1.0 ADDITIONAL SEDIMENT SAMPLING

1.1 Introduction

This Field Sampling Plan (FSP) Addendum 9 has been prepared on behalf of West Lake Landfill OU-1 Respondents Bridgeton Landfill, LLC, Cotter Corporation (N.S.L.), and the U.S. Department of Energy (DOE) (collectively, Respondents) for the design investigation for the selected Amended Remedy for Operable Unit-1 (OU-1) of the West Lake Landfill Superfund Site (Site). The United States Environmental Protection Agency (EPA) approved (with modifications) the FSP, with the associated Design Investigation Work Plan (DIWP), Quality Assurance Project Plan (QAPP), and Data Management Plan (DMP), in September 2020. The final version of the FSP is dated October 16, 2020.

Addendum 9 has been prepared in response to: (i) analytical results from sediment samples with greater than 7.9 picocuries per gram (pCi/g) for combined thorium and/or combined radium in a subset of the samples collected between July 2022 and September 2022 and (ii) in response to EPA's June 22, 2023, Design Investigation Evaluation Report (DIER) Comment letter. Historical aerial photography was evaluated in conjunction with recently collected data to develop a plan for the next phase of field work in the North Surface Water Body (NSWB).

Addendum 9 investigation results will be summarized in an addendum to the DIER which will include the data results and a figure depicting the revised extent of RIM based on those results if changes are warranted.

1.2 Summary of Design Investigation Findings

Sediment samples were collected as part of the initial phase of the DI from locations in and adjacent to the NSWB. Results from the sampling indicated that the concentration of combined thorium at one location in the NSWB (NWB-SED-03) was greater than 7.9 pCi/g from the depth interval of 1 to 2 feet below the mud line (bml), which was the deepest interval sampled during the initial investigation. Analytical results are presented in **Table A9-1** and on **Figure A9-1**.

Based on the initial sampling results, additional sampling was proposed in FSP Addendum 7 to assess the radionuclides in deeper sediments at these locations. Analytical data for the additional sampling locations are included in **Table A9-1**. NWB-SED-03-R was installed to assess the concentration of deeper sediments in the vicinity of the original location NWB-SED-03. Step-out borings NWB-SED-03-A and NWB-SED-03-B were also installed to the west and east, respectively, and offset towards the middle of the water body from the original location (NWB-SED-03). Combined thorium at NWB-SED-03-A ranged from 6.43 pCi/g at the surface to 15.1 pCi/g at 3.0 to 3.8 feet bml, the deepest interval sampled. Combined thorium at NWB-SED-03-B ranged from 4.35 pCi/g (0.5 to 1 foot bml) to 22.5 pCi/g (3 to 4 feet bml). Based on these samples and others, the vertical extent of RIM has not been delineated in the NSWB.

Step-out borings AC-SED-7-A, NWB-SED-01-R, NWB-SED-02-R, and NWB-SED-04-R1 were installed to further delineate the vertical extent of RIM. Combined thorium results at AC-SED-7-A were lowest (1.69 pCi/g) at the deepest interval sampled (2 to 3 feet bml), and below the definition of RIM. NWB-SED-01-R was sampled with a different methodology, since previous methods were not successful, that allowed sampling from deeper intervals (i.e., 2.7 to 3 feet and 3 to 3.9 feet bml) without collecting overlying sediments. Combined thorium results observed in these deeper intervals were lower (2.08 pCi/g and 2.67 pCi/g, respectively) than the results observed from 1 to 2 feet bml during the initial mobilization (i.e., 7.02 pCi/g at NWB-SED-01) and were below

the definition of RIM. The results in NWB-SED-02-R were highest (14.1 pCi/g) and exceeded the RIM definition in the deepest interval sampled (from 2 to 3 feet bml). NWB-SED-04-R1, which was offset from the originally planned location, had a combined thorium concentration of 12 pCi/g in the deepest interval sampled (3 to 3.5 feet bml), which is above the definition of RIM.

1.3 Review of Historic Aerial Imagery

The NSWB was constructed sometime before September 7, 1953 (**Figure A9-2**) based on review of historical aerial photographs. More than half of the basin extended into the current Meeks and St. Louis County properties located northeast of the Area 2 site boundary as shown in the September 19, 1973 and May 6, 1974 aerials (see **Figures A9-3** and **A9-4**, respectively). By 1981 (see **Figure A9-5**), the north and western side of the basin were partially filled. Otherwise, the basin dimensions remained relatively unchanged until February 25, 1995 (see **Figure A9-6**), when more filling on the northern and western edges is evident. By March 17, 2000, buildings and a surrounding asphalt parking lot had been constructed on the Meeks parcel adjacent to the NSWB and Area 2 (see **Figure A9-7**). The December 15, 2022 aerial photograph in **Figure A9-8** shows that the NSWB is generally unchanged from March 17, 2000. A building was later constructed in the 2000 parking lot area but the development footprint is also generally unchanged from 2000. **Figure A9-8** shows the dimensions of the NSWB footprint as outlined from review of the aerial photographs discussed above (September 19, 1973, to December 15, 2022).

1.4 Supplemental Sampling

Additional sediment sampling activities are proposed for the NSWB and surrounding fill areas. Most of the proposed sampling is located outside of the Bridgeton Landfill property. The timing of the proposed supplemental sampling is subject to negotiation of access agreements with the property owners of the Meeks property and the St. Louis County roadway. The following section describes the scope of work and expected procedures for these activities pending access agreements.

1.4.1 North Surface Water Body Additional Delineation Sampling

Additional sampling is proposed to further delineate the vertical and lateral extent of RIM within the NSWB and specifically at NWB-SED-02-R, NWB-SED-03-A, NWB-SED-03-B, NWB-SED-03-R and NWB-SED-04-R1. Analytical results in the deepest interval sampled at these locations, as discussed above, exceed 7.9 pCi/g. The analytical results of previously collected sediment samples are shown in **Table A9-1**.

Figure A9-9 shows the locations of the additional sediment samples proposed for collection to complete the vertical and lateral extent of RIM in the NSWB. Samples will be collected continuously at 0–0.5 ft, 0.5–1 ft, and at 1-ft intervals thereafter. The last two samples will be collected at 1-ft intervals extending two ft into competent soil. The samples will be analyzed for radium and thorium isotopes to identify RIM. Assuming this extensive sampling program delineates the lateral and vertical extent of 7.9 pCi/g of combined thorium or combined radium, this sampling program is intended to both delineate and verify removal extents so that the removals would be verified during remedial action using geometric survey, not additional analytical chemistry sampling.

1.4.2 Soil Sampling Adjacent to the Current Northern Surface Water Body Footprint

Five borings (NWS-SB-001, NWB-SB-002, NWB-SB-003, NWB-SB-004 and NWB-SB-005) are proposed to be drilled adjacent to the current NSWB footprint in sediment areas filled in historically, as shown in **Figure A9-9**. Each of these borings will be drilled to elevations consistent with the sediment samples. Samples will be collected continuously at 0–0.5 ft, 0.5–1 ft, and at 1-ft intervals thereafter. The last two samples will be collected at 1-ft intervals at an elevation no less than two feet below the competent soil elevation beneath the water body. The component soil elevation is to be determined from the installation of the additional borings described in Section 1.4.1. These samples will also be analyzed for radium and thorium isotopes to identify RIM.

1.4.3 Soil Sampling Adjacent to the Area 2 Boundary and Upstream of the Current Northern Surface Water Body Footprint

Two additional borings are proposed to be drilled on east side of historic boring WL-244-MH to confirm the placement of the 7.9 pCi/g boundary between DI borings A2-TH-126 and A2-TH-127, per the request of EPA during a meeting held November 8, 2023. The proposed borings are shown in **Figure A9-9**. Each of these borings will be hand augered to four feet below DI datum. Samples will be collected continuously at 0–0.5 ft, 0.5–1 ft, and at 1-ft intervals thereafter.

1.5 Sampling Methods and Protocols

The FSP describes standardized field procedures for the work performed during the design investigation activities for OU-1. The work proposed in this Addendum uses those standard methods and protocols provided in the FSP. The specific provisions in the FSP that will be used are described below. Proposed borings are summarized in Table A9-2.

Direct push technology (DPT), as described in Section 2.2.1.1 of the FSP, will be used to drill all the vertical and lateral borings within the current footprint of the NSWB. To access the proposed drilling locations with a track rig, crane mats will be utilized if the water level in the basin remains low. Construction of a temporary central road with spurs to each drilling location may also be considered as an alternative to crane mats. If the water level in the basin is greater than 30 inches, the track rig will be placed on a barge to maneuver to the proposed drilling locations. A DPT mounted Marsh Master may also be utilized. A combination of crane mats, barge, and Marsh Master may be needed to access all the proposed locations. Sediment samples will be logged and sampled following the procedures in FSP Section 2.4.2.6. Samples will be submitted for laboratory analysis of the parameters listed in FSP Section 2.4.5.2 in lieu of those listed in FSP Section 2.4.5.3 as discussed above.

DPT will be used to drill the proposed borings within the former NSWB footprint. The fill may contain construction debris, so if the target drill depths cannot be achieved using this technology, sonic drilling techniques will be employed in a separate mobilization. Soil samples will be logged and sampled following the procedures in FSP Section 2.4.2.6. Samples will be submitted for laboratory analysis of the parameters listed in FSP Section 2.4.5.2 in lieu of those listed in FSP Section 2.4.5.3 as discussed above.

Due the presence of overhead utilities, the two proposed borings on the east side of historic boring WL-MH-244 will be hand augured. Soil samples will be logged and sampled following the procedures in FSP Section 2.4.2.6. Samples will be submitted for laboratory analysis of the parameters listed in FSP Section 2.4.5.2.

The details regarding the proposed sediment and soil sample locations are summarized in Table A9-2 and shown in **Figure A9-9**.

NOTES:

1. FEBRUARY 25, 1995 AERIAL SHOWN.
2. THE TOPOGRAPHY DEPICTED IS A COMPILE BETWEEN A SERIES OF GROUND SURVEYS FROM WEAVER CONSULTANTS GROUP (WEAVER) AND PHOTGRAMMETRIC METHODS BY FIRMATEK, LLC. THE FLIGHT DATE FOR THE FIRMATEK TOPOGRAPHY WAS NOVEMBER 11, 2002, WHILE THE WEAVER GROUND SURVEYS RANGE FROM 2020 THROUGH 2023. (2' CONTOURS SHOWN).
