Guidance for Statistical Analysis of Ground-Water Monitoring Data at RCRA Facilities (USEPA, 1989). The statistical test is performed by simply comparing the value of Z to the value of U. If Z is greater than U then it is concluded that a statistically significant increase has occurred.

The Shewhart control chart will be used in the following manner. If a secondary parameter(s) exceeds the Shewhart limit and at least two secondary parameters fail a statistical test at any given well during a given sampling event, the well would be re-sampled in quadruplicate for the offending parameters, and the mean(s) of the quadruplicate analyses would be used to confirm whether the Shewhart limit(s) is exceeded. If there is confirmation, then it would be concluded that there has been a statistically significant increase. If the increase is not confirmed, any unconfirmed measurements would be dropped from the control chart and replaced with the means of the quadruplicates.

The CUSUM control chart is designed to detect a trend of increasing concentrations over time, regardless of whether the Shewhart limit is exceeded or not. In the CUSUM procedure, the cumulative sum of the values for Z - k are tabulated over time, each time a round of samples are analyzed. The value for Z is computed as described above, and k is a selected parameter. During each analysis subsequent to the background determination period, a value for Z - k is computed and added to the previous total. As long as the cumulative total of Z - k is a negative number the cumulative sum (S) remains zero. As positive values accumulate, the value for S is compared to a selected value, h. If S is greater than h, then a statistically significant event has occurred. The values used for k and h will be k = 1 and h = 5, respectively, as recommended (USEPA ,1989).

The CUSUM limit will be utilized in conjunction to the Shewhart limit and proportions test as follows. If the CUSUM limit is exceeded and at least two or more secondary parameters have failed a statistical test at any given well during any given sampling period, quadruplicate re-sampling of the well in question will be initiated. The mean values of the quadruplicate sample will then be used to re-compute S. If S again exceeds h, then the increase is confirmed. If the increase is not confirmed then the mean values of the quadruplicate sampling replace the results of the anomalous (unconfirmed) values within the CUSUM statistic for future analyses. These non-confirmed exceedances must be removed from the CUSUM control chart because their inclusion may cause additional false positive results when subsequent sample results are added to the cumulative sum.

For parameters that contain at least half non-detectable concentrations in the intrawell background database, a statistical test to determine the significance of the proportion of detectable occurrences during detection monitoring will be used. The test of proportions, which is based on the binomial distribution, is statistical test suited to this purpose. This statistical procedure analyzes the significance of an increase in the rate of detectable occurrences over time.

To implement the test of proportions, the proportion of detectable occurrences during the 8 background samples will be compared to the rate of detectable occurrences in the most recent 4 detection monitoring samples. The statistic is computed by the equation:

$$Z^* = \frac{P_m - P_b}{[\,p(1-p)(1/N_m + 1/N_b)]^{0.5}}$$

where:

P_m = proportion of detectable concentrations in the last four detection monitoring samples

P_b = proportion of detectable concentrations in the eight intrawell background samples

N_m = number of detection monitoring samples (4)

N_b = number of background samples (8)

p = weighted proportion defined as:

$$p = \frac{n_m + n_b}{N_m + N_b}$$

where:

n_m = number of detection monitoring samples above method detection limits

n_b = number of background samples above method detection limits

The value of Z* is then simple compared to a critical value, Z_c, obtained from standard tables for the normal variant, Z, at the desired level of significance. The test will be conducted at the 0.05 level of significance, therefore Z_c is equal to 1.645. Any value of Z* greater than Z_c signals a statistical failure for that parameter.

Each time a new detection monitoring sample is collected, the result would be added to the previous three samples for determining the proportion of detectable occurrences. Thus, both the background and detection monitoring proportions involve a moving window, with the background lagging at least six years behind the window of detection monitoring. If detection limits are lowered during the monitoring program, the proportion of detectable occurrences will be the proportion of results above the older background detection limit until the background is updated to include the new lower detection limits. For example, if the old detection limit was 20 and the new detection limit is 10, then only concentrations above 20 (even though a concentration of 11 or above is now "detectable") will be considered detectable until the moving background window is based on samples with a detection limit of 10.

WDI will use the proportions test as follows. If there is a statistically significant increase in any two secondary parameters at a particular monitoring well (i.e. two failures of the test of proportions or a combination of control chart and proportions test failures), then re-sampling in quadruplicate would be initiated to confirm the suspected increase. Confirmation would be completed if both failures are repeated.

To guard against the unlikely possibility of a large increase in a single secondary parameter going unflagged by the above statistical program, WDI will consider any concentration of a secondary parameter that is greater than 10 times the background concentration (or the reported detection limit for highly censored parameters) as a default violation of the statistical tests described above. This will ensure that clearly anomalous data are evaluated even if only a single secondary parameter is affected.

(Wayne Disposal – attachment #15) (Michigan Disposal – attachment # 14)

INTRODUCTION:

In accordance to the Michigan Department of Environmental Quality (MDEQ), Waste and Hazardous Materials Division (WHMD) Part 111, ambient air monitoring will be conducted as a requirement of the Hazardous Waste License. The ambient air monitoring plan is an attachment to the license and a stand alone document. The ambient air quality will be monitored at seven stations around the perimeter of the site, including six existing stations and one proposed station that will be added prior to the operation of landfill Cells VI-F&G. These locations are noted on the attached Figure 1. The ambient air monitoring program described will be used to characterize the air quality associated with both Michigan Disposal Waste Treatment Plant (MID 000724831) and Wayne Disposal, Inc. (MID 048090633) Site #2. All six sites are monitored for Polychlorinated Biphenyls (PCBs) using a polyurethane foam (PUF) sampler, metals using a high volume Total Suspended Particulate (TSP) sampler, and Volatile Organic Compounds (VOCs) using a sorbent tube sampler. Site 9 (82983) is a collocated site that has pairs of each sampling device. The AQD and WHMD recently approved the discontinuation of sampling for PM10 (particulate with a diameter of 10 microns and less). The sampling for all parameters will be conducted in accordance to the methods specified by the United States Environmental Protection Agency (USEPA) in Title 40 of the Code of Federal Regulations (CFR) Parts 50, 53, 58 and the

Toxic Organic Compendium Method, TO-17 for solid sorbent tubes. The sampling will be conducted on the prescribed sample days as determined by the (USEPA).

SAMPLING

Sampling for PCB's will be conducted with a high volume PUF sampler. Samples collected from the PUF sampler are analyzed and reported as total PCBs. Sampling for the PCB compounds will be conducted in adherence to the USEPA's Toxic Organic Compendium Methods TO-4A or TO-10A. The PUF samplers will operate every 12th day for a 24 hour period at an air sampling rate of approximately 200 to 280 lpm.

Metal concentrations will be determined from the samples collected in a reference method high volume TSP sampler. The sampling for multi-metals will adhere to the requirements of 40 CFR Part 50, Appendix G for the determination of lead. All sections referenced by Part 50, Appendix G will likewise be followed. Thenalysis will be performed using USEPA Reference Methods for lead and the other metals listed in the attached table to this monitoring plan. Quality control and assurance requirements specified in the method will be incorporated in the sampling protocol. Samples will be collected every 12 days for a twenty-four (24) hour period with a nominal flow rate of 50 cfm $\pm$ 10 cfm.

VOC's will be sampled utilizing a system of sorbent tubes capable of effectively collecting the listed compounds in the attached table. A constant flow sampling pump is operated at approximately 0.10 liters per minute (lpm). Samples will be collected at a flow rate adequate to reach the required limits of detection. Sampling will be conducted in adherence to the USEPA's Toxic Organic Compendium Method, TO-17 for solid sorbent tubes. Sampling will be conducted on an every 12 – day schedule.

QUALITY ASSURANCE

On each run day, samples from the collocated site shall be analyzed and reported to the MDEQ, AQD for the assessment of sampler precision. One sample day per month, one blank sorbent tube and metals filter shall accompany the samples to the collocated site , not have air pulled through it, then submitted to the laboratory as a "trip blanks". All laboratory quality assurance, such as the analysis of blanks and standards, shall be made available to the MDEQ upon request for the determination of accuracy. If any parameter that is analyzed by the laboratory and determined to be non-detectable, the value of the method detection limit for that compound divided by 2 (MDL/2) shall be reported. Staff from the MDEQ AQD and WHMD may audit the ambient air monitoring program, files, and samplers at their discretion.

REPORTING

Within 60 days after the end of the month in which it was collected, all ambient air monitoring data will be reported in an acceptable electronic format to the MDEQ, AQD. The facility will keep copies of all ambient air data on-site for at least 3 years. A request can be made to the Chief of the WHMD to modify the monitoring plan if one year of sampling events show non-detectable levels of that parameter. The determination to alter the ambient air monitoring plan shall be made by staff from both the WHMD and the AQD. The final approval letter regarding any changes to the ambient air monitoring plan will be issued by the WHMD.

Attachment D. Revisions to Soil Monitoring SAP

SM SAP does not apply to an off-site detection of PCBs in soil/sediments. In the event PCBs are detected and/or confirmed in off-site soil/sediments, WDI must notify the MDEQ in accordance with the General Operating Conditions of the Operating License for Reporting Noncompliance that may endanger human health or the environment

2.0 REVISIONS

WDI may revise this SM SAP and submit the revised plan to the Chief of the Waste and Hazardous Materials Division of the Michigan Department of Environmental Quality (WHMD/MDEQ) for review and approval prior to implementation.

3.0 SAMPLE LOCATIONS

Currently, there are twenty five sampling locations for the soil monitoring program. There are 20 soil sampling locations and five sediment sampling locations, identified as SM-1 through SM-25, on Figure 1, that also depicts the boundaries for Area A and Area B watersheds. Locations SM-26 through SM-34 will be added to the program post MC VI F&G construction and post-closure as indicated on Figure 1. The locations for the SM SAP samples have been surveyed and are marked in the field with a monument. With the development of Cell VI F&G and the eventual relocation of the waste transfer box, some soil sampling locations will be eliminated and/or relocated. Sediment sampling locations SM-30, SM-31, SM-32 and SM-33 and soil sampling location SM-34 will be added after Cell VI-F is constructed and four additional soil sampling locations (SM-26 through SM-29) will be added after final cover is installed.

SOIL MONITORING
SAMPLING AND ANALYSIS PLAN

WAYNE DISPOSAL, INC. SITE #2
MID 048 090 633

1.0 INTRODUCTION

This Soil Monitoring Sampling and Analysis Plan (SM SAP) identifies the procedures for monitoring on-site soil and ditch sediment samples at Wayne Disposal, Inc. (WDI), Site 2 during the active life of the hazardous waste disposal facility. The soil monitoring program described in the SM SAP is designed to test on-site soil and ditch sediments for the presence of polychlorinated biphenyls ("PCBs"). PCBs detected in the soils or sediments could potentially be transported by storm water into the sedimentation basins at the site. The storm water in the sedimentation basins is treated for PCBs prior to discharge to Quirk Drain in accordance with a National Pollution Discharge Elimination System (NPDES) Permit. This monitoring program is one of the checks on the engineered controls and operational procedures employed by WDI to detect an on-site release of hazardous waste or hazardous waste constituents as early as possible and allow WDI to initiate efforts to locate and control the source and prevent the off-site release of hazardous waste or hazardous waste constituents.

This SM SAP also prompts notification and response actions that WDI must take when an apparent or confirmed threshold level exceedance of PCBs in on-site soil/sediments occurs. This

SM SAP does not apply to an off-site detection of PCBs in soil/sediments. In the event PCBs are detected and/or confirmed in off-site soil/sediments, WDI must notify the MDEQ in accordance with the General Operating Conditions of the Operating License for Reporting Noncompliance that may endanger human health or the environment

2.0 REVISIONS

WDI may revise this SM SAP and submit the revised plan to the Chief of the Waste and Hazardous Materials Division of the Michigan Department of Environmental Quality (WHMD/MDEQ) for review and approval prior to implementation.

3.0 SAMPLE LOCATIONS

Currently, there are twenty five sampling locations for the soil monitoring program. There are 20 soil sampling locations and five sediment sampling locations, identified as SM-1 through SM-25, on Figure 1, that also depicts the boundaries for Area A and Area B watersheds. Locations SM-26 through SM-34 will be added to the program post MC VI F&G construction and post-closure as indicated on Figure 1. The locations for the SM SAP samples have been surveyed and are marked in the field with a monument. With the development of Cell VI F&G and the eventual relocation of the waste transfer box, some soil sampling locations will be eliminated and/or relocated. Two additional perimeter ditch samples (SM-30 and SM-31) will be added after Cell VI-F is constructed and four additional locations (SM-26 through SM-30) will be added after final cover is installed.

One grab sample of soil will be collected from within 10 feet of the surveyed monument from each of the respective soil monitoring locations. One sediment sample will be collected from within the ditch at each of the respective drainage ditch locations within 10 feet of the surveyed monument in a linear fashion. At the time of sampling, the exact location for each of the individual samples will be marked with a flag and a written description of the location (distance from monument and compass direction) will be recorded on the sample collection log so that a confirmation sample can be collected if necessary (see Section 5 below). Upon initiation of WDI's next routine sampling event, the flag will be moved to the new sampling location following the procedures described in this section of the SM SAP

4.0 SAMPLE FREQUENCY

The SM SAP samples are to be collected semiannually in March and September of each respective year.

5.0 SAMPLE COLLECTION

Samples from each of the 25 monitoring locations shown on Figure 1 are to be collected using a disposable hand trowel or other tool capable of excavating a short distance into the soil/sediment. Each individual sampling location is to be prepared by laying out an area approximately one-half foot square on the soil/sediment surface and carefully removing vegetation, sticks, rocks or other debris to expose a clear sampling surface. At each individual sampling location, one sample is to be collected by removing the top inch of soil/sediment from the one-half foot square area, placing the soil/sediment into a separate stainless steel bowl, disposable foil pan, or ziplock bag, gently mixing the soil/sediment in the selected type of container to homogenize the sample, and removing the homogenized soil/sediment from the container into clean glass sampling jars. A sample from each of the 25 sampling locations is to be submitted to the laboratory for PCB analysis.

Clean protective gloves must be worn during sample collection and must be replaced at each sample location. Care should be taken at all times when handling the samples. Each sample jar must be labeled with the sampling location, the time and date of the event, and the sampler's initials. If it is necessary to use non-disposable sampling equipment, the equipment will be decontaminated between sampling locations. In addition, one blind duplicate and one equipment blank for each piece of non-dedicated (if used) sampling equipment utilized in the sampling process (i.e. sample collection tools and homogenizing container) must be collected for each sampling event. The equipment blank must be collected by pouring clean de-ionized water over and/or into the decontaminated piece of equipment and collecting the rinsate in the appropriate jar for analysis. After collection, the samples must be stored in a clean cooler containing ice or ice packs. The coolers containing samples must be stored in a secure location, until being transported to the laboratory.

A sample collection log (Figure 2) must be filled out at each sampling location and any unusual conditions encountered must be noted. A chain of custody (COC) form must also be filled out for each sampling event. This COC must be filled out fully for each sample submitted for analysis and each person responsible for the handling of these samples must sign and date the form. When the samples are delivered to the laboratory and the lab has signed for their receipt, a copy of the COC must be retained on site in the Quality, Environment, Health and Safety (QEHS) Department records.

6.0 SAMPLE ANALYSIS

The samples from each of the 25 sampling locations will be analyzed for total PCBs where total PCBs equals the sum of the following PCB aroclors: PCB-1016, PCB-1221, PCB-1232, PCB-1242, PCB-1248, PCB-1254 and PCB-1260. The analytical method detection limit will be 0.1 mg/kg on a dry weight basis. Samples will be analyzed in accordance with USEPA SW-846 Method 8082. Samples will be analyzed within 40 days of collection to meet holding time requirements for the analytical method.

The laboratory quality control/quality assurance manual (QA/QC Manual) describing the required internal policies, guidelines and procedures of any WDI contract lab is contained in the Groundwater Sampling and Analysis Plan (GW SAP). WDI is to use this QA/QC Manual in evaluating the QA/QC standard operating procedures of any contract laboratory utilized for the purposes of this SM SAP and ensure that the laboratory employs generally acceptable practices that meet the specifications of the QA/QC Manual in the GW SAP.

7.0 DATA EVALUATION

The analytical data must be evaluated to determine whether there has been an apparent threshold level exceedance (ATLE). The applicable threshold level depends on whether the sample location is within Area A or Area B (see Figure 1). The threshold levels are defined as follows:

- Area A ATLE: Total PCBs (as defined in Section 6.0 of this SM SAP) at or above 0.75 mg/kg.

- Area B ATLE: Total PCBs (as defined in Section 6.0 of this SM SAP) at or above 0.1 mg/kg, the method detection limit for the PCB analyses.

8.0 RESPONSE ACTIONS

In the event of an ATLE, WDI must verbally notify the WHMD/MDEQ, Hazardous Waste Program Section staff immediately in accordance with the Environmental Monitoring Conditions of the Operating License and implement the procedures identified below to confirm the ATLE.

- Within 7 days of the ATLE, WDI must collect a verification sample at each soil sampling location for which an ATLE was reported. Each verification sample must be collected along the sides and bottom of the hole left by the prior sample. WDI must notify the WHMD/MDEQ prior to conducting verification sampling so that the WHMD/MDEQ can, if it chooses, split samples with WDI. .

If the ATLE is not confirmed by the additional sample analysis, WDI is to resume routine monitoring. If the ATLE is repeated upon analyzing the second sample a CTLE has occurred. In the event of a CTLE, WDI must notify the MDEQ in accordance with the Environmental Monitoring Conditions of the Operating License. Further, in the event of any CTLE, within 14 days of the CTLE, WDI is to collect the first phase of delineation samples to determine the extent of the areas exceeding the CTLE. Samples are to be collected and analyzed in accordance with the requirements in Sections 5.0 and 6.0. WDI must notify the WHMD/MDEQ prior to conducting delineation sampling so that the WHMD/MDEQ can, if it chooses, split samples with WDI.

Different approaches for locating delineation samples are required to be implemented depending on whether the CTLE has occurred:

- On top of closed landfills or other open areas.
- Along linear features such as drainage ditches or interior roads.

The approach for locating delineation samples for each of these scenarios is defined below. Before immediately and automatically implementing the defined delineation approach provided below, a visual evaluation of the area is to be completed to determine if there are features in the area that suggest a preferential pattern for the PCB exceedance (e.g. visible dust patterns, erosion gullies, vegetative cover or lack thereof, low areas, etc). If it is determined that a preferential deposition pattern is present, WDI must collect samples from those locations as appropriate. Dependent on the type and size of the feature, samples from preferential area(s) may be included as extra samples or as part of the grid sampling procedure discussed below if their locations allow. If the visual check shows no features suggesting that the PCB exceedance may be preferentially located, the following procedure is to be used to locate delineation samples.

For a CTLE on top of closed landfills or other open areas, a grid sampling strategy is to be employed as follows:

- A 100 by 100 foot grid, divided into 25 by 25 foot grid intervals, is to be centered over the CTLE location and sixteen soil samples are to be collected from the center of each 25 by 25 foot grid interval. Of the sixteen soil samples, the four step-out soil samples immediately adjacent to the CTLE location and the four corner soil samples from the 100 by 100 foot grid are to be analyzed for PCBs. The laboratory is to hold the remaining eight soil samples pending the results from the initial eight soil samples. Close communication with the laboratory will be required to insure that initial samples are analyzed quickly so that analysis of the additional samples for delineation, if necessary, can be completed without violating the holding time requirements of the PCB analytical method. WDI may voluntarily perform additional sampling within the bounds defined by the above procedure in order to refine the delineated boundary of the area exceeding the threshold limit defined in Section 7.0.

- If none of the eight initially analyzed soil samples contain PCBs above the threshold level defined in Section 7.0, the horizontal extent of the exceedance is considered to be the area inside the square drawn by connecting the four sample points immediately adjacent to the CTLE location.
- If any of the eight initially analyzed samples contain PCBs above the threshold level defined in Section 7.0, WDI is to do the following:
    - Contact the laboratory and request them to conduct PCB analysis on the soil samples that were collected and held for all locations that are contiguous to the PCB exceedance.
    - Within 14 days following WDI's determination that a PCB exceedance in a response soil sample has occurred, submit a work plan, based upon a grid or transect approach, to the WHMD/MDEQ for review and approval to identify the extent of the PCB contaminated area along with a schedule for completing the work.

For a CTLE along a linear feature, sampling is to occur as follows:

- For a CTLE in a drainage ditch, three samples are to be collected, one upstream and two downstream, at approximately 25 feet intervals, on each side of the CTLE (taking care to pick locations of sediment accumulation areas), assuming the linear feature extends the required length in each direction. If the linear feature does not extend the required length in either direction, sampling will occur at the largest possible interval before the end of the linear feature is encountered.
- For a CTLE along a roadway, two soil samples are to be collected by stepping out approximately 25 feet in both directions parallel to the roadway and two samples are to be collected from directly across the roadway if samples from the opposite side of the roadway area were not collected and analyzed as part of the original sampling.
- If none of the samples are above the threshold levels defined in Section 7.0, the extent of soil/sediments expected to exceed the remediation threshold of 1 ppm for Area A and .1 or the method detection limit for Area B, will be bounded by a 50-foot long area centered on the CTLE sampling location.
- If any of the samples are above the threshold levels defined in Section 7.0, WDI is to continue using the same approach, stepping out at 25 foot intervals (or the largest possible distance, whichever is less) in the direction of the linear feature to collect additional samples. This sample pattern is to be repeated until the first location is found that is below the applicable threshold level in Section 7.0 or until the linear feature terminates.

After the delineation phase has been completed by obtaining the delineation phase sampling results identifying the area of soil/sediments with CTLE(s), the analytical data will be evaluated and WDI is to submit a plan to remove soils/sediments and to determine the source(s) or expected source(s) of the PCBs to the WHMD/MDEQ for review and approval. The plan is to be submitted to the WHMD/MDEQ within 14 days of completing the delineation phase. WDI shall remove at least the top six inches of soil/sediments (WDI may voluntarily remove more) of all soils at or above 1.0 mg/kg in Area A and at or above the method detection limit in Area B, perform verification sampling to confirm that the underlying soils/sediments are below the applicable threshold limit identified in Section 7, and the placement of clean soils to replace the excavated soils. The plan submitted to WHMD/MDEQ need only include a schedule to complete the excavation, fill and verification sampling described above; a drawing that shows the delineation sampling results, the limits of the soil to be removed, and the approximate locations of the verification samples; the source of the clean fill material, except if WDI will deviate from the removing 6 inches of soil in response to the CTLE, in such case WDI shall propose the corrective measure/remedy; and the steps to be taken to identify and control the source(s) of the PCBs. The verification sample locations are to be selected in accordance with the MDEQ Sampling Strategies and Statistics Training Materials for Part 201 Cleanup Criteria.

9.0 REPORTING REQUIREMENTS

For semi-annual reports, the final data must be received from the laboratory, evaluated and transmitted to the WHMD/MDEQ within 60 days of sampling. The report is to include a narrative of the sampling event, a map showing the locations sampled, copies of the sampling logs, a tabular summary and discussion of the data, a discussion of field and laboratory QA/QC, a description of any ATLEs or CTLEs, any resampling conducted, and any additional actions taken and/or proposed as a result of the report findings.

If a CTLE occurs, the data associated with the delineation phase, collected in accordance with Section 8.0, is to be received from the laboratory, evaluated, and transmitted to the WHMD/MDEQ within 45 days of the final sampling. The report is to include a narrative of the delineation sampling, copies of the sampling logs, a summary and discussion of the data, a drawing showing the delineation boundary, a schedule to perform soil removal (or an alternate plan, with schedule, in the event WDI proposes a remedy other than soil removal) and the steps to be taken to identify and control the source(s) of the PCBs.

Verification sampling data, collected to confirm that all soil/sediments exceeding the applicable threshold level has been removed in accordance with Section 8.0 is to be received from the laboratory, evaluated, and transmitted to the WHMD/MDEQ within 45 days following completion of the final round of verification sampling. The report is to include a narrative of the verification sampling, locations of all verification samples, copies of the sampling logs, a summary and discussion of the data, a drawing showing the limits of the excavation and the locations of the verification samples.

An annual summary report of the monitoring results must be submitted to WHMD/MDEQ by March 1 of the following year. At a minimum, the annual report must contain a map showing all locations sampled, a tabular summary and discussion of the analytical data collected during the previous year, a description of any threshold limit exceedances (i.e. ATLE and/or CTLE), any delineation and source investigation sampling conducted as a result of a CTLE, and any response actions performed to eliminate the source. Additionally, WDI must evaluate the sampling locations to determine whether the existing sample locations are adequate to effectively detect potential releases and prompt timely response activities.

10.0 RECORD KEEPING REQUIREMENTS

All analytical data and annual monitoring reports generated under this SM SAP must be stored on site within the QEHS filing system and be available to MDEQ staff for inspection.

1.0 INTRODUCTION

This Surface Water Sampling and Analysis Plan (SW SAP) identifies the procedures to be used for monitoring on-site surface water (storm water) samples from the perimeter ditches that convey on-site surface water run-off at Wayne Disposal, Inc. (WDI), Site 2 to the North and South Sedimentation Basins. All surface water collected in the two sedimentation basins is treated by sedimentation, filtration and activated carbon adsorption prior to discharge to Quirk Drain. The effluent from this treatment process is discharged into Quirk Drain in accordance with an effective National Pollutant Discharge Elimination System (NPDES) permit.

The surface water monitoring program described by this SW SAP is designed to test the quality of the on-site surface water to determine if hazardous waste or hazardous waste constituents are present within the surface water and prompt notification and response actions that WDI must take if an apparent or confirmed significant increase in a monitored parameter occurs. This monitoring program is one of the checks on the engineered controls and operational procedures employed by WDI to detect an on-site release of hazardous waste or hazardous waste constituents as early as possible and allow WDI to initiate efforts to locate and control the source and prevent the off-site release of hazardous waste or hazardous waste constituents.

2.0 REVISIONS

WDI may revise this SW SAP and submit the revised plan to the Chief of the Waste and Hazardous Materials Division of the Michigan Department of Environmental Quality (WHMD/MDEQ) for review and approval prior to implementation.

3.0 SAMPLE LOCATIONS

Surface water grab samples are currently collected from each of the six permanent locations shown on Figure 1 designated as SS-1, SS-2, SS-5, SS-6, SS-7, and SS-8. SS-3 is the effluent from the treatment system and is monitored in accordance with an effective NPDES permit for the facility. SS-4 was abandoned due to changes to the drainage system at the site. Location SS-8 will be abandoned during the construction of MC VI-F. Locations SS-9 and SS-10 will be added to the program MC-VI-F is constructed. Locations SS-11 and SS-12 will be added to the program when MC-VI-G is constructed. A description of each location, including its location with respect to being in "Area A" or Area B , is included on Table 1.

4.0 SAMPLE FREQUENCY

Each surface water sample location in the program are to be sampled quarterly following a rain event (defined as a 0.5 inches or more in 24 hours) when surface water is present within the ditches. Surface water samples will not be collected within the calendar quarter if there are no significant rain events that allow for the sampling to be completed.

5.0 SAMPLE COLLECTION

Surface water grab samples for each of the required parameters are to be collected from each of the six sampling locations. Samples for volatile organic compounds (VOCs) are to be collected first and require zero headspace (no air bubbles) and minimal agitation of the water sample. Samples for PCBs are collected next followed by total phenolics and then the remaining parameters. Duplicate samples must be collected at each sample location for VOCs, PCBs and metals. . The duplicate samples are to be held by the laboratory as potential confirmation samples to be analyzed in the event of an apparent statistically significant increase (ASSI) using the criteria defined in Section 7.0 of this SW SAP. The duplicate sample for PCBs must be extracted when it arrives at the laboratory and the extract held in case a confirmation analysis is required.

Samples are to be collected by dipping the bottles provided by the laboratory into the water and directly filling the containers. If site conditions do not allow for the bottles to be hand lowered into the surface water, the bottles can be inserted into a Teflon dipper and lowered, via the Teflon Dipper, into the surface water to collect the sample. If a Teflon dipper is used for sample collection, the dipper must be properly decontaminated between locations by washing the device with a laboratory grade non-phosphate detergent and rinsing thoroughly with clean deionized water. Care must be taken to ensure that any preservatives in the bottles are not spilled during sample collection. Field measurements of pH, specific conductance, temperature and dissolved oxygen are collected with calibrated field instruments at the time of sampling. WDI is to use the instructions for the use and maintenance of these instruments contained in the Groundwater Sampling and Analysis Plan for equipment used to collect field measurements under this SW SAP.

Protective gloves must be worn during sample collection and clean gloves must be used at each sample location.. Care should be taken at all times when handling the samples. Samples to be analyzed for volatile organic compounds require zero-headspace, no air bubbles and minimal agitation of the sample. Samples collected for metals analyses are not to be filtered as the metals analyses are "totals" analyses. Each sample container must be carefully labeled with the sampling location, time and date, and the sampler's initials. Field Quality Assurance/Quality Control samples must include:

- One trip blank in each cooler utilized for storing and shipping samples. The trip blank must be analyzed for VOCs and PCBs.

- One field blank for each day in which samples are collected. The field blank samples are to be collected by filling an identical set of sample bottles at a given location with clean deionized water. The field blank samples must be analyzed VOCs and PCB.
- One blind duplicate for each sampling event. The duplicate must be collected by filling an identical set of sample bottles at a given location and submitting them for an identical analysis.
- One equipment blank per sampling day for each piece of non-dedicated sampling equipment utilized in the sampling process (i.e. the Teflon dipper). The equipment blank must be collected by pouring clean deionized water over the decontaminated piece of equipment and collecting the rinsate in the appropriate jar for analysis. The equipment blank must be analyzed for VOCs and PCBs.

After collection, the samples must be stored in a clean cooler containing ice or ice packs. The coolers containing samples must be stored in a secure location until being transported to the laboratory.

A sample collection log (Figure 2) must be filled out at each sampling location and any unusual conditions (e.g. odors, sheens) encountered must be noted. A chain of custody (COC) form that lists each sample submitted to the laboratory must be fully filled out for each sampling event and each person who has custody of the samples, from sample collection through sample check-in, must sign and date the form. When the samples are delivered to the laboratory and the laboratory has signed for their receipt, a copy of this form must be retained on site in the Quality, Environment, Health and Safety (QEHS) Department records.

6.0 SAMPLE ANALYSIS

One surface water grab sample from each of the required sampling locations must be analyzed for the parameters listed on Table 2 using the analytical methods and method detection limits specified in Table 2. The potential confirmation duplicate samples from each location must be retained at the laboratory but need only be analyzed if an ASSI is detected in the first sample using the criteria described in Section 7.0 of this SW SAP.

In some cases the laboratory may not be able to attain the method detection limits specified due to factors such as sample dilution or matrix effects. If this is the case, the laboratory report must include an explanation for not achieving the specified method detection limits.

The laboratory quality control/quality assurance manual (QA/QC Manual) describing the required internal policies, guidelines and procedures of any WDI contract lab is contained in the WDI Groundwater Sampling and Analysis Plan (GW SAP). WDI is to use this QA/QC Manual in evaluating the QA/QC standard operating procedures of any contract laboratory utilized for the purposes of this SW SAP and ensure that the laboratory employs generally acceptable practices that meet the specifications of the QA/QC Manual in the GW SAP

7.0 DATA EVALUATION

The analytical data from the surface water samples is to be evaluated as follows:

- For VOCs, any reported concentration at or above the method detection limit is an apparent statistically significant increase (ASSI).

- For PCBs, the data will be evaluated as follows:
  - For samples obtained from Area B, any reported concentration at or above the method detection limit is an ASSI.
  - For samples obtained from Area A, any reported concentration at or above 0.5 mg/L is an ASSI.

- For metals, inorganic parameters, and pH, the data will be evaluated using the sign test as described in Attachment A. In addition, if a ten-fold increase in concentration is noted in any metal or inorganic parameter between sampling events in any of the individual grab samples, then there has been an ASSI.

8.0 RESPONSE ACTIONS

In the event of an ASSI, WDI must verbally notify the WHMD/MDEQ, Hazardous Waste Program Section staff immediately in accordance with the Environmental Monitoring Conditions of the Operating License and implement the procedures identified below to confirm the ASSI.

- If a VOC is present in a sample above its method detection limit, the duplicate sample must be analyzed.
- If a metal in any grab sample has met or exceeded ten times increase criteria identified in Section 7.0, an ASSI has occurred and the duplicate sample must be analyzed for the offending parameter(s) .
- If PCBs have met or exceeded the criteria identified in Section 7.0, an ASSI has occurred and the duplicate sample extract must be analyzed.
- If the sign test fails at any location then the sample location must be inspected closely and resampled as soon as there is water to sample and analyzed for all sign test procedures.

If the holding time for any sample or sample extract has been exceeded, the location where the ASSI sample was collected must be resampled as soon as there is water in the sample location and the sample must be analyzed.

If an ASSI is not repeated ,WDI will resume routine monitoring. If the ASSI is repeated upon analyzing the second sample, a confirmed statistically significant increase (CSSI) has occurred. In the event of a CSSI, WDI must notify the WHMD/MDEQ in accordance with the General Operating Conditions of the Operating License for Reporting Noncompliance that may endanger human health or the environment. Further, in the event of a CSSI, within 30 days of becoming aware of a CSSI, WDI must:

- Determine whether a discharge of hazardous waste and/or hazardous waste constituents to off-site surface waters is occurring, determine the source, and take immediate steps to eliminate and prevent any such discharge. WDI may demonstrate a source other than the licensed facility caused the CSSI or that the CSSI resulted from error in sampling, analysis or evaluation.
- Submit a report to the WHMD/MDEQ documenting WDI's investigation, response, and any further response actions proposed.

9.0 REPORTING REQUIREMENTS

For quarterly reports, the final data must be received from the laboratory, evaluated and the report transmitted to the WHMD/MDEQ within 60 days of sampling. The report must include a narrative description of the sampling event, a map showing the locations sampled, copies of the sampling logs, a tabular summary and discussion of the analytical data and the data statistics, a discussion of field and laboratory QA/QC, the field measurements collected (pH, specific conductance, temperature and dissolved oxygen), a description of any statistically significant events (i.e. ASSI and/or CSSI), any resampling or additional sampling conducted as a result of a CSSI, and any additional actions proposed as a result of the reported data.

In addition to the quarterly reports, an annual summary report of surface water monitoring results must be submitted to the WHMD/MDEQ by March 1 of the following year. At a minimum, the annual report must contain a map showing all locations sampled, a tabular summary and discussion of the analytical data collected during the previous year, a description of any statistically significant events (i.e. ASSI and/or CSSI), any resampling of additional sampling conducted as a result of a CSSI, and any additional actions proposed as a result of the reported data.

10.0 RECORD KEEPING REQUIREMENTS

All analytical data and quarterly and annual monitoring reports must be stored on site within the QEHS filing system and be available for inspection as required.

Table 1. Description of Surface Water Monitoring Locations

Sampling Location	Stormwater Run-Off Source Unique to Location	Area Designation
SS-1	east side of MC VI and west side of MC XI	A
SS-2	southeast corner of MC VII, northeast corner of MC XI part of west side of MC X and southeast cover drain of MC VII	B
SS-5	east side of MC V (and VI-E), west and part of south sides of MC VII and part of north side of MC XI	A
SS-6	north side of MC-V	A
SS-7	east side of MC VII, west side of MC IX, part of north side of MC IX, and northeast cover drain of MC VII	B
SS-8	east side of MC-IV and west side of MC-V (to be abandoned for VI F&G construction)	A
SS-9	north of MCI VI-F (to be added when VI-F ditch is constructed)	A
SS-10	west of MC VI-F (to be added when VI-F ditch is constructed)	A
SS-11	west of MC VI-G (to be added when cell VI-G is constructed)	A
SS-12	south of MC-1/VI-G (to be added when cell VI-G is constructed)	A
samples collected quarterly unless no significant precipitation events for the calendar quarter

Statistical Monitoring Plan for Surface Water Monitoring

WDI Site #2 Hazardous Waste Landfill
MID 048 090 633

Revision 1.0, December 94
Revision 1.1, October 99

I. Introduction

The following statistical monitoring plan provides a description of the statistical procedures to be used for identifying a statistically significant increase of monitoring parameters in the surface water monitoring program for the above referenced facility. The program is intended to determine if hazardous waste constituents may be entering the storm water run-off from non-contact areas of the facility.

II. Statistical Evaluation

The statistical program provides two procedures to be used together for each set of monitoring data. The first procedure applies to the volatile organic and PCB compounds only and is not a true statistical test. For these compounds, any occurrence above the reported detection limit (which is a statistical quantity to some degree) is considered statistically significant. The second procedure is a comparison of the overall inorganic surface water quality to the average quality during a background period by using the sign test. This procedure is described in detail below.

Statistical Sign Test - The purpose of this statistical analysis of the surface water is to determine whether the overall surface water quality during a monitoring event is statistically different compared to "background" surface water quality. To determine the statistical significance of differences between monitoring and background samples, a test know as the sign test is used. This test applies to all inorganic parameters, which will generally be present in detectable concentrations. The sign test determines if enough of these parameters are higher than the background averages to conclude that there is a statistically significant difference in water quality.

The sign test will be performed at the 0.05 significance level to determine if the number of parameters that are present in the monitoring samples in higher concentrations than the background is statistically significant. To perform the sign test, the concentration of each inorganic monitoring parameter is compared to the background concentration for that sampling event. The current background concentrations utilized for the sign test are presented on Table 2. If the monitoring concentration is higher, then a "+" is assigned to that parameter; if the background concentration is higher then a "-" is assigned for that parameter; and if the concentration are equal then a "0" is assigned for that parameter. The total number of "+" parameters and the total number if "+" and "-" parameters are then used with the binomial probability table, Table 1, attached to this plan. To determine if the number of "+"parameters is statistically significant, the table is entered at n, the total number of "+" and "-" parameters and the corresponding value for y is determined for the largest number for alpha that is less than or equal to 0.05. This number y is the smallest number of "-" parameters that can be obtained without a statistically significant increase (e.g. if there are any less "-" parameters then there will be too many "+" parameters.) So the number of pluses is statistically significant if it is greater than the total number of pluses and minuses less the quantity y determined form the table. For instance, if there are eight parameters, the largest value of y corresponding to a value of alpha less than 0.05 is 1. Therefore, 8 - 1 = 7 plus values (or 8 plus values) would result in a failure of the test.

1.0 INTRODUCTION

The purpose of this document is to outline the procedures for monitoring leachate in compliance with current license and permit conditions and applicable regulations. Leachate monitoring includes the collection and analysis of leachate samples and monitoring leachate levels for the purpose of ensuring that leachate is effectively removed from operating and closed hazardous waste landfill cells.

Collection and analysis of leachate samples is conducted in order to characterize the leachate for the purpose of developing appropriate monitoring parameter lists for other monitoring programs such as groundwater and leak detection. Further, the composition of the leachate over time is an indication of the degree of stabilization of the wastes within the landfill.

Leachate level monitoring is necessary to ensure that leachate collection systems are functioning properly so as to limit the leachate head on the liner system. CFR 40 264.301(2) states that "The Regional Administrator will specify design and operating conditions in the permit to ensure that the leachate depth over the liner does not exceed 30 cm (1 foot)". Wayne Disposal, Inc. Site #2 monitors the volume of leachate pumped from each active and closed cell at the facility. The volume of leachate pumped from each cell per month is recorded in the operating log.

The following SAP describes how EQ maintains compliance with the conditions outlined above.

2.0 DESCRIPTION OF LEACHATE COLLECTION SYSTEMS

Leachate level control is a function of the design and operation of the leachate collection systems (LCS). Each LCS at WDI is designed to transmit leachate to the sump at rates sufficient to permit removal of leachate so that levels do not build up on the primary liner to a depth greater than one foot. The slope of the cell floor, permeability of granular materials, and the size and spacing of collector pipes are all taken into consideration in the design transmissivity of the LCS.

Once the leachate is conveyed to the collection sump, it must be removed at a rate sufficient to prevent leachate from backing up into the collection system to levels higher than one foot. The pumps are set within the sump beneath the level where the leachate conveyance pipes enter the sump (see Figure 1.). These 4" or 6" diameter HDPE pipes are directly on top of the liner. The pumps are set up on an automatic switch which turns the pump on when the leachate level in the sump rises to a certain level which is below the elevation of the pipes. As long as the pumps keep the leachate levels in the sump below the top of the leachate collection system, then compliance with the one foot head rule is maintained. Therefore, the key to compliance is maintaining an operating collection system in each cell. Frequent inspection and swift repairs of these systems are necessary to ensure that any mechanical problems are remedied in a timely manner.

The volume of leachate pumped out of each sump is recorded on a totalizing flow meter which is placed in line in the discharge line from the pump. Leachate is conveyed to the wastewater pretreatment plant on site.

3.0 LEACHATE LEVEL AND VOLUME MEASUREMENTS

The keys to maintaining compliance with leachate level and volume record keeping requirements are frequency of inspection and maintenance of each system. To ensure proper performance of the leachate collection system, weekly inspections of the sump areas must be conducted. Figure 2 is a checklist form for recording the results of this weekly inspection. The main components of this inspection are determining leachate levels in the sump, whether the pump/meter is operating correctly and the monthly volume of leachate. An outline of these procedures in the form of a flow chart is included on Figure 3. The procedures for the weekly inspection are as follows:

Step #1. PUMP/METER FUNCTION

a. Take meter reading from flowmeter and record on form. If the meter has moved since the last reading then proceed to Step 2. If not, then proceed to step 1.b.

b. Change pump switch to "hand" position listen for the sound of the pump turning on and check for meter advancement. Then change pump switch back to "auto" position.

c. If the meter moves then proceed to step 2.

d. If meter does not move then:

i. Determine if pump intake is below leachate level in sump. This is done by visual inspection (can you see the pump above the leachate) and by sound (the pump makes a distinctive noise when trying to draw in air). If the levels are down, then the inspection is completed and the results should be noted on the form.

ii. If the pump intake is below the leachate level then further investigation is necessary. These next steps must be conducted in accordance with a confined space permit issued by the QEHS Affairs Department. Record the apparent malfunction on the inspection form and report results to the Site Manager or his/her designee and proceed with steps 2 and 3.

Step #2. LEVEL MEASUREMENT

a. Measure the leachate level in sump from the top of the sump with an electronic water level sounding device.

b. Compare the depth to leachate with the minimum allowable depth listed on Figure 2. Determine whether the level is in compliance.

c. Record the result on the weekly inspection form.

d. Notify the Landfill or QEHS Manager immediately if the levels are found to be above the allowable level.

Step #3. REPAIRS

a. Unless a specific problem is evident from the inspection (e.g. the pump doesn't turn on), the following steps should be conducted:

   i. Remove the meter, switch back to "hand" position and check for flow.

   ii. If there is flow, then field clean the meter, replace and check for meter advancement. If the meter advances, then switch back to "auto" position. If not, take the meter in for repair or replacement.

iii. If there is no flow, then disconnect power to pump and remove pump and pump switch from the sump. Inspect the electrical cord and the pump switch. Replace the pump and test functions. If the pump or the switch still doesn't work, remove the pump, have it power washed and get it repaired/replaced.

iv. If the pump and meter are functional but no flow is observed then arrangements must be made to clean out the pipes.

v. All actions taken and any repairs/replacements conducted must be reported to the Landfill or QEHS Manager.

Note that pumping must continue as needed to keep leachate levels down even if the flow meter or the automatic pump switch is not functioning. If the meter is broken, note the time period in which there is no meter on line so that the missing volume data can be estimated. If the switch is bad, then the pump must be operated manually until the switch is fixed. The sump should be inspected daily to determine if pumping is required until the switch is fixed or until a pumping schedule suitable for maintaining the leachate level for that sump has been determined. If the pump itself is not working, then immediate steps must be made to replace and/or repair the pump. Spare parts and spare pumps must be kept in stock on site if they are not readily available from a reliable vendor.

The weekly inspection checklist forms are to be filed in the Landfill Manager's office. Also, the sumps must be inspected on a weekly basis for evidence of deterioration, etc. Any conditions noted that would require maintenance or repair should be noted on the weekly inspection form

(Figure 2) and reported to the Landfill Manager. Any repairs required on the sump or pump that is necessary to keep leachate levels in compliance must be given the highest priority.
On a monthly basis, the total volume recorded on the flow meters from each sump is summarized from the Weekly Inspection Checklist for Leachate Collection Systems onto an electronic spread sheet.

In addition to these inspections, periodic maintenance of the LCS is required. In particular, leachate clean-out pipes, where present, must be jetted once every two years unless experience indicates that a more or less frequent jetting program is necessary or adequate

4.0 LEACHATE SAMPLING AND ANALYSIS

Leachate samples are to be collected annually from each of the 16 currently collection sumps within Master Cells V, VI and VII as shown on Figure 4. When additional cells VI-E-NE, VI-F and VI-G are constructed and put into operation the leachate must be sampled in accordance with this plan as well. The samples are collected during the third quarter of each year. Samples are collected by lowering a clean stainless steel sampling bucket (or disposable bailer) down into the sump and retrieving a sample. New (or dedicated) nylon rope is used each time a sump is sampled. The stainless steel bucket must be decontaminated between each sample location with cleaning solution and a distilled water rinse.

The sample is then carefully decanted into appropriate sampling containers. Samples for VOC's are collected first while ensuring that no headspace is present within the sampling vials. Additional samples are then collected in order of decreasing volatility, semi-volatiles then total organic carbon then phenolics and finally metals and indicator parameters. Appropriate sample handling and container requirements are summarized on Figure 5. Metals are analyzed as "total metals" quantity; no filtration is required.

Protective gloves must be worn during sample collection and care should be taken to prevent spills on skin or clothing. Each sample container must be carefully labeled with the sampling location, time and date, identity of preservatives contained within and the sampler's initials. After collection, the samples shall be stored in a clean cooler containing ice or ice packs. The coolers containing samples must be stored in a secure location, on-site, until they are transported to the laboratory.

Field Quality Assurance/Quality Control samples must include:

- One trip blank for every ten samples collected. The trip blank must be stored in the cooler utilized for storing and shipping samples. The trip blank must be analyzed for VOCs.
- One field blank for each ten samples collected. The field blank samples are to be collected by filling an identical set of sample bottles at a given location with clean deionized water. The field blank samples must be analyzed VOCs.
- One blind duplicate for each sampling event. The duplicate must be collected by filling an identical set of sample bottles at a given location and submitting them for an identical analysis.
- One equipment blank per sampling day for each piece of non-dedicated sampling equipment utilized in the sampling process (i.e. the stainless steel bucket. The equipment

blank must be collected by pouring clean deionized water over the decontaminated piece of equipment and collecting the rinsate in the appropriate jar for analysis. The equipment blank must be analyzed for VOCs.

A sample collection log (Figure 6) must be filled out at each sampling location. The log must be filled out to include the location, date, time, identity of sampler and a description of any unusual conditions encountered must be noted. A chain of custody form must be filled out for each sampling event. This form must be filled out fully for each sample submitted for analysis and each person responsible for the handling of these samples must sign and date the form. When the samples are delivered to the laboratory and the lab has signed for their receipt, a copy of this form must be retained on site in the operating record and another copy forwarded to QEHS Department.

Except as described below, each sample must be analyzed for the parameters listed on Figure 7, which also contains the analytical methods and targeted method detection limits. Exceptions to this are as follows: 1) The PCB's listed on Figure 5 are only analyzed in samples from Master Cell VI. and 2) In order to fully characterize the leachate, each of the leachate sumps in MC V, MC VI-A (AN & AS) through VI-E and MC VII must be analyzed for a modified list of 40 CFR 264 Appendix IX parameters on a rotating basis. The list is considered "modified" as dioxins and furans are analyzed at screening levels as opposed to a breakdown of the specific cogeners. Analysis of the cogeners requires the use of a specialty laboratory and the ultra-low detection limits have no practical use in this leachate characterization. Each year, two of the leachate samples must be analyzed for the modified list of Appendix IX parameters. The two cells sampled will change each year until all are sampled and then the process will be repeated throughout the operation of the facility. New cells will not be analyzed for the Appendix IX constituents until they have been producing leachate for at least one year. A list of Appendix IX parameters along with corresponding analytical methods and detection limits are presented on Figure 8. It is recognized that in most cases the detection limits shown on Figures 7 and 8 will not be attained due to sample dilutions and matrix effects.

Laboratory Quality control frequencies and precision/accuracy requirements are provided in the Groundwater Sampling and Analysis Plan for this facility, which includes the Quality Assurance Manual for the contract laboratory. This manual describes the internal policies, guidelines and procedures of Trimatrix and is not intended to describe the specific details of this particular monitoring program. Rather, we use this document as a guideline in evaluating Trimatrix's QA/QC and standard operating procedures to ensure that generally acceptable practices are employed.

5.0 REPORTING REQUIREMENTS

Within 60 days after each sampling event is completed, the analytical results must be submitted to MDEQ along with a summary of QA/QC data and the sampling documentation forms. The monthly leachate volumes as well as a summary of the leachate level data should be included in this submittal. In addition to the reporting requirements described above, an annual leachate report must be filed with the MDEQ by March 1 of the following year. In this report, annual leachate production rates, leachate head levels and leachate analytical results are to be evaluated and summarized. This summary must also include a description of any non-compliances and associated corrective actions and of any major maintenance activities (such as jetting of leachate lines).

The leachate analytical data must be evaluated with respect to the need to refine secondary collection and groundwater monitoring programs by summarizing, in table form, the rate of detection and concentration of leachate monitoring parameters. The results of this summary will be compared to groundwater and leak detection parameter lists. Any parameter that is found in more than 50% of the leachate samples and/or in concentrations greater than 1 mg/L will be considered for inclusion in the leak detection and/or groundwater monitoring program(s). WDI will recommend whether to include such a parameter based on its chemical properties and any other relevant information.

Leachate volume and head level information must be evaluated in graphical and/or tabular form, respectively. Monthly and annual volumes for each cell must be plotted to determine if there are increases in production rates that should be evaluated. The head levels must be presented to show the dates and results of head measurements and identify any periods where heads exceed the 1 foot limit as well as the duration of the exceedance and the cause and correction of the exceedance.

1.0 INTRODUCTION

The following sampling and analysis plan outlines the standard procedures for measuring flow volumes and for the collection and analysis of samples of the liquids collected from the leak detection, collection and removal system (LDCRS) in Master Cell VI. There are currently eight LDCRS sumps, one for each for five of the cells within Master Cell VI: VI-A South, VI-A North, VI-B, VI-C and VI-D, and three in MC VI-E (VI-E-SE, VI-E-SW and VI-E-NW). The locations of these sumps are shown on Attachment A. Five additional LDCRS sumps will located in MC VI-E (VI-E-NW), MC-VI-F and MC-G however these will not be operational until these cells are constructed and begin to receive waste.

This document has been prepared to direct the efforts of monitoring personnel in the collection of samples and volume measurements so as to meet the requirements of the Operating Licnese issued under Part 111 of Michigan Act 451 for the facility and to ensure sound practices for the collection of these data.

This plan must be revised if there are any changes to the equipment or procedures contained herein. All proposed changes must be submitted to the Waste and Hazardous Materials Division (WHMD) of the Michigan Department of Environmental Quality (MDEQ) for review and approval prior to implementation.

2.0 PUMPING/SAMPLING EQUIPMENT

Each LDCRS sump must be equipped with a Grundfos Redi-Flo2™ submersible pump with a Redi-Flo2 controller package and totalizing flow meter, or alternative pumping equipment that is approved by the WHMD. The installation and operating instructions for this system are included in Attachment B. These pumps were selected for the following attributes: 1) they are composed of stainless steel and Teflon and thus have low potential to impact the quality of environmental samples, 2) the pumps are designed to collect groundwater samples with minimal aeration or perturbation of the sample and, 3) with the controller package the pumping rates are adjustable with high rates for removing liquids from the sump and low rates for sampling. Any alternative pump system installed in the LDCRS should have similar attributes for pumping and for collecting samples.

The reinforcement of the LDCRS in Master Cell VI subcell A-North completed in August, 2006 required the installation of a Black Hawk Model 101 pump system. This system was selected for its ability to draw water from a suction tube that extends through the 1-inch diameter slipline. The installation and operating instructions for this system are included in Attachment B.

The discharge tube for the pumps is composed of HDPE. At the surface, this tube is connected to a stainless steel or PVC discharge tube with the flow meter in line. The opening at the top of each LSCRS riser must be tightly covered with a cap in which the discharge tube and electrical cable penetrate through sealed ports. The discharge tube and electrical cable must be configured such that it does not come into contact with the ground surface and such that the end hava a valve that is protected. Any changes to the configuration of the LDCRS riser pipe as the waste surface ascends must ensure that the sampling tube is not susceptible to contamination.

3.0 VOLUME AND FIELD MEASUREMENTS

The volume of liquids removed from each LDCRS must be recorded weekly on Attachment C. The volume readings from the flow meters are generally collected during the weekly inspection. At the end of each month, Attachment C must be submitted to the QEHS Department for recording and evaluation. The weekly volume data must be evaluated each month to determine the average flow rate produced on a gallons-per-acre-per day basis..

In addition to the weekly volume recording, each LDCRS must be inspected on a weekly basis to ensure that there is no evidence of damage or tampering that could allow waste or waste constituents to have entered the system. The weekly/after storm inspection form in the Inspection Plan is used for documenting these inspections. This form must be fully completed with evidence of malfunctioning equipment or other potential problems described in detail.

Once per month, a sample of the water from each LDCRS sump must be field tested for pH and specific conductivity. These values must be recorded on Attachment C. The monthly volume data and field parameter data must be submitted to the QEHS Department at the end of each month.

4.0 COLLECTION OF SAMPLES

Unless there is an insufficient amount of liquid generated by a LDCRS during a month's time (time between monthly purging/volume recording events), samples must be collected for analysis on a quarterly basis from each LDCRS sump. In addition, any sump which yields volumes above the maximum expected volume (see Section 7.1) during a monthly purging/volume recording event must be sampled and analyzed for the quarterly parameter list. Further, any time a monthly field specific conductivity value exceeds the maximum expected value (see Section 7.1) a sample must be collected and analyzed for quarterly parameters, unless the conductivity measurement was made during the collection of the quarterly sample for that sump.

Prior to collecting the samples, the sump must be pumped until a minimum of 20 gallons are removed in order to ensure that the lines have been flushed (this is approximately 3 tubing volumes) unless the production rate of the sump indicates that less than 20 gallons will be available. Prior to sampling the flow rate of the pump must be throttled back to the minimum deliverable flow rate and then the samples are collected. The sump then must be pumped until dry.

Samples are collected within Wayne Disposal, Inc, nitrogen glove box. Prior to sampling, the glove box is purged with nitrogen for approximately 20 minutes. The sample containers are placed within the box during purging. The glove box is connected to the LDCRS pumps with a fitting that allows new Tygon tubing to be used for each sample. At the time of sampling, the flow from the LDCRS is diverted into the glove box by turning the valve on the back of the box. All containers are then filled within the box while under positive pressure from the nitrogen. All containers are closed before opening the glove box to remove them.

During the sample event, specific conductance and pH of the liquid must be measured on a sample of the liquid. The volume purge data and pH/conductance data for each sump must be recorded on the Attachment C.

Samples for VOC's are collected first while ensuring that no headspace is present within the sampling vials. Next, fill the bottles for total organic carbon, total phenolics and dissolved metals in that order. Finally, collect the remaining miscellaneous samples (e.g. sulfate, chloride, etc.). All samples are to be collected in the appropriate containers with the appropriate preservatives as outlined on Attachment D, "Handling Requirements of Monitoring Parameters." Care must be taken to ensure that preservatives are not spilled during sampling. Samples for dissolved metals may be field filtered with an in-line 0.45 micron filter cartridge and acidified to pH < 2 with HNO_3, or, filtered and preserved at the laboratory upon delivery.

A trip blankand a field blank for VOC analyses must be maintained and submitted for analysis for each 10 samples collected and/or for each day samples are collected. In addition, one blind duplicate samples must be submitted for complete analyses for every other sampling event (two per year). Each sample container must be carefully labeled with the sampling location, time and date, identity of preservatives contained within and the sampler's initials. After collection, the samples shall be stored in a clean cooler containing ice or ice packs. The coolers containing samples must be stored in a secure location until transport to the laboratory.

5.0 ANALYTICAL PROCEDURES

Each sample is to be analyzed for the parameters listed on Attachment E, "Method Detection Limits for Organic and Inorganic Parameters." The analytical methods and targeted method detection limits must be those specified in WHMD Operational Memo Gen-8. If a revised Memo Gen-8 is published Attachment E must be modified (if necessary) to be consistent with the revisions. Laboratory Quality control frequencies and precision/accuracy requirements are provided in the Quality Assurance Manual for the current contract laboratory, TriMatrix, which is contained in the Groundwater Sampling and Analysis Plan for this facility. This manual describes the internal policies, guidelines and procedures of Trimatrix. This manual is not intended to describe the specific details of this particular monitoring program. Rather, we are to use this document as a guideline in evaluating Trimatrix's QA/QC and standard operating procedures to ensure that generally acceptable practices are employed.

6.0 RECORD KEEPING

In addition to the inspection/volume measurement forms contained in Attachment C and the weekly inspections, there are three other items required to ensure adequate record keeping for the LDCRS monitoring program. First, a field notebook must be maintained during sampling which includes, at a minimum, the identity of sampling personnel, the dates and time when samples are collected, a description of the sampling event (i.e. routine monthly, etc.), volume meter readings, and any pertinent observations of sample characteristics or sampling environment. Second, an equipment inventory, repair and maintenance log must be maintained in the Engineering Field Office at the site. This log shall contain the serial numbers of all sampling equipment and a record of any repairs, maintenance, calibration or replacement of this equipment. Finally, a chain of custody form must be filled out for each sampling event. A sample copy is included as Attachment F. This form must be filled out fully for each sample submitted for analysis and each person responsible for the handling of these samples must sign and date the form. When the samples are delivered to the laboratory and the lab has signed for their receipt, a copy of this form must be retained. Copies of these forms must then be transmitted to the QEHS Department along with volume records.

7.0 DATA ANALYSIS AND REPORTING

Data analysis and reporting are required for both the volume data and the analytical data. Both volume and analytical data are evaluated statistically to determine if there has been a significant change.

7.1 Volume Rate Analysis

Volume data must be evaluated monthly to determine an average daily flow rate in gallons-per-acre-per-day (gpad). This is done by utilizing the following formula:

Flow Rate (gpad) = (Total Volume (gal)/Time (days))/Area of LDCRS (acres)

Areas, in acres, for the seven LDCRS are as follows: VI-AS (7.65), VI-AN (5.83), VI-B (6.13), VI-C (4.87) VI-D (7.24), VI-ESE (8.9), VI-ESW (4.6) and VI-ENW (9.4). Areas, in acres, for the future LDCRS for VI-ENE is expected to be 3.8. Areas for Cells VI-F and VI-G will be calculated based on final design drawings.

Experience with LDCRS volume rate data suggest the following behaviors are expected: 1) volume rates generally decrease over time, 2) the rates are dependent on filling rates and initial moisture content of the compacted clay component of the area being filled, and 3) short term fluctuations in rates (e.g. weekly or daily) may be large compared to average monthly rates. Evaluating the volume rate data as an indication of performance of the primary liner must take into account the expected behavior of LDCRS.

The volume data for each individual LDCRS are evaluated by comparing each monthly rate to a maximum expected rate which is based on a moving window to account for trends or fluctuations. The maximum expected rate is defined as the mean plus three standard deviations calculated from the previous two years data for each sump individually. It must be noted that an exceedance of the maximum expected rate may be a normal response to an increase in the filling rate or the return to active filling over an area which has not received waste for a period of time. The volume data must be routinely reported to MDEQ with the quarterly analytical data. However, if the monthly volume yields a rate greater than the maximum expected rate then a sample must be collected and analyzed for the parameters listed on Attachment E as soon as practical (allowing time for sump to recharge). The MDEQ must be notified of the nature of the exceedance and the intention to sample. Steps should also be taken to determine if increases in flow rate corresponds to filling rates or filling location as these may apply to the affected cell.

7.2 Evaluation of Field Specific Conductance Data

The monthly specific conductance data from each LDCRS sump must be evaluated for increases compared to recent data. This is done by comparing the measured specific conductance to the mean plus three standard deviations calculated from the previous eight conductance measurements from that sump. If the measured conductance exceeds this quantity then a sample must be collected and analyzed for the parameters listed on Attachment E as soon as practical unless the conductance measurement was collected at the time of the quarterly sample collection. The MDEQ must be notified of the nature of the exceedance and the intention to sample.

7.3 Analytical Data Evaluation

All quarterly analytical results must be evaluated statistically and reported to the Waste and Hazardous Materials Division of the MDEQ within 60 days of the completion of each sampling event. The statistical program for the LDCRS monitoring results is presented in Attachment G. In addition to the use of statistics to evaluate the occurrence of organic compounds, WDI also tracks the concentrations of all other monitoring parameters within a database. This database should be updated upon receipt of each set of analytical results and observed for unusual data points or trends. The quarterly report must also include a description of the sampling events, a table of the volume measurements and a summary of the QA/QC information both field and laboratory.

7.4 Annual Report

An annual report describing the sampling events, a summary of the QA/QC information, sampling documentation, an evaluation of the volume records (graphical and tabular) and analytical results and a summary of any non-compliance or maintenance items that occurred during the previous year must be prepared. This annual report must be submitted to MDEQ by March 1 of the following year.

8.0 DECONTAMINATION PROCEDURES

While the landfill cells are in operation, sampling of the LDCRS requires that the sampling vehicle drive into active cells and, in some cases onto the waste. For this reason, it is important that the sampling vehicle and equipment are properly decontaminated after sampling. The sampling vehicle must be power-washed by the mobile decon unit both outside and inside prior to leaving the cell area. All disposable PPE used by sampling personnel should be removed and disposed of in an appropriate receptacle at this time as well. The glove box should be cleaned with TSP or other non-organic detergent both inside and out on at least a quarterly basis.

Attachment G - LDCRS Statistical Monitoring Plan

STATISTICAL EVALUATION

The statistical program for LDCRS monitoring utilizes Nonparametric Prediction Limits (NPPLs) to evaluate the monitoring data. In order to balance false positive and statistical power with this test, resamples are used, the number of which are determined by the number of sampling points and the number of background observations. Since there is no "upgradient" in the LDCRS system, and there was no substantial pre-waste disposal sampling program, the definition of background is not defined in a traditional sense. Thus the use of resamples is selected somewhat arbitrarily (see below).

The NPPL is defined as the highest concentration of a monitoring parameter detected in a background sample. For parameters that are never detected in the background, the NPPL is defined as the reported detection limit. Since the parameters to be analyzed statistically are all organic compounds, the reported detection limit, as listed on Attachment E of the LDCRS Sampling and Analysis Plan are the NPPLs. Therefore, any reported concentration of an Attachment E parameter at or above these limits is considered an apparent statistically significant increase.

If an Attachment E compound is detected, then the NPPL been exceeded and WDI will immediately notify the Waste Management Division (WMD) of the Michigan Department of Environmental Quality (MDEQ) and arrange resampling as soon as possible to confirm or refute the apparent statistically significant increase. Quadruplicate samples will be collected for confirmation purposes and analyzed for the offending parameter(s). Since these quadruplicates are not independent samples, it does not constitute a multiple resampling as defined by the NPPL test. Thus the quadruplicate samples constitute a single resampling. If three of the four quadruplicate samples are clean, then the statistical increase is not confirmed. If two or more of the quadruplicates contain the compound of interest the apparent increase will be deemed confirmed and WDI shall respond in accordance with the current Operating License.

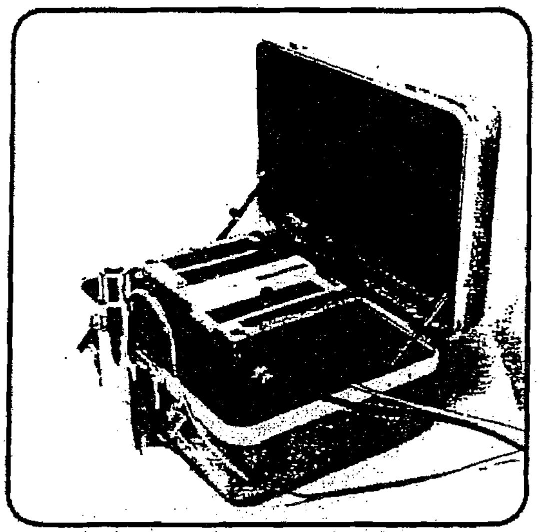
Redi-Flo2



Installation and Operating Instructions

GRUNDFOS

SAFETY WARNING

Adherence To Environmental Regulations

When handling and operating the Redi-Flo2 system, all environmental regulations covering the handling of hazardous material must be observed. When the pump is taken out of operation, great care should be taken to ensure that the pump contains no hazardous material that might cause injury to human health or to the environment.

Motor Fluid

The pump motor is filled with approximately .85 ounces (25 milliliters) of contaminant-free water. During operation, it is possible that a very small portion of this water could be replaced by the fluid being pumped. Therefore, there is a potential risk for cross contamination if used in portable applications. A filling syringe is provided with each pump to simplify the replacement of this water with clean water.

Returning A Pump For Service

Only pumps that are certified as uncontaminated will be accepted by GRUNDFOS for servicing. GRUNDFOS must receive this certification prior to receiving the pump. If not, GRUNDFOS will refuse to accept delivery of the pump. In these cases, all costs incurred in returning the product to the customer will be paid by the customer.

Electrical Hazards

The Redi-Flo2 pumping system is not approved for Class I, Division I, Group D locations as specified by the National Electrical Code (NEC). Consult local authorities and regulations if you have any doubt about its suitability for a specific application.

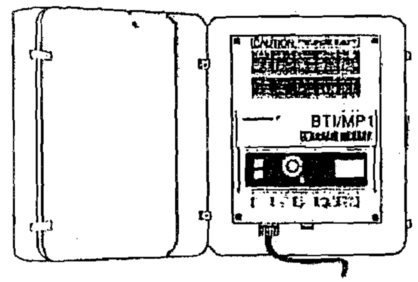
PRE-INSTALLATION CHECKLIST

Components of Your Redi-Flo2

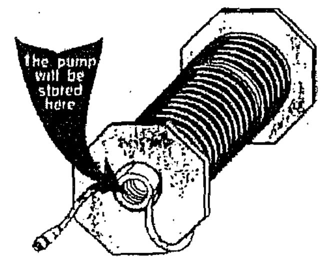
Your Redi-Flo2 Environmental Pumping system should contain the following components:

A. Converter in a protective carrying case
B. MP1 pump and motor with motor lead

A



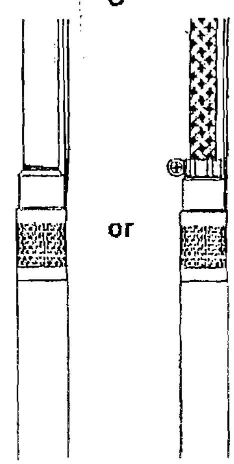
B



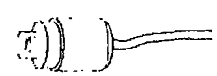
To operate the system you will also need:

C. Hose or pipe to connect to the pump and lower it into the well
D. An electrical plug to connect the converter power cord to your portable generator (or other power source)
E. Some type of safety cable (and attachments) for lowering and lifting the pump

C

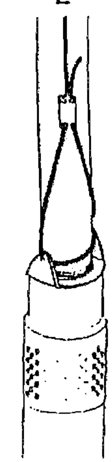


D



(The exact type of plug used will depend upon your generator).

E



ASSEMBLING THE Redi-Flo2

Assembly Instructions

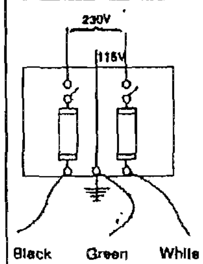
All electrical work should be performed by a qualified electrician in accordance with the latest edition of the National Electrical Code, local codes and regulations.

1

Unpack the components of the Redi-Flo2 system. The MP1 pump will be packed in the center of the motor lead roll.

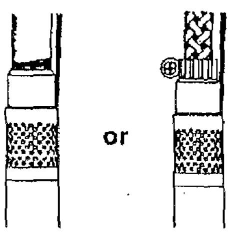
2

Strip the cord jacket and insulation from the ends of the converter power cord. Consult your local electrician to connect the leads to the electrical plug. (The ground wire should be connected to the elongated plug terminal and single phase 230 volt power should be measured across the black and white leads.)



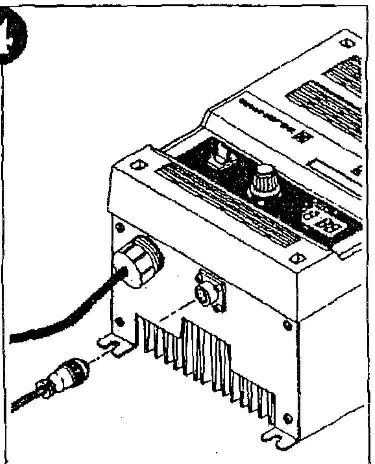
If the converter connects directly to a permanent power supply, consult your local electrician to connect the wires as shown.

3



Connect the MP1 pump to the pipe or hose through which the fluid will be pumped. If a hose is connected, a compression coupling should be used to ensure a strong, watertight fit. A safety cable may be attached to the pump (using a special bracket), as well as a plastic spiral flex clamp to secure the wire. A check valve may also be fitted to prevent liquid from flowing back into the pump after it is turned off (backflow prevention).

4



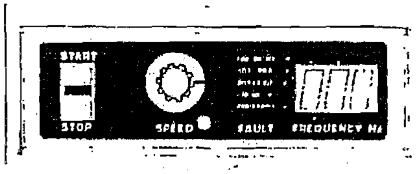
Fit the motor lead plug into the converter. Fit the converter plug into the generator (or other power source).

OPERATING THE Redi-Flo2

Starting

The Redi-Flo2 is easy to operate. Simply:

1. Submerge the pump in water.
2. Start the generator (or other power source).
3. If the generator has a circuit breaker, turn it on.
4. Check the frequency display on the front of the converter. It should read "0" (zero). If it doesn't, refer to the Troubleshooting section on pages 13-14.
5. If this is the first time the converter is being used or it has not been used for more than six months, leave the converter on for at least 15 minutes before proceeding to step 6.
6. Set the converter's speed dial near the middle of the dial (12 o'clock position).
7. Start the pump by pressing the **Start/Stop** switch into the "Start" position.
8. Adjust the pump performance by turning the speed dial.



Stopping

To stop the pump, press the **Start/Stop** switch on the converter to the "Stop" position. There is no need to reduce the pump speed first. Turn the POWER OFF at the generator ***BEFORE*** removing the motor lead from the converter.

Operating Conditions

To ensure the Redi-Flo2 operates properly, follow these guidelines:

- The MP1 pump must be installed vertically with the discharge end pointing upwards.
- The electrical voltage to the converter must always be between 190 and 253 volts (single phase, AC).
- The motor and pump must always be completely submerged in fluid to ensure lubrication of the shaft seal and cooling of the motor.
- While the pump is pumping, the distance down from the ground level to the level of the water in the well must not be greater than 270 feet.
- If the pump is used in a well larger than 4" in diameter, a shroud should be used around it to ensure proper motor cooling.
- The temperature of the water being pumped should be between 34°F and 86°F (1°C and 30°C).

Purging A Well

If the pump is being used to purge a well, start it at the maximum speed. Do not stop the pump until the pumped water contains no visible particles (to avoid blockage within the pump).

Thawing A Frozen Pump

If the liquid in the pump is frozen so the motor shaft cannot rotate, lower it into water and start it at the slowest speed. Continue to operate the pump at this speed for about 10 minutes, at which time it will be thawed and ready for operation.

Dismantling & Reassembling

The MP1 pump can be dismantled and reassembled quickly and easily by referring to the diagram on page 11 and following these steps:

DISMANTLING

1. Shut the pump off using the converter's Start/Stop switch.
2. Turn the generator (or other power supply) OFF.
3. Disconnect the motor lead from the converter.
4. Remove the pipe or hose connected to the pump (OPTIONAL).
5. Remove the Set Screw (position 12 in the diagram on page 11). Grasp the Inlet Screen (position 1) and slowly but forcefully pull it up over the Pump Housing (position 2).

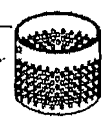
DO NOT ALLOW THE INLET SCREEN TO SCRAPE THE INSULATION FROM THE MOTOR LEADS.

6. Unscrew and remove the Pump Housing (counterclockwise when viewed from the top). This will expose the impeller assembly (guide vanes, wear rings, etc.), which can now be removed by hand for extended cleaning or replacement.

REASSEMBLY

To reassemble the MP1 pump, refer to the diagram on page 11 and:

1. Make sure the motor lead is not connected to the converter.
2. Return the impeller assembly components (guide vanes, wear rings, etc.) to the shaft in the proper order.
3. Screw the Pump Housing (position 2) back onto the top of the pump. If all of the impellers and chambers were replaced correctly, the Pump Housing should screw on easily. Hand tighten.
4. Slip the Inlet Screen (position 1) back over the Pump Housing. Screw the Set Screw (position 12) back into the Inlet Screen.

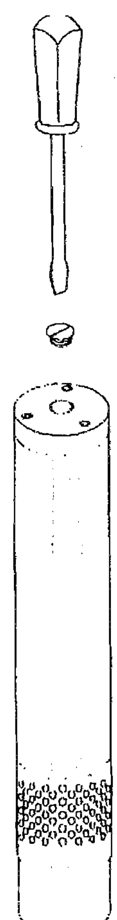


MAKE SURE YOU LINE UP THE MOTOR LEAD WITH THE RECESSED AREA IN THE PUMP HOUSING TO AVOID SCRAPING THE INSULATION FROM THE LEADS

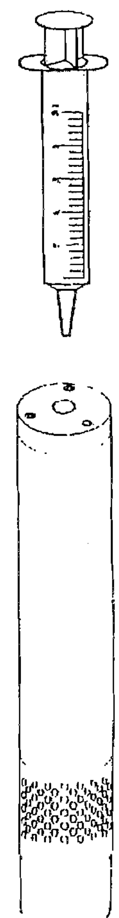
Replacement Of Motor Fluid

If the pump is moved from well to well, it should be thoroughly decontaminated prior to being installed in the next well. In addition to cleaning the individual components inside and outside, the water in the pump motor should be replaced using the syringe that came with your pump. This can be accomplished through the following steps:

1. Shut the pump off using the converter's Start/Stop switch.
2. Turn the generator (or other power supply) OFF.
3. Unplug the pump from the converter.
4. Turn the pump and motor upside down.



5. Use a flat screwdriver to remove the filling screw on the bottom of the motor.



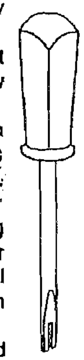
6. Empty the water from the motor and refill it using contaminant-free water and the syringe that came with your MP1 pump. The water level should be even with the bottom edge of the screw hole.
7. Replace and tighten the filling screw.
8. Turn the pump over several times, then remove the filling screw again to let any trapped air escape (if air is left inside the motor, the life of the motor will be shortened). Add more water, if necessary.
9. Replace and tighten the filling screw.

Replacing the Motor Lead

To replace the motor lead, refer to the diagram on page 11 and follow these steps:

REMOVING THE OLD MOTOR LEAD

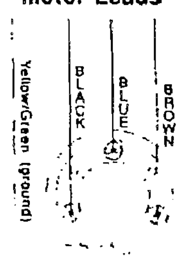
1. Make sure the power is turned **OFF**, the converter is turned **OFF**, and the motor lead is not connected to the converter.
2. Loosen and remove the Set Screw (position 12) from the Inlet Screen (position 1).
3. Slide the Inlet Screen off the pump. If you plan to use this motor lead again, be careful not to scrape insulation from it as the Inlet Screen is removed.
4. Loosen and remove the Pump Housing (position 2). Remove the impeller assembly (impellers, guide vanes, etc.).
5. Refer to the illustration on page 8. Use the special Motor Lead Screwdriver (shown at right) that came with your new motor lead to loosen and remove the Motor Lead Screw (position 14) for the ground lead (green/yellow wire).
6. Pull up on the ground lead to remove it. Using a small screwdriver and precision electronics pliers, pry up and remove the Teflon® Washer (position 15) and Brass Washers (position 16) from inside the enlarged Ground Motor Screw (position 13). Remove the Ground Motor Screw.
7. Use an allen wrench (2.5 mm) to remove the two Motor Screws (position 19) holding the Suction Interconnector (position 10) in place. Remove the Suction Interconnector but be very careful to note which of its slots is lined up with which motor lead -- this will be very helpful during reassembly. You may wish to scratch a mark on both the Suction Interconnector and the motor to aid in matching them up later.
8. Refer to the illustration at the bottom of this page. Use the special Motor Lead Screwdriver to loosen and remove the remaining Motor Lead Screws (position 14).
9. Pull up on each of the leads to remove them. Make a note which color conductor comes out of each hole -- **this is a MUST** when installing the new motor lead. Using a small screwdriver and precision electronics pliers, unscrew and remove the Teflon ® Washer (position 15) and the Grommet (position 17).



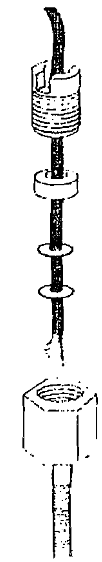
INSTALLING THE NEW MOTOR LEAD

10. Ensure the motor lead holes are clean and free of moisture.
11. String the Inlet Screen (position 1) onto the motor lead.
12. String the motor lead components (shown at right) onto the end of each motor lead wire (except the yellow/green ground wire).
13. For each wire, place the Crimped Pin (position 18) down into the motor lead hole. Press the Grommet (position 17) and Teflon ® Washer (position 15) down around the lead.

Be sure to reconnect the lead wires in their previous pattern so that in clockwise order they are **black-blue-brown** as shown at left.

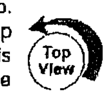


14. While pushing the lead down into the motor lead hole, use the special Motor Lead Screwdriver to tighten the Motor Lead Screw (position 14) into place. Repeat for the other two lead wires.
15. Replace the Suction Interconnector (position 10). Replace the Ground Motor Screw (position 13). Since the ground wire will be attached to this screw, you will want to put it into the hole that will cause the least amount of twisting to the wire.
16. Replace and tighten the two Motor Screws (position 19) with an allen wrench.
17. Repeat steps 12-14 for the ground motor lead. Note on the illustration (at right) that the ground lead uses two Brass Washers (position 16) instead of a Grommet and Crimped Pin.
18. Return the impeller assembly to the top of the Suction Interconnector (position 10). Refer to the diagram on page 11 for the proper sequence.
19. Screw the Pump Housing (position 2) back onto the Suction Interconnector.
20. Position the motor lead in the recessed area of the Pump Housing.
21. Carefully push the Inlet Screen (position 1) over the Pump Housing and the Suction Interconnector.



BE VERY CAREFUL TO AVOID SCRAPING THE INSULATION FROM THE MOTOR LEAD AS THE INLET SCREEN IS FITTED.

22. Line up the screw hole in the Inlet Screen with the screw hole in the Pump Housing. Fit and tighten the Set Screw (position 12).
23. Connect the motor lead to the converter and test the rotation of the pump. Submerge the pump in water, start it at its slowest speed and make sure the pump shaft is turning counterclockwise (when viewed from the top). If the rotation is incorrect, switching any two power leads (with POWER OFF) will correct the problem.



24. Reconnect the hose or pipe.

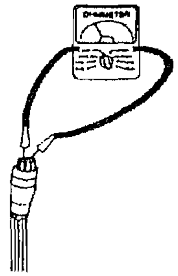
Teflon® is a registered trademark of Du Pont

Periodic Motor Inspection

If the pump is operating at a decreased capacity and the impeller assembly components (impellers, guide vanes, etc.) do not appear to be the cause, the motor should be checked. A checklist of things to examine includes:

- Check the fluid level inside the motor (refer to page 6). Replace and refill as necessary.
- Inspect the outside of the motor for cracks, dents, etc.
- Remove the Inlet Screen (position 1), Pump Housing (position 2), and the impeller assembly (guide vanes, wear rings, etc.). Try to spin the motor shaft by hand. It should spin freely. If it does not, the motor must be replaced.
- Check the winding and insulation resistance of the motor and lead.

Winding Resistance



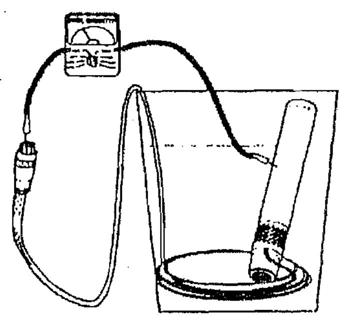
Turn off the power and disconnect the motor lead from the converter. Using an ohmmeter, set the scale to R X 1. Zero-adjust the meter and measure the resistance between any two power conducting leads (prongs on the motor lead plug).

If the ohm value is too low, the motor may be shorted. If too high, the motor windings or the leads may be open.

Lead Length	Ohm Value
0 feet	3.0 - 3.5 Ω
50 ft	3.6 - 4.1 Ω
75 ft	3.9 - 4.4 Ω
100 ft	4.2 - 4.7 Ω
125 ft	4.5 - 5.0 Ω
150 ft	4.8 - 5.3 Ω
175 ft	5.1 - 5.6 Ω
200 ft	5.4 - 5.9 Ω
250 ft	6.0 - 6.5 Ω
300 ft	6.6 - 7.1 Ω

Insulation Resistance

Turn the power off and disconnect the motor lead from the converter. Use a megohmmeter or megger (1 Meg = 1 M = 1 million). Zero-adjust the meter and measure the resistance between any power conducting leads (prongs on the motor lead plug) and ground. A good way to accomplish this (as shown at right) is to submerge the motor lead and MP1 pump in a bucket of water. Touch one lead of the megohmmeter to the pump and one to a motor lead.

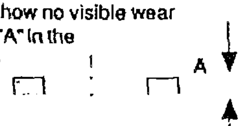


If the ohm value is lower than 2MΩ, the motor is defective and must be replaced.

Checking Components For Wear

The pump components should be periodically checked to ensure they are still within their minimum operating tolerances (illustrated below).

Impeller (position 5) .... The impellers should show no visible wear.
Guide Vane (position 3) .... The guide vanes should show no visible wear
Wear Ring (position 4) .... The minimum thickness ("A" in the illustration) should never be less than 1.0 mm



In addition, visually check all components for cracks, corrosion, or wear.

Storage Requirements

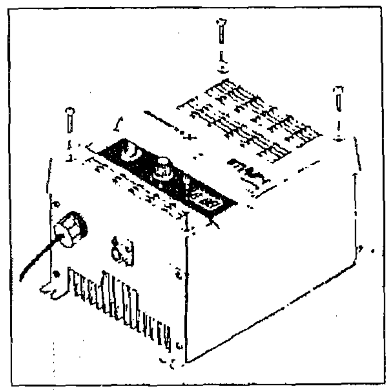
The pump should be thoroughly cleaned before storage to ensure no contamination is present. Both the pump and the converter should be stored in a clean and dry area in the following temperature range:

-20°C to +50°C
or
0°F to 120°F

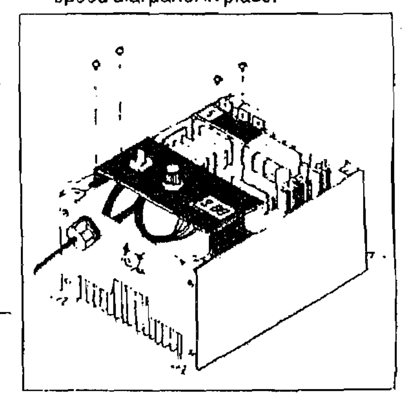
Replacing the Converter Fuses

The converter fuses can be replaced by following these steps:

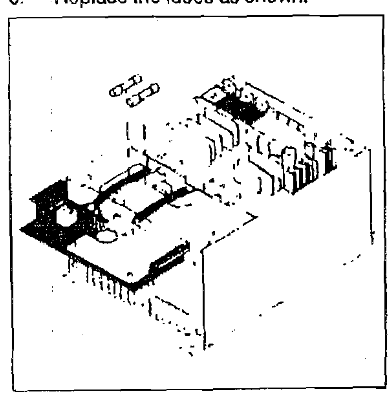
1. Turn the **POWER OFF.**
2. Disconnect the converter from the power source.
3. Wait at least 3 minutes to give the capacitors time to discharge any remaining voltage.
4. Remove the four screws holding the front cover of the converter in place and remove the front cover.



5. Remove the four screws holding the speed dial panel in place.



6. Replace the fuses as shown.



NOTE:
The BTI/MP1 converter uses two T30A, type FERRAZ fuses.

PARTS LIST

Pump Components

Position No.	Part Description	Number Used
1	Inlet Screen	1
2	Pump Housing	1

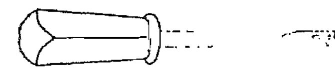
Service Kits, Service Tools, and Motor Leads

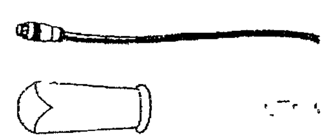
Replacement parts, service tools, and motor leads are available using the following part numbers:

Service Kits: Position No. In Diagram	Part Description	No. In Kit	Part Number
3	Guide Vane	2	125061
4	Wear Ring	2	
5	Impeller	2	
6	Spacer Ring	2	
7	Wear Plate	2	

Service Tools	Part Number
Special Motor Lead Screwdriver	SV0370
Syringe (to refill motor)	ID6066



Motor Leads		Part Number
All motor leads come with a Converter Plug attached and a special Motor Lead Screwdriver	50 foot length	1A 5081
	75 " "	1A 5082
	100 " "	1A 5083
	125 " "	1A 5084
	150 " "	1A 5085
	175 " "	1A 5086
	200 " "	1A 5087
	250 " "	1A 5088
	300 " "	1A 5089



TROUBLESHOOTING

The converter will shut itself off if any major faults occur, and signal (on the converter display) the cause of the fault. These include:

If the display shows this:	The fault is:	Which is caused by:	To correct, simply:
	**Function Loss**	• A thermal cut-out or shutdown	Wait until the motor has cooled to a normal temperature. Restart the motor using the on/off switch on the converter.
		• Defective motor lead or pump • Momentary problem (transient fault)	1. Reset the converter and restart it. If it shuts down again, then ... 2. Switch off the power supply. Turn the power supply back on and restart the converter. If the converter shuts down again, the pump or the motor lead may be defective. If the converter **doesn't** shut down again, it was probably a transient fault (momentary power surge, etc.). **IF ALL CHECKS INDICATE THAT THE PUMP IS O.K., THEN THE CONVERTER MAY BE DEFECTIVE**
	**Overvoltage**	• The input voltage is too high • There was a momentary power surge	1. Reset the converter and restart it. If it shuts down again, then ... 2. Reduce the voltage coming into the converter (refer to the "Technical Data" section on the following pages for operating ranges).
	**Low Line**	• The input voltage is too low • There was a momentary voltage drop	1. Reset the converter and restart it. If it shuts down again, then ... 2. Increase the voltage coming into the converter (refer to the "Technical Data" section on the following pages for operating ranges).
	**Power Supply**	The power supply is defective	Check the voltage of the incoming power supply (should be between 190-253 V).
	**Pump Problem** (If numbers climb only to about 50 - 130)	• The pump shaft is locked • One of the 3 motor leads is not making contact with the motor	1. Turn the speed dial to maximum frequency. If this results in a **Function Loss**, follow the troubleshooting instructions listed above. 2. If you **don't** get a Function Loss, the problem is with the converter.
	**No Display = No Power**	• The converter is not being supplied with power • The power being supplied is a very low voltage • The internal fuses are defective	1. Check the amount of the incoming voltage. If it is within allowable limits (190 - 253 V), then ... 2. Flip the generator circuit breaker (if it has one) to the "ON" position. Reset the converter and restart it. If the converter still shows no display, then ... 3. Switch the power supply off. Check the fuses in the converter and replace if necessary. If the fuses are OK, then ... 4. Check the electrical plugs to ensure all connections are made properly.

TECHNICAL SPECIFICATIONS

Converter Specifications

Power

Supplied By Generator/Power Supply

Voltage:	Single phase, 230 volt (+ or - 10%)
Frequency:	50-60 Hz (+ or - 2%)
Maximum Current:	10 amps

Produced By Converter

Output Voltage:	3 phase 25 volts to 3 phase 220 volt
Frequency:	46 - 400 Hz
Maximum Current:	5.5 amps
Internal Fuse:	2 each of T 30 A, type FERRAZ

Connections

Motor Lead Connector:	AMP CPC Plug, Type 206429-1
Power Cable:	Type SJOW, 14 AWG, 10' long

Dimensions and Weight

Dimensions:	Case is 9"x14"x18.5"
Net Weight:	25 lbs

Operating Conditions

Ambient Temperature:	32°F to 104°F (0° to 40° C)
Relative Air Humidity:	Maximum 95%
Radio Noise Filter:	Noise may occur when the converter is connected to the municipal electrical supply. It can be eliminated by adding a filter, such as a Siemens filter, type B 84112-B-A 120/20 A.

Storage Conditions

Ambient Temperature:	-13°F to 149°F (-25° to 65°C)
Relative Air Humidity:	Maximum 50% at 104°F (40°C) unlimited Maximum 90% at 68°F (20°C) for periods not exceeding 30 days per year. 75% annual average Non-condensing

Performance

Acceleration Time:	0 to 400 Hz in 10 seconds
Deceleration Time:	400 to 0 Hz in 10 seconds

Motor/Pump Specifications

Power

Input Power:	1.5 Kw (2 Horsepower)
Voltage:	3 phase, 220 volts at 400 Hz
Maximum Current:	5.5 amps
Motor Protection:	Thermal overload - Thermik Geratebau, Series SY6 Disconnect Temperature: 176°F (80°C) Rate Current: 5 amps Current Overload - Incorporated into converter

Connections

Discharge Port:	1/2" Female NPT
Net Weight:	5.5 lbs (includes pump)
Available Lead Lengths:	50, 75, 100, 125, 150, 175, 200, 250, and 300 feet

Operating Conditions

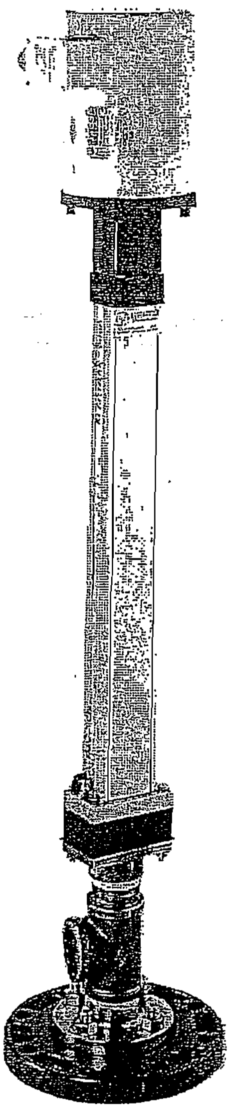
Max. Fluid Temp.:	86°F (30°C)
Min. Fluid Temp.:	34°F (1°C)

Dimensions and Weight

Dimensions:	(Including pump and motor) 11.3"x1.81" diameter
Net Weight:	5.5 lbs.

Installation and Operation Guide

Anchor Electric Piston Pump®

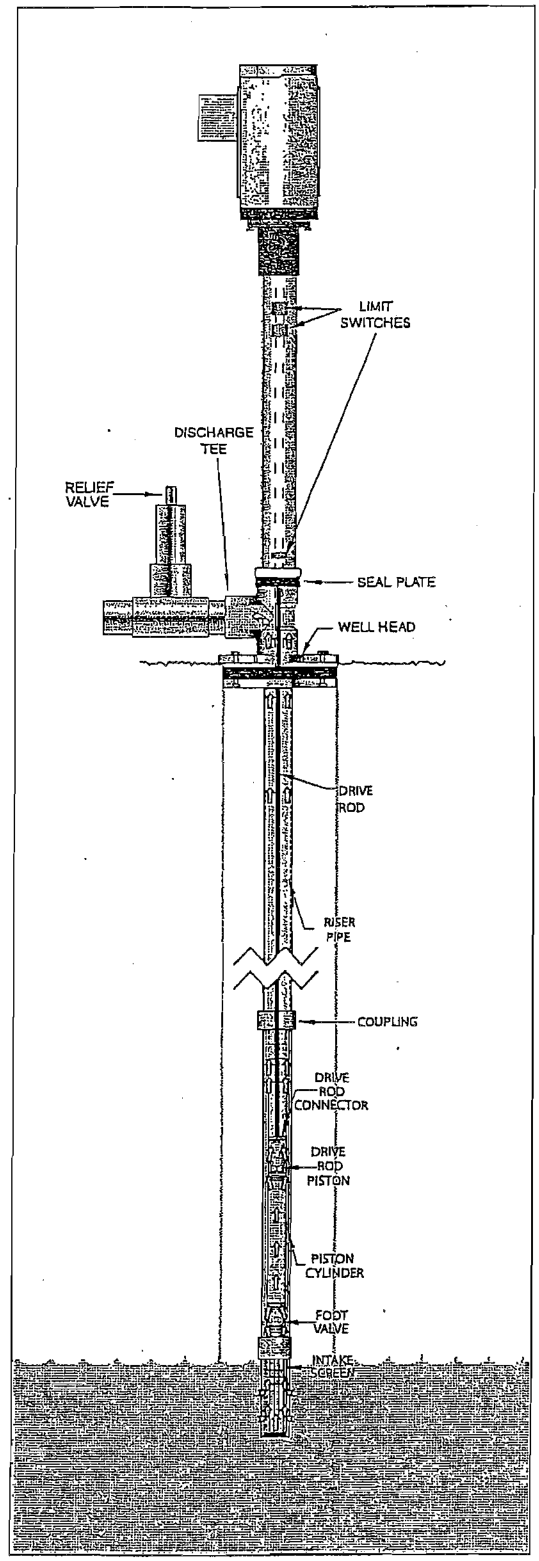


BLACKHAWK®
ENVIRONMENTAL COMPANY
21W161 Hill Ave., Glen Ellyn, IL 60137
Phone: 630.469.4916 Fax: 630.469.4896
www.blackhawkco.com

SECTION 1

SHIPMENT INSPECTION

Take an inventory of the components; pump cylinder, top head drive motor assembly, drive rod and piston. This Anchor Pump® should remain in it's shipping carton until it is ready to be installed. You will find a separate pump control box. It should be securely mounted at or near the well.



Installation Materials

1. 10′ rise pipe, NPT Thread on each end

   or

   HDPE riser pipe with stainless steel NPT transition fitting
2. Stainless steel couplings
3. Hoisting cable
4. 12″ Pipe nipple for transition at well seal and discharge tee

Tools for Installation

1. Chained channel lock
2. Pipe wrenches
3. Vice grips
4. 1/2″ Wrench
5. 11/16″ Wrench
6. 5/8″ Wrench
7. Tape measure
8. Water level indicator
9. Hacksaw
10. File and sand paper

SECTION 2

PRE-INSTALLATION CHECKLIST

Before beginning installation, the following checks should be made.

A Condition of the well.

If the pump is to be installed in a new well, the well should be fully developed and bailed or blown free of drill cuttings and pipe casing debris. The construction of the Anchor Pump® makes it resistant to abrasion; however no pump, made of any material, can forever withstand the destructive wear that occurs when constantly pumping sandy fluid. Determine the actual depth of the well, the static water level in the well, and the draw down level at the pumps maximum capacity. The pump selection and setting depth should be based on this data. The inside diameter of the well casing should be checked to ensure that it is not smaller than the pump.

B Condition of the fluid.

Anchor Pumps® are designed for fluids up to 200°F (PV.C pipe up to 140° and steel pipe up to 200°. Fluids can be viscous up to #6 fuel oil, have tar pitch consistency or contain gas.

C Installation Depth.

Place pump one (1) foot above the bottom of the well. Remember not to block pump intake.

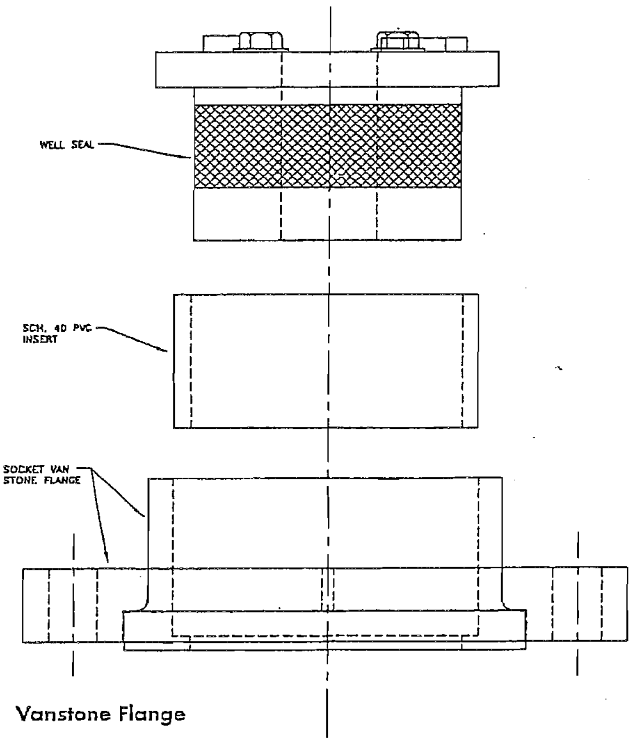
D Power supply.

The drive motor power demand is noted on the name plate of the Anchor Pump® electric motor. Power supply can be 115V, 230V, 1HP or 220V/460V, 3HP. Power is converted by the VFD control to either 230V, 3hp or 460V, 3HP power to run the drive motor.

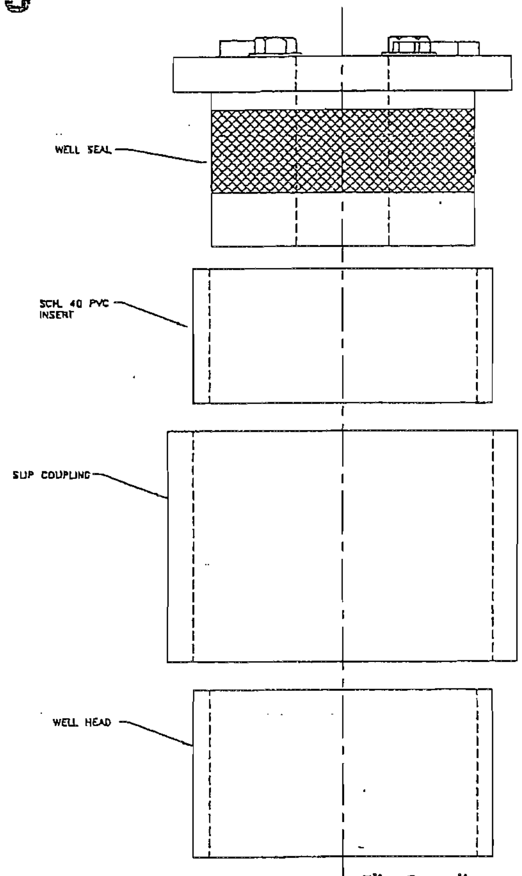
Installation

Step 1

Wellhead Preparation: Three Choices of Wellheads



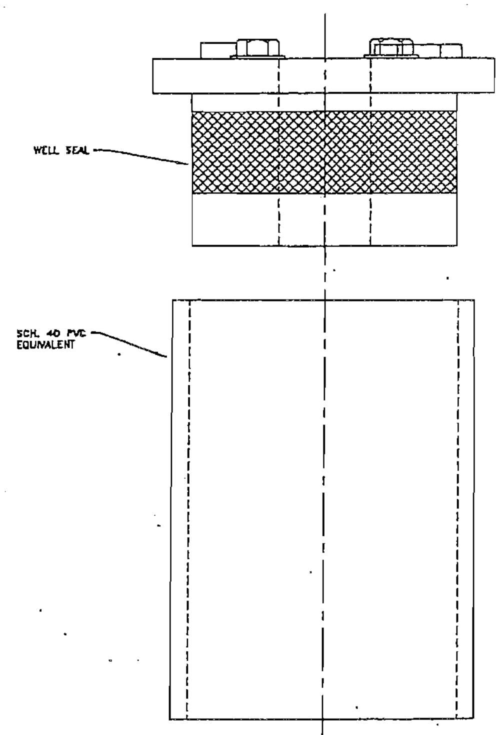
Vanstone Flange



Slip Coupling

Prepare top head well casing by removing all debris, caps or other closures, thus opening well, tank or sump for pump installation. Three typical well casing completions.

*Well casings may be vertical or horizontal.



Well Casing

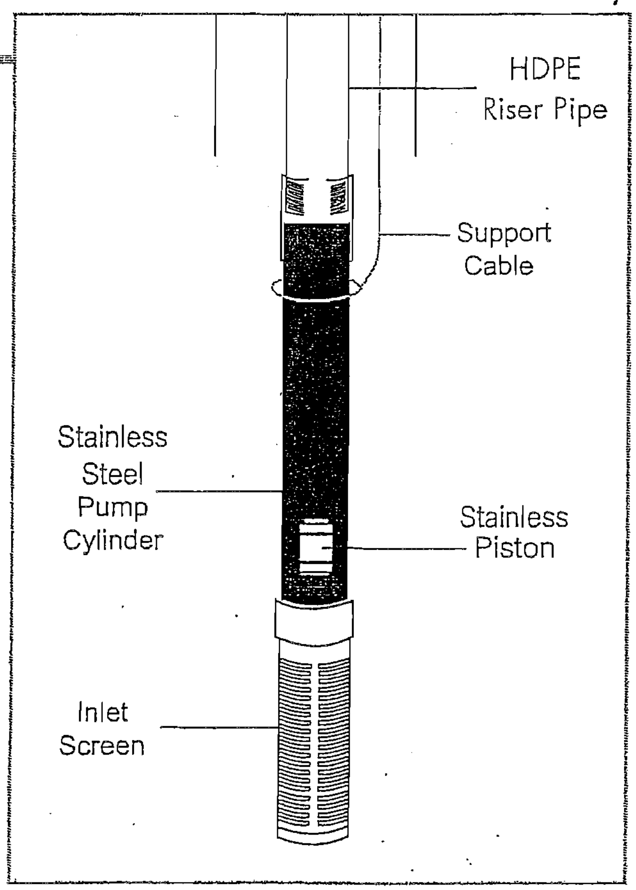
INSTALLATION CONT.

Step 2

ANCHOR PUMP FOOT VALVE CYLINDER INSTALLATION

- Attach foot valve cylinder assembly to bottom section of riser pipe.
- Note: Recommend attaching a support cable.
- Note: If using liquid level control device refer to separate installation sheet.

Foot Valve Assembly



NOTE: When using HDPE, make sure the pistons are put in before attaching foot valve to HDPE pipe.

ANCHOR PUMP RISER PIPE INSTALLATION

2		WELL SEAL SIZE VARIES
1	SA-40-7001	SS 2" TEE

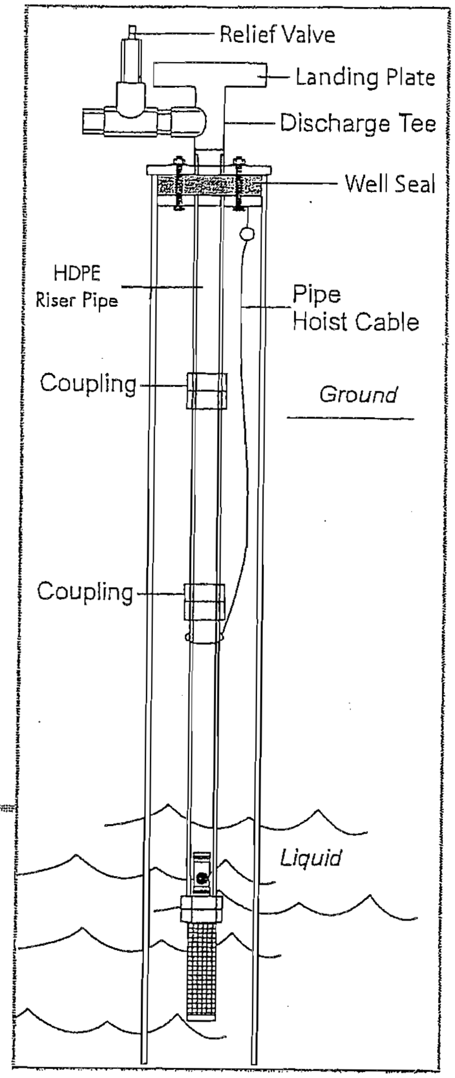
INSTALLATION CONT.

Step 4

ANCHOR PUMP RISER PIPE & WELL CAP INSTALLATION

a. Install all riser pipe until inlet screen is at specified depth and attach well cap onto riser pipe.
b. Attach cable to the bottom of the well cap.
c. Attach well cap to top of wellhead.
d. This riser pipe is to be suspended from the well head, not to be standing on bottom of well, tank or sump.

If using hard riser pipe it is recommended that maximum 10' pipe lengths with NPT Threads on both ends and threaded stainless steel couplings to be used for riser pipe.



Step 5

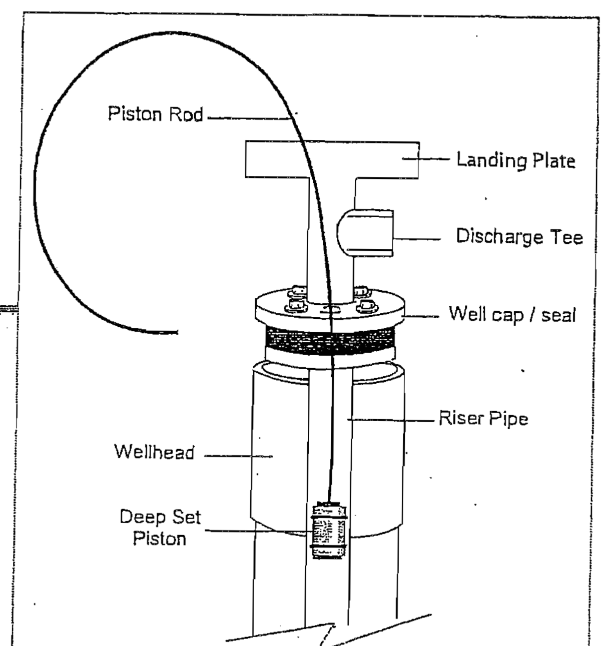
DRIVE ROD/PISTON INSTALLATION

A. Uncoil piston-rod-assembly
(Lay coil out in open area.)
(Caution: Coil under tension!)

B. Attach Drive Piston

C. Slide drive piston down riser pipe to bottom.

Note: Piston will have much more resistance for the final 2-3 ft. of install.

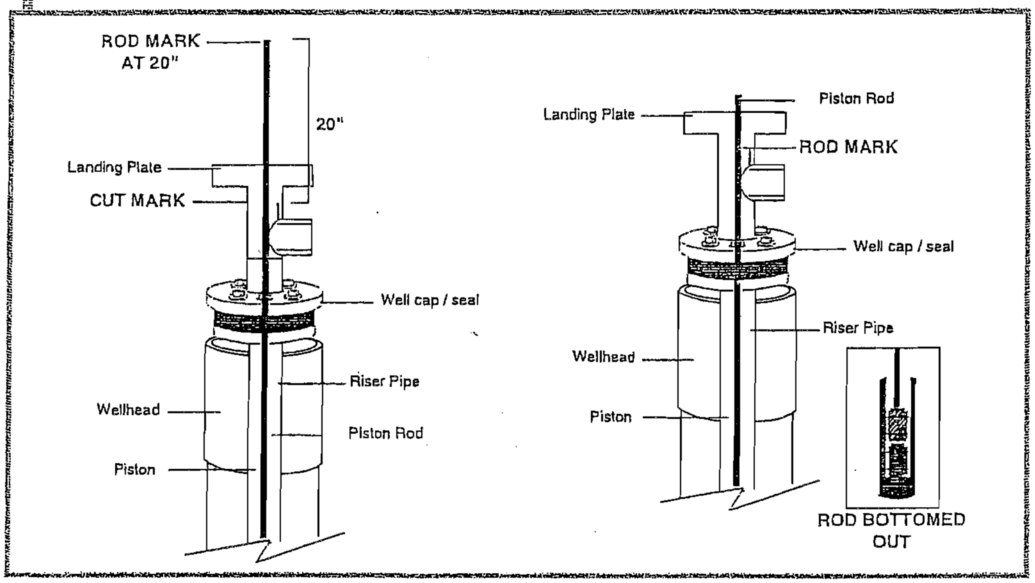


INSTALLATION CONT.

Step 6

CONNECTION OF ROD TO TOP HEAD DRIVE MOTOR ASSEMBLY

Hand pump well by moving the fiberglass drive rod up and down in the downhole foot valve cylinder assembly to ensure that the pump is pumping liquid.



A. Rod bottomed out – Mark rod at top of discharge tee. Clean and sand rod.

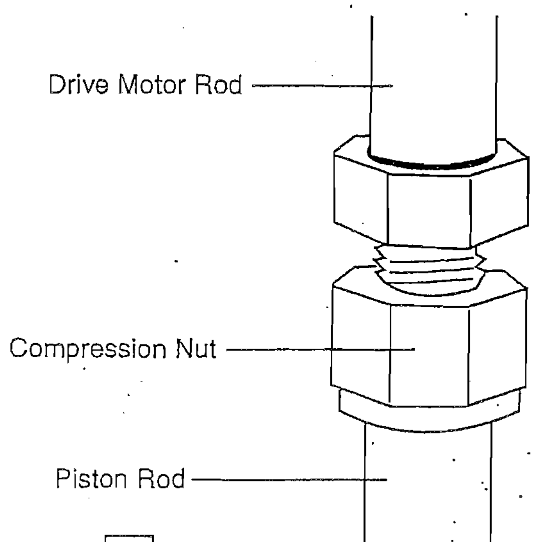
B. Lift rod up and cut 20" below mark.

Step 7

ATTACH COMPRESSION FITTING TO CUT END OF ROD AND SCREW INTO DRIVE MOTOR ROD

Attach ferrule and compression fitting to squared cut end of fiberglass rod. Make sure fiberglass compression ferrule digs deep into fiberglass drive rod to secure fiberglass piston.

A. Cut and square rod.
B. Rough-up finish with sandpaper.
C. Attach compression fitting to cut end of rod and screw into drive motor rod.
D. Excessively tighten nut.
E. Loosen nut to check that ferrule has crimped into rod.
F. Reattach to motor.



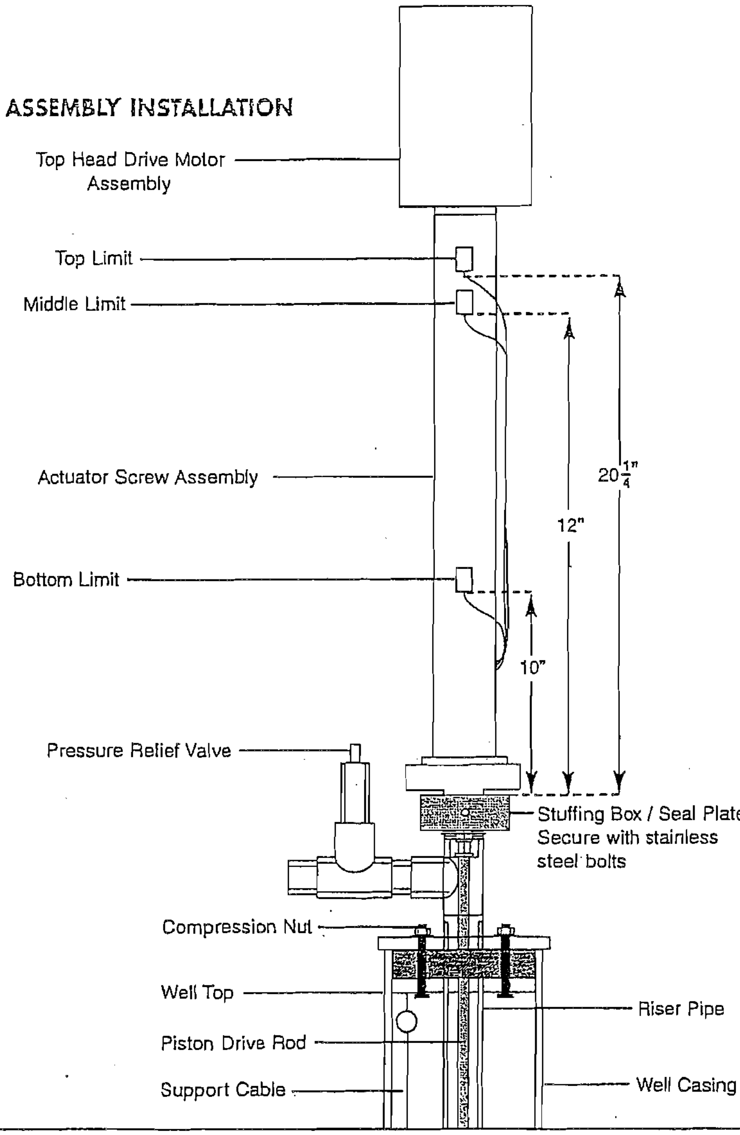
INSTALLATION CONT.

ANCHOR PUMP® TOP HEAD DRIVE MOTOR ASSEMBLY INSTALLATION

Step 8

Note: Before installing drive motor into well, refer to Electrical Control Panel Instructions (Section 5-7).

A. Install top head drive motor assembly onto well top.
B. Secure the well head landing plate with 4 bolts.
C. Attach Power supply/control panel.



SCM SUB-MICRO DRIVE INSTALLATION

LIMIT SWITCH SETUP

LIMIT SWITCH (NOTE 1)	TYPE	DISTANCE FROM TOP OF BASE PLATE TO BOTTOM OF SWITCH	TERMINAL CONNECTION
Bottom	Normally Open	10"	13E
Middle	Normally Open	12"	13A
Top	Normally Open	20.25"	13A

PARAMETER SETTINGS

SPEED	101gpm	102gpm	103gpm	SPM (Strokes per Min.)
60	1.35	3.27	7.37	20.06
50	1.19	2.89	6.53	19.98
40	1.02	2.47	5.58	19.03
30	0.82	1.98	4.47	16.75
20	0.58	1.40	3.16	12.75
10	0.30	0.73	1.65	6.97

SECTION 4

POWER SUPPLY

There are Five Typical Electric Drive Motor Control Panels.

–ELECTRIC DRIVE MOTOR REFER TO SECTION 5 FOR SEPARATE INSTALLATION AND OPERATION SHEET OF THE DRIVE MOTOR AND CONTROL PANEL SUPPLIED FOR JOB.

1. VFD Control only
2. NEMA 4 enclosure - Stop / Start
3. NEMA 4 enclosure - Auto restart, (start on power up.)
4. NEMA 4 enclosure - Auto restart, Level Control, Stroke Counter.
5. NEMA 4 enclosure - Auto restart, High Level Tank Shut Off, Stroke Delay Timer.

*Control Panels can be customized to application.

SECTION 5

ANCHOR ELECTRIC STARTUP

MOTOR ROTATION IS VERY IMPORTANT

Drive Unit not installed yet (The easiest and best way to check for rotation)

1. Set the drive on the ground with at least two feet of room for the rod to move in and out.
2. Pull the rod out by hand at least one foot. If you can not pull the rod out by hand turn the motor counterclockwise till it is extended at least one foot.
3. Make sure power feed is disconnected and wire up the feed and the motor as shown on the schematics. Be sure to connect the feed and motor ground to the drive.
4. Turn the power and drive switch on.
5. If the motor does not move. Read the LOGO! screen:
   - If the screen says **"ALARM HIGH TANK LEVEL"** it will not pump until the high tank level signal is removed.
   - If the screen says **"STROKE DELAY"** see "Changing LOGO! Stroke Delay and Stroke Dwell Time" sheet and set Parameter 11, "TH" to 00:00.
   - If the screen says **"STROKE DWELL"** turn the stroke dwell switch to **OFF**.
   - If the screen says **"LOW LEVEL"** set the Auto/Hand selector switch to Hand mode. This will bypass the level control and the screen should now display **"HAND RUN"**

5. The rod should move in toward the motor first and then cycle out and in. The motor should first rotate clockwise as seen from above the motor.
6. If the rod moves in toward the motor first the rotation is correct. Go to step #9.

continued

7. If the rod moves out away from the motor first the rotation is wrong. Turn the drive switch and the power off. **WAIT THREE MINUTES** Switch two of the motor leads, either at the motor T1 and T3 or U and W at the SUB-Micro (AC Tech). **Do not switch the power feed wires or L1, L2, L3 this will not reverse the rotation.**
8. Return to step #4
9. Turn the drive switch and power off. Connect the sucker rod and install drive unit on the well.
10. If the Auto/Hand selector switch was set to Hand mode reselect the Auto mode. The level control can not work unless the Auto/Hand selector switch is in the Auto mode.

Drive Unit installed on well

(We do not recommend checking for rotation with the drive Unit installed.)

1. Make sure power feed is disconnected and wire up the feed and the motor as shown on the schematics. Be sure to connect the feed and motor ground to the drive.
2. If it is not possible to see motor rotation, remove any piping from the discharge tee. You will be able to see the rod moving inside the tee.
3. Turn the power and drive switch on. The motor should first rotate clockwise as seen from above the motor.
4. If the motor does not move. Read the LOGO! screen:
   - If the screen says **"ALARM HIGH TANK LEVEL"** it will not pump until the high tank level signal is removed.
   - If the screen says **"STROKE DELAY"** see "Changing LOGO! Stroke Delay and Stroke Dwell Time" sheet and set Parameter 11, "TH" to 00:00.
   - If the screen says **"STROKE DWELL"** turn the stroke dwell switch to **OFF**.
   - If the screen says **"LOW LEVEL"** set the Auto/Hand selector switch to Hand mode. This will bypass the level control and the screen should now display **"HAND RUN"**
5. If the rod moves up first or clockwise the rotation is correct. Go to step #8
6. If the rod moves down first or counter clockwise the rotation is wrong. Turn the drive switch and the power off. **WAIT THREE MINUTES** Switch two of the motor leads, either at the motor T1 and T3 or U and W at the SUB-Micro (AC Tech). **Do not switch the power feed wires or L1, L2, L3 this will not reverse the rotation.**
7. Return to step #3
8. Turn the drive switch and power off.
9. If the Auto/Hand selector switch was set to Hand mode reselect the Auto mode. The level control can not work unless the Auto/Hand selector switch is in the Auto mode.

OPERATION

The Anchor Pump® and system should be periodically checked for fluid quality, pressure, drawdown, cycle rate, and performance of the stuffing box.

1. Visually inspect Anchor Pump® operation.
2. Check liquid discharge.
3. Check power connections.
4. Check seal plate relief ports.
5. Check piston seal.
   - Turn off power.
   - Remove power line from drive motor.
   - Disconnect pump driver from wellhead.
   - Disconnect pump driver from drive rod.
   - Extract piston rod from well.
   - Inspect piston seal and, if worn replace.
   - Reinstall.

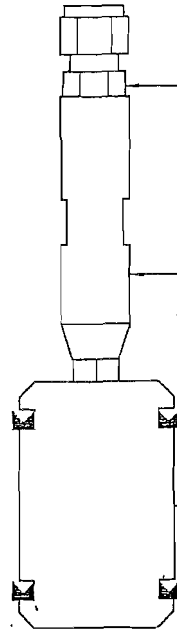
	103 BUNA	P03DSB
	103 VITON	P03DSV



SECTION 9

Anchor Pump Troubleshooting Guide

OBSERVATION	CAUSE	SOLUTION
- Pump not operating	- No power	- Check to see that power supply is on, and that all connections are sound.
	- Variable Frequency Drive (VFD) fault	- Check VFD fault description in VFD booklet. If unable to get pump operating based upon booklet instructions.
- Electric driver not cycling properly	- Parameter settings or limit switch settings incorrect	- Remove electric driver from discharge tee (or well top). Disconnect down hole drive rod. Lay driver in dry flat space with room for rod to cycle in and out. Run system with provided control panel. If not cycling properly, check the limit switch positions and parameter settings on VFD and adjust if necessary.
- Pump driver operating (cycling), but not pumping liquid	- Restricted liquid discharge	- Check for closed valve, clogged discharge, or any other obstruction. Remove obstruction and restart pump.
	- Intake Plug	
	- Piston drive disconnected	- Reconnect down hole drive rod to electric drive rod. If separated at compression fitting, a replacement drive rod ferrule will be required. (Ferrules cannot be re-crimped.)
	- Drive piston not in pump cylinder	

continued

Anchor Pump Troubleshooting Guide continued

OBSERVATION	CAUSE	SOLUTION
	- Down hole drive rod may have been cut incorrectly - Riser pipe string may have a leak - No liquid at pump intake (down hole) to pump	- Perform inflation (glove) test. Disconnect liquid discharge hose/pipe from pumps discharge tee. Hold latex glove (or other inflatable object) over discharge tee mouth. Seal with a tight grip. Allow pump to operate. - Remove and re-cut or adjust rod length as per installation instructions. - Check pipe connections and check for cracks or leaks. Repair or replace compromised pipe or fittings. - Check to make sure that there is liquid to pump.
- *With drive rod and drive piston out of riser pipe, fill riser pipe with water.* Water drains out quickly	- Foot valve assembly/pipe string not water tight	- Remove riser pipe and footvalve assembly and inspect, replace, and/or repair.
- Water stays in riser pipe *(and drive rod and drive piston have been deemed OK)*	- Foot valve assembly/pump intake may be clogged	- Use drive rod extension poker to displace footvalve check ball and thus back flush foot valve and intake area. - If back flushing does not work, then remove riser pipe and footvalve assembly and inspect, replace, and/or repair.
- Drive rod / drive piston assembly tough to remove from footvalve assembly / riser pipe.	- Pump intake may be clogged	- Follow directions for clogged intake foot valve.
- Pump driver moving erratically when operating.	- Loose connections - Down hole drive rod length incorrect	- Check all connections to be sure they are tight. - Check rod length and adjust as per installation instructions.
- Pumped liquid in driver - Stuffing box drain port leakage.	- Pump driver exposed (submersed) to water - Stuffing box seals worn	- Replace stuffing box seals.

continued

Anchor Pump Troubleshooting Guide continued

CHANGING LOGO! STROKE DELAY AND STROKE DWELL TIME

Stroke delay allows the pump to be off for a time than on for a time (B11; TH and TL). Stroke dwell stops the pump at each up stroke for a given time it is selected by a Short, Medium and Long selector switch.

1. Press the "DOWN ARROW" once or twice to show the date and time.
2. Press "ESC".
3. Press "DOWN ARROW" to select "Set Param".
4. Press "OK".
5. Use the "UP ARROW" and "DOWN ARROW" to select:
   a) "B11" for stroke delay.
   b) "B33", "B34" and "B35" for short, medium or long dwell.
   c) Press "OK".
   d) For stroke delay use the "LEFT ARROW" and "RIGHT ARROW" to move between "TH" (time stopped) and "TL" (time running). Use the "UP ARROW" and "DOWN ARROW" to change the times. The time to the left of the ":" is hours and the numbers to the right of ":" is minutes. "Ta" should be ignored. If you do not wish to use stroke delay set "TH" to 00:00 and "TL" to 99:00.
   e) For stroke dwell use the arrows to move the cursor on "T", the numbers to the left of the ":" are minutes and the number to the right are seconds.
6. Press "OK" when finished.
7. Press "ESC" to get to main screen
8. Press "ESC" again.
9. Press the "UP ARROW" arrow to return to the message screen.

TROUBLESHOOTING SCM ELECTRIC DRIVE

1. Turn on the power and make sure that the LOGO! "Q1" momentary closes 3 seconds after being powered up. "Q2" closes after 4 seconds and "Q3" opens after 5 seconds. If "Q3" does not open after 7 seconds see below:
2. Read the LOGO! screen. If the screen says "ALARM HIGH TANK LEVEL" it will not pump until the high tank level is removed. This can be forced by removing the LOGO! I3 wire. Otherwise if the switch is turned to hand it will run. The LOGO! screen will say what condition the pump is in.
3. If the LOGO! screen says "STROKE DELAY" see "Changing LOGO! Stroke Delay and Stroke Dwell Time" sheet and set Parameter 11, "TH" to 00:00.
4. If the LOGO! screen says "STROKE DWELL" turn the stroke dwell switch to OFF.
5. If the LOGO! screen says "LOW LEVEL", at the Warrick Level control short "G", "L", and "H" together it should run now and it was not running because the water level was not high enough.

continued

TROUBLESHOOTING SCM CONTROL PANELS

Troubleshooting SCM Control Panels

1. Check Motor rotation. The power disconnect to the panel needs to be turned off for three minutes before each test. The correct rotation is clockwise looking at the motor from the top. See "ELECTRIC ANCHOR STARTUP" for details.
2. Turn on the power and make sure the drive switch is on.
3. If there is a wire connected to LOGO! I3 make sure there is not a 110 volt signal to it. This is the TANK FULL input. On panels with OBA4 LOGO!'s they will display "TANK FULL" when there is a signal. If there is a 110 volt signal the pump will not pump until the tank is emptied or the signal removed.
4. If there is a wire connected to LOGO! I4 make sure there is not a 110 volt signal to it. This is the LOW LEVEL input. On panels with OBA4 LOGO!'s they will display "LOW LEVEL" when there is a signal. If there is a 110 volt signal see step 10 for details.
5. Check limit switches for conductivity. Remove wires from terminal blocks in panel and test wires that come from the limit switches. The switches are normally open and close with a signal from a magnet. If limits have conductivity without a signal from a magnet or sporadic conductivity with a signal from a magnet replace limit switches. See actuator drawings for part numbers.
6. Check for 12 VDC at AC-Tech 1, 11, 13E, 13A, and 13B. AC-Tech 2 is the common lead.
7. If there is 12 VDC at 13B the pump will not run. That is the stop signal which comes from LOGO! Q3. Look at LOGO! Inputs.
8. If there is 12 VDC at 13E and 13A the pump will not run. Check limit switch conductivity again. 13E is the start signal from the LOGO! Q1 and the reverse signal from the bottom limit switch. 13A is the reverse signal from the middle and top limit switches. The AC-Tech can not run with two reverse signals.
9. To test the AC-Tech. Turn off the power disconnect to the panel. Label and remove the motor leads from the AC-Tech U, V, W, and PE. Label and remove 13E, 13A, and 13B. Turn on the power disconnect and the drive switch. Using a jumper wire touch 11 to 13E. The AC-Tech should display speed. Using a jumper wire touch 11 to 13A. The AC-Tech should count down then back up to speed. If the AC-Tech tests good turn off power disconnect and reconnect all wires.
10. To test Warrick. Label and remove probe wires from terminals T10, T11, and T12. The NC contact should be sending a 110 volt signal to LOGO! I4. On panels with OBA4 LOGO!'s they will display "LOW LEVEL" when there is a signal. Make sure power and drive switch are on. Jumper terminals on lower part of Warrick G, L, and H all together. The 110 volt signal now should not be at LOGO! I4. Remove the jumper going to H and the signal should still not be at LOGO! I4. Remove the jumper going to L and signal should now be back to LOGO! I4. If the Warrick tests good and Level control does not work properly there is a problem with the probes.

If you still have problems call Blackhawk at 630-469-4916.

LIMITED WARRANTY

Anchor Pumps® manufactured by Blackhawk Environmental Company (Blackhawk) are warranted to the original user only to be free of defects in material and workmanship for a period of 12 months from date of manufacture. Blackhawk's liability under this warranty shall be limited to repairing or replacing at Blackhawk's option, without charge, F.O.B. Blackhawk's factory, any product of Blackhawk manufacture. Blackhawk will not be liable for any costs of removal, installation, transportation, or any other charges which arise in connection with a warranty claim. Products which are sold but not manufactured by Blackhawk are subject to the warranty provided by the manufacturer of said products and not by Blackhawk's warranty. Blackhawk will not be liable for damage or wear to said products by abnormal operating conditions, accident, abuse, misuse, unauthorized alteration or repair, or if the product was not installed in accordance with Blackhawk's printed installation and operating instructions.

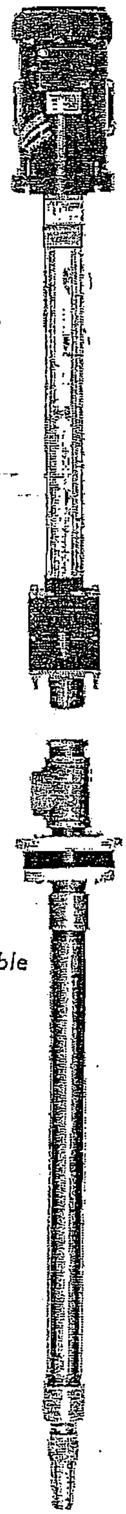
To obtain service under this warranty, the defective product must be returned to Blackhawk together with proof of purchase and installation date, failure date, and supporting installation data. Unless otherwise provided, contact will be made to Blackhawk for instructions prior to return of defective product. Any defective product to be returned to Blackhawk must be sent freight prepaid; documentation supporting the warranty claim and/or a Return Material Authorization must be included if so instructed.

Blackhawk will not be liable for any incidental or consequential damages, losses, or expenses arising from installation, use or any other causes. There are not expressed or implied warranties, including merchantability or fitness for a particular purpose, which extend beyond those warranties described or referred to above.

Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages and some jurisdictions do not allow limitations on how long implied warranties may last. Therefore, the above limitations or exclusions may not apply to you. This warranty gives you specific legal rights and you may also have other rights which vary from jurisdiction to jurisdiction.

Anchor Electric Piston Pump® Model 101E

Patented Top-Head-Drive Piston Pump



Flow Range
0-1.35 US GPM 5.1 LPM
Operational Depth
804 Ft. 245 M with 1 hp motor
Well Casing Size
Minimum 2 In. 4.85 CM

Description

The Anchor Electric Piston Pump Model 101E is powered by electricity. The control motor is located at surface grade for easy installation and maintenance. Power to the pump is direct from grade through the sucker rod assembly. The pump removes water and product (e.g. oil, solvents, leachate) from a two (2) inch (4.85 cm) diameter well casing or greater to depths of 804 feet (245 meters) with a 1 hp motor. The fluid inlet is located at the bottom of the pump intake cylinder and removes water or product to 0 submergence depth.

Performance and Technical Data

Performance

Operational Depth	804'
Flow Range	0 to 1.35 US GPM / 5.1 LPM 1,900 US GPD / 7,300 LPD
Discharge per Stroke	.05 US Gallons per stroke Note: flow does not vary with depth
Motor	1/2 or 1 hp
Power Supply	120 or 230 Volt Single Phase or 230 or 460 Volt Three Phase
Maximum Discharge Pressure	348 PSI
Maximum Lift	804 feet of water or 348 PSIG Variable speed (stroke) control adjusts to well conditions; liquid drawn down to top of strainer.

Technical

Stroke Length	12" (30.48 cm)
Maximum External Diameter	2.9" (7.37 cm)
Total Cylinder Length	30" (76.2 cm)
Connection of Riser Pipe	1-1/4" (3.18 cm)
Connection to Sucker Rod	7/16" - 20
Recommended Internal Diameter of Bore Hole	2-3" (4.85 - 7.62 cm) or greater diameter
Weight of Cylinder	8 lbs.
Discharge Size	2" NPT
Installation	Unit can be installed vertically or horizontally
Driver Weight	40 lbs.
Driver Rod Weight	12 lbs./100'
Foot Valve Assembly Weight	8 lbs.
Minimum Well Casing Size	2"*

* Up to 1000 feet.

Statistical Program for the LDCRS

Attachment G - LDCRS Statistical Monitoring Plan

STATISTICAL EVALUATION

The statistical program for LDCRS monitoring utilizes Nonparametric Prediction Limits (NPPLs) to evaluate the monitoring data. In order to balance false positive and statistical power with this test, resamples are used, the number of which are determined by the number of sampling points and the number of background observations. Since there is no "upgradient" in the LDCRS system, and there was no substantial pre-waste disposal sampling program, the definition of background is not defined in a traditional sense. Thus the use of resamples is selected somewhat arbitrarily (see below).

The NPPL is defined as the highest concentration of a monitoring parameter detected in a background sample. For parameters that are never detected in the background, the NPPL is defined as the reported detection limit. Since the parameters to be analyzed statistically are all organic compounds, the reported detection limit, as listed on Attachment E of the LDCRS Sampling and Analysis Plan are the NPPLs. Therefore, any reported concentration of an Attachment F parameter at or above these limits is considered an apparent statistically significant increase.

If an Attachment E compound is detected, then the NPPL been exceeded and WDI will immediately notify the Waste Management Division (WMD) of the Michigan Department of Environmental Quality (MDEQ) and arrange resampling as soon as possible to confirm or refute the apparent statistically significant increase. Quadruplicate samples will be collected for confirmation purposes and analyzed for the offending parameter(s). Since these quadruplicates are not independent samples, it does not constitute a multiple resampling as defined by the NPPL test. Thus the quadruplicate samples constitute a single resampling. If three of the four quadruplicate samples are clean, then the statistical increase is not confirmed. If two or more of the quadruplicates contain the compound of interest the apparent increase will be deemed confirmed and WDI shall respond in accordance with the current Operating License.

1.0 INTRODUCTION

The following sampling and analysis plan outlines the procedures to be used for the collection and analysis of samples from the suction lysimeters present beneath the hazardous waste management areas (HWMA) of Master Cells V and VII at Wayne Disposal Site #2 Hazardous Waste Landfill. The lysimeter monitoring program functions as an early leak detection program beneath the lowest point (leachate collection sumps) of the HWMA subcells within these Master Cells. There are ten lysimeters in place. They were installed as five pairs so that adequate volume could be extracted for samples at each location. Pairs are located beneath cells V-B, VII-A, VII-B and VII-C (2 pairs identified as VII-C west and VII-C east). The locations of the lysimeters are shown on Figure 1.

This sampling and analysis plan has been prepared to direct the efforts of monitoring personnel in the collection and analysis of samples so as to meet the requirements of Michigan Act 451, Part 111 for the facility and to ensure sound practices for the collection of these data. This plan must be revised if there are any changes to the procedures contained herein. Any proposed changes must be submitted to the Waste & Hazardous Materials Division (WHMD) of the Michigan Department of Environmental Quality (MDEQ) for review and approval before the changes are implemented..

2.0 DESCRIPTION OF EQUIPMENT

The lysimeters were placed beneath the cell by angle drilling at an angle of approximately 65° from vertical to a depth approximately 50 feet below ground surface and at least 5 feet below the lowest point of the bottom of the cell. A drawing of a typical installation is shown on Figure 2. The suction lysimeter system consists of a lysimeter, which takes in the moisture from the surrounding soil, vacuum tubing, and because of the depth, a transfer vessel at mid-depth. The lysimeters were manufactured by Timco Manufacturing and are composed entirely of Teflon™, as is the tubing and transfer vessel. There is a 2-inch PVC casing attached to the transfer vessel. The "sand-pack" placed around the lysimeter is a silica flour slurry. The whole system is cased in a 6-inch steel casing to within four feet of the lysimeter assembly. Bentonite pellets were used to seal the lysimeter and silica pack from possible seepage from above. At the surface there are three lines with stop-cocks: (one with a pressure gauge) for pressurizing the lysimeter, one to pressurize the transfer vessel and one for transmitting the sample.

3.0 SAMPLE COLLECTION PROCEDURES

Samples of the water collected by the lysimeters are collected on a semi-annual basis. The sampling process involves applying a vacuum to the system to draw moisture into the lysimeter, transferring the water from the lysimeter to the transfer vessel and then applying pressure to the transfer vessel to drive the sample to the surface. This is generally a 3-day process. During the first day, check to make sure the gauge is in working order. Then, set the initial vacuum by opening the stop-cock on the line with the pressure gauge and applying 10-20 psi using a hand pump. Close the stop-cock. On the second day, repeat this process. To sample the system on the third day, hook-up a breathable quality compressed air tank or nitrogen tank to the line with the gauge. Open the stop-cocks on each line. Apply about 8-10 psi for 2-3 minutes. Hook-up the compressed gas tank to the transfer vessel pressure line and apply 25-30 psi. The sample will be discharged from the sample line. Collect the samples and close the stopcocks. Samples from pairs may be composited if insufficient sample is collected from a single lysimeter.

Protective gloves must be worn during sample collection and care should be taken to ensure minimal agitation/aeration of the samples. The vials must be filled completely with zero head-space. Each sample container must be carefully labeled with the sampling location, time and date, and the sampler's initials. After collection, the samples must be stored in a clean cooler containing ice or ice packs. The coolers containing samples must be stored in a secure location until transport to the laboratory.

A field blank must be collected with each lysimeter sample collected. A trip blank must be maintained for each day the lysimeters are sampled. Due to the difficulty in getting enough sample for analysis, duplicate samples are not collected for the lysimeter monitoring program.

A chain of custody form must be filled out for each sampling event. This form must be filled out fully for each sample submitted for analysis and each person responsible for the handling of these samples must sign and date the form. When the samples are delivered to the laboratory and the lab has signed for their receipt, a copy of this form must be forwarded to the QEHS Department.

4.0 SAMPLE ANALYSIS

Each sample must be analyzed for the parameters listed on Figure 3, which also contains the analytical methods and targeted method detection limits. Laboratory Quality control frequencies and precision/accuracy requirements are provided in the Quality Assurance Manual for the current contract laboratory, TriMatrix Laboratories, which is contained in the Groundwater Sampling and Analysis Plan for this facility. This manual describes the internal policies, guidelines and procedures of TriMatrix. This manual is not intended to describe the specific details of this particular monitoring program. Rather, we are to use this document as a guideline in evaluating the current laboratory's QA/QC and standard operating procedures to ensure that generally acceptable practices are employed.

5.0 RECORD KEEPING AND INSPECTION REQUIREMENTS

There are two items required to ensure adequate record keeping for the lysimeter monitoring program. First, the lysimeter sampling and inspection log (Figure 4) must be filled out at each sampling location during each sampling event. The log must include the identity of sampling personnel, the dates and time when samples are collected, a description of the sampling event, and any pertinent observations of sample characteristics or sampling environment. In addition, this form must be used to record an inspection of the lysimeter outlet including the pressure gauges, stopcocks and the outer protective casing. Second, a chain of custody form must be filled out for each sampling event, as described above. This form must be filled out fully for each sample submitted for analysis and each person responsible for the handling of these samples must sign and date the form.

6.0 DATA EVALUATION AND REPORTING REQUIREMENTS

The data must be received from the laboratory, evaluated and transmitted to the MDEQ within 60 days of sampling. The statistical analysis of the data is identical to that for the LDCRS monitoring program and is provided as Attachment A. An apparent statistically significant increase identified by the statistical test must be reported to MDEQ within 24 hours. An apparent statistically significant increase must be confirmed or refuted by resampling. In general, the lysimeters do not recharge for at least several months. Any lysimeter yielding an apparent statistically significant must be resampled within 3 months unless insufficient sample can be collected. If there is insufficient sample within 3 months this result must be reported to MDEQ along with a schedule for attempting the next sample. . Confirmed statistically significant increases must also be transmitted immediately to the MDEQ.

The semi-annual reports must include a description of the sampling event, a summary of field and laboratory QA/AC information, the field logs and a summary of any non-compliances or maintenance performed.

Attachment A
Statistical Analysis

Attachment A – Lysimeter Statistical Monitoring Plan

INTRODUCTION

The following statistical monitoring plan provides a description of the statistical procedures used for identifying a statistically significant increase of monitoring parameters in the lysimeter monitoring program at WDI. The program is intended to provide an early warning that hazardous waste constituents may be penetrating the liner systems of cells V-B, VII-A, VII-B and VII-C East and VII-C West.

STATISTICAL EVALUATION

The statistical program for lysimeter monitoring utilizes Nonparametric Prediction Limits (NPPLs) to evaluate the monitoring data. In order to balance false positive and statistical power with this test, resamples are used, the number of which are determined by the number of sampling points and the number of background observations. Since there is no "upgradient" in the lysimeter network, and there were pre-waste disposal samples collected from these devices, the definition of background is not defined in a traditional sense. Thus the use of resamples is selected somewhat arbitrarily (see below).

The NPPL is defined as the highest concentration of a monitoring parameter detected in a background sample. For parameters that are never detected in the background, the NPPL is defined as the reported detection limit. Since the parameters to be analyzed statistically are all volatile organic compounds, the reported detection limit, as listed on Figure 3 of the Lysimeter Sampling and Analysis Plan are the NPPLs. Therefore, any reported concentration of a Figure 3 parameter at or above these limits is considered an apparent statistically significant increase.

If a Figure 3 compound is detected, then the NPPL been exceeded and WDI will immediately notify the Waste Management Division (WMD) of the Michigan Department of Environmental Quality (MDEQ) and arrange resampling as soon as possible to confirm or refute the apparent statistically significant increase. Quadruplicate samples, if there is sufficient volume, will be collected for confirmation purposes and analyzed for the offending parameter(s). Since these quadruplicates are not independent samples, it does not constitute a multiple resampling as defined by the NPPL test. Thus the quadruplicate samples constitute a single resampling. If three of the four quadruplicate samples are clean, then the statistical increase is not confirmed. If two or more of the quadruplicates contain the compound of interest the apparent increase will be deemed confirmed and WDI shall respond in accordance with the current Operating License.

REVISION 3.6 – SEPTEMBER 2011

SEDIMENTATION BASIN SAMPLING AND ANALYSIS PLAN

WAYNE DISPOSAL, INC., SITE #2 MID 048 090 633

1.0 INTRODUCTION

This Sedimentation Basin Sampling and Analysis (SB SAP) plan identifies the procedures to be used for monitoring sediment samples from the north sedimentation basin (NSB), the south sedimentation basin (SSB), and, after it is constructed, the northwest sedimentation basin (NWSB) at Wayne Disposal, Inc. (WDI), Site 2. The sedimentation basins receive on-site surface water (storm water) run-off primarily from unpaved areas and final cover systems of the facility via a network of open ditches and subsurface pipes. The sedimentation basins do not receive run-off from active hazardous waste disposal cells. All surface water collected in the sedimentation basins is treated by sedimentation, filtration and activated carbon adsorption prior to discharge to Quirk Drain. The effluent from this treatment process is discharged into Quirk Drain in accordance with a National Pollutant Discharge Elimination System (NPDES) permit. This monitoring program is one of the checks on the engineered controls and operational procedures employed by WDI to detect an on-site release of hazardous waste or hazardous waste constituents as early as possible and allow WDI to initiate efforts to locate and control the source and prevent the off-site release of hazardous waste or waste constituents.

The monitoring program described in this SB SAP is designed to monitor the chemical quality of the sediments that have accumulated in the bottom of each basin over time. Monitoring the composition of certain parameters within the sediment is done to determine if hazardous waste or hazardous waste constituents are present. This monitoring program is one of the checks on the engineered controls and operational procedures employed by WDI to detect an on-site release of hazardous waste or hazardous waste constituents as early as possible and allow WDI to initiate efforts to locate and control the source and prevent the off-site release of hazardous waste or hazardous waste constituents. The SB SAP, in addition to describing the monitoring program prompts notification and response actions that WDI must take if an apparent or confirmed significant increase in a monitored parameter occurs.

2.0 REVISION

WDI may revise this SB SAP and submit the revised plan to the Chief of the Waste and Hazardous Materials Division of the Michigan Department of Environmental Quality (WHMD/MDEQ) for review and approval prior to implementation.

3.0 SAMPLE LOCATIONS

Each sedimentation basin is divided into six sections as shown in Figures 1, 2 and 3 for the SSB, NSB and NWSB, respectively. One grab sample is collected at random locations within each section of each basin during each sampling event. The locations for each sampling point are to be measured using a GPS or equivalent method and the coordinates listed on the sample log (Figure 3) included in this plan.

4.0 SAMPLE FREQUENCY

All sedimentation basins are to be sampled on an annual basis. The sampling event will include the SSB, NSB and the NWSB (after construction) and should be scheduled in the spring at approximately the same time each year.

5.0 SAMPLE COLLECTION

For each basin, a grab sample is to be collected from each section of each basin shown in Figures 1, 2, and 3. In addition, a representative composite sample from each basin is to be created by combining equal portions from each grab sample from the basin. Sufficient volume of sediment must be collected at each grab sample location such that there is adequate volume to 1) perform the required grab sample analysis, 2) contribute a portion to the composite sample and 3) have enough left over sample to used by the laboratory for a confirmation of an apparent statistically significant increase of PCBs, if necessary. Confirmation procedures are specified in Section 8.0 of this document.

The individual grab samples from each section of each basin are to be collected from a small rowboat utilizing a Ponar grab-type sampler or an auger sampler with an extension. The person conducting the sampling will position the boat at one of the sampling locations, lower the sampling device and retrieve a sample. The sample will then be removed from the sampler and placed directly into the appropriate container using a clean Teflon hand trowel. The composite sample from each respective basin is to be collected by placing equal volumes of collected sediment from each individual grab sample location within the respective basin into a stainless steel bowl or disposable foil pan. After equal portions from all grab sample locations from the respective basin have been collected and placed into the bowl/pan, the sediment in the bowl is to be gently mixed to homogenize the sample, and then placed into an appropriate container.

Clean protective gloves must be worn during sample collection and clean gloves must be used at each sample location. Care should be taken at all times when handling the samples to avoid sample cross-contamination. Each sample container must be labeled with the sampling location, the time and date of the sampling event, and the sampler's initials. The sample collection log (Figure4) is to be filled out at each sampling location and any unusual conditions (e.g. odors, sheens) encountered are to be noted. In addition, a chain of custody (COC) form is to be filled out for each sampling event. The COC is to be filled out fully for each sample submitted for analysis and each person handling the samples must sign and date the form. When the samples are delivered to the laboratory and the laboratory has signed for their receipt, a copy of this form is to be retained on site in the Quality, Environment, Health and Safety (QEHS) Department records. After collection, the samples are to be stored in a clean cooler containing ice or ice packs. The coolers containing samples are to be stored in a secure location, until being transported to the laboratory.

All non-dedicated sampling equipment is to be thoroughly cleaned and decontaminated between sample locations by scrubbing with a brush and rinsing with de-ionized water to remove all visible soil/sediment material.

Field Quality Assurance/Quality Control samples collected for each sampling event, including confirmation sampling events, include:

- One trip blank for each cooler utilized for storing and shipping PCB samples. The trip blank is to be analyzed for PCBs.
- One blind duplicate for each sampling event. The duplicate sample is to be analyzed for the identical set of parameters as the samples. The duplicate is to be collected by filling an identical set of sample containers at a given location and submitting them for an identical analysis.
- One equipment blank per sampling day for each piece of non-dedicated sampling equipment utilized in the sampling process (i.e. sample collection tool/ponar and/or composite sample collection bowl/foil pan). The equipment blank is to be collected by pouring clean de-ionized water over the decontaminated piece of equipment and collecting the rinsate in the appropriate container for analysis. The equipment blank is to be analyzed for the identical set of parameters as the samples.

6.0 SAMPLE ANALYSIS

Each grab sample from the SSB, NSB and NWSB is to be analyzed for the parameters listed in Table 1 identified as grab sample parameters. The analytical methods and method detection limits specified are also listed on Table 1. Each composite sample from each basin is to be analyzed for all of the PCB aroclors listed on Table 1 using the analytical methods and method detection limits specified. In addition, all grab samples must also be extracted for PCB analyses but only analyzed if necessary as confirmation samples per Section 8.0. In some cases, the laboratory may not attain the method detection limits specified due to sample dilutions and matrix effects. If this is the case, the laboratory report must include an explanation for not achieving the specified method detection limits.

The laboratory quality control/quality assurance manual (QA/QC Manual) describing the required internal policies, guidelines and procedures of any WDI contract lab is contained in the Groundwater Sampling and Analysis Plan (GW SAP). WDI is to use this QA/QC Manual in evaluating the QA/QC standard operating procedures of any contract laboratory utilized for the purposes of this SB SAP and ensure that the laboratory employs generally acceptable practices that meet the specifications of the QA/QC Manual in the GW SAP.

7.0 DATA EVALUATION

The analytical data from the sedimentation basin samples is to be evaluated as follows:

- For a SSB or NWSB PCB composite sample, an apparent statistically significant increase (ASSI) has occurred if the total concentration of the PCB compounds listed in Table 1 is greater than or equal to 1 mg/kg on a dry-weight basis.
- For a NSB PCB composite sample, an ASSI has occurred if the total concentration of the PCB compounds listed in Table 1 is greater than or equal to the method detection limit.
- For metals, phenols (all sedimentation basins), and total and amenable cyanide (south and northwest sedimentation basins only), the data will be evaluated using graphical trend analysis. An ASSI for any parameter has occurred if increasing concentrations are noted for any individual parameter in four consecutive sampling events and/or a ten-fold increase in concentration is noted in any parameter between sampling events in any of the

individual grab samples. If four consecutive samples show increasing concentrations, WDI must determine the difference between the first and fourth sample concentrations and determine if this quantity is greater than 10 percent of the mean of the concentration of those four measurements for that parameter. If the difference is greater than 10 percent of the mean then an ASSI is reported. If the difference is less than 10 percent of the mean then no ASSI will be reported.

8.0 RESPONSE ACTIONS

In the event of an ASSI, WDI is to verbally notify WHMD/MDEQ, Hazardous Waste Program Section staff immediately, give them an opportunity to split confirmation samples, and implement the procedures identified below to confirm the ASSI. Confirmation samples must be collected and submitted for analysis within 7 days of providing notification of an ASSI.

- For the composite PCB samples, procedures to determine if a CSSI has occurred are as follows. The additional grab samples collected in each section of the basin that were sent to the lab and extracted are to be analyzed for PCBs. If any of the grab samples for which PCBs are detected are above the action levels defined in Section 7.0 (i.e. the ASSI is repeated), then a CSSI will have been confirmed for that section of the basin that the grab sample represented.
- For the metals, total and amenable cyanide, and phenols grab samples, procedures to determine if a confirmed statistically significant increase (CSSI) has occurred are as follows. Any section of the basins for which an ASSI is reported for metals, total and

amenable cyanide, and/or phenols is to be resampled by collecting four additional samples within the section of the basin with the ASSI. If the concentrations in two of the four confirmation samples are equal to or greater than the original sample, then the increase is a confirmed statistically significant increase (CSSI).

In the event an ASSI is not repeated, WDI will resume routine monitoring. In the event an ASSI is repeated upon analyzing the second sample, a confirmed statistically significant increase (CSSI) has occurred. In the event a CSSI has occurred, WDI must notify WHMD/MDEQ in accordance with the General Operating Conditions of the Operating License for reporting noncompliance that may endanger human health or the environment. Further, within 30 days of becoming aware of a CSSI, WDI must implement the following actions depending upon the CSSI parameter and the CSSI location:

- For a metals CSSI in either basin and/or a phenolics, total cyanide, or amenable cyanide CSSI in the SSB or NWSB, submit a work plan for WHMD review and approval to delineate the extent of contamination in the basin, identify and eliminate the source of the contamination, and determine if concentrations are sufficiently elevated to require removal of sediments from the impacted basin. Guidance regarding determining whether or not removal of contaminated sediments is required is provided in Attachment 3 of the Remediation and Redevelopment Division's (RRD) Operational Memorandum No 4.
- For a PCB CSSI in the SSB or NWSB, submit a work plan to delineate and/or remove sediments from the impacted basin for the WHMD/MDEQ review and approval.

- For a PCB CSSI in the NSB, immediately implement a source assessment program by collecting quarterly grab samples for PCB analysis from each respective section of the basin for a minimum of one year and perform a trend analysis using the data.
  - If PCBs are detected above a concentration of 1 mg/kg in any individual sediment grab sample during any quarterly sampling event, submit a work plan within 30 days of the detection to delineate and/or remove sediments in the impacted basin for WHMD review and approval. In addition, WDI will submit to the WHMD/MDEQ for review and approval a work plan that provides for additional storm water sampling and analysis to identify the source of the PCBs in the NSB sediments and, depending upon the results from the additional storm water monitoring, recommend actions to eliminate the source and/or conduct additional source investigation.
  - If the PCB results from the required quarterly sampling are less than 1 mg/kg, continue to collect quarterly sediment grab samples for PCB analysis from each respective section of the basin until the one year period and the trend analysis of the data is complete. If PCBs are detected subsequent to the CSSI in any two grab samples from the basin, WDI will submit to the WHMD/MDEQ for review and approval within 30 days of the second detection a work plan that provides for additional storm water sampling and analysis to identify the source of the PCBs in the NSB sediments and, depending upon the results from the additional storm water monitoring, recommend actions to eliminate the source and/or conduct additional source investigation and removal.

WDI may voluntarily remove sediments from any sedimentation basin without WHMD/MDEQ approval if WDI verbally notifies WHMD/MDEQ, Hazardous Waste Program Section staff of the removal at least five days in advance of the removal and performs the removal in compliance with all applicable laws. In the event WDI chooses to voluntarily remove sediments from either basin in response to an ASSI or CSSI, all source investigation and removal requirements defined above shall still be implemented.

9.0 REPORTING REQUIREMENTS

A final SB SAP Report (Report) documenting the annual sampling under this plan, including the data received from the laboratory, is to be submitted to the WHMD/MDEQ within 60 days of each sampling event. All Reports must include a narrative description of the sampling event, a map of each respective basin showing each location sampled, copies of the sampling logs, a tabular summary and discussion of the data, the trend analysis calculations and discussion of the trend analysis results, a description of any ASSI and/or CSSI, as applicable, and any resampling conducted, and/or any additional actions required and/or recommended as a result of the Report findings. In addition to this report, an annual summary report of sedimentation basin monitoring results must be submitted to RMD/MDEQ by March 1 of the following year

10.0 RECORD KEEPING REQUIREMENTS

All analytical data and Reports generated under this SB SAP must be stored on site within the QEHS filing system and be available to MDEQ staff for inspection.

TABLE OF CONTENTS

SECTION 1

INTRODUCTION

1.1 PURPOSE

Energy*Solutions* has developed this Bulk Waste Disposal and Treatment Facilities – Waste Acceptance Criteria (BWF WAC) document to assist waste generators and their contractors by providing information about the capabilities and requirements of Energy*Solutions*' disposal and treatment facilities. Energy*Solutions* is authorized to receive:

- Class A Low-Level Radioactive Waste (LLRW)
- NORM/NARM
- Class A Mixed LLRW (i.e., radioactive and hazardous)
- 11e.(2) Byproduct Material
- PCB Radioactive, and
- Other various forms and types of radioactive wastes

The BWF WAC provides information on Energy*Solutions*' waste acceptance processes including:

- Waste characterization and profiling,
- Pre-shipment sampling and analysis,
- Waste packaging, transportation and delivery,
- Waste receipt, verification sampling and acceptance, and
- Waste treatment and disposal

These waste acceptance criteria collectively pertain to the Bulk Waste and Treatment Facilities which are described in detail below. The BWF WAC does not apply to Energy*Solutions*' Containerized Waste Facility (CWF). Please refer to the CWF WAC which can be downloaded from Energy*Solutions*' website at www.energysolutions.com.

1.2 SCOPE

Numerous state and federal agencies regulate the management, transportation, treatment and disposal of radioactive and hazardous materials. This document provides guidance on Energy*Solutions*' waste acceptance process and should be used in conjunction with current copies of Energy*Solutions*' licenses, permits and applicable state and federal regulations. These license, permits, and regulations take precedence over any information contained in this document. Generators may request variances from the BWF WAC on a case-by-case basis. Energy*Solutions* will evaluate such requests and provide written notification to the generator if the variance is approved.

Energy*Solutions*' licenses and permits along with links to applicable parts of the Utah Radiation Rules are included on Energy*Solutions*' website at www.energysolutions.com. In addition, Appendix A of this document contains a list of contact information for both Energy*Solutions* and the State of Utah. For additional information, representatives of Energy*Solutions*' Business Development Department are available to answer any questions and can be contacted at (801) 649-2000.

1.3 RESPONSIBILITIES

The generator is responsible to characterize, classify, schedule, manifest, package and transport waste shipments to Energy*Solutions*' disposal facility in accordance with the BWF WAC, licenses, permits, and applicable state and federal regulations. For waste classification, generators must have in place a quality control program to ensure compliance with the waste classification requirements. The generator or authorized representative must complete and submit a Radioactive Waste Profile Record to Energy*Solutions* for review and approval prior to shipment. Additional forms and certifications may also be required such as the Special Nuclear Material Exemption Certification, the PCB Waste Certification, and the Land Disposal Restriction Notification and/or Certification. Section 4 details the waste profiling process. The generator or authorized representative should be available to resolve issues that arise associated with waste shipments.

Energy*Solutions* is responsible to safely and compliantly receive, treat (if applicable), and dispose of waste shipments in accordance with all applicable permits, licenses, and regulations. Energy*Solutions* will provide disposal and/or treatment certificates upon request from the generator. In addition, Energy*Solutions* will contact the generator to resolve non-conforming waste shipments or discrepancies with the contractual terms and conditions associated in accordance with the receipt and management of waste shipments.

SECTION 2

SITE AND FACILITY DESCRIPTION

2.1 SELECTION OF THE CLIVE DISPOSAL SITE LOCATION

The initial selection of the Energy*Solutions* disposal site location dates back to the late 1970s when the Department of Energy (DOE) and the State of Utah began the cleanup of an abandoned uranium mill site. The Vitro mill site, located in central Salt Lake City, was one of the first sites cleaned up under the DOE Uranium Mill Tailings Remediation Action (UMTRA) Program.

The DOE investigated 29 sites to identify the safest permanent disposal site for these materials. After eight years of characterization and evaluation of several sites, the DOE selected the Clive site located in Utah's West Desert approximately 75 miles west of Salt Lake City. The site's remote location, low precipitation, naturally poor groundwater, and low-permeability clay soils were some of the attractive qualities of the area. From 1984 to 1988, the Vitro tailings were relocated to Clive and placed in an above-ground disposal cell.

Since acquiring land adjacent to the Vitro disposal embankment and obtaining a disposal license, the vision of Energy*Solutions*' Clive facility has been to provide a private disposal option for material from cleanups and generators of radioactive waste in separate disposal embankments similar to those used for DOE's Vitro project. The Clive site has received waste from cleanups carried out across the country including projects by the Environmental Protection Agency (EPA), DOE, Department of Defense, and private companies. The initial disposal license was for Naturally Occurring Radioactive Material (NORM). Since 1988, Energy*Solutions*' Radioactive Material License (RML) has been amended several times, expanding the types of radioactive materials to include low-level radioactive waste (LLRW), in addition to NORM.

2.2 LICENSES, PERMITS, AND AUTHORIZATIONS

Energy*Solutions* is permitted, licensed, and authorized to receive, treat, and dispose Class A LLRW, NORM/NARM, Class A Mixed LLRW, 11e.(2) Byproduct Material, Special Nuclear Material based on concentration limits, as well as Polychlorinated Biphenyl (PCB) Radioactive Waste, and PCB Mixed Waste in accordance with the following documents:

- ➢ Radioactive Material License (RML) Number UT 2300249, as amended
  - Class A LLRW as defined in Utah Administrative Code R313-15-1008
  - Class A Mixed LLRW (radioactive and hazardous)
  - NORM/NARM
  - Special Nuclear Material (concentration based limits)

- ➢ 11e.(2) Byproduct Material License Number UT 2300478, as amended
  - 11e.(2) Byproduct Material as defined by the Atomic Energy Act, as amended

- ➢ State-Issued Part B Permit Number UTD982598898, as amended
  - Storage, treatment, and disposal of Mixed Waste
  - Authorizes disposal of specific types of PCB regulated waste in the Mixed Waste disposal facility

- ➢ Groundwater Quality Discharge Permit Number UGW450005, as amended
  - Authorizes disposal of specific types of PCB regulated waste in the Class A LLRW disposal facility

- ➢ Special Nuclear Material (SNM) Exemption Order issued by the NRC, as amended
  - Authorizes receipt, storage, treatment, and disposal of waste containing SNM based on concentration limits rather than mass limits

- ➢ TSCA Coordinated Approval issued by the EPA Region 8, as amended
  - PCB Radioactive and PCB Mixed Waste (40 CFR Part 761)

Section 3 details the various waste types and waste forms that are acceptable at Energy*Solutions*. Waste streams that are subject to multiple regulations must meet the requirements for each applicable regulation.

2.3 SITE LOCATION AND ACCESS

Energy*Solutions*' operations are conducted on and adjacent to Section 32, Township 1 South, Range 11 West, SLM, Tooele County, Utah. The facility is about 75 miles west of Salt Lake City and about three miles south of Interstate 80, Exit 49. The site is conveniently accessed by both highway and rail transportation. The disposal site mailing address is:

Energy*Solutions* LLC
Clive Disposal Site
Interstate 80, Exit 49
Clive, UT 84029 (84083 if using Fed Ex)
Phone: (435) 884-0155

Energy*Solutions* receives waste shipped via bulk truck, containerized truck, enclosed truck, bulk railcars, rail boxcars, and rail intermodals. The transportation access allows Energy*Solutions* to operate throughout the entire year. The disposal site is accessed by the Union Pacific Railroad at Energy*Solutions*' private siding. Energy*Solutions* uses more than ten miles of track and three locomotives for railcar management. Covered railcar rotary dumper and covered railcar decontamination facilities allow for the efficient unloading, decontamination and return of rail shipments.

2.4 DISPOSAL AND TREATMENT FACILITIES

The design and operation of the Energy*Solutions* disposal site provides a long-term disposal solution with a minimal need for active maintenance after closure. Energy*Solutions* uses an above-ground engineered disposal cell. The design of these cells is patterned after DOE and EPA specifications for the VITRO disposal embankment. Each licensed disposal embankment meets or exceeds the applicable regulatory requirements.

Figure 2-1 shows the locations of Energy*Solutions*' waste treatment, disposal, and operations areas at the Clive facility. Energy*Solutions*' waste operations are managed as three facilities:

- "Bulk Waste Facility" (BWF) – including Mixed Waste, LARW, 11e.(2) and Class A LLRW
- "Containerized Waste Facility" (CWF) – located within the Class A LLRW area
- "Treatment Facility" (TF) – located in the southeast corner of the Mixed Waste area

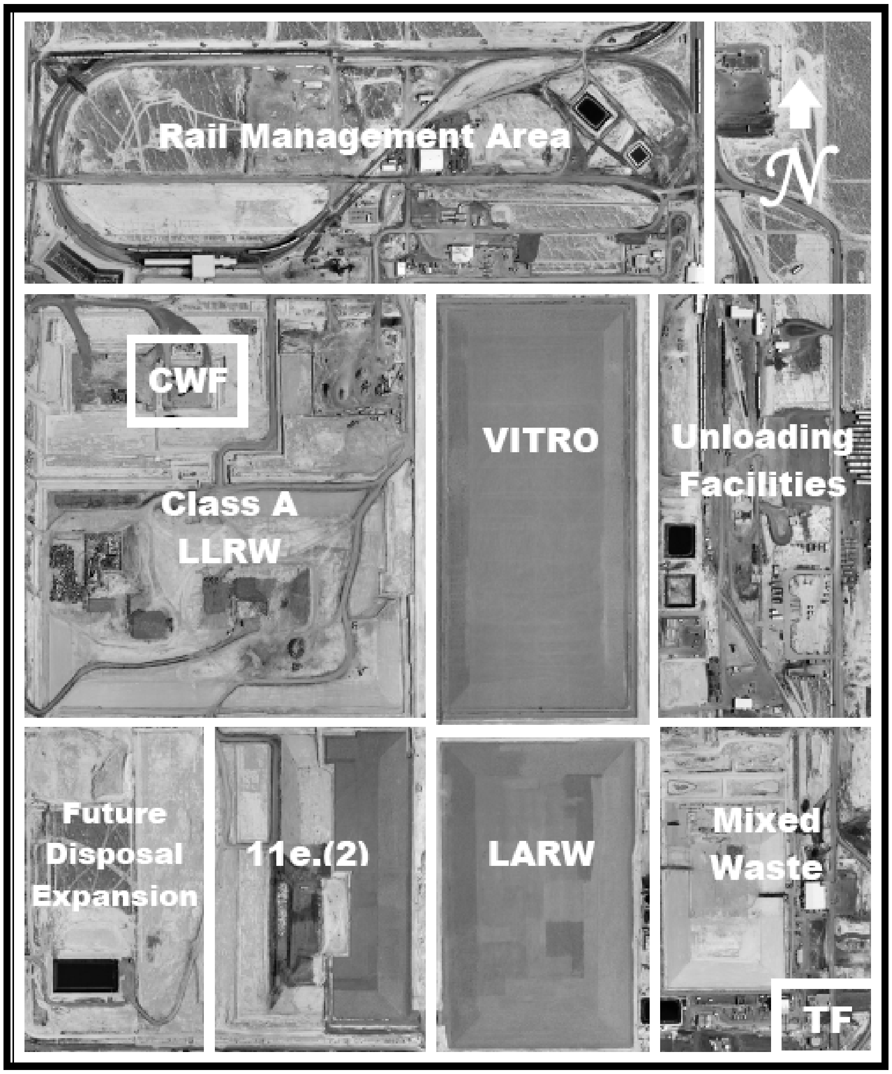

Figure 2-1. Energy*Solutions'* Disposal and Treatment Facilities

Bulk Waste Facility

Waste shipped for direct disposal that is compliant with the ALARA Criteria described below is managed at Energy*Solutions*' Bulk Waste Facility (BWF). Such waste is either removed from the container or filled with a grout-like mixture to minimize void spaces. Waste that is removed from the shipping container is typically compacted into 12-inch soil lifts. Waste that consists of debris items that do not have a dimension small enough to be compacted into the 12-inch soil lifts are disposed of using grout in a different disposal area within the BWF. Waste is directly disposed at the Class A LLRW, Mixed Waste, or 11e.(2) disposal embankments. Bulk containers (e.g., intermodals, gondolas, etc.) and non-bulk containers (e.g., drums, boxes, etc.) are acceptable for receipt at the BWF.

The Bulk Waste Facility (BWF) includes the following disposal embankments and structures:

- Class A LLRW and NORM disposal embankment
- 11e.(2) Byproduct Material disposal embankment
- Mixed Waste disposal embankment for LDR compliant solid waste
- Intermodal unloading facility for unloading and staging bulk waste shipments for disposal
- Railcar Rollover facility for unloading and staging bulk waste shipments for disposal
- Rail Wash Facility for decontamination, surveying, and releasing of railcars
- Container Wash Facility for decontamination, surveying and releasing of bulk containers

Containerized Waste Facility

Waste shipped for direct disposal exceeding Energy*Solutions*' ALARA Criteria is managed at the Containerized Waste Facility (CWF). Waste must be packaged in disposal containers (e.g., drums, boxes, liners, etc.) instead of bulk containers (e.g., intermodals, gondolas, etc.) for shipments to the CWF since Energy*Solutions* will not remove such waste from its container due to the elevated dose rates. Please refer to Energy*Solutions*' CWF WAC for information on shipping waste to the CWF.

Shipments to the CWF typically are shipped in a shielded transportation package such as a cask as illustrated in Figure 2-2.

Figure 2-2. Cask Shipment at the Containerized Waste Facility

Treatment Facility

Waste shipped to Energy*Solutions* for treatment or liquid solidification prior to disposal is managed at Energy*Solutions*' Treatment Facility. The Treatment Facility is shown in Figure 2-1 as "TF". The

Treatment Facility is designed for radioactive waste that requires treatment for RCRA constituents and for liquid radioactive wastes requiring solidification prior to disposal. Energy*Solutions*' Mixed Waste treatment and solidification capabilities include:

- Chemical Stabilization – Including oxidation, reduction, neutralization and deactivation.
- Amalgamation – For the treatment of elemental mercury.
- Macroencapsulation – For the treatment of radioactive lead solids, RCRA metal-containing batteries and hazardous debris.
- Microencapsulation – To reduce the leachability of hazardous constituents in mixed wastes that are generally dry, fine-grained materials such as ash, powders or salts.
- Liquid Solidification – For the solidification of radioactively contaminated liquids such as aqueous solutions, oils, antifreeze, etc. to facilitate land disposal. Mixed waste liquids can also be treated and solidified at the Treatment Facility.
- Vacuum Thermal Desorption of Organic Constituents - For the thermal segregation of organic constituents from wastes including wastes with PCBs. Waste containing PCB liquids is also acceptable for VTD treatment. The organic liquid condensate must be treated prior to final disposal. The non-liquid waste residue will be further treated for metal contaminates (if required) and disposed at the Mixed Waste embankment.
- Debris Spray Washing – To remove contaminants from applicable hazardous debris.

Each of these treatment technologies are discussed in further detail in Section 3.1.3.

Currently, all waste processed at the Treatment Facility are disposed in the Mixed Waste disposal embankment. The Treatment Facility includes open and covered waste storage areas for storing, sampling, and staging Mixed Waste shipments, including the following buildings and areas:

- Mixed Waste Operations Building
- Mixed Waste Treatment Building
- Liquids Storage Building
- Mixed Waste storage, staging and sampling areas

2.5 ALARA CRITERIA FOR THE BULK WASTE AND TREATMENT FACILITIES

Energy*Solutions* has implemented an "As Low As Reasonably Achievable" (ALARA) Criteria to minimize worker exposures. The ALARA Criteria is not a license condition but is used as the primary distinction between waste that is acceptable for direct disposal at the BWF and CWF. Wastes with higher dose rates exceeding the ALARA Criteria are disposed at the CWF where waste packages are directly disposed without sampling and actual waste handling. Conversely, wastes with dose rates less than the

ALARA Criteria may be disposed at the BWF since the waste is sampled and, in most cases, removed from the shipping container.

As shown in the table below, these ALARA Criteria define allowable external contact dose rates and loose surface contamination limits for waste managed at the BWF.

External Contact Dose Rate	Removable Surface Contamination On Exterior Surfaces of Debris
< 200 mR/hr on manifested container < 500 mR/hr on external, accessible surfaces of waste in container < 80 mR/hr on contact of unshielded bulk containers with resin	< 500 dpm α/100 cm^2 < 50,000 dpm β,γ/100 cm^2

External Contact Dose Rate Limits

The external contact dose rate limit of 200 mR/hr applies to the manifested container (e.g., drums/boxes on a flatbed truck or enclosed van, bulk containers such as intermodals, sealands, cargo containers, etc.). For example, if drums or boxes are shipped in a bulk container, such as an intermodal, and the intermodal is manifested as the strong, tight container, then the external contact dose rate of 200 mR/hr applies to the intermodal and not to the drums or boxes inside the intermodal. The drums and boxes in this case would be considered waste and must not contain any item with dose rates exceeding 500 mR/hr on the external, accessible surfaces of the item.

The dose rate for debris items such as pipes should only be measured on the exterior surfaces and on the plane surface of the opening of the pipe to demonstrate compliance with the ALARA Criteria. For example, the internal pipe surfaces may exceed the 500 mR/hr dose limit only if the surface plane to the opening of the pipe is less than 500 mR/hr. Shield plates used to cover the opening of the pipe should not be used solely to lower the dose rates below the criteria since Energy*Solutions* is required to remove or penetrate into the debris items to fill internal voids with grout material.

Another example is DAW placed into 55 gallon drums and compacted into pucks. The dose rate criteria apply to the external surfaces of the puck itself and not to the DAW inside the puck.

Resin External Contact Dose Rate Limits

Resins shipped in bulk containers must comply with the ALARA Criteria. This is due to the required resin blending process that necessitates worker proximity to the waste. Resins shipped in disposal containers such as drums, boxes, liners, etc. may be acceptable at the BWF for grouting if the container is compliant with the ALARA Criteria for non-bulk packages. Resins shipped to the BWF must be shipped under a Waste Profile specific for resins unless specifically approved in writing by Energy*Solutions*. Resins with dose rates that exceed these limits must be disposed at the CWF.

Removable Surface Contamination Limits

The same ALARA principles apply to the removable surface contamination limits. The main concern is controlling loose contamination on the exterior surfaces of debris items removed from the container. Fixatives may be applied to the debris items to reduce the removable contamination levels below the specified limits.

Requests for Exceptions

Requested exceptions to the ALARA Criteria are evaluated on a case-by-case basis. For example, Mixed Waste exceeding the ALARA Criteria will be evaluated since the CWF cannot accept Mixed Waste for disposal. Generators must provide radiation and contamination surveys of the container and/or waste item when requesting approval to exceed the ALARA Criteria. Dose rate measurements at one foot from the waste should be provided on the radiation survey. The transportation mode and manifested package information should also be included with the request. The generator must receive written approval for exemptions to the ALARA Criteria prior to shipment of the waste.

SECTION 3

WASTE CRITERIA

3.1 ACCEPTABLE RADIOACTIVE WASTES

The type, form, and quantity of LLRW, NORM, 11e.(2) byproduct material, and mixed waste that Energy*Solutions* can receive for treatment and disposal is governed by the various licenses and permits under which Energy*Solutions* operates. Energy*Solutions* has been issued an Agreement State Radioactive Material License (License #UT 2300249, as amended) by the Utah Division of Radiation Control (DRC). This license authorizes Energy*Solutions* to receive Class A LLRW, NORM, and NARM waste. Energy*Solutions* has been issued a separate license to receive and dispose of uranium and thorium mill tailings byproduct material as defined by section 11e.(2) of the Atomic Energy Act of 1954, as amended.

The Utah Division of Solid and Hazardous Waste (DSHW) issued Energy*Solutions* a State-Issued Part B Permit (Permit #UT 982598898, as amended) to treat and dispose of hazardous waste which is also contaminated with LLRW, NORM, or NARM wastes (mixed waste). Early in 1999, Energy*Solutions* received a Permit modification which authorized the receipt and disposal of PCB Radioactive and PCB Mixed wastes. In 2002, Energy*Solutions* received a TSCA Coordinated Approval from the EPA to expand PCB receipt and disposal options. The TSCA Coordinated Approval has been subsequently expanded to include additional types of PCB radioactive and PCB mixed wastes.

3.1.1 Class A Low-Level Radioactive Waste

Energy*Solutions* is authorized to receive Class A Low-Level and Mixed Low-Level Radioactive Waste. These wastes must be classified in accordance with the requirements of the Utah Administrative Code (UAC) R313-15-1008, Classification and Characteristics of Low-Level Radioactive Waste. Utah rule R313-15-1008 is similar to the NRC Waste Classification requirements in 10 CFR 61.55 with the addition of Radium-226. Generators must have in place a quality control program to ensure compliance with the waste classification requirements and prepare and retain with manifest documentation a record documenting the generator's waste classification analysis. Shippers and generators should also review NRC IE Bulletin No. 79-19 to ensure compliance with applicable training requirements in managing LLRW.

The information provided below is a summary of the waste classification regulations and how generators must classify their LLRW prior to shipment to Energy*Solutions*. Further guidance is provided in NRC's "Branch Technical Position on Concentration Averaging and Encapsulation", as amended (BTP). All generators shipping LLRW to Energy*Solutions* must comply with the NRC's BTP as specified in Condition 16 of the Radioactive Material License.

Determination of waste class involves two considerations. First, consideration must be given to specific long-lived radionuclides listed in Table I of UAC R313-15-1008. Second, consideration must be given to specific short-lived radionuclides listed in Table II of UAC R313-15-1008. The waste is Class A if the radionuclides listed in either Table I or Table II are not present in the waste. Both tables are provided below.

The concentration limits for determining waste class are given in curies per cubic meter with the exception of the following Table I radionuclides which are given in nanocuries per gram: alpha-emitting transuranic radionuclides with a half-life greater than five years, Pu-241, Cm-242, and Ra-226. The following bullets outline the steps for determining waste class per R313-15-1008.

Classification Tables from UAC R313-15-1008

Table I

Radionuclide	Ci/m^3	nCi/g
C-14	8	
C-14 (act)	80	
Ni-59 (act)	220	
Nb-94 (act)	0.2	
Tc-99	3	
I-129	0.08	
Alpha-emitting transuranics > 5 year half-life		100
Pu-241		3,500
Cm-242		20,000
Ra-226		100

- When the waste does not contain any radionuclides listed in either Table I or II, it is Class A.
- When the concentration does not exceed 0.1 times the value in Table I, the waste is Class A.
- When the concentration exceeds 0.1 times the value in Table I, but does not exceed the value in Table I, the waste is Class C. Energy*Solutions* is not authorized to receive Class B and Class C waste.
- For wastes containing mixtures of radionuclides listed in Table I, the total concentration shall be determined by the sum of fractions rule as illustrated in the example below.
- When the waste does not contain any of the radionuclides listed in Table I, classification shall be determined based on the concentrations shown in Table II.

Table II

Radionuclide	Column 1 Ci/m^3	Column 2 Ci/m^3	Column 3 Ci/m^3
Total of all radionuclides < 5 year half-life	700	*	*
H-3	40	*	*
Co-60	700	*	*
Ni-63	3.5	70	700
Ni-63 (act)	35	700	7,000
Sr-90	0.04	150	7,000
Cs-137	1	44	4,600

* There are no limits established for these radionuclides in Class B or C wastes. Practical considerations such as the effects of external radiation and internal heat generation on transportation, handling, and disposal will limit the concentrations for these wastes. These wastes shall be Class B unless the concentrations of other radionuclides in Table II determine the waste to be Class C independent of these radionuclides.

- When the concentration does not exceed the value in Column 1 of Table II, the waste is Class A.
- When the concentration exceeds the value in Column 1 but does not exceed the value in Column 2 of Table II, the waste is Class B.
- When the concentration exceeds the value in Column 2 but does not exceed the value in Column 3 of Table II, the waste is Class C.
- For wastes containing mixtures of the radionuclides listed in Table II, the total concentration shall be determined by the sum of fractions rule.

For waste material that contains more than one radionuclide, the waste must be classified by applying the sum of fractions rule described in UAC R313-15-1008(1)(g). This rule states:

> "For determining classification for waste that contains a mixture of radionuclides, it is necessary to determine the sum of fractions by dividing each radionuclide's concentration by the appropriate limit and adding the resulting values. The appropriate limits shall all be taken from the same column of the same table. The sum of fractions for the column shall be less than 1.0 if the waste class is to be determined by that column."

The following examples demonstrate the application of the sum of fractions rule in determining waste class.

EXAMPLE #1: A generator has one 55 gallon container of soil contaminated with plutonium-238, radium-226, uranium-234, uranium-235, uranium-238, cesium-137, and strontium-90. The density of the soil is 1.6 g/cm^3 and is used to convert concentration units from pCi/g to Ci/m^3. The radionuclide concentration in the container is as follows:

Radionuclide	**Container Concentration (pCi/g)**	**Container Concentration (Ci/m^3)***	**Table I Class A Concentration Limit (pCi/g)**	**Table II Class A Concentration Limit (Ci/m^3)**
Pu-238	3,000	4.8 E-03	10,000	- -
Ra-226	6,000	9.6 E-03	10,000	- -
U-238	5,000	8.0 E-03	- -	- -
U-235	1,100	1.8 E-03	- -	- -
U-234	5,000	8.0 E-03	- -	- -
Sr-90	5,000	8.0 E-03	- -	0.04
Cs-137	8,000	1.3 E-02	- -	1

* The soil density (1.6 g/cm^3) is used to convert from pCi/g to Ci/m^3.

The sum of fractions rule is applied to the container according to the radionuclides listed in Table I and II as follows:

$$\text{Table I:} \quad \frac{3.0E+03}{1.0E+04}+\frac{6.0E+03}{1.0E+04}=9.0E-01$$

$$\text{Table II:} \quad \frac{8.0E-03}{4.0E-02}+\frac{1.3E-02}{1.0E+00}=2.6E-02$$

Based on the sum of fractions rule, the waste in this container is determined to be Class A waste (i.e., 90 percent of the Class A limit for Table I radionuclides). This container is acceptable for disposal at Energy*Solutions* since it meets the sum of fractions rule. The uranium radionuclides are not included in the sum of fractions calculation since these radionuclides are not included in Table I or II of R313-15-1008.

EXAMPLE #2: A generator has one 55 gallon container of Dry Active Waste (DAW) contaminated with americium-241, technetium-99, europium-155, colbalt-58, and cesium-135. The density of the DAW is 0.25 g/cm^3 and is used to convert Table II units from pCi/g to Ci/m^3. The radionuclide concentration in the container is as follows:

Radionuclide	Container Concentration (pCi/g)	Container Concentration (Ci/m^3)*	Table I Class A Concentration Limit (pCi/g)	Table II Class A Concentration Limit (Ci/m^3)
Am-241	6,000	1.5 E-03	10,000	- -
Tc-99	900,000	2.3 E-01	0.3 Ci/m^3	- -
Eu-155	150,000	3.8 E-02	- -	700
Co-60	100,000	2.5 E-02	- -	700
Cs-135	500,000	1.3 E-01	- -	- -

* The DAW density (0.25 g/cm^3) is used to convert from pCi/g to Ci/m^3.

The sum of fractions rule is applied to the container according to the radionuclides listed in Table I and II as follows:

$$\text{Table I:} \quad \frac{6.0E+03}{1.0E+04}+\frac{2.3E-01}{3.0E-01}=1.4E+00$$

$$\text{Table II:} \quad \frac{3.8E-02}{7.0E+02}+\frac{2.5E-02}{7.0E+02}=9.0E-05$$

Based on the sum of fractions rule, the waste in the DAW container exceeds the Table I Class A concentration limit and would not be acceptable at Energy*Solutions*. Note that Cs-135 is not included in the sum of fractions calculation since this radionuclide is excluded in Table I or II of R313-15-1008.

<u>Waste Classification Labels on Packages</u>

All waste packages containing LLRW, including Mixed LLRW, must be labeled either "Class A Unstable" or "Class AU" and appropriately marked in Block 16 of the Uniform Low-Level Radioactive Waste Manifest Form 541. There are no State or Federal regulations that prescribe the size or color of the classification labels. The Utah DRC, however, requires that each package be labeled with a minimum of 0.5-inch lettering in contrasting color (refer to the "Generator Site Access Permit Enforcement Policy - Utah Division of Radiation Control", as amended). This requirement also applies to bulk packaging (e.g., intermodals, gondolas, etc.).

LLRW Compact Export Approval

Energy*Solutions*' disposal site is not classified as a LLRW compact site under the Federal Low-Level Radioactive Waste Policy Act, as amended. Condition 9A of the Radioactive Material License requires generators to demonstrate that the LLRW has been approved for export to Energy*Solutions* prior to the initial shipment of waste. Approval is required from the LLRW compact of origin, or for states unaffiliated, the state of origin. This license condition only applies to non-DOE generators of LLRW and excludes Mixed LLRW. In addition, Energy*Solutions* is not authorized to receive LLRW from the Northwest Compact. Please contact Energy*Solutions* for assistance in complying with this license condition.

3.1.2 NORM/NARM Waste

Energy*Solutions*' Radioactive Material License allows receipt and disposal of Naturally Occurring or Accelerator-Produced Radioactive Material (NORM/NARM). NORM/NARM does not include Byproduct, Source, or Special Nuclear Material and generally contains radionuclides in the uranium and thorium decay series. Since NORM/NARM waste is not considered LLRW, the waste classification regulations do not apply.

3.1.3 Class A Mixed Low-Level Radioactive Waste

Energy*Solutions* is authorized to receive Class A Mixed Low-Level Radioactive Waste (Mixed Waste) for (1) disposal, or (2) treatment and disposal. Mixed Waste is defined by Energy*Solutions*' State-Issued Part B Permit (# UTD982598898) as:

> Waste defined by the Low Level Radioactive Waste Policy Act, Public Law 96-573; this is radioactive waste not classified as high-level radioactive waste, transuranics waste, spent nuclear fuel, or byproduct material as defined by section 11e.(2) of the Atomic Energy Act, and contains hazardous waste that is either listed as a hazardous waste in Subpart D of 40 CFR 261 and/or exhibits any of the hazardous waste characteristics identified in Subpart C of 40 CFR 261, or hazardous waste which also contains naturally occurring radioactive materials.

In accordance with 40 CFR 268.7, a Land Disposal Restriction Notification and/or Certification must accompany each shipment of Mixed Waste. This includes former hazardous wastes that have been treated to remove the Hazardous Waste Codes.

3.1.3.1 Acceptable Hazardous Waste Codes

The specific EPA Hazardous Waste Codes that may be received by Energy*Solutions* are identified in its Statue-Issued Part B Permit. A copy of this permit is included on Energy*Solutions*' web site at www.energysolutions.com or on the Utah Division of Solid and Hazardous Waste web site at www.hazardouswaste.utah.gov/HWBranch/CFFSection/EnvirocarePermit.htm. The following Utah Hazardous Waste Codes are not acceptable at Energy*Solutions*: F999 and P999.

3.1.3.2 LDR Compliant Mixed Waste

Mixed Waste must be analyzed to determine if treatment is required prior to disposal. Mixed Waste that is determined to be compliant with the Land Disposal Restriction (LDR) treatment standards specified in 40 CFR 268 may be directly disposed in Energy*Solutions*' Mixed Waste disposal embankment. Energy*Solutions* is required to verify LDR compliance for all Mixed Waste streams prior to disposal.

Condition 14.B of the Radioactive Material License prohibits Energy*Solutions* from disposing of characteristic Mixed Waste after treatment in the LLRW disposal embankment. Energy*Solutions* has extended this condition to Mixed Waste treated by generators at their facility. The waste profile must describe the waste as having undergone treatment. As a result, any waste that at the point of generation was considered a hazardous waste per 40 CFR 261 will be disposed of in the Mixed Waste disposal embankment. As noted above, an LDR Certification must be included with the shipping paperwork for treated Mixed Waste (including formerly characteristic or listed hazardous waste).

3.1.3.3 Mixed Waste Requiring Treatment

Energy*Solutions* may also receive Mixed Waste that requires treatment in order to comply with LDR treatment standards. Energy*Solutions* is approved under the State-Issued Part B Permit to operate a mixed waste treatment facility. Mixed Waste that is not LDR compliant may be treated by Energy*Solutions* using one of the following treatment technologies or methods:

- Chemical Stabilization, Oxidation, Reduction, Neutralization, and Deactivation
- Macroencapsulation of hazardous debris or radioactive lead solids
- Debris Spray Washing
- Microencapsulation
- Thermal Treatment of Organics
- Mercury Treatment (Amalgamation)

<u>Chemical Stabilization</u>

Chemical stabilization involves the addition of approved chemical reagents in accordance with a waste-specific treatment formula and is performed in mixers at Energy*Solutions*' Treatment Facility. Formula additions of waste, reagents, and water involve the following chemical processes to chemically bind contaminants to reduce their ability to leach from the waste.

- Stabilization (STABL)
- Deactivation (DEACT)
- Neutralization (NEUTR)
- Oxidation (CHOXD)
- Reduction (CHRED)

Formula development may also be applied to Mixed Waste with very low levels of organic contaminants that require chemical destruction in order to meet total concentration based standards versus a leach standard as determined by the Toxicity Characteristic Leaching Procedure (TCLP) test. Mixed Waste requiring chemical stabilization may be sized and homogenized using various equipment including shredders, vibrating screens, and mixers. In order to evaluate chemical compatibility with the stabilization treatment process, generators shipping waste with Hazardous Waste Codes D001, D002, or D003 must provide a list of specific chemicals in each container with the shipping paperwork.

Macroencapsulation of Hazardous Debris and Radioactive Lead Solids

Mixed Waste consisting of hazardous debris may be macroencapsulated in accordance with the "Alternative Treatment Standards for Hazardous Debris" as specified in 40 CFR 268.45. Figure 3-1 illustrates macroencapsulation of hazardous debris in a container using a polymer or performed in-cell using pozzolanic material. Treatment of hazardous debris via macroencapsulation must meet the following criteria:

> "Macroencapsulation of hazardous debris requires application of surface coating materials such as polymeric organics (e.g., resins and plastics) or use of a jacket of inert inorganic materials to substantially reduce surface exposure to potential leaching media" (40 CFR 268.45).

In order for hazardous debris to qualify for this alternative treatment, the waste must comply with the debris definition in 40 CFR 268.2(g).

> "Debris means solid material exceeding a 60 mm particle size that is intended for disposal and that is: A manufactured object; or plant or animal matter; or natural geologic material. However, the following materials are not debris: Any material for which a specific treatment standard is provided in Subpart D, Part 268, namely lead acid batteries, cadmium batteries, and radioactive lead solids; Process residuals such as smelter slag and residues from the treatment of waste, wastewater, sludges, or air emission residues; and intact containers of hazardous waste that are not ruptured and that retain at least 75% of their original volume. A mixture of debris that has not been treated to the standards provided by § 268.45 and other material is subject to regulation as debris if the mixture is comprised primarily of debris, by volume, based on visual inspection" (emphasis added).

Figure 3-1. Macroencapsulation of Hazardous Debris

Therefore, packaged waste subject to macroencapsulation (MACRO) may contain other material that does not meet the debris definition (e.g., paint chips, scale, etc.) to the extent that the mixture is "comprised primarily of debris". Consistent with the ALARA principle, this definition provides generators with flexibility in managing waste streams requiring treatment without having to sort and segregate non-debris items prior to treatment. However, as noted in 40 CFR 268.2(h), "deliberate mixing of other hazardous material with debris to change its treatment classification (i.e., from waste to hazardous debris) is not allowed under the dilution prohibition in § 268.3."

Radioactive Lead Solids (RLS) are another type of hazardous waste that requires treatment via macroencapsulation. Radioactive Lead Solids include, but are not limited to, all forms of lead shielding and other elemental forms of lead. There are no size criteria for RLS unlike the 60 mm particle size requirement for hazardous debris. As such, smaller forms of RLS such as lead shot or fines require macroencapsulation prior to disposal.

Energy*Solutions*' MACRO treatment capability accommodates any size or weight of hazardous debris, thus enabling the generator to reduce the amount of time and cost associated with preparing waste packages for shipment. Generators with large debris over 20,000 pounds requiring macroencapsulation will provide the following information to Energy*Solutions* for review during the waste acceptance process: drawings, photographs, dimensions, weight, description of access ports to internal voids, radiological dose rate and contamination levels, and loading plans.

Debris Spray Washing

Debris Spray Washing is another alternative treatment option utilized by Energy*Solutions* to treat hazardous debris. High pressure water is sprayed at the debris surface to remove hazardous constituents to a "clean debris surface". This treatment technology is best if used on non-porous debris such as metal. ''Clean debris surface'' criteria are specified in 40 CFR 268.45:

> "Clean debris surface means the surface, when viewed without magnification, shall be free of all visible contaminated soil and hazardous waste except that residual staining from soil and waste consisting of light shadows, slight streaks, or minor discolorations, and soil and waste in cracks, crevices, and pits may be present provided that such staining and waste and soil in cracks, crevices, and pits shall be limited to no more than 5% of each square inch of surface area."

Microencapsulation

Microencapuslation (MICRO) is a technology used on Mixed Waste to reduce the leachability of the hazardous constituent. The types of Mixed Waste most suitable for MICRO include, but are not limited to, ash, powders, and salts. MICRO involves the combining of waste with molten polyethylene to form a material that does not leach hazardous constituents in excess of established TCLP treatment standards. Mixed Waste is placed into the mixer with polyethylene. These are mixed at a high frequency with shear and frictional forces until the polyethylene melts and mixes with the waste to create a microencapsulated waste form. The treatment system includes size separation, size reduction, and a waste dryer for waste preparation prior to treatment.

Thermal Treatment of Organics

Mixed Waste streams contaminated with organic hazardous constituents are among the most difficult waste streams to treat. The LDR treatment standards are expressed in terms of total organic concentrations (i.e., mg/kg) versus TCLP concentration based standards. As such, treatment of organic contaminated waste streams requires either destruction or removal of the organic constituent from the waste.

Energy*Solutions* utilizes Vacuum-Assisted Thermal Desorption technology (VTD) to treat organic contaminated waste streams including waste streams containing PCBs. Waste containing PCB liquids is also acceptable for VTD treatment.

Mixed Waste streams are heated in the VTD system at sufficient temperatures to volatize the organic constituents which are then condensed and collected as a liquid. The thermally treated residue is then sampled to verify LDR compliance. In some cases, the treatment residue will require additional treatment to stabilize hazardous metals prior to disposal. The organic liquid condensate will require further treatment to comply with LDR treatment standards.

Mercury Treatment

Elemental mercury contaminated with radioactive materials must be treated via amalgamation per 40 CFR 268.40. Amalgamation of elemental mercury involves the mixing of reagents with the mercury to produce a non-liquid, semi-solid amalgam that reduces the potential emissions of elemental mercury vapors to the air. The Utah DSHW also requires the amalgamation treatment to reduce the leachability of elemental mercury to below the characteristic concentration limit of 0.2 mg/L TCLP. This requirement applies to amalgamated mercury treated at either Energy*Solutions*' Treatment Facility or treated at another facility and shipped to Energy*Solutions* for disposal. Generators may ship elemental mercury contaminated with radioactive materials to Energy*Solutions* for treatment and disposal.

Energy*Solutions* is also capable of treating both Low (< 260 ppm Hg) and High Mercury Subcategory waste streams (≥ 260 ppm Hg). Waste streams containing Low Subcategory Mercury must be treated to less than 0.025 mg/L TCLP mercury. The EPA requires High Mercury Subcategory waste streams be treated thermally by incinerating (IMERC) or retorting (RMERC). Energy*Solutions* has received a site-specific treatment variance from the Utah Solid and Hazardous Waste Control Board to treat High Mercury Subcategory waste streams via stabilization instead of IMERC or RMERC. Consequently, waste streams containing High Subcategory Mercury are treated via stabilization and analyzed post-treatment to ensure the TCLP mercury results are less than 0.2 mg/L.

Hazardous debris that is contaminated with mercury may be macroencapsulated in accordance with the "Alternative Treatment Standards for Hazardous Debris" as specified in 40 CFR 268.45. Elemental mercury must be removed from hazardous debris to the maximum extent practical including, but not limited to, draining pumps, hoses, pipes, etc. and wiping excessive mercury from external surfaces.

3.1.4 11e.(2) Byproduct Material

Energy*Solutions* is licensed by the Utah DRC to receive and dispose of 11e.(2) byproduct material as defined by the Atomic Energy Act, as amended. 11e.(2) byproduct material is defined as the tailings or waste produced by the extraction or concentration of uranium or thorium from any ore processed primarily for its source material content. Shipments of 11e.(2) waste will be managed and disposed of in a separate disposal embankment specifically licensed and designed for this material.

3.1.4.1 Radionuclide Concentration Limits

Energy*Solutions* may accept 11e.(2) byproduct material with an average concentration in any transport vehicle (truck or railcar) not to exceed 4,000 pCi/g for natural uranium or for any radionuclide in the Radium-226 series, 60,000 pCi/g for Thorium-230, or 6,000 pCi/g for any radionuclide in the thorium decay series. Energy*Solutions*' 11e.(2) Byproduct Material License does not require a sum of fractions calculation. The concentration limits are based on the average concentration of the 11e.(2) byproduct material over the transport vehicle upon receipt and not each individual container on the transport vehicle.

3.1.4.2 Acceptable Forms of 11e.(2) Byproduct Material

In addition to soil and soil-like 11e.(2) byproduct material, Energy*Solutions* may accept 11e.(2) contaminated debris. The generator must certify in the Radioactive Waste Profile Record that the debris was either generated during the cleanup of an 11e.(2) facility or is an integral part of the operations of extraction or concentration of uranium or thorium.

All debris must be less than 10 inches in at least one dimension and no longer than 12 feet in any dimension. Debris that exceeds this size limit (e.g., 11e.(2) oversize debris) is not acceptable for disposal under the 11e.(2) license. Generators with 11e.(2) contaminated debris that are unable to size the debris prior to shipment must contact Energy*Solutions*' Customer Service representative to make necessary arrangements for Energy*Solutions* to size the debris upon receipt.

Shipments of 11e.(2) byproduct material containing free liquid will be considered nonconforming and managed in accordance with Energy*Solutions*' 11e.(2) license.

3.1.4.3 Certification of 11e.(2) Byproduct Material

Energy*Solutions* requires that each generator or owner certify in writing that the waste is 11.e(2) byproduct material as defined by the Atomic Energy Act, as amended. Specifically, the generator or owner must certify that the waste materials are tailings or waste produced by extraction or concentration of uranium or thorium from any ore processed primarily for its source material content. The generator or owner must also certify that the waste material does not contain any other radioactive waste or hazardous waste. The generator or owner must provide the following information as it relates to the 11e.(2) byproduct material:

- License under which the waste was processed
- Licensee that was issued the license
- License issue and/or expiration date
- Issuing agency
- Type of license
- Volume of tailings

The generator or owner must attach to the certification a list of all radiological and non-radiological constituents in the waste and the maximum and average concentrations of such constituents. Energy*Solutions* will perform an independent verification as to the accuracy of the information contained in the certification.

3.1.4.4 Shipping Paperwork for 11e.(2) Byproduct Material

Although 11e.(2) byproduct material is specifically excluded from the definition of Low-Level Radioactive Waste; Energy*Solutions* requires that all shipments be manifested using the Uniform Low-Level Radioactive Waste Manifest (NRC Forms 540 and 541). However, 11e.(2) byproduct material does not have to be classified in accordance with the requirements of URC R313-15-1008. Generators may enter "N/A" in column 16 of the NRC Form 541 for Waste Classification.

3.1.5 Special Nuclear Material

Condition 13 of the Radioactive Material License incorporates the Special Nuclear Material Exemption issued by the NRC. Under specified conditions, the exemption allows Energy*Solutions* to possess waste containing SNM in greater mass quantities than prescribed in 10 CFR Part 150 without obtaining an NRC license pursuant to 10 CFR Part 70. The conditions are based on concentration limits of SNM in the waste and have been established by the NRC to ensure criticality safety. Special Nuclear Material (SNM) is defined in the UAC R313-12-3 as:

> Plutonium, uranium-233, uranium enriched in the isotope 233 or in the isotope 235, and other material that the U.S. Nuclear Regulatory Commission, pursuant to the provisions of Section 51 of the Atomic Energy Act of 1954, as amended, determines to be Special Nuclear Material, but does not include source material; or any material artificially enriched by any of the foregoing but does not include source material.

Each generator shipping waste containing SNM (i.e., uranium enriched in U-235, U-233, Pu-236, Pu-238, Pu-239, Pu-240, Pu-241, Pu-242, Pu-243, or Pu-244) must complete and sign Energy*Solutions*' SNM Exemption Certification form as part of the waste profiling process. A copy of this form must also accompany each radioactive waste manifest for waste streams that contain any of the above isotopes. The SNM Exemption Certification form lists specific requirements that must be met in order for Energy*Solutions* to receive and accept waste containing any amount of SNM.

The NRC developed the SNM Exemption conditions based on criticality studies and independent calculations. A variety of scenarios were analyzed to determine limiting criticality conditions for waste materials containing SNM. The NRC determined that several conditions in addition to concentration limits would be required to assure criticality safety. A discussion of their approach is documented in the *Safety Evaluation Report Regarding the Proposed Exemption from Requirements of 10 CFR Part 70* (SER) (Docket 40-8989). Specific guidance from the SER is included in this section.

The following information provides general guidance on completing the SNM Exemption Certification form. These guidelines are grouped into four sections similar to the sections on the form.

3.1.5.1 Condition 1 - Percent Enrichment of Uranium-235

The first section contains a table that lists U-235 concentration limits and related measurement uncertainty values for four different scenarios. These scenarios allow for different enrichments, waste configurations and commingling with moderating material in different percentages. The measured concentrations and associated uncertainties of U-235 in individual waste containers at time of receipt must not exceed the values listed in the RML, Condition 13. Generators with low SNM concentrations relative to the specified limits may select the most restrictive scenario which allows more flexibility in demonstrating compliance with other conditions in the SNM Exemption. Check "Not Applicable" if the waste does not contain enriched U-235. Other SNM isotopes including U-233, Pu-236, and Pu-238 through Pu-244 and their associated limits are also listed.

The measurement uncertainty values listed in the last column of the table represent a maximum allowable concentration limit rather than a percentage value. The NRC provides the following guidance in the SER:

> Staff considers that a reasonable measurement uncertainty value (one-sigma) would be in the range of 15 percent. Staff used 30 percent (two-sigma) in calculating the operational limit to increase the confidence level that the concentration of the waste based on a measurement

> would not exceed the subcritical value. Other radiochemistry techniques may be used to quantify the concentration of these radionuclides. These techniques typically have lower measurement uncertainty levels, but introduce sampling uncertainty. The measurement uncertainty levels are included in condition 1 and represent 15 percent of the maximum concentration value. A concentration value was used for the measurement uncertainty rather than a percentage value to allow greater flexibility for generators with waste having very low SNM concentrations.

3.1.5.2 Condition 2 – Specified Limits for Waste Containing SNM

Each generator must certify to all five conditions listed in this section and provide justification based on process knowledge, physical observations, and/or testing. These conditions are categorized as follows:

- SNM Isotope Concentration Limits
- Spatial Distribution Requirements
- Bulk Chemical Limits
- Unusual Moderator Limits
- Soluble Uranium Limits

These conditions require the generator to adequately characterize the waste in terms of the range and variability of SNM concentrations in the waste.

<u>SNM Isotope Concentration Limits</u>

Condition 2.a requires the generator to certify that concentrations of SNM in individual waste containers do not exceed the applicable U-235 concentration limit and the concentration limits for all isotopes listed in Table 1 of the SNM Exemption Certification form. Generators must certify that measurement uncertainty values from radiological testing are less than the maximum allowable concentration values listed in Table 1. As previously stated, a concentration value was used for the measurement uncertainty rather than a percentage value to allow greater flexibility for generators with waste having very low SNM concentrations.

<u>Spatial Distribution Requirements</u>

Condition 2.b requires the generator to certify that the SNM is homogeneously distributed throughout the waste or that the SNM concentrations in any contiguous mass of 600 kilograms (1,323 lbs) do not exceed on average the specified limits. This certification may be based on process knowledge or testing of the waste. The SER provides the following guidance on verifying spatial distribution of SNM:

> Knowledge of the process by which the waste was generated or laid down may assure that the concentration varies smoothly throughout the volume with a maximum in a known location. It is then only necessary to measure the concentration at this maximum plus other measurements confirming smooth variation. In other cases where a smooth variation in SNM concentration in the waste is not present, additional measurements and characterization will be needed.

If spatial distribution of SNM in the waste is not known through process knowledge, generators may be able to certify to this requirement by using the following example.

EXAMPLE: A generator's waste stream contains less than 10 percent enriched U-235. Based on the limits in Condition 1, the corresponding U-235 concentration limit is 1,900 pCi/g. The mass of U-235 at a concentration of 1,900 pCi/g in 600 kg of waste can be calculated using the specific activity for U-235 ($2.16X10^6$ pCi/g) as follows:

$$\frac{1{,}900\,\frac{pCi}{g} \times 600{,}000\,g}{2.16X10^6\,\frac{pCi}{g}} = 527.8\ g\ U235$$

If the total mass of U-235 per container does not exceed the mass of U-235 in 600 kg of waste at 1,900 pCi/g, then compliance with the spatial distribution requirement can be achieved. Therefore, for this example, the mass of U-235 in the waste containers must not exceed 527.8 grams. Compliance with DOT regulations must also be met for shipments containing SNM.

Radioactive liquid waste containing SNM may also be accepted for solidification prior to disposal provided the SNM concentration does not exceed the SNM concentration limits specified in Condition 1. For containers of liquid waste with more than 600 kg of waste, the total activity (pCi) in the manifested container must not exceed the SNM concentration in Condition 1 times 600 kg of waste. For example, the maximum activity of Pu-239 in any manifested container of liquid waste is 6.0 mCi as shown below:

$$10{,}000\,\frac{pCi}{g} \times 600{,}000\ g = 6.0x10^9\ pCi = 6.0\,mCi\ Pu\text{ - }239$$

The maximum activity of SNM in the liquid waste is limited by the volume of liquid shipped in a container and the concentration of SNM in the waste. Consequently, to comply with this condition, the Pu-239 concentration allowed in the liquid waste decreases as the size of the shipping container increases.

Bulk Chemical Requirements

Condition 2.c excludes wastes containing "pure forms" of chemicals containing carbon, fluorine, magnesium, or bismuth in bulk quantities except as allowed by the conditions in Section 1 (e.g., a pallet of drums, a B-25 box). By "pure forms," it is meant that mixtures of the above elements such as magnesium oxide, magnesium carbonate, magnesium fluoride, bismuth oxide, etc. do not contain other elements. Demonstration of compliance with this condition may be based on process knowledge or testing.

The exclusion of bulk quantities of these chemicals in waste containing SNM is based on the criticality studies conducted by Oak Ridge National Laboratories (ORNL) for the NRC. The ORNL studies used silicon dioxide (SiO_2) to represent the waste matrix in performing criticality calculations. Additional studies were performed replacing the silicon in the SiO_2 matrix with other common elements and determined that the above chemicals produced more reactive systems. Therefore, the NRC implemented this condition to restrict waste forms that contain pure forms of these chemicals.

Unusual Moderator Limits

Condition 2.d limits the total quantities of beryllium, hydrogenous material enriched in deuterium, or graphite to one percent or less of the total weight of the waste (except as allowed by the conditions in

Section 1). Information supporting this requirement may be based on process knowledge, physical observations, or testing. The following explanation from the SER provides the basis for this limit:

> Unusually effective neutron moderating materials, such as beryllium, graphite, or heavy water, could provide a more reactive matrix. Previous evaluations have shown that the presence of large amounts of beryllium can permit criticality to occur at lower concentrations of SNM in soil. Therefore, limiting unusual moderators is required to assure the effectiveness of the SNM concentration limits in maintaining criticality safety. Because prohibiting unusual moderators could result in problems demonstrating compliance, staff decided to set a finite maximum limit on unusual moderators.

Soluble Uranium Limits

Condition 2.e limits highly soluble forms of uranium in waste packages to 350 grams of uranium-235 or 200 grams of uranium-233. If the waste contains mixtures of U-233 and U-235, the waste must meet the sum of the fractions rule on a container basis. Highly soluble forms of uranium include, but are not limited to: uranium sulfate, uranyl acetate, uranyl chloride, uranyl formate, uranyl fluoride, uranyl nitrate, uranyl potassium carbonate, and uranyl sulfate. Compliance with this condition may be based on process knowledge or testing.

This condition is based on an evaluation performed by the NRC to determine mechanisms that could increase the concentration of SNM in the waste. The SER identifies one such mechanism which involves the potential for highly soluble uranium to be readily leached with water and concentrate in the waste. Generators must evaluate each waste stream to determine the chemical composition of uranium in the waste and to ensure that the presence of highly soluble forms of uranium do not exceed the mass limits specified above.

3.1.5.3 Condition 3 – Characterization of Waste Containing SNM

The NRC developed specific pre-shipment requirements that have been implemented into the waste profiling process. Energy*Solutions* reviews this information to determine if the pre-shipment waste characterization and assurance plan is complete and that the supporting information is sufficient to demonstrate compliance with all SNM Exemption requirements. This section describes the information that must be attached to the Waste Profile and includes the following items:

- Waste Description
- Waste Characterization Summary
- Uniformity Description
- Manifest Concentration

Condition 3.a requires the generator to describe how the waste was generated, the physical form of the waste, and the uranium chemical composition. The uranium chemical composition of the waste is required to support condition 2.e which limits highly soluble forms of uranium. If compliance with this requirement cannot be demonstrated by process knowledge, approved laboratory methods are available to determine the uranium leaching characteristics of the waste.

Condition 3.b requires the generator to describe how the waste was characterized, the range of SNM concentrations, and the analytical results with error values used to develop the concentration ranges. This information is required to support Conditions 1, 2.a, and 2.b. Generators must sufficiently sample and characterize the waste to ensure that the SNM concentrations do not exceed the specified limits and that the SNM is homogeneously distributed throughout the waste.

A description of the spatial distribution of SNM in the waste is required by Condition 3.c. This description supports the certification of Condition 2.b. The NRC provides guidance in the SER to assist generators in demonstrating compliance with this requirement. Section 3.3.3.2 contains the related NRC guidance.

Condition 3.d requires a description of the methods that will be used to determine the SNM concentrations on the manifests. If concentrations of SNM are significantly lower than the specified limits or the SNM is uniformly distributed throughout the waste, generators are not necessarily required to perform direct measurements on every container. Appropriate methods such as scaling factors may be used in these instances. As SNM concentrations approach the limits, however, generators must perform more extensive characterization to determine the range and variability of SNM in the waste. The following NRC guidance is provided in the SER:

> Where the concentration is a small fraction of the concentration limit and characterization results indicate relatively small variation in that concentration, using scaling factors would be an appropriate method to determine SNM concentrations in individual waste containers. However, where the concentration of SNM approaches the concentration limit or the characterization results indicate large variations in SNM containers, using direct measurements on each package would be an appropriate method to determine SNM concentrations in individual waste containers.

Waste packages that contain elevated concentrations of SNM must be characterized by direct measurements which should involve sampling and/or radiological testing procedures for individual packages.

3.1.5.4 Condition 4 – Generator's Certification

The generator's certification of compliance is required in the final section. Each generator must certify that the information provided on the SNM Exemption Certification form is complete, true, and accurate. The form and all supporting information must be attached to the Waste Profile upon submission to Energy*Solutions*. In addition, the SNM Exemption Certification form must be included with each waste manifest. The information supporting the form, however, should not be included with the manifest.

3.1.6 Polychlorinated Biphenyl (PCB) Radioactive Waste

Energy*Solutions* is authorized to receive and dispose of most types of PCB/radioactive and PCB/mixed wastes defined by the EPA in 40 CFR 761. The EPA issued Energy*Solutions* a TSCA Coordinated Approval for receipt and disposal of drained PCB Articles and PCB Containers that contained PCBs at concentrations equal to or greater than 500 ppm. Wastes received under the TSCA Coordinated Approval must be disposed in the Mixed Waste disposal embankment. All PCB waste shipped to the Mixed Waste disposal facility must be accompanied with a Uniform Hazardous Waste Manifest. As required by 40 CFR 761, the Uniform Hazardous Waste Manifest must include the date the PCB waste was removed from service. Articles and containers of PCB waste must also be dated with the removed from service date per 40 CFR 761.65(c)(8). Empty PCB containers that contained PCBs at concentrations less than 500 ppm may be disposed in the Class A LLRW Facility; however, this waste will require a Uniform Hazardous Waste Manifest and include the removed from service date on each outer container. A Uniform Hazardous Waste Manifest is not required for any other PCB wastes disposed at the Class A LLRW Facility.

The following sections describe the types of PCB waste categories acceptable for disposal at the Class A LLRW or Mixed Waste disposal embankments. Asterisks indicate PCB waste categories that require disposal in Energy*Solutions*' Mixed Waste disposal embankment.

Energy*Solutions*' Ground Water Quality Discharge Permit (GWQDP) and State-Issued Part B Permit prohibit the receipt of any PCB liquids except for 1) intact, non-leaking PCB Small Capacitors or 2) PCB waste that will be treated via VTD. Shipments of PCB wastes containing unauthorized free liquids will not be accepted by Energy*Solutions* unless re-profiled to a VTD waste stream. Generators shipping PCB wastes in re-usable containers must be lined to prevent PCB contamination on the internal surfaces of the container. Containers contaminated with PCBs will be returned to the shipper as a PCB Container.

3.1.6.1 PCB Remediation Waste

PCB Remediation waste is waste containing PCBs as a result of a spill, release, or other unauthorized disposal, at the following concentrations: (1) Materials disposed of prior to April 18, 1978, that are currently at concentrations ≥ 50 ppm PCBs, regardless of the concentration of the original spill; (2) materials which are currently at any volume or concentration where the original source was ≥ 500 ppm PCBs beginning on April 18, 1978, or ≥ 50 ppm PCBs beginning on July 2, 1979; and (3) materials which are currently at any concentration if the PCBs are spilled or released from a source not authorized for use under this part. PCB remediation waste means soil, rags, and other debris generated as a result of any PCB spill cleanup, including, but limited to soil, gravel, dredged materials, such as sediments, settled sediment fines, and aqueous decantate from sediment, sewage sludge containing < 50 ppm PCBs, buildings and other man-made structures (such as concrete floors, wood floors, or walls) porous surfaces, and non-porous surfaces. Unless sampled and analyzed in accordance with 40 CFR 761.283, .286, or .292, the PCB waste shall be assumed to contain ≥ 50 ppm PCBs (40 CFR 761.61(a)(5)(i)(B)(2)(i)).

<table>
<tr><th>PCB Remediation Waste Category</th><th>Definition</th><th>Acceptable</th></tr>
<tr><td>Non-liquid Cleaning Materials and PPE</td><td>Includes non-porous surfaces and other non-liquid materials such as rags, gloves, booties, other disposable PPE, and similar materials resulting from PCB cleanup activities.</td><td rowspan="2">Yes</td></tr>
<tr><td>< 50 ppm or
< 100 μg/100 cm²</td><td>PCB Remediation waste containing < 50 ppm or < 100 μg/100 cm².</td></tr>

≥ 100 μg/100 cm²</td><td>PCB Remediation waste containing ≥ 50 ppm or ≥ 100 μg/100 cm².</td><td>Yes*</td></tr>
</table>

* Requires disposal in Energy*Solutions*' Mixed Waste disposal embankment.

3.1.6.2 PCB Bulk Product Waste

PCB Bulk Product waste is waste derived from manufactured products containing PCBs in a non-liquid state, at any concentration where the concentration at the time of designation for disposal was ≥ 50 ppm PCBs. PCB Bulk Product waste includes bulk wastes or debris from the demolition of buildings and other man-made structures manufactured, coated, or serviced with PCBs.

PCB Bulk Product Waste Category	Definition	Acceptable
Presumed or known to leach < 10 μg/L PCBs	Plastics (such as plastic insulation from wire or cable; radio, television and computer casings; vehicle parts; or furniture laminates); preformed or molded rubber parts and components; applied dried paints, varnishes, waxes or other similar coatings or sealants; caulking; Galbestos; non-liquid building demolition debris; or non-liquid PCB bulk product waste from the shredding of automobiles or household appliances from which PCB small capacitors have been removed (shredder fluff). Other PCB Bulk Product waste that leaches PCBs at < 10 ug/L of water measured using a procedure used to simulate leachate generation.	Yes
Presumed or known to leach ≥ 10 μg/L PCBs	Paper or felt gaskets, fluorescent light ballasts with PCBs in the potting material ≥ 50 ppm	Yes*

* Requires disposal in Energy*Solutions*' Mixed Waste disposal embankment.

3.1.6.3 PCB Articles

A PCB Article is any manufactured article, other than a PCB Container, that contains PCBs and whose surfaces have been in direct contact with PCBs. A "PCB Article" includes capacitors, transformers, electric motors, pumps, pipes and any other manufactured item (1) which is formed to a specific shape or design during manufacture, (2) which has end use functions dependent in whole or in part upon its shape or design during end use, and (3) which has either no change of chemical composition during its end use or only those changes of composition which have no commercial purpose separate from that of the PCB Article.

Energy*Solutions* received a TSCA Coordinated Approval from the EPA to receive and dispose of drained PCB Articles. PCB Articles must be drained of all liquid to the maximum extent practical but in no case shall the liquid exceed one percent of the waste volume (all free liquid must be absorbed). PCB Articles that have been drained must be filled with sufficient absorbent material to absorb all remaining liquid. Some PCB Articles also require flushing with solvents for a specified time period (e.g., PCB Transformers). Energy*Solutions* is also able to process PCB Large Capacitors and leaking PCB Small Capacitors through VTD.

The following table lists the various types of PCB Articles and whether the material is acceptable for disposal in either the mixed waste disposal embankment or LLRW disposal embankment.

PCB Articles Category		Definition	Acceptable
PCB Transformers		Any transformer that contains ≥ 500 ppm PCBs.	Yes*[1]
PCB Capacitors (Intact and non-leaking)		Any capacitor that contains ≥ 500 ppm PCBs. Capacitor is a device for accumulating and holding a charge of electricity and consisting of conducting surfaces separated by a dielectric. Assume PCBs ≥ 500 ppm in a capacitor of unknown concentration made prior to July 2, 1979. Assume PCBs < 50 ppm in a capacitor made after July 2, 1979.	--
	PCB Small Capacitors	A capacitor which contains less than 3 lbs of dielectric fluid. A capacitor whose total volume is less than 100 cubic inches may be considered to contain less than 3 lbs of dielectric fluid. Includes fluorescent light ballasts containing intact and non-leaking PCB small capacitors and PCB potting material (< 50 ppm).	Yes*
	PCB Large High or Low Voltage Capacitors	A large high voltage capacitor contains 3 lbs or more of dielectric fluid and which operates at or above 2,000 volts. A large low voltage capacitor contains 3 lbs or more of dielectric fluid and which operates below 2,000 volts.	Yes*
PCB Hydraulic Machines		Includes die casting machines	Yes*[2]
PCB-Contaminated Electrical Equipment		Any electrical equipment (such as transformers, capacitors, and circuit breakers, including those in railroad locomotives and self-propelled cars) which contain ≥ 50 ppm and < 500 ppm PCBs in the dielectric fluid. In the case of dry electrical equipment, the electrical equipment is PCB-Contaminated if it has PCBs > 10 ug/100 cm^2 and < 100 ug/100 cm^2 as measured by a standard swipe test (40 CFR 761.123).	Yes
Other PCB Articles			--
	PCB Article (≥ 500 ppm PCBs)		Yes*
	PCB-Contaminated Article	Any article which contains ≥ 50 ppm and < 500 ppm PCBs in the dielectric fluid. In the case of dry electrical equipment, the electrical equipment is PCB-Contaminated if it has PCBs > 10 ug/100 cm^2 and < 100 ug/100 cm^2 as measured by a standard swipe test per 40 CFR 761.123.	Yes

* Requires disposal in Energy*Solutions*' Mixed Waste disposal embankment.
[1] Requires solvent flushing.
[2] Requires solvent flushing if PCB concentrations ≥ 1,000 ppm.

3.1.6.4 PCB Containers

A PCB Container is any package, can, bottle, bag, barrel, drum, tank, or other device that contains PCBs or PCB Articles and whose surfaces have been in direct contact with PCBs. PCB Containers must be emptied to the extent practical and not contain any free standing liquid. All PCB Containers received for disposal require a Uniform Hazardous Waste Manifest and removed from service dates. Waste containing PCBs in a liquid or solid phase is acceptable for VTD treatment (refer to Section 3.1.3.3).

PCB Container Category	Definition	Acceptable
≥ 500 ppm PCBs	The PCB concentration of material which was contained in the PCB Containers was ≥ 500 ppm	Yes*
< 500 ppm PCBs	The concentration of material which was contained in the PCB containers was < 500 ppm	Yes

* Requires disposal in Energy*Solutions*' Mixed Waste disposal embankment.

3.1.7 UCNI and Export Controlled Waste

Energy*Solutions* has been granted approval from the DOE to receive Unclassified Controlled Nuclear Information (UCNI) and Export Controlled radioactive waste. This type of waste primarily originates from the DOE gaseous diffusion enrichment facilities. DOE generators must contact Energy*Solutions* prior to shipping UCNI and Export Controlled radioactive waste.

3.1.8 Chelating Agents

Energy*Solutions* is authorized to dispose of waste containing up to 22 percent by weight chelating agents in the Mixed Waste disposal embankment. Waste disposed of in the LLRW disposal embankment must contain less than 0.1 percent by weight chelating agents. Generators may ship waste containing greater than 22 percent chelating agents to Energy*Solutions*' Treatment Facility once approved during the waste profiling process. Energy*Solutions* will treat waste containing greater than 22 percent chelating agents prior to disposal in order to comply with this requirement.

3.1.9 Asbestos and Beryllium
