Enhanced Groundwater Remediation  
Progress Report  
U.S. vs. Lindsay Manufacturing Company  
C.A. 8:92-00015  
URS Job No.: 33750799

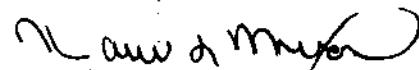

Dear Ms. Easley:

Lindsay Manufacturing Company (LMC) is pleased to submit this Enhanced Groundwater Remediation Progress Report summarizing the Consent Decree items completed or undertaken during the period from October 1, 2004 to March 31, 2005. This report presents an assessment of the supplemental remedial pumping system started in April 2004 and a summary of analytical results from the sixty-fourth (November 2004) and sixty-fifth (February 2005) quarterly rounds of groundwater sampling.

If you have any questions regarding this Enhanced Groundwater Remediation Progress Report, please do not hesitate to contact LMC or URS at your convenience.

Sincerely,

URS CORPORATION

Karen L. Mixon  
Project Manager

## **CONTENTS (Continued)**

### **FIGURES**

- 1 Vicinity Map
- 2 Well Locations Downgradient of Facility
- 3 Monitoring and Interceptor Well Locations
- 4 Estimated Capture Zone
- 5 Total VOC Concentrations (November 2004)
- 6 Total VOC Concentrations (February 2005)
- 7 MW89-12 and MW89-15 Concentration Trends
- 8 Concentration/Time Trends for Total Volatile Organics for Wells MW89-15, MW89-12, 92-3A, 92-3B, and Preister's Domestic (before)

### **TABLES**

- 1 Summary of Pumping Volumes
- 2 Summary of Wells Sampled and Analytical Plan
- 3 Summary of Analytical Results for Monitoring Wells
- 4 Summary of Analytical Results for Domestic, Irrigation, and Stock Wells

### **Appendices**

- A Capture Zone Calculations
- B Analytical Laboratory Reports and Data Review Reports

## **1.0 INTRODUCTION**

This Enhanced Groundwater Remediation Progress Report summarizes tasks completed or undertaken during the period from October 1, 2004 to March 31, 2005 as required by the Consent Decree (1992, Civil Action 8:92-00015) for the Lindsay Manufacturing facility (facility) owned and operated by Lindsay Manufacturing Company (LMC). A summary of analytical results from the sixty-fourth (November 2004) and sixty-fifth (February 2005) quarterly rounds of groundwater sampling is presented in this report as well as a cumulative assessment of the supplemental remedial pumping system started in April 2004 and shutdown for the winter in November 2004.

As required by Section 121(c) of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), as amended, 42 U.S.C. Section 9621(c), the United States Environmental Protection Agency (EPA) completed the second Five-Year Review (EPA 2003) in July 2003 of the remediation work associated with the facility located in Lindsay, Nebraska (Figure 1). The Five-Year Review concluded that the selected remedy documented in the Record of Decision (ROD) (EPA 1990) remains protective, but additional work is required to ensure that public health and the environment continue to be protected. Action items designated in the Five-Year Review included installation of an extraction well (G127000) between the facility and the Preister household (10 and 17 shown on Figure 2) and installation of wells south of the Preister property to delineate the southern extent of the chlorinated volatile organic compounds (VOCs) in groundwater.

Well G127000 was installed in February 2004 and pumping began in May 2004. Three additional monitoring wells (MW04-01, MW04-02, and MW04-03 on Figure 2) were installed in November 2004 to delineate the eastern edge and southern extent of VOCs in groundwater as described in Section 3 of this report. Additional to the pumping of downgradient extraction well G127000, LMC reestablished the pumping of the Add-On interceptor well (AOIW) and continued pumping of well MW89-12 to enhance the removal of VOCs from groundwater beneath the facility (Figure 3).

As part of the biannual reporting, the effectiveness of the remedial pumping based on capture zone analysis and groundwater quality is summarized in this report with recommendations for future operation and monitoring.

## **2.0 SUPPLEMENTAL REMEDIAL ACTIONS**

### **2.1 REMEDIAL PUMPING SYSTEM**

The current focus of remediation is removal of VOCs in the area downgradient of the facility via seasonal extraction at well G127000 and beneath the facility via wells AOIW and MW89-12. The groundwater extracted from each of these wells is discharged through center pivot irrigation systems per EPA and Nebraska Department of Environmental Quality (NDEQ) approvals. LMC

has entered into long-term agreements with several property owners for the land application and beneficial use of the extracted groundwater for irrigation purposes. Because groundwater cleanup at the facility and on adjacent properties is being conducted under CERCLA, the land application of groundwater for irrigation purposes is regulated primarily by EPA under the CERCLA program with consultation by NDEQ. It is LMC's understanding that the discharge from these wells is exempt from permitting pursuant to CERCLA section 121(e) and the 1992 Consent Decree.

The remedial pumping system was operated from April 2004 through part of November 2004, when all wells were shutdown for the winter. The volume of groundwater pumped, total days pumped, and average pumping rate for each well in the system are summarized in Table 1. Well locations are shown on Figure 3.

Well G127000 was installed in February 2004 and groundwater from the well is used to irrigate fields owned/farmed by John Preister. The purpose of extracting groundwater at well G127000 is to capture VOC-contaminated groundwater that has migrated past the facility boundary and minimize continued migration towards the Preister household and further downgradient. Well AOIW, idle since 1998, was restarted as part of the on-facility extraction system. This well provides the best opportunity to minimize migration of VOCs past the facility boundary as it is located at the boundary and its configuration allows creation of the largest capture zone. Well MW89-12 has been operated at the facility since 1989. The operation of well MW89-12 allows for extraction of VOC-contaminated groundwater closer to the source where the concentration is highest. The well is located approximately 400 feet from the facility boundary and assists in developing a "clean zone" between the source area and well AOIW on the facility. Using well MW89-12 maximizes the efficiency of the extraction system as more VOC-contaminated groundwater will be removed per day for the operational costs incurred than by using the AOIW solely. Groundwater from the AOIW and MW89-12 is used to irrigate fields south and east of the facility (Beller property) and north of the facility (LMC property), respectively. Although not utilized for groundwater interception in 2004, wells OIW and TIW are available for future use if needed. The operation of the remedial pumping systems and a preliminary capture zone analysis based on assumed operating parameters were described in the O&M Plan (URS 2004).

The pumping data summarized in Table 1 were used to estimate capture zones of each well during operation in 2004. As indicated in the O&M Plan (URS 2004), an expectation of reduced capture of VOCs relative to the preliminary capture zone analysis was anticipated due to continual adjustment of operational parameters and managing logistics during the first year of operation. Issues affecting the operation of the remedial system in 2004 are discussed with the capture zone assessment in Section 2.2.

## **2.2 CAPTURE ZONE ASSESSMENT**

The capture zone represents the area of groundwater that will be intercepted by a pumping well after the well has been operating at a constant rate for a significant period of time. Outside of the capture zone, groundwater is not intercepted by the well. Aquifer characteristics, such as

hydraulic conductivity and groundwater gradient affect the width of the capture zone, as does the pumping rate and duration from a well. URS reviewed the potential capture zones associated with extraction wells AOIW, MW89-12, and G127000 based on the data collected in 2004 and compared the results to the capture zones previously assumed during the design of the remedial pumping system.

The original capture zone analysis for wells AOIW, MW89-12, and G127000 was based on the following assumptions as described in the O&M Plan (URS 2004).

- Groundwater flow velocity for the area is approximately 1 foot per day in the vicinity of well G127000 to 2 feet per day at wells AOIW and MW89-12.
- Induced recharge from Shell Creek is minimal (applicable to well G127000 only).
- The wells will operate for an 8 to 9 month annual irrigation period at steady state conditions (continuous pumping).
- The wells will operate during spring, summer, and fall only, so evapotranspiration (in addition to the presence of the upper confining layer) will minimize the effects of induced recharge from irrigation.

Variations in the geologic and hydrogeologic properties (saturated thickness, hydraulic conductivity, etc.) were also evaluated for each well location. A capture zone was estimated for each well based on the assumptions provided above, geologic/hydrogeologic information, and predicted pumping volumes. The assumed capture zones based on the initial analysis are shown on Figure 4. The groundwater extraction from each well was intended to operate continuously, 24 hours per day, 7 days per week at assumed minimal pumping rates for 8 to 9 months during the year when feasible based on weather, infiltration, irrigation, or farming conditions (crop type).

The pumping data collected in 2004, geologic data collected during installation of additional southern terminus wells in November 2004, and additional review of hydraulic conductivity information in the Remedial Investigation (RI) Report (Dames & Moore 1990) were used to refine the capture zone for each extraction well. The associated assumptions, data, and calculations used to estimate capture zones for the operating period from April 2004 through November 2004 are provided in detail in Appendix A. The potential approximate capture zones for each well based on minimum and maximum pumping rates achieved during 2004 are shown on Figure 4. These capture zone boundaries are based on the assumption that pumping at each well was consistent and continuous at a minimum pumping rate which as shown on Table 1 was not the case during the first year of operation. Pumping at each well was at a variable rate and was intermittently disrupted for short periods of time due to maintenance requirements, mechanical adjustments, or farm practices.

## **2.2.1 AOIW**

Pumping at the AOIW began in May 2004 coincidental with the start of the irrigation season and shut down in October 2004. The well was operated most of 6 months during 2004. However, as shown on Table 1, the pumping data from May through July 2004 was lost due to telemetry equipment failure. LMC corrected the problem and data were recorded from August until the well was shut down in October 2004. The measured pumping rates from the AOIW ranged from 169 to 525 gallons per minute (gpm) compared to the planned pumping rate of 500 gpm.

The previously calculated capture zone was based on a hydraulic conductivity of 393 feet/day (URS 2004). The conductivity was revised to 550 ft/day based on additional review of the RI report (Dames & Moore 1990) and an aquifer thickness of 40 feet at the AOIW (as observed during well drilling). The higher relative hydraulic conductivity yields a narrower capture zone than previously estimated (Appendix A, Figure 4).

At the minimum pumping rate (169 gpm), the capture zone does not extend across the width of the VOC plume. However, the well was only operated at this rate for approximately 8 days at the end of the pumping period and is not representative of overall operation. At the higher recorded pumping rates (325 gpm and greater), the capture zone at AOIW extends across the plume width, although it does not extend across the facility footprint. The 2004 operational data shows that this well can develop a sufficient capture zone when operated for a sustained period at sufficient rates. However, because of the higher estimated hydraulic conductivity, the width of the capture zone is reduced. To create and maintain a capture zone that extends across the plume width at the facility, a pumping rate of 500 gpm or greater will need to be achieved and sustained for a period of 8 months. Based on the assumed groundwater velocity in the vicinity of the well, the VOC plume is estimated to migrate approximately 250 feet during the non-operational months. A sustained pumping rate of 500 gpm should be sufficient to capture VOC-contaminated groundwater that may migrate past the capture zone area of influence during non-pumping periods.

## **2.2.2 Well 89-12**

Well MW89-12 was pumped from April 2004 through November 2004. The well was operated all or part of 8 months (161 days total) during this timeframe. Pumping rates from MW89-12 ranged from 16 to 49 gpm compared to the planned pumping rate of 40 gpm.

The original hydraulic conductivity value of 374 ft/day used in the previous capture zone analysis (URS 2004) was revised to 520 ft/day based on additional review of the RI report (Dames & Moore 1990) and an aquifer thickness of 45 feet at MW89-12. As with the AOIW, the higher relative hydraulic conductivity yields a narrower capture zone than previously estimated (Appendix A, Figure 4).

The capture zone for MW89-12 is within the AOIW capture zone, and extends across the Cell 2 former source area (Figure 4). The operational history for 2004 shows that the system can

develop a sufficient capture zone when operated for a sustained period at sufficient rates. However, because of the higher estimated hydraulic conductivity, the width of the capture zone is reduced requiring a higher pumping rate to achieve an effective capture zone. The pump in well MW89-12 was replaced in January 2005 with a larger pump capable of pumping up to 100 gpm after the original pump failed in November 2004. At a sustained pumping rate of 60 gpm, the capture zone at MW89-12 should be sufficient to capture the VOC plume in the former Cell 2 source area.

### **2.2.3 Well G127000**

Pumping at well #G127000 began in May 2004 coincidental with the start of the irrigation season and shut down in September 2004. Pumping rates ranged from 120 to 561 gpm. The pumping rate at this well was increased or decreased depending upon the volume of water needed for irrigation. LMC operated well G127000 approximately 5 months during 2004. The planned pumping period of 8 months was not achieved due to reduced irrigation needs resulting from an unseasonably wet spring and early summer.

URS performed a capture zone analysis for well G127000 using pump test data for the well from the 2004 aquifer pumping test, and pumping data collected from April to September 2004.

At the minimum pumping rate (120 gpm), the capture zone does not extend across the entire width of the VOC plume. However, the capture zone does extend through the area of the plume where VOC concentrations exceed MCLs. When the system is not operational, VOCs in the center of the plume may migrate past the well. If the well is inoperative for six months, the expected migration distance is approximately 360 feet. At the 2004 maximum pumping rate (561 gpm), the leading edge of the capture zone increases significantly both laterally and downgradient to capture VOC-contaminated groundwater that migrated past the well (Figure 4). However, at the planned continuous pumping rate (250 gpm), a portion of the VOCs in the central portion of the plume may migrate past the capture zone area of influence during non-pumping periods. Because the higher pumping rates (>500 gpm) are only required intermittently during the growing season, the most beneficial option for VOC removal will be to explore options for operating well G127000 on a year-round basis.

## **2.3 SUMMARY**

The intent of the remediation pumping system was to operate on a continual basis for 8 months of the year at sustained minimum pumping rates for each well. The continuity of pumping was not established during the 2004 season. Factors affecting the length of time and pumping rate included:

- a shortened irrigation season due to a wet spring,

- variability of well discharges based on pressure head differences caused by the pivot systems as they moved across variable terrain,
- irrigation practices of the water users,
- maintenance issues and mechanical adjustments.

Overall, the wells operated from 5 to 7 months versus the 8 month planned pumping period in the O&M Plan. Additionally, pumping variations and downtime affected the formation of effective capture zones. As such, future operations should emphasize consistent pumping for the entire operational period.

As shown on Figure 4, the decreased pumping rate and higher estimated conductivity in the vicinity of the on-facility extraction wells result in narrower capture zones at wells AOIW and MW89-12 than originally predicted. As discussed above, maintaining pumping continuity and a designated minimum pumping rate are important in creating and maintaining an effective capture zone at these wells. To maintain effective capture and prevent plume migration at G127000, year-round operational options may provide the best resolution.

The potential capture zones for the three extraction wells has been adjusted based on both revised hydraulic conductivity (AOIW and MW89-12) data and pumping records for 2004. The 2004 pumping data indicate that the operational procedures can achieve adequate pumping rates to form effective capture zones; however, the 2005 operation will need to address how to continually pump each well at a minimum pumping rate for an extended period (at least 8 months) so that capture zones can be created and maintained from year to year and the mitigation of the plume movement is not adversely impacted by winter shutdowns.

## **3.0 GROUNDWATER MONITORING**

### **3.1 GROUNDWATER MONITORING SYSTEM**

The groundwater monitoring system consists of monitoring wells installed on the facility property and downgradient of the facility. Groundwater quality in the Sand and Gravel Aquifer is monitored beneath the Lindsay facility at wells MW87-3, MW89-15, MW89-12, OIW, and AOIW, and downgradient of the facility at TIW, MW89-10B, MW89-11B, MW92-3A, MW92-3B, G127000, MW04-01, MW04-02, MW04-03, and Preister's Old Domestic well. Wells monitoring the groundwater quality in the perched sand channel located beneath the facility include MW89-13 and MW89-14 (Figure 2). As noted previously, wells MW89-12, OIW, and AOIW are also used or may be used for interceptor/extraction wells.

In November 2004, LMC installed three new monitoring wells, MW04-01, MW04-02, and MW04-03 (Figure 2), to delineate the eastern edge and southern terminus of the VOC groundwater plume downgradient of the facility. These wells are screened across the full

thickness of the Sand and Gravel Aquifer. Passive diffusion bags (PDBs) were placed in each well at 10 ft intervals from the top of the screen to near the bottom to assess vertical distribution of VOCs in the Sand and Gravel Aquifer at these locations.

Several domestic, stock, and irrigation wells are included in the monitoring system on a quarterly or annual sampling basis. The Beller Domestic, Preister Domestic (installed June 2003), Beller New Stock (G122015), Beller Irrigation (#54278), and Beller Stock Tank Pens #6 and #7 (Figure 2) were sampled in November 2004 and February 2005.

The Beller Irrigation Well #54278 was retrofitted from an irrigation well to a stock well after the November 2004 sampling event and prior to the February 2005 sampling event. As part of the retrofit, a 2" casing was installed next to the primary casing to allow year round access for monitoring at this location.

The following irrigation wells were sampled in November 2004: Anthony Klassen (#G33172), John Klassen Irrigation (G56241), Martischang Irrigation, and Weylan Neal Irrigation (G31798 [Figure 2]). These wells were not available for sampling in February 2005 due to winter shutdown.

### 3.2 GROUNDWATER QUALITY

Groundwater samples from monitoring wells were collected in November 2004 and February 2005. In addition, two water samples were collected in January 2005 from a surface discharge potentially related to a spring or shallow perched groundwater. A summary of wells sampled and the analytical program is presented in Table 2. Well locations are shown on Figures 2 and 3. All samples were analyzed for VOCs unless otherwise noted. Selected sample locations were also analyzed for metals, sulfate, and pH in accordance with the modified Statement of Work (SOW) associated with the Consent Decree. In addition, samples collected from MW87-3, MW89-12, MW89-15, AOIW, Beller New Stock (G122015), Beller Domestic, Preister Domestic (2003), or MW04-03 were analyzed for 1,4-dioxane during each sampling event to follow-up on detections in samples collected in August and September 2004. Field measurements for pH, temperature and specific conductivity were recorded at the time of sample collection for those wells requiring sampling via pumps. Laboratory analytical results and field measurements are summarized in Tables 3 and 4. Concentrations of total VOCs for selected wells are shown on Figures 5 and 6. Copies of data validation memoranda and laboratory data reports are included in Appendix B of this report. Analytical anomalies were not identified during the data validation process but there were items of note.

During the review of the data from November 2004, the laboratory noted that the acid used to preserve VOC samples was contaminated with acetone and possibly 2-butanone and methylene chloride. In addition, it was noted by the reviewer that in some cases the results for acetone in the dilutions of samples exceeded the non-diluted results. As all samples collected for VOC analysis were preserved, the results for acetone in all samples associated with the November 2004 sampling

round were considered suspect and not used for evaluation. The reported results for 2-butanone and methylene chloride were considered suspect as well. Acetone and 2-butanone were reported as detected in several of the samples collected in February 2005 at relatively consistent levels that could be indicative of laboratory or field contamination unrelated to groundwater quality at Lindsay. However, at four sample locations, Beller #54278, MW04-02 (98' bgs), MW92-3A, and MW92-3B, the acetone and/or 2-butanone results were elevated well above values that can be attributed to laboratory contamination. The results at Beller #54278 may be due to products used during the well retrofit. The results at MW04-02 (98' bgs), MW92-3A, and MW92-3B appear anomalous compared to the November 2004 data. In preparation for the May 2005 sampling event, corrective actions have been implemented to address potential causes of cross-contamination resulting from laboratory or field introduced sources. The results will be reassessed after the May 2005 data are evaluated.

The laboratory raised the reporting limit for 1,4-dioxane from 1.0 ug/L to 5.0 ug/L with concurrence from URS prior to the February 2005 sampling event due to analytical complications with this compound at the lower reporting limit. EPA has not established a federal maximum contaminant level (MCL) or maximum contaminant level goal (MCLG) for 1,4-dioxane in drinking water. 1,4-Dioxane, however, is listed in USEPA's list of unregulated contaminants for drinking water, and EPA has published a health-based advisory of 3 ug/L and a risk-based preliminary remediation goal of 6.1 ug/L. Nebraska has not established an MCL, MCLG or advisory level for 1,4-dioxane. Analytical results are discussed based on whether the compound was detected or not at the specified location.

Sample analytical data for VOCs, zinc, cadmium, chromium and lead were compared to established cleanup levels identified in the SOW associated with the Consent Decree. The cleanup levels primarily consist of federal MCLs and secondary MCLs as described in the Consent Decree. Sulfate, iron and pH were compared to alternate cleanup levels agreed upon by NDEQ, EPA and LMC in December 2000.

### **3.2.1 Perched Sand Channel**

Groundwater quality in the perched sand channel located beneath the facility is monitored by wells MW89-13 and MW89-14. Concentrations of VOCs, metals, and/or conventional in wells MW89-13 and MW89-14 were similar to or less than previous quarters (Table 3); however, detected concentrations of the above-referenced compounds were below MCLs and alternate cleanup levels, with the exception of zinc at MW89-14 in November 2004. Zinc was slightly above the secondary MCL (5 mg/L).

### **3.2.2 Sand & Gravel Aquifer**

Groundwater samples collected from wells completed in the Sand and Gravel Aquifer were analyzed for VOCs, metals and inorganic parameters as summarized in Table 2. Concentrations of 1,1-dichloroethene (1,1-DCE) and/or tetrachloroethene (PCE) exceeded MCLs in samples collected from on-facility wells MW87-3, MW89-12, MW89-15, OTW, and AOIW and at

downgradient wells MW04-02, MW04-03, Preister's Old Domestic, and G127000 during both sampling events. The concentration of PCE exceeded the MCL at MW92-3A during both sampling events, but 1,1-DCE exceeded the MCL only during the February 2005 event.

Trichloroethene (TCE) exceeded the MCL at MW89-12 during both events. Other VOCs (1,1-dichloroethane, 1,2-dichloroethene, and 1,1,1-trichloroethane) at these wells were either not detected or below applicable MCLs. Generally, VOC concentrations were similar to or less than previous quarters; however at MW87-3 and MW89-15, significant increases in concentrations of one or more VOCs noted during August 2004 were also noted in November 2004. By February 2005, detected VOC concentrations in MW87-3 and MW89-15 were comparable to pre-August 2004 conditions. The increase in concentrations at MW87-3 and MW89-15 is most likely the result of the remedial pumping described in Section 2.

MW04-01, MW04-02, and MW04-03 were sampled at multiple depths below ground surface (bgs) for VOCs. In general, VOC concentrations in MW04-02 and MW04-03 increased as the sample depth increased. VOCs were not detected at MW04-01, MW89-10B, or the TIW.

As discussed in Section 3.2, the reporting limit for 1,4-dioxane was raised to 5.0 ug/L prior to the February 2005 sampling event. 1,4-Dioxane was detected in samples from MW87-3, MW89-12, MW89-15, AOIW, and G127000. Based on the results collected in November 2004 and February 2005, the highest concentrations were detected at MW89-12 and these results were below those detected at MW89-12 in August 2004.

Detected metals and sulfate concentrations in the above-referenced wells were similar to or less than previous quarters. The concentrations of iron, zinc, and sulfate exceeded the cleanup levels at MW89-15 during both sampling events. In addition, the concentration of cadmium exceeded the MCL at MW89-15 in February 2005. Concentrations of chromium detected in wells MW92-3A and MW92-3B exceeded the MCL during the November 2004 sampling event. Metals were not analyzed for at these two well locations in February 2005. With the exceptions noted above, detected concentrations of all other metals and/or sulfate and pH in monitoring wells completed in the Sand and Gravel Aquifer were below their respective MCLs or alternate cleanup levels.

### **3.2.3 Domestic, Stock, and Irrigation Wells**

#### ***Beller and Preister Home Treatment Systems***

Samples were collected from the treatment systems at the Beller and Preister households before the treatment system (BFF), after the first filter (AFF), and after the last filter (ALF). VOCs or metals were not detected above the MCLs in before treatment samples at either household. VOCs were not detected in the samples collected after the treatment systems. Low levels of PCE were detected in the Beller (AFF) samples during both sampling events but the concentrations were well below the MCL. 1,4-Dioxane was not detected in the before treatment samples during either sampling event.

### ***Additional Domestic, Stock, and Irrigation Wells***

Groundwater quality was monitored at Beller New Stock (G122015), Beller Old Irrigation, Beller Irrigation (#54278 – retro to stock well), Beller Stock Tank Pens #6 and #7, Weylan Neal Irrigation (G31798), Anthony Klassen Irrigation (G33172), John Klassen Irrigation (G56241), and Martischang Irrigation. Concentrations of VOCs, metals, and/or sulfate were similar to or less than previous quarters. With the exceptions of 1,1-DCE and PCE in Beller New Stock (G122015) Beller Stock Tank Pens #6 and #7, and Weylan Neal Irrigation (G31798), VOC concentrations were below MCLs. 1,4-Dioxane was detected in Beller New Stock (G122015) and Beller Stock Tank Pens #6 and #7. Concentrations of metals and sulfate were below MCLs and alternate cleanup levels when analyzed.

#### **3.2.4 Additional Sample Locations**

Two water samples, Surface Discharge Klassen West and Surface Discharge Klassen East, were collected in January 2005 from a surface discharge potentially related to a spring or shallow perched groundwater (Figure 6). The samples were collected to assess if VOCs and/or 1,4-dioxane were present and potentially assist in the location of additional southern terminus wells. VOCs were not detected in the sample collected from the west location and 1,4-dioxane was not detected in the western or eastern sample locations.

## **4.0 CONCLUSIONS**

VOCs are detected in groundwater from wells aligned to the southeast from the facility to MW04-03. The data indicate that the lateral dispersion of VOCs along this line is relatively narrow (Figures 5 and 6). Based on the data collected at MW04-03, the southern extent of VOC-containing groundwater has not been determined.

As discussed in previous biannual reports, peaks in concentrations at on-site wells MW89-12 and MW89-15 coincide with seasonal stress on the aquifer during the summer irrigation season (Figures 7 and 8). It is typical for concentrations to decrease and stabilize during the following winter. As shown on Figure 8, the total concentrations of VOCs monitored at downgradient wells MW92-3A, MW92-3B, and Preister's Domestic well show an overall decrease or stabilized concentrations. The concentrations of VOCs also decrease an order of magnitude from the facility (represented by MW89-15) downgradient to the Preister Domestic wells (Figure 8).

Based on the revised aquifer data and recorded pumping rates, the estimated capture zones for wells AOIW, MW89-12, and G127000 are narrower than originally predicted (Figure 4). The primary cause of the reduced capture zone area is the reduced pumping rates from the planned rates and the shorter than normal irrigation season in 2004. The zones are based on consistent pumping for 8 to 9 months at a consistent minimum rate from each extraction/irrigation well. With consistent pumping rates and an increase in pumping duration, the operational data from 2004 does indicate that the system can be effective in controlling the plume in the vicinity of the

source area (AOIW and MW89-12) and through the central portion of the downgradient plume (G127000). The operational data collected in 2004 also illustrated the impact on capture zones due to changes to pumping rates, pumping schedules, and system maintenance as the result of weather, changes in field conditions or crop rotation, seasonal farm practices (planting, spraying, harvesting), or system breakdowns.

## **5.0 PROJECTED ACTIONS FOR BIANNUAL PERIOD APRIL 1 - SEPTEMBER 30, 2005**

Based on continual review of the groundwater quality data and operations of the remedial pumping system in 2004 and the current data collected in February 2005, LMC intends to proceed with planning and completion of the following during 2005:

- Install additional monitoring wells to delineate the southern terminus of the VOC plume
- Explore options to allow extended (8 months to year-round) extraction of groundwater at G127000

Planning for installation of additional monitoring wells began after receipt of the data from MW04-02 and MW04-03 in December 2004. Currently, LMC is negotiating land agreements with owners of property identified for well placement. Upon completion of the land agreements, LMC will provide EPA a plan for the placement, well design, and sampling of additional wells. It is assumed that these wells will likely be installed post-harvest 2005 as all of the locations will require significant land work for access for drill rigs. If started in advance of the fall, crops will be destroyed as part of the installation.

The inconsistent pumping at well G127000 in 2004 was caused by the inability to use the volume of water necessary to pump and create an adequate capture zone. It is not possible to increase the pumping volume and use the resulting volume of water generated on the surrounding fields. Another means of creating and maintaining the capture zone at this location is to continually achieve the minimal pumping rate of 250 gpm but increase the overall time that the system is operated (greater than 8 months). LMC collected additional data in February 2005 (metals, sulfate, pH, 1,4-dioxane, as well as VOCs) to assess the possibility of discharging extracted water to Shell Creek. LMC intends to evaluate this possibility in preparation for the 2006 season.

## **6.0 RECOMMENDATIONS**

Based on the quarterly groundwater data collected and assessment of the remedial pumping system, URS recommends the following for the monitoring period from April 2005 to October 2005:

- Continue pumping of MW89-12 as an interceptor well with a consistently maintained pumping rate of 60 gpm from April-May through November 2005.
- Continue pumping of the AOIW to achieve continual minimum pumping rates of 500 gpm from April-May through November 2005.
- Continue pumping of G127000 to achieve continual minimum pumping rate of 250 gpm from May through September 2005 (or longer if possible). Pursue discharge options to augment the use of the water for irrigation and so that pumping can be increased to facilitate creation and maintenance of the necessary capture zone.
- Continue to delineate the southern extent of the VOC plume. As a safeguard for potential receptors downgradient prior to the installation of new monitoring wells, include sampling for VOCs of the following wells in the May 2005 and August 2005 sampling periods: Richard Wagner Irrigation, John Klassen Irrigation (G56241), Ron Pfeifer (G68239), and Tom Jarecki Domestic. The well locations are shown on Figure 2.
- Complete an elevation survey of extraction well and monitoring well measuring points in order to provide accurate water level elevation measurements and an accurate groundwater gradient for future capture zone monitoring and calculations.

Notes:  
NA = Not Analyzed or Not Available  
ND = Not Detected  
NS = No Standard

J = Indicates that value is an estimate either because quality control criteria were not met, or because the value was below the quantitation limit.

U = Indicates that the compound was analyzed for, but not detected.

UJ = The analyte was not detected above the reported sample quantitation limit; however, the reported quantitation limit is an approximate value.

bgs = Below Ground Surface

Bold font indicates result reported is above or equal to the MCL or the alternate cleanup level.

<sup>1</sup> Reference letter from State of Nebraska to Lindsay Manufacturing Company dated 12/14/00

<sup>2</sup> The EPA MCL for 1,2-DCE is the sum of the individual EPA MCLs for the cis-1,2-DCE (70 ug/L) and trans-1,2-DCE (100 ug/L) isomers.

\* EPA secondary MCLs

1,1-DCE = 1,1-Dichloroethene

1,1-DCA = 1,1-Dichloroethane

1,2-DCE = total of cis-1,2-dichloroethene and trans-1,2-dichloroethene

1,2-DCA = 1,2-Dichloroethane

1,1,1-TCA = 1,1,1-Trichloroethane

TCE = Trichloroethylene

PCE = Tetrachloroethylene

Total Volatile Organics = Sum of detected results for 1,1-DCE, 1,1-DCA, 1,2-DCE, 1,2-DCA, 1,1,1-TCA, TCE, and PCE

Notes:

NA = Not Analyzed or Not Available

ND = Not Detected

NS = No Standard

J = Indicates that value is an estimate either because quality control criteria were not met, or because the value was below the quantitation limit.

U = Indicates that the compound was analyzed for, but not detected.

UJ = The analyte was not detected above the reported sample quantitation limit; however, the reported quantitation limit is an approximate value.

Bold font indicates result reported is above or equal to the MCL or the alternate cleanup level.

<sup>1</sup> Reference letter from State of Nebraska to Lindsay Manufacturing Company dated 12/14/00

<sup>2</sup> The EPA MCL for 1,2-DCE is the sum of the individual EPA MCLs for the cis-1,2-DCE (70 ug/L) and trans-1,2-DCE (100 ug/L) isomers.

\* EPA secondary MCLs

1,1-DCE = 1,1-Dichloroethene

1,1-DCA = 1,1-Dichloroethane

1,2-DCE = total of cis-1,2-dichloroethene and trans-1,2-dichloroethene

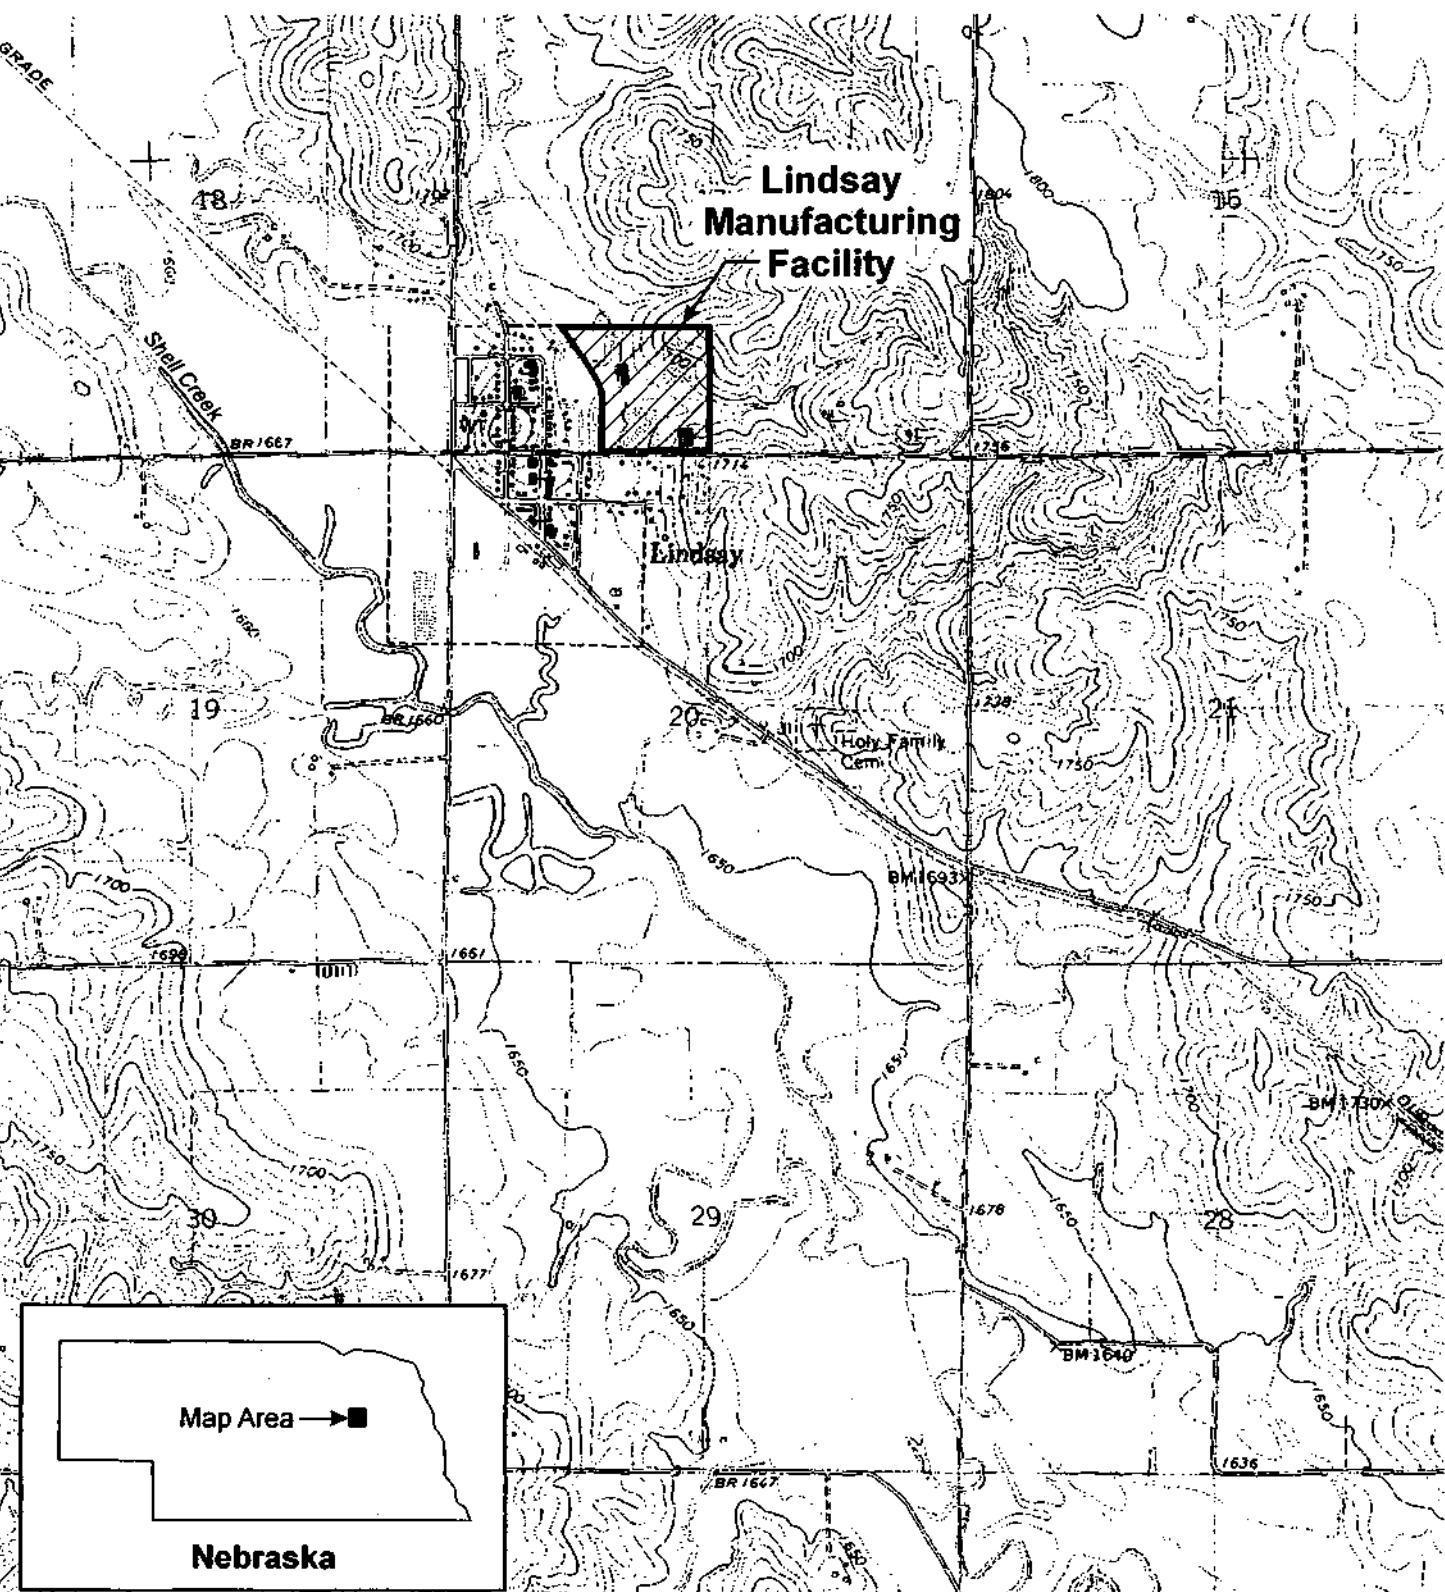

1,2-DCA = 1,2-Dichloroethane

1,1,1-TCA = 1,1,1-Trichloroethane

TCE = Trichloroethene

PCE = Tetrachloroethene

Total Volatile Organics = Sum of detected results for 1,1-DCE, 1,1-DCA, 1,2-DCE, 1,2-DCA, 1,1,1-TCA, TCE, and PCE

Project # 33750799

Date: April 6, 2005

Author: Vance Atkins

Technical Review by: Ty Griffith

**Known Conditions and Assumptions:**

Well G127000:

Range of Hydraulic conductivities based on findings of June, 2004 48-hour pumping test.

Calculated Aquifer Transmissivity range = 38,000 (pumping) to 44,000 (recovery) ft<sup>2</sup>/day

Calculated hydraulic conductivity (K) by dividing transmissivity by observed aquifer thickness (50 feet)

K range = 760 to 880 ft/day

Hydraulic gradient estimated based on observed aquifer conditions and observed travel times of VOCs

Well 89-12:

Hydraulic conductivity revised from previous calculations

Revised values based on findings of June, 1984 72-hour pumping test of Well OIW (Dames & Moore, 1990, RI/FS Table 3.6-2)

Calculated Aquifer Transmissivity = 176,000 gpd/ft = 23,500 ft<sup>2</sup>/day (based on transmissivity observed as Well P-9, approximately 90 feet southeast of 89-12 location)

Aquifer thickness = 45 feet (based on thickness observed at Well 92-2, approximately 90 feet southeast of 89-12 location) (Well 89-12 does not fully penetrate aquifer)

Calculated hydraulic conductivity by dividing transmissivity by observed aquifer thickness (45 feet)

K = 520 ft/day

Hydraulic gradient based on surveyed wellhead elevations and groundwater measurements

Well AOIW:

Hydraulic conductivity revised from previous calculations

Revised values based on findings of February, 1989 step-drawdown and constant-rate pumping tests of Well AOIW (Dames & Moore, 1990, RI/FS Table 3.6-4)

Calculated average Aquifer Transmissivity = 165,000 gpd/ft = 22,060 ft<sup>2</sup>/day

Aquifer thickness = 40 feet (based on thickness observed during drilling)

Calculated hydraulic conductivity by dividing transmissivity by observed aquifer thickness (40 feet)

K = 550 ft/day

Hydraulic gradient based on surveyed wellhead elevations and groundwater measurements

**Analytical Method:** Based on known conditions and stated assumptions.

The capture area was evaluated based on planned and actual pumping rates for the three wells using standard equations from Todd (1980) and others.

The attached calculation sheets document the formulas, the numeric values used for aquifer parameters, and the results.

Revised capture radius based on 2004 pumping records: Well G127000  
 Lindsay Manufacturing  
 Lindsay, Nebraska  
 Project # 33750799

Date: April 6, 2005

**Definition of Variables used to estimate withdrawal rate and capture radius**

	Planned pumping rate (250 gpm)			May pumping rate (120 gpm)			June pumping rate (398 gpm)			July pumping rate (294 gpm)			August pumping rate (561 gpm)			September pumping rate (188 gpm)				
	Symbol	Range of Values	units	Symbol	Range of Values	units	Symbol	Range of Values	units	Symbol	Range of Values	units	Symbol	Range of Values	units	Symbol	Range of Values	units		
Hydraulic Conductivity (from 72-hour pump test)	K	760	880	ft/day	K	760	880	ft/day	K	760	880	ft/day	K	760	880	ft/day	K	760	880	ft/day
Aquifer thickness (observed during drilling)	b	50	50	ft	b	50	50	ft	b	50	50	ft	b	50	50	ft	b	50	50	ft
Hydraulic gradient (assumed based on aquifer conditions)	i	0.001	0.001	ft/ft	i	0.001	0.001	ft/ft	i	0.001	0.001	ft/ft	i	0.001	0.001	ft/ft	i	0.001	0.001	ft/ft
	Q	48,100	48,100	ft <sup>3</sup> /day	Q	23,100	23,100	ft <sup>3</sup> /day	Q	76,600	74,100	ft <sup>3</sup> /day	Q	56,600	56,600	ft <sup>3</sup> /day	Q	108,000	108,000	ft <sup>3</sup> /day

To estimate capture we used the following equations from "Groundwater Hydrology" by D.K. Todd, 1980

$$X_{\text{stagn}} = Q/2\pi K b^2 I \text{ where } X_{\text{stagn}} \text{ is the downgradient limit of capture (the downgradient stagnation point)}$$

$$Y_{\text{div}} = +/- Q/2\pi K b^2 I \text{ where } 2^* Y_{\text{div}} \text{ equals the maximum width of capture}$$

For the tested conditions:

	Range of Values	units		Range of Values	units		Range of Values	units		Range of Values	units		Range of Values	units		Range of Values	units		
X <sub>stagn</sub> =	201	174	ft	X <sub>stagn</sub> =	97	84	ft	X <sub>stagn</sub> =	321	268	ft	X <sub>stagn</sub> =	237	205	ft	X <sub>stagn</sub> =	452	391	ft
Y <sub>div</sub> =	600	550	ft	Y <sub>div</sub> =	300	260	ft	Y <sub>div</sub> =	1000	840	ft	Y <sub>div</sub> =	700	640	ft	Y <sub>div</sub> =	1400	1230	ft

The shape of the Capture zone can be estimated by:

$$x = \frac{-y}{\tan(2\pi K b^2 I / Q)}$$

For the listed capture estimate, the shape of the capture area given by assigning a series of y values and solving for x

Low Range +/- y	x	High Range +/- y	x	Low Range +/- y	x	High Range +/- y	x	Low Range +/- y	x	High Range +/- y	x	Low Range +/- y	x	High Range +/- y	x	Low Range +/- y	x	High Range +/- y	x

**RE:** QA/QC Data Summary Review  
64th Quarterly Groundwater Sampling (November 2004)  
Organic Data  
Lindsay Manufacturing 33750799

---

The data quality review of 45 groundwater samples, one rinsate blank, and two trip blanks collected between November 7 and 22, 2004 has been completed. The samples were analyzed for volatile organic compounds (VOCs) by EPA Method 8260B at Analytical Resources, Incorporated (ARI) located in Tukwila, Washington. Selected samples were analyzed for 1,4-dioxane by EPA Method 8270C as indicated in the cross-reference below. Samples were analyzed for the chemical constituents as described in *Groundwater Monitoring Plan, Remedial Action, for Lindsay Manufacturing Company, Lindsay, Nebraska* (Management Plan), dated September 1, 2004.

The analyses were performed in general accordance with methods specified in EPA's *Test Methods for Evaluating Solid Waste (SW-846), Update IIIB*, April 1998. The laboratory provided a full data package containing sample results and associated QA/QC data. The following samples are associated with ARI sample delivery groups (SDGs) HI24, HI50, and HJ85:

<u>Sample ID</u>	<u>ARI ID</u>	<u>Requested Analyses</u>
Duplicate (Field Duplicate of 87-3)	HI24A	VOCs
89-13	HI24B	VOCs
87-3	HI24C	VOCs

The following comments refer to ARI's performance in meeting the quality control specifications described in the analytical methods. Data were qualified based on the method criteria and guidance provided in the EPA document *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review*, October 1999.

The laboratory noted that the acid used to preserve VOC samples was contaminated with acetone and possibly 2-butanone and methylene chloride. In addition, it was noted by the reviewer that in some cases the results for acetone in the dilutions of samples exceeded the non-diluted results. As all samples collected for VOC analysis were preserved, the results for acetone in all samples associated with this sampling round are qualified 'DNR' for Do Not Report. The reported results for 2-butanone and methylene chloride are considered suspect and will be monitored during the next sampling round.

Samples were shipped by overnight delivery to the laboratory and cooler temperatures were within the EPA-recommended range of 4°C±2°C.

1. Holding Times – Acceptable
2. GC/MS Instrument Performance Checks - Acceptable
3. Initial and Continuing Calibrations – Acceptable except as noted below:

VOCs by Method 8260B - The percent relative standard deviations (%RSDs) exceeded the method criteria of 15% for acetone, bromodichloromethane, bromomethane, bromoform, chloroethane, 2-chloroethylvinylether (2-CVE), dibromochloromethane, 1,1-dichloroethene, cis-1,2-dichloroethene, cis-1,3-dichloropropene, trans-1,3-dichloropropene, 2-hexanone, methylene chloride, 4-methyl-2-pentanone, styrene, 1,1,2,2-tetrachloroethane, 1,1,2-trichloroethane, trichlorofluoromethane, 1,1,2-trichloro-1,2,2-trifluoroethane, vinyl acetate, vinyl chloride, and/or o-xylene in the initial calibrations analyzed on November 5, 2004 (instrument ID Finn3), November 11, 2004 (Finn1), November 12, 2004 (Finn5).

November 19, 2004 (Finn1), and December 2, 2004 (Finn1). Due to the exceedances, the laboratory elected to evaluate the compounds based on the alternative curve types of linear or quadratic fit rather than average response factor. The correlation coefficients were acceptable for all linear and quadratic curves. Data were not qualified based on the use of alternative curve types.

The percent recovery for 2-butanone (78.1%) was below the method criteria of 80-120% in the continuing calibration analyzed on November 15, 2004 (Finn1). The results for 2-butanone in samples 89-13, 89-11B, Beller's Old Irrigation Well, 89-10B, 89-14, and Beller's Domestic BFF are qualified as estimated and flagged with a 'UJ' based on the continuing calibration.

The percent recoveries for carbon disulfide (77.3%) and trans-1,2-dichloroethene (78.0%) were below the method criteria of 80-120% in the continuing calibration analyzed on November 16, 2004 (Finn1). The results for carbon disulfide and trans-1,2-dichloroethene in samples Beller's Domestic AFF, Beller's Domestic ALF, Preister's Domestic BFF, Preister's Domestic AFF, Preister's Domestic ALF, and Lab Trip Blank (HI24Q) are qualified as estimated and flagged with a 'UJ' based on the continuing calibration.

The percent recoveries for chloromethane (62.8%), bromomethane (122.9%), trichlorofluoromethane (134.4%), and 1,1,2-trichloro-1,2,2-trifluoroethane (142.3%) were outside the method criteria of 80-120% in the continuing calibration analyzed on November 16, 2004 (Finn5). Bromomethane, trichlorofluoromethane, and 1,1,2-trichloro-1,2,2-trifluoroethane were not detected in the associated samples and are not qualified. The results for chloromethane in samples Duplicate and 87-3 are qualified as estimated and flagged with a 'UJ' based on the continuing calibration.

The percent recoveries for acetone (124.4%), methylene chloride (125.0%), and carbon disulfide (125.5%) exceeded the method criteria of 80-120% in the continuing calibration analyzed on November 17, 2004 (Finn1). Methylene chloride and carbon disulfide were not detected in samples 92-3B Well, TI Well, and Anthony Klassen Irrigation and are not qualified. Acetone was not detected in sample TI Well and is not qualified. The results for acetone in samples 92-3B Well and Anthony Klassen Irrigation were previously flagged 'DNR' and require no further qualification.

The percent recoveries for 2-CVE (60.5%), cis-1,3-dichloropropene (77.7%), trans-1,3-dichloropropene (71.3%), 2-hexanone (65.3%), and bromoform (77.2%) were below the method criteria of 80-120% in the continuing calibration analyzed on November 18, 2004 (Finn3). The 2-CVE data are rejected based on QA/QC issues identified later in this report and are not further qualified based on continuing calibration results. The results for cis-1,3-dichloropropene, trans-1,3-dichloropropene, 2-hexanone, and bromoform in samples Beller's Stock Tank Pen #7, Beller's Stock Tank Pen #6, Beller's New Stock Well, 89-12 Well (analyzed November 18, 2004), 89-15 Well, AOI Well, and Weylan Neal Irrigation are qualified as estimated and flagged with a 'UJ' based on the continuing calibration.

The percent recoveries for acetone (123.1%), methylene chloride (120.3%), and 2-butanone (121.5%) exceeded the method criteria of 80-120% in the continuing calibration analyzed on November 23, 2004 (Finn1). Methylene chloride and 2-butanone were not detected in sample Lab Trip Blank (HI50O) and are not qualified. The result for acetone in sample Lab Trip Blank (HI50O) was previously flagged 'DNR' and requires no further qualification.

The percent recoveries for acetone (76.4%), carbon disulfide (121.3%), 2-butanone (78.6%), 2-CVE (65.3%), trans-1,3-dichloropropene (73.2%), 2-hexanone (67.9%), and bromoform (79.0%) were outside the method criteria of 80-120% in the continuing calibration analyzed on November 23, 2004 (Finn3). The 2-CVE data are rejected based on QA/QC issues identified later in this report and are not further qualified based on continuing calibration results. Carbon disulfide was either not reported from this analysis date or not detected in the associated samples and is not qualified. The results for 2-butanone, trans-1,3-dichloropropene, 2-hexanone, and bromoform in samples 89-12 Well and OI Well (analyzed November 23, 2004) are qualified as estimated and flagged with a 'UJ' based on the continuing calibration results. These compounds were not reported from this analysis date for samples 92-3A Well and Preister's New Irrigation

and are not qualified. The results for acetone in samples 89-12 Well, OI Well, 92-3A Well, and Preister's New Irrigation were previously flagged 'DNR' and require no further qualification.

The percent recovery for vinyl acetate (130.0%) exceeded the method criteria of 80-120% in the continuing calibration analyzed on November 30, 2004 (Finn1). Vinyl acetate was not detected in the associated samples and is not qualified.

The percent recoveries for 1,1,2-trichloro-1,2,2-trifluoroethane (133.6%), methylene chloride (128.6%), trans-1,2-dichloroethene (78.7%), and 1,1,2,2-tetrachloroethane (77.7%) were outside the method criteria of 80-120% in the continuing calibration analyzed on December 1, 2004 (Finn1). These compounds were not reported from this analysis date for samples MW04-02 at 78', MW04-02 at 88', MW04-02 at 98', MW04-03 at 45', MW04-03 at 55', MW04-03 at 65', and MW04-03 at 85' and are not qualified. Methylene chloride results reported as detected in samples MW04-03 at 105', MW04-03 at 110', and MW04-03 at 120' are qualified as not detected due to method blank contamination as described later in this report. The results for trans-1,2-dichloroethene, and 1,1,2,2-tetrachloroethane in samples MW04-03 at 105', MW04-03 at 110', and MW04-03 at 120' are qualified as estimated and flagged with a 'UJ' based on the continuing calibration.

**1,4-Dioxane by Method 8270C** – The percent recoveries for 1,4-dioxane and the surrogate 1,4-dioxane-d8 were below the method criteria of 80-120% in the continuing calibrations analyzed on November 16, 2004 (79.7% and 71.5%, respectively) and November 17, 2004 (61.2% and 61.6%, respectively). As 1,4-dioxane is not a calibration check compound (CCC) and not commonly requested, the laboratory elected to use the more liberal in-house control criteria of 60-140%. Based on reviewer judgment, the results for 1,4-dioxane in samples Beller's Domestic BFF, Beller's Domestic ALF, Preister's Domestic BFF, Preister's Domestic ALF, 89-12 Well, 89-15 Well, and AOI Well are qualified as estimated and flagged with a 'J' or 'UJ' due to the low continuing calibration results.

4. Blanks – Acceptable except as noted below:

**VOCs by Method 8260B** – Methylene chloride was detected in the method blanks analyzed on November 16, 2004 (Finn1, 0.3 ug/L), November 17, 2004 (Finn1, 0.5 ug/L), November 30, 2004 (Finn1, 0.2 J ug/L), December 1, 2004 (Finn1, 0.5 ug/L), and December 3, 2004 (Finn1, 0.3 J ug/L). With the exceptions of samples Lab Trip Blank (HI24Q), Lab Trip Blank (HI50O), MW04-02 at 68', MW04-03 at 65', MW04-03 at 85', MW04-03 at 105', MW04-03 at 110', and MW04-03 at 120', methylene chloride was not detected in the associated samples. Per CLP guidelines, analytes detected in samples that are also detected in blanks are qualified if the sample concentration is less than five times (5x) the blank concentration. For common laboratory contaminants such as methylene chloride, acetone, and 2-butanone, analytes detected in samples that are also detected in blanks are qualified if the sample concentration is less than ten times (10x) the blank concentration. The results for methylene chloride in samples Lab Trip Blank (HI24Q), Lab Trip Blank (HI50O), MW04-02 at 68', MW04-03 at 65', MW04-03 at 85', MW04-03 at 105', MW04-03 at 110', and MW04-03 at 120' were less than 10x the method blank concentrations and are qualified as not detected and flagged 'U.'

Acetone (5.4 ug/L) and 2-butanone (1.7 ug/L) were detected in the rinsate blank collected on November 10, 2004 (HI50M). Data were not qualified based on the rinsate blank results.

5. Surrogates – Acceptable

6. Internal Standards - Acceptable

7. Laboratory Control /Laboratory Control Duplicate Sample (LCS/LCSD) – Acceptable except as noted below:

VOCs by Method 8260B – The percent recoveries for one or more analytes were outside the laboratory control limits in the LCS and/or LCSDs as indicated in the table below:

Date Analyzed	Instrument ID	Analyte	LCS Result	LCSD Result	RPD	Control Limits	Assigned Qualifier
11/16/04	Finn1	1,1,2-TC-1,2,2-TFA Methylene Chloride	122% 128%	OK OK	OK OK	65-120% 60-124%	None None
11/16/04	Finn5	Acetone	OK	131%	OK	43-130%	DNR
11/18/04	Finn3	cis-1,3-DCP	OK	71.0%	OK	74-131%	None
11/22/04	Finn1	Vinyl Acetate	125%	OK	OK	27-122%	None
11/23/04	Finn3	cis-1,3-DCP trans-1,3-DCP	OK OK	71.0% 65.6%	OK OK	74-131% 68-127%	None None
12/1/04	Finn1	1,1,2-TC-1,2,2-TFA Methylene Chloride	132% 125%	130% 125%	OK OK	65-120% 60-124%	None None

OK = Result acceptable

RPD = Relative Percent Difference

1,1,2-TC-1,2,2-TFA = 1,1,2-Trichloro-1,2,2-trifluoroethane

cis-1,3-DCP = cis-1,3-Dichloropropene

trans-1,3-DCP = trans-1,3-Dichloropropene

Data qualifiers were not assigned if at least two out of three control criteria were acceptable (LCS, LCSD, and/or RPD). In the event that the percent recoveries in the LCS and LCSD exceeded the control limits, data qualifiers were not assigned if the affected compound was reported as not detected in the associated samples.

Methylene chloride and 1,1,2-trichloro-1,2,2-trifluoroethane were either not reported from the respective analyses or reported as not detected in the samples analyzed on December 1, 2004 (Finn1) and are not qualified based on the LCS/LCSD results.

8. Matrix Spike/Matrix Spike Duplicate (MS/MSD) - Acceptable except as noted below:

VOCs by Method 8260B – MS/MSDs were performed on samples Beller's Domestic AFF, Martischang Irrigation, 89-12 Well, MW04-01 at 96', and MW04-03 at 85'. 2-CVE was not recovered from the MS/MSD pairs. Data are not typically qualified based on MS/MSD results alone; however, the non-recovery of 2-CVE is likely due to decomposition of 2-CVE by the hydrochloric acid sample preservative. As all of the associated samples were acidified for preservation, results for 2-CVE in all samples are rejected and flagged with an 'R.'

In addition to 2-CVE, the percent recoveries for one or more analytes were outside the laboratory control limits as indicated in the table below:

Sample ID	Analyte	MS Result	MSD Result	RPD	Control Limits	Assigned Qualifier
89-12 Well	Chloromethane	134%	OK	OK	46-133%	None
	Vinyl Chloride	134%	OK	OK	49-133%	None
	cis-1,3-DCP	OK	70.8%	OK	74-131%	None
	trans-1,3-DCP	OK	66.0%	OK	68-127%	None
MW04-01 at 96'	1,1,2-TC-1,2,2-TFA	122%	122%	OK	65-120%	None
	1,1,2,2-Tetrachloroethane	OK	75.0%	OK	77-124%	None
MW04-03 at 85'	1,1,2-TC-1,2,2-TFA	140%	140%	OK	65-120%	None
	1,1-Dichloroethene	215%	210%	OK	71-117%	J
	Methylene Chloride	162%	175%	OK	60-124%	None
	trans-1,2-Dichloroethene	69.0%	72.0%	OK	74-117%	UJ
	1,1,1-Trichloroethane	150%	162%	OK	70-120%	J
	1,1,2,2-Tetrachloroethane	69.5%	OK	OK	77-124%	None

Data qualifiers were not assigned if at least two out of three control criteria were acceptable (MS, MSD, and/or RPD). In the event that the percent recoveries in the MS and MSD exceeded the control limits, data qualifiers were not assigned if the affected compound was reported as not detected in the associated samples.

1,1,2-Trichloro-1,2,2-trifluoroethane was not detected in sample MW04-01 at 96'; therefore, data were not qualified in this sample based on the MS/MSD results.

1,1,2-Trichloro-1,2,2-trifluoroethane and methylene chloride were not detected in sample MW04-03 at 85'; therefore, data were not qualified for these compounds in this sample based on the MS/MSD results. The results for 1,1-dichloroethene, trans-1,2-dichloroethene, and 1,1,1-trichloroethane in sample MW04-03 at 85' are qualified as estimated and flagged with a 'J' or 'UJ' based on the MS/MSD results.

1,4-Dioxane by Method 8270C – A MS/MSD was not performed in association with this analysis. Precision was assessed for samples Beller's Domestic BFF, Beller's Domestic ALF, Preister's Domestic BFF, and Preister's Domestic ALF using the LCS/LCSD results. Precision was not assessed for samples 89-12 Well, 89-15 Well, and AOI Well,

9. Field Duplicate (Applicable to VOC analysis only) – Acceptable

VOCs by Method 8260B - A field duplicate was submitted for sample 87-3 and identified as Duplicate. Results were comparable.

10. Target Compound Identification – Acceptable

VOCs by Method 8260B – The results for acetone and/or 2-butanone in multiple samples were flagged with an 'M' by the laboratory to indicate poor spectral match. Results reported as detected for acetone in all associated samples were previously qualified as 'DNR' based on the acid preservative contamination and require no further qualification. The 'M' flagged result for 2-butanone in sample MW04-01 at 76' is qualified as estimated and flagged with a 'J.'

11. Reporting Limits – Acceptable except as noted below:

VOCs by Method 8260B – Samples 92-3A Well, Preister's New Irrigation, MW04-02 at 78', MW04-02 at 88', MW04-02 at 98', MW04-03 at 45', MW04-03 at 55', MW04-03 at 65', MW04-03 at 85', MW04-03 at 105', MW04-03 at 110', and MW04-03 at 120' required dilution to quantitate 1,1-dichloroethene, 1,1,1-trichloroethane, and/or tetrachloroethene within the linear range of the instrument. Sample results which exceeded the calibration range of the instrument were flagged 'E' by the laboratory and have been qualified as 'DNR' for Do Not Report. As the reporting limits were lower for the undiluted analyses, the results for compounds that were not flagged 'E' by the laboratory in the undiluted analyses of samples 92-3A Well, Preister's New Irrigation, MW04-02 at 78', MW04-02 at 88', MW04-02 at 98', MW04-03 at 45', MW04-03 at 55', MW04-03 at 65', MW04-03 at 85', MW04-03 at 105', MW04-03 at 110', and MW04-03 at 120' are flagged 'DNR' for the diluted analysis.

Sample OI Well required dilution to quantitate 1,1-dichloroethene and 1,1,1-trichloroethane within the linear range of the instrument. As the reporting limits are lower for the undiluted analysis, the results for compounds other than 1,1-dichloroethene and 1,1,1-trichloroethane in the undiluted analyses would typically be flagged 'DNR' in the diluted analysis. However, upon inspection of the raw sample results and chromatograms for both the diluted and undiluted analyses of sample OI Well, it was determined that several low-level detections (chloroform, 1,2-dichloroethane, trichloroethene, and 1,1,2-trichloroethane) were potentially the result of laboratory carryover contamination. The results for all VOCs in the undiluted analysis of sample OI Well are qualified 'DNR' and will not be used.

The reporting limits for all VOCs in samples Duplicate, 87-3, Beller's Stock Tank Pen #7, Beller's Stock Tank Pen #6, Beller's New Stock Well, 89-12 Well, 89-15 Well, AOI Well, and Weylan Neal Irrigation were elevated due to the dilutions necessary to quantitate high levels of target analytes. The elevated reporting limits do not adversely impact the use of the data for project objectives.

1,4-Dioxane by Method 8270C – The results for 1,4-dioxane in samples Beller's Domestic BFF, Beller's Domestic ALF, and Preister's Domestic BFF were flagged with a 'Y' by the laboratory to indicate an elevated reporting limit due to matrix interference and/or activity on the instrument. The results for 1,4-dioxane that were flagged 'Y' by the laboratory in samples Beller's Domestic BFF, Beller's Domestic ALF, and Preister's Domestic BFF are qualified as not detected and flagged with a 'U' at the raised reporting limit.

12. Type of Review - Summary

**Overall Assessment of Data:**

The usefulness of the data is based on the EPA guidance documents listed above. Upon consideration of the information presented above, the data are acceptable except where flagged with data qualifiers that modify the usefulness of the individual values. Data qualifiers do not affect the use of the data in relation to the project consent decree.

**Data Qualifiers:**

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

DNR - Do Not Report. Multiple results reported from different analytical dates and/or dilutions. Value from another analysis should be used.

**RE:** QA/QC Data Summary Review  
64th Quarterly Groundwater Sampling (November 2004)  
Inorganic Data  
Lindsay Manufacturing 33750799

---

The data quality review of 11 groundwater samples and one rinsate blank collected between November 7 and 10, 2004 has been completed. The samples were analyzed for total metals (cadmium, chromium, lead, iron, and zinc), sulfate, and pH by Analytical Resources, Incorporated (ARI) located in Tukwila, Washington. The analyses were performed in general accordance with EPA Methods 6010B/7421, 375.2, and 150.1, respectively. Samples were analyzed for the chemical constituents as described in *Groundwater Monitoring Plan, Remedial Action, for Lindsay Manufacturing Company, Lindsay, Nebraska (Management Plan)*, dated September 1, 2004.

The analyses were performed in general accordance with methods specified in EPA's *Test Methods for Evaluating Solid Waste (SW-846), Update IIIB*, April 1998 and *Methods for Chemical Analysis of Water and Wastes*, March 1983. The laboratory provided a full data package containing sample results and associated QA/QC data. The following samples are associated with ARI sample delivery groups (SDGs) HI24 and HI50:

<u>Sample ID</u>	<u>ARI ID</u>
Duplicate (Field Duplicate of 87-3)	HI24A
89-13	HI24B
87-3	HI24C
Beller's New Stock Well	HI24F
89-14	HI24J
Beller's Domestic BFF	HI24K
Preister's Domestic BFF	HI24N
89-12 Well	HI50A
89-15 Well	HI50B
92-3A Well	HI50E
92-3B Well	HI50F
Trip Blank (Rinsate Blank)	HI50M

The following comments refer to ARI's performance in meeting the quality control specifications outlined in EPA Methods 6010B/7421, 375.2 and 150.1. Data were qualified based on the method criteria and guidance provided in the EPA document "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review," July 2002.

Samples were shipped by overnight delivery to the laboratory and cooler temperatures were within the EPA-recommended range of 4°C±2°C.

1. Holding Times – Acceptable except as noted below:

pH by Method 150.1 – The holding time for pH is 24 hours from collection. Samples Duplicate, 89-13, 87-3, 89-14, Beller's New Stock Well, Beller's Domestic BFF, Preister's Domestic BFF, 89-12 Well, 89-15 Well, 92-3A Well, 92-3B Well, and Trip Blank were analyzed one day past the 24-hour method holding time. The results for pH in these samples are qualified as estimated and flagged with a 'J' based on holding time exceedance.

2. Initial and Continuing Calibrations – Acceptable where applicable

3. Blanks – Acceptable where applicable except as noted below:

Metals by Methods 6010B and 7421 – Zinc (0.013 mg/L) was detected in the rinsate blank (Trip Blank) collected on November 10, 2004. Data were not qualified based on the rinsate blank results.

Lead was detected in the fourth instrument continuing calibration blank (CCB4) analyzed on November 15, 2004 (0.001 mg/L). The result for lead in sample Beller's New Stock Well (0.005 mg/L) is less than 10x the CCB concentration and is qualified as not detected and flagged with a 'U' based on the CCB result. Lead was not detected in any other sample associated with this blank.

4. Laboratory Control Sample (LCS) and/or Standard Reference Material (SRM) - Acceptable

5. Matrix Spike Samples – Acceptable except as noted below:

Metals by Methods 6010B and 7421 – Matrix spikes were performed on samples 89-13 Well and 89-12 Well. Results were acceptable.

pH by Method 150.1 – A matrix spike was not performed in association with pH analysis. Precision was assessed using the laboratory duplicate results.

Sulfate by Method 375.2 - Matrix spikes were performed on samples Duplicate and 89-12 Well. Results were acceptable.

6. Laboratory Duplicate Analysis - Acceptable

Metals by Methods 6010B and 7421 – Laboratory duplicates were performed on samples 89-13 Well and 89-12 Well. Results were acceptable.

pH by Method 150.1 – Laboratory duplicates were performed on samples Duplicate and 89-12 Well. Results were acceptable.

Sulfate by Method 375.2 - Laboratory duplicates were performed on samples Duplicate and 89-12 Well. Results were acceptable.

7. Field Duplicate - Acceptable

General - A field duplicate was submitted for sample 87-3 and identified as Duplicate. Results were comparable for all inorganic analyses.

8. ICP Interference Check Sample (applicable to Metals only) - Acceptable

9. ICP Serial Dilution (applicable to Metals only)

Per the method, the serial dilution was not required as these samples do not constitute an unusual matrix.

10. Type of Review – Summary

**Overall Assessment of Data:**

The usefulness of the data is based on the EPA guidance documents listed above. Upon consideration of the information presented above, the data are acceptable except where flagged with data qualifiers that modify the usefulness of the individual values.

**Data Qualifiers:**

U - The analyte was analyzed for, but not detected above the reported sample quantitation limit.

J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

DNR - Do Not Report. Multiple results reported from different analytical dates and/or dilutions. Value from another analysis should be used.

**RE: Client Project: Lindsay Groundwater, 807**  
**ARI Job Nos.: HI24 & HI50**

Dear Karen:

Please find enclosed the original chain of custody documentation and the final data package for the samples from the project referenced above. Analytical Resources, Inc. (ARI) received sixteen water samples and a trip blank in good condition on November 9, 2004 and fourteen water samples and a trip blank on November 11, 2004. The samples were received intact and in good condition. The samples were received at cooler temperatures of 2.0 and 2.6 degrees Celsius.

The samples were analyzed for volatile organic compounds, semivolatile organic compounds, pH, sulfate and total metals as requested on the chain-of-custody.

Anomalies associated with these analyses are discussed in the case narrative.

A copy of this package will remain on file with ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,

ANALYTICAL RESOURCES, INC.

**Limits of Liability:** ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, notwithstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

**Sample Retention Policy:** All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

**Analytical Resources, Incorporated**  
Analytical Chemists and Consultants

## Case Narrative

**URS Corporation**

**Lindsay Groundwater Cleanup, 807**

**ARI Job Nos.: HI24 & HI50**

**2 December 2004**

### **Volatile Organic Compounds by Method 8260B**

Small amounts of methylene chloride were detected in two of the method blanks associated with the analyses of these samples. Since this is a common laboratory contaminant, no corrective actions were taken. All positive results for methylene chloride have been "B" flagged for samples associated with these two method blanks.

Acetone was detected in several of these samples. It has since been discovered that the preservative in these vials may have been contaminated with acetone by the supplier. All positive results for acetone should be suspect even though this compound was not detected in the method blanks.

### **1,4-Dioxane by method 8270C**

These analyses proceeded without incident of note.

### **Total Metals Analysis by methods 6010B and 7421**

These analyses proceeded without incident of note.

### **Conventional Analyses**

Several samples were received outside of holding time for pH analysis. All samples were analyzed for pH as soon as possible after receipt.

RPD calculated using sample concentrations per SW846.

LCS spike recovery is evaluated using only the nine regulated compounds noted in the ARI LQAP. The other LCS spike compound recoveries are advisory and used for analytical troubleshooting should any of the nine regulated compounds be out of control.

Results reported in  $\mu\text{g}/\text{L}$

RPD calculated using sample concentrations per SW846.

LCS spike recovery is evaluated using only the nine regulated compounds noted in the ARI LQAP. The other LCS spike compound recoveries are advisory and used for analytical troubleshooting should any of the nine regulated compounds be out of control.

RPD calculated using sample concentrations per SW846.

LCS spike recovery is evaluated using only the nine regulated compounds noted in the ARI LQAP. The other LCS spike compound recoveries are advisory and used for analytical troubleshooting should any of the nine regulated compounds be out of control.

Results reported in  $\mu\text{g}/\text{L}$

RPD calculated using sample concentrations per SW846.

LCS spike recovery is evaluated using only the nine regulated compounds noted in the ARI LQAP. The other LCS spike compound recoveries are advisory and used for analytical troubleshooting should any of the nine regulated compounds be out of control.

Results reported in  $\mu\text{g}/\text{L}$

RPD calculated using sample concentrations per SW846.

LCS spike recovery is evaluated using only the nine regulated compounds noted in the ARI LQAP. The other LCS spike compound recoveries are advisory and used for analytical troubleshooting should any of the nine regulated compounds be out of control.

**RE: Client Project: Lindsay Groundwater, 807**  
**ARI Job No: HJ85**

Dear Karen:

Please find enclosed the original chain of custody documentation and the final data package for the samples from the project referenced above. Analytical Resources, Inc. (ARI) received sixteen water samples in good condition on November 23, 2004. The samples were received intact and in good condition. The samples were received at a cooler temperature of 4.0 degrees Celsius.

The samples were analyzed for volatile organic compounds as requested on the chain-of-custody.

Anomalies associated with these analyses are discussed in the case narrative.

A copy of this package will remain on file with ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,

ANALYTICAL RESOURCES, INC.

**Limits of Liability:** Analytical Resources, Inc. (ARI) will perform all requested services in accordance with appropriate methodology follow ARI Standard Operating Procedures and Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI releases ARI from any liability in excess thereof, notwithstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the client.

Please sign here if you would like these samples disposed of after expiration of standard archive times (60 days for waters 90 days for soils, sediments per contract). If you do not want these samples discarded we will begin charging you for storage after the disposal date. Samples to be discarded after expiration:

Lims NO.: 04-2055B to 04-20573

## Preliminary Examination Phase:

1. Were intact, properly signed and dated custody seals attached  
To the outside of the cooler? .....  YES  NO
2. Were custody papers included with the cooler .....  YES  NO
3. Were custody papers properly filled out (ink, signed etc.)? .....  YES  NO
4. Complete custody forms and attach all shipping documents .....  OK  NA

Cooler Accepted By: B - Jyl Date: 11/23/04 Time: 0940

## Log-IN Phase:

5. Was a temperature blank include in the cooler? .....  YES  NO  
4.0 °C
6. Record Cooler Temperature .....  YES  NO
7. What kind of packing material was used? .....  YES  NO  
Bubblewrap
8. Was sufficient ice used (if appropriate)? .....  YES  NO
9. Were all bottles sealed in separate plastic bags? .....  YES  NO
10. Did all bottles arrive in good condition (unbroken)? .....  YES  NO
11. Were all bottle labels complete and legible? .....  YES  NO
12. Did all bottle labels and tags agree with custody papers? .....  YES  NO
13. Were all bottles used correct for the requested analyses? .....  YES  NO
14. Do any of the analyses (bottles) require preservative?  
(If so, Preservation checklist must be attached) .....  YES  NO
15. Were all VOA vials free of air bubbles? .....  YES  NO
16. Was sufficient amount of sample sent in each bottle? .....  YES  NO
17. Notify Project Manager of any discrepancies or concerns. .....  OK  NA

Cooler Opened By: B - Jyl Date: 11/23/04 Time: 0940

Explain any discrepancies or negative responses:

**Case Narrative**

**URS Corporation  
LMC Lindsay Monthly  
ARI Job No: HJ85  
8 December 2004**

**Volatile Organic Compounds by Method 8260B**

Acetone was detected in all samples. It has been discovered that the preserved vials used for VOAs were contaminated by the supplier of these vials. Acetone was not detected in the associated method blanks as preserved vials were not used. All known contaminated lots of vials have been removed from use and vials from a second supplier are now in use. All acetone results for these samples should be considered suspect and the result of possible vial contamination.

0005

**RE:** QA/QC Data Summary Review  
65th Quarterly Groundwater Sampling (January-February 2005)  
Organic Data  
Lindsay Manufacturing 33750799

**Info:**

**Date:** April 14, 2005

---

The data quality review of 43 water samples, two field duplicates, two field blanks, and three trip blanks collected between January 31 and February 23, 2005 has been completed. The samples were analyzed for volatile organic compounds (VOCs) by EPA Method 8260B at Analytical Resources Incorporated (ARI) located in Tukwila, Washington. Selected samples were analyzed for 1,4-dioxane by EPA Method 8270C as indicated in the cross-reference below. Samples were analyzed for the chemical constituents as described in *Groundwater Monitoring Plan, Remedial Action, for Lindsay Manufacturing Company, Lindsay, Nebraska* (Management Plan), dated September 1, 2004.

The analyses were performed in general accordance with methods specified in EPA's *Test Methods for Evaluating Solid Waste (SW-846), Update IIIB*, April 1998. The laboratory provided a full data package containing sample results and associated QA/QC data. The following samples are associated with ARI sample delivery groups (SDGs) HR06, HT46, HT50, HT62, and HT97:

<u>Sample ID</u>	<u>Laboratory ID</u>	<u>Requested Analyses</u>
Surface Discharge Klassen West*	HR06A	VOCs and 1,4-Dioxane
Surface Discharge Klassen East*	HR06B	1,4-Dioxane
Beller's Domestic BFF	HT46A	VOCs and 1,4-Dioxane
Beller's Domestic AFF	HT46B	VOCs
Beller's Domestic ALF	HT46C	VOCs and 1,4-Dioxane
Preister's Domestic BFF	HT46D	VOCs and 1,4-Dioxane
Preister's Domestic AFF	HT46E	VOCs
Preister's Domestic ALF	HT46F	VOCs and 1,4-Dioxane
Preister's Old Domestic Well	HT46G	VOCs
Beller's Stock Tank Pen #7	HT46H	VOCs and 1,4-Dioxane
Beller's Stock Tank Pen #6	HT46I	VOCs and 1,4-Dioxane
89-12 Well	HT46J	VOCs and 1,4-Dioxane
Beller's Irrigation to Stock Well	HT46K	VOCs
MW04-01 (76')	HT46L	VOCs
MW04-01 (86')	HT46M	VOCs
MW04-01 (96')	HT46N	VOCs
MW04-01 (106')	HT46O	VOCs
MW04-01 (116')	HT46P	VOCs
Duplicate (Field Duplicate of Preister's Domestic BFF)	HT46Q	VOCs
Lab Trip Blank (Trip Blank)	HT46R	VOCs
89-14 Well	HT50A	VOCs
89-15 Well	HT50B	VOCs and 1,4-Dioxane

<u>Sample ID (continued)</u>	<u>Laboratory ID</u>	<u>Requested Analyses</u>
89-13 Well	HT50C	VOCs
87-3 Well	HT50D	VOCs and 1,4-Dioxane
MW04-02 @ 68'	HT50E	VOCs
MW04-02 @ 78'	HT50F	VOCs
MW04-02 @ 88'	HT50G	VOCs
MW04-02 @ 98'	HT50H	VOCs
89-11B	HT50I	VOCs
Oil Well	HT50J	VOCs
89-10B Well	HT50K	VOCs
92-3A Well	HT50L	VOCs
92-3B Well	HT50M	VOCs
Beller's New Stock Well	HT50N	VOCs and 1,4-Dioxane
Preister's New Irrigation Well	HT50O	VOCs and 1,4-Dioxane
Duplicate (Field Duplicate of 87-3 Well)	HT50P	VOCs and 1,4-Dioxane
Lab Trip Blanks (Trip Blank)	HT50Q	VOCs
TI Well	HT62A	VOCs
AOI Well	HT62B	VOCs and 1,4-Dioxane
MW04-03 @ 45'	HT62C	VOCs
MW04-03 @ 55'	HT62D	VOCs
MW04-03 @ 65'	HT62E	VOCs
MW04-03 @ 85'	HT62F	VOCs
MW04-03 @ 105'	HT62G	VOCs
MW04-03 @ 110'	HT62H	VOCs
MW04-03 @ 120'	HT62I	VOCs
Field QA/QC ~ PDB (PDB Blank)**	HT62J	VOCs
Trip Blank (Equipment Blank)	HT62K	VOCs and 1,4-Dioxane
Lab Trip Blank (Trip Blank)	HT62L	VOCs
MW04-03 Bailer	HT97A	1,4-Dioxane

\* Samples were submitted to the laboratory as Artesian Klassen Well West and Artesian Klassen Well East. Following sample collection and discussion with the client, a well was not specifically identified hence the sample names have been changed for reporting purposes to better reflect site observations pending additional information.

\*\* This PDB blank is associated with PDBs reinstalled for May 2005.

The following comments refer to ARI's performance in meeting the quality control specifications described in the analytical methods. Data were qualified based on the method criteria and guidance provided in the EPA document *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review*, October 1999.

Samples were shipped by overnight delivery to the laboratory. The cooler associated with SDG HR06 was received at a temperature above the EPA-recommended range of  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$  at  $11.5^{\circ}\text{C}$ . Per the laboratory, ice was present in the cooler upon receipt. Data for samples associated with SDG HR06 were not qualified based on the elevated cooler temperature. The laboratory trip blank associated with SDG HT62 (HT62L) was not included on the COC for these samples.

1. Holding Times – Acceptable
2. GC/MS Instrument Performance Checks - Acceptable
3. Initial and Continuing Calibrations – Acceptable except as noted below:

**VOCs by Method 8260B** - The percent relative standard deviations (%RSDs) exceeded the method criteria of 15% for vinyl acetate, 2-butanone, bromodichloromethane, chlorodibromomethane, 2-chloroethylvinylether (2-CVE), 4-methyl-2-pentanone, cis-1,3-dichloropropene, trans-1,3-dichloropropene,

1,1,1-trichloroethane, 2-hexanone, 1,1,2-trichloroethane, o-xylene, styrene, bromoform, carbon tetrachloride, 4-bromofluorobenzene, acetone, carbon disulfide, and/or ethylbenzene in the initial calibrations analyzed on January 3, 2005 (instrument ID Finn3), January 17, 2005 (NT-3), February 18, 2005 (Finn1), March 1, 2005 (Finn3), and March 4, 2005 (Finn1). Due to the exceedances, the laboratory elected to evaluate these compounds based on the alternative curve types of linear or quadratic fit rather than average response factor. The correlation coefficients were acceptable for all linear and quadratic curves. Data were not qualified based on the use of alternative curve types.

The percent recoveries for chloromethane (78.4%), 2-butanone (124.9%), and 1,2-dichloropropane (62.1%) were outside the method criteria of 80-120% in the continuing calibration analyzed on February 2, 2005 (Finn3). As 2-butanone was not detected in the associated samples, data were not qualified for this compound based on the elevated continuing calibration result. The results for chloromethane and 1,2-dichloropropane in samples Surface Discharge Klassen West and Surface Discharge Klassen East were qualified as estimated and flagged with a 'UJ' based on these continuing calibration results.

The percent recoveries for chloromethane (72.6%), carbon disulfide (70.6%), 1,1,1-trichloroethane (78.5%), and carbon tetrachloride (78.7%) were below the method criteria of 80-120% in the continuing calibration analyzed on February 23, 2005 (Finn1). The results for chloromethane, carbon disulfide, 1,1,1-trichloroethane, and carbon tetrachloride in samples Beller's Domestic BFF, Beller's Domestic AFF, Beller's Domestic ALF, Preister's Domestic BFF, Preister's Domestic AFF, Preister's Domestic ALF, Beller's Irrigation to Stock Well, MW04-01 (76'), MW04-01 (86'), and Lab Trip Blank (HT46R) were qualified as estimated and flagged with a 'J' or 'UJ' based on these continuing calibration results.

The percent recoveries for 1,1,2-trichloro-1,2,2-trifluoroethane (124.7%) and 1,1,2-trichloroethane (122.4%) exceeded the method criteria of 80-120% in the continuing calibration analyzed on February 25, 2005 (Finn1). The results for 1,1,2-trichloro-1,2,2-trifluoroethane and 1,1,2-trichloroethane in the associated samples were either reported as not detected or qualified as Do Not Report (DNR) based on QC issues detailed later in this report and do not require further qualification.

The percent recoveries for 1,1,2-trichloro-1,2,2-trifluoroethane (128.4%), acetone (126.2%), and 1,1,2-trichloroethane (125.0%) exceeded the method criteria of 80-120% in the continuing calibration analyzed on February 28, 2005 (Finn1). 1,1,2-Trichloro-1,2,2-trifluoroethane and 1,1,2-trichloroethane were not detected in the associated samples and were not qualified. The results for acetone in samples 87-3 Well, 92-3A Well, and 92-3B Well were qualified as estimated and flagged with a 'J' based on the elevated continuing calibration result. The results for acetone in the other associated samples were either reported as not detected or qualified as DNR based on QC issues detailed later in this report and do not require further qualification.

The percent recoveries for 2-butanone (77.2%), 2-CVE (54.8%), and cis-1,3-dichloropropene (78.8%) were below the method criteria of 80-120% in the continuing calibration analyzed on February 28, 2005 (NT-3). The results for 2-CVE in the associated samples were rejected based on QC issues detailed later in this report and do not require further qualification. The results for 2-butanone and cis-1,3-dichloropropene in samples Beller's Stock Pen #7, Beller's Stock Pen #6, 89-12 Well, and 89-15 Well were qualified as estimated and flagged with a 'J' or 'UJ' based on these continuing calibration results. The results for 2-butanone and cis-1,3-dichloropropene in samples MW04-02 @78' and MW04-02 @98' were qualified as DNR based on QC issues detailed later in this report and do not require further qualification.

The percent recoveries for chloromethane (75.8%), 1,1,2-trichloro-1,2,2-trifluoroethane (125.8%), 2-CVE (73.3%), and 1,2-dichloroethane-d4 (74.0%) were below the method criteria of 80-120% in the continuing calibration analyzed on March 2, 2005 (Finn1). 1,1,2-Trichloro-1,2,2-trifluoroethane was not detected in the associated samples and was not qualified based on the elevated continuing calibration result. The results for 2-CVE in the associated samples were rejected based on QC issues detailed later in this report and do not require further qualification. Data were not qualified based on the low surrogate (1,2-dichloroethane-d4) recovery in this continuing calibration. The results for chloromethane in samples T1

Well, AOI Well, MW04-03 @ 45', MW04-03 @ 55', MW04-03 @ 65', MW04-03 @ 85', MW04-03 @ 105', MW04-03 @ 110', MW04-03 @ 120', Field QA/QC (Bailer), Trip Blank (HT62K), and Lab Trip Blank (HT62L) were qualified as estimated and flagged with a 'UJ' based on this continuing calibration result.

The percent recovery for chloromethane (73.3%) was below the method criteria of 80-120% in the continuing calibration analyzed on March 7, 2005 (Finn1). The result for chloromethane in Lab Trip Blanks (HT50Q) is qualified as estimated and flagged with a 'UJ' based on this continuing calibration result.

The percent recoveries for carbon disulfide (62.1%) and 2-butanone (131.2%) were outside the method criteria of 80-120% in the continuing calibration analyzed on March 8, 2005 (Finn1). The results for carbon disulfide and 2-butanone were qualified as DNR in the associated samples based on QC issues detailed later in this report and do not require further qualification.

1,4-Dioxane by Method 8270C – The percent recovery for the surrogate 1,4-dioxane-d8 (75.8%) was below the method criteria of 80-120% in the continuing calibration analyzed on March 8, 2005 (NT-4). Data were not qualified based on the low surrogate recovery in this continuing calibration.

4. Blanks – Acceptable except as noted below:

VOCs by Method 8260B – Methylene chloride (4.2 ug/L), acetone (4.2 ug/L), 2-butanone (3.0 ug/L), and toluene (0.6 ug/L) were detected in the passive-diffusion bag (PDB) blank (HT62J). This PDB blank is associated with PDBs installed after completion of the February 2005 sampling event. The data from the May 2005 sampling event will be qualified appropriately based on the appropriate PDB blank.

Methylene chloride (1.5 ug/L), acetone (7.0 ug/L), chloroform (3.2 ug/L), bromodichloromethane (1.0 ug/L), toluene (1.5 ug/L), ethylbenzene (0.2 ug/L), and m+p-xylene (0.7 ug/L) were detected in the equipment blank (HT62K). Data were not qualified based on the equipment blank results.

5. Surrogates – Acceptable

6. Internal Standards - Acceptable

7. Laboratory Control /Laboratory Control Duplicate Sample (LCS/LCSD) – Acceptable except as noted below:

VOCs by Method 8260B – The relative percent difference (RPD) for acetone in the LCS/LCSD pair analyzed on February 2, 2005 (FINN3, 32.0%) exceeded the laboratory control limit of 30%. As the percent recoveries for acetone in the LCS and LCSD were acceptable, data were not qualified based on the RPD for the LCS/LCSD pair.

The percent recoveries for 2-CVE in the LCS (58.0%) and LCSD (58.8%) analyzed on February 28, 2005 (NT-3) were below the laboratory control limits of 65-138%. The results for 2-CVE in the associated samples were rejected based on QC issues detailed later in this report and do not require further qualification.

The percent recovery for 1,1,2-trichloroethane (125%) in the LCS analyzed on March 8, 2005 (Finn1) exceeded the laboratory control limits of 74-124%. As the percent recovery in the LCSD and the RPD for the LCS/LCSD pair were acceptable, data were not qualified for 1,1,2-trichloroethane based on the LCS result.

8. Matrix Spike/Matrix Spike Duplicate (MS/MSD) - Acceptable except as noted below:

VOCs by Method 8260B – MS/MSDs were performed on samples 89-12 Well, 89-14 Well, and TI Well. 2-CVE was not recovered from the MS/MSD pairs. Data are not typically qualified based on MS/MSD results alone; however, the non-recovery of 2-CVE is likely due to decomposition of 2-CVE by the hydrochloric acid sample preservative. As all of the associated samples were acidified for preservation, results for 2-CVE in all samples are rejected and flagged with an 'R.'

In addition to 2-CVE, the percent recoveries for 1,1-dichloroethene in the MS (135%) and MSD (130%) performed on sample 89-14 Well exceeded the laboratory control limits of 74-120%. The result for 1,1-dichloroethene in sample 89-14 Well was qualified as estimated and flagged with a 'J' based on the elevated MS/MSD results.

1,4-Dioxane by Method 8270C – A MS/MSD was not performed in association with this analysis. Precision was assessed for all samples with the exception of Surface Discharge Klassen West and Surface Discharge Klassen East using the LCS/LCSD results. Precision was not assessed for samples Surface Discharge Klassen West and Surface Discharge Klassen East.

9. Field Duplicates – Acceptable

General - Field duplicates were submitted for samples Preister's Domestic BFF (VOCs only) and 87-3 Well (VOCs and 1,4-Dioxane) and identified as Duplicate (HT46Q) and Duplicate (HT50P), respectively. Results were comparable.

10. Target Compound Identification – Acceptable

11. Reporting Limits – Acceptable except as noted below:

VOCs by Method 8260B – The laboratory flagged the result for trichloroethene in sample Beller's Stock Tank Pen #7 to indicate that the reported result was below the reporting limit but above the method detection limit (MDL). The result for trichloroethene in sample Beller's Stock Tank Pen #7 is considered estimated.

Samples Beller's Irrigation to Stock Well, MW04-02 at 68', MW04-02 at 78', MW04-02 at 88', MW04-02 at 98', MW04-03 at 45', MW04-03 at 55', MW04-03 at 65', MW04-03 at 85', MW04-03 at 105', MW04-03 at 110', and MW04-03 at 120' required dilution to quantitate 1,1-dichloroethene, 1,1,1-trichloroethane, tetrachloroethene, acetone, and/or 2-butanone within the linear range of the instrument. Sample results which exceeded the calibration range of the instrument were flagged 'E' by the laboratory and have been qualified as 'DNR' for Do Not Report. As the reporting limits were lower for the undiluted analyses, the results for compounds that were not flagged 'E' by the laboratory in the undiluted analyses of samples Beller's Irrigation to Stock Well, MW04-02 at 68', MW04-02 at 78', MW04-02 at 88', MW04-02 at 98', MW04-03 at 45', MW04-03 at 55', MW04-03 at 65', MW04-03 at 85', MW04-03 at 105', MW04-03 at 110', and MW04-03 at 120' are flagged 'DNR' for the diluted analysis.

The reporting limits for all VOCs in samples Beller's Stock Tank Pen #7, Beller's Stock Tank Pen #6, 89-12 Well, 89-15 Well, OI Well, 92-3A Well, Beller's New Stock Well, and Preister's New Irrigation Well were elevated due to the dilutions necessary to quantitate high levels of target analytes. The elevated reporting limits do not adversely impact the use of the data for project objectives.

1,4-Dioxane by Method 8270C – The laboratory flagged the results for 1,4-dioxane in samples 87-3 Well and Preister's New Irrigation Well with a 'J' to indicate that the reported results were below the reporting limit but above the MDL. The results for 1,4-dioxane in samples 87-3 Well and Preister's New Irrigation Well are considered estimated.

12. Other Items

VOCs by Method 8260B – Acetone and 2-butanone were detected in several samples with a wide range of concentrations. Samples Beller's Irrigation to Stock Well, MW04-02(98'), 92-3A Well, and 92-3B Well were reported with concentrations of acetone and 2-butanone elevated above other samples collected during the February 2005 event. Based on the results and comparison to previous data rounds, it appears these results are likely due to laboratory and/or field contamination and not necessarily indicative of groundwater quality. Corrective actions have been implemented since February 2005 and include discarding all sample vials, PDBs, and rinsate water currently stored at the client facility. All sampling bottles and equipment will be provided by the laboratory directly before the next sampling event to minimize potential cross-contamination. Additionally, the client will store all bottles and equipment in an alternate location to minimize potential contamination. The May 2005 data will be used to assess the corrective actions.

13. Type of Review - Summary

Overall Assessment of Data

The usefulness of the data is based on the EPA guidance documents listed above. Upon consideration of the information presented above, the data are acceptable except where flagged with data qualifiers that modify the usefulness of the individual values. Data qualifiers do not affect the use of the data in relation to the project consent decree.

Data Qualifiers

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

DNR - Do Not Report. Multiple results reported from different analytical dates and/or dilutions. Value from another analysis should be used.

**RE:** QA/QC Data Summary Review  
65th Quarterly Groundwater Sampling (January-February 2005)  
Inorganic Data  
Lindsay Manufacturing 33750799

**Info:**

**Date:** April 14, 2005

---

The data quality review of 7 groundwater samples, one field duplicate, and one equipment blank collected between February 20 and 23, 2005 has been completed. The samples were analyzed for total metals (cadmium, chromium, lead, iron, and zinc), sulfate, and pH by Analytical Resources, Incorporated (ARI) located in Tukwila, Washington. The analyses were performed in general accordance with EPA Methods 6010B/7421, 375.2, and 150.1, respectively. Samples were analyzed for the chemical constituents as described in *Groundwater Monitoring Plan, Remedial Action, for Lindsay Manufacturing Company, Lindsay, Nebraska (Management Plan)*, dated September 1, 2004.

The analyses were performed in general accordance with methods specified in EPA's *Test Methods for Evaluating Solid Waste (SW-846), Update IIIB*, April 1998 and *Methods for Chemical Analysis of Water and Wastes*, March 1983. The laboratory provided a full data package containing sample results and associated QA/QC data. The following samples are associated with ARI sample delivery groups (SDGs) HT46, HT50, and HT62:

<u>Sample ID</u>	<u>ARI ID</u>
Beller's Domestic BFF	HT46A
Preister's Domestic BFF	HT46D
89-14 Well	HT50A
89-15 Well	HT50B
87-3 Well	HT50D
Preister's New Irrigation Well	HT50O
Duplicate (Field Duplicate of 87-3 Well)	HT50P
AOI Well	HT62B
Trip Blank (Equipment Blank)	HT62K

The following comments refer to ARI's performance in meeting the quality control specifications outlined in EPA Methods 6010B/7421, 375.2 and 150.1. Data were qualified based on the method criteria and guidance provided in the EPA document "*USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*," July 2002.

Samples were shipped by overnight delivery to the laboratory and cooler temperatures were within the EPA-recommended range of 4°C±2°C.

1. Holding Times – Acceptable except as noted below:

pH by Method 150.1 – The holding time for pH is 24 hours from collection. Samples Beller's Domestic BFF, Preister's Domestic BFF, 89-14 Well, 89-15 Well, 87-3 Well, and AOI Well were analyzed one day past the 24-hour method holding time. The results for pH in these samples are qualified as estimated and flagged with a 'J' based on holding time exceedance.

2. Initial and Continuing Calibrations – Acceptable where applicable

3. Blanks – Acceptable where applicable

4. Laboratory Control Sample (LCS) and/or Standard Reference Material (SRM) - Acceptable

5. Matrix Spike (MS) – Acceptable except as noted below:

Metals by Methods 6010B and 7421 – Matrix spikes were performed on samples 89-14 Well and AOI Well. Results were acceptable.

Sulfate by Method 375.2 – A matrix spike was performed on sample Beller's Domestic BFF. Results were acceptable.

6. Laboratory Duplicate Analysis - Acceptable

Metals by Methods 6010B and 7421 – Laboratory duplicates were performed on samples 89-14 Well and AOI Well. Results were acceptable.

pH by Method 150.1 – Laboratory duplicates were performed on samples Beller's Domestic BFF, 89-14 Well, and Trip Blank (HT62 K). Results were acceptable.

Sulfate by Method 375.2 – A laboratory duplicate was performed on sample Beller's Domestic BFF. Results were acceptable. Results were acceptable.

7. Field Duplicate - Acceptable

General - A field duplicate was submitted for sample 87-3 Well and identified as Duplicate. Results were comparable for all inorganic analyses.

8. ICP Interference Check Sample (applicable to Metals only) - Acceptable

9. ICP Serial Dilution (applicable to Metals only)

Per the method, the serial dilution was not required as these samples do not constitute an unusual matrix.

10. Type of Review – Summary

Overall Assessment of Data

The usefulness of the data is based on the EPA guidance documents listed above. Upon consideration of the information presented above, the data are acceptable except where flagged with data qualifiers that modify the usefulness of the individual values.

**Data Qualifiers**

**U** - The analyte was analyzed for, but not detected above the reported sample quantitation limit.

**J** - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

**UJ** - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

**R** - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

**DNR** - Do Not Report. Multiple results reported from different analytical dates and/or dilutions. Value from another analysis should be used.

**RE: Client Project: Lindsay Groundwater, 807**  
**ARI Job No: HR06**

Dear Karen:

Please find enclosed the original chain of custody documentation and the final data package for the samples from the project referenced above. Analytical Resources, Inc. (ARI) received two water samples in good condition on February 1, 2005. The samples were received intact and in good condition. The samples were received at a cooler temperature of 11.5° Celsius.

The samples were analyzed for volatile organic compounds and 1,4-dioxane, as requested on the chain-of-custody.

Anomalies associated with these analyses are discussed in the case narrative.

A copy of this package will remain on file electronically with ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,

ANALYTICAL RESOURCES, INC.

**Limits of Liability:** Analytical Resources, Inc. (ARI) will perform all requested services in accordance with appropriate methodology follow ARI Standard Operating Procedures and Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI releases ARI from any liability in excess thereof, notwithstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the client.

Please sign here if you would like these samples disposed of after expiration of standard archive times (60 days for waters 90 days for soils, sediments per contract). If you do not want these samples discarded we will begin charging you for storage after the disposal date. **Samples to be discarded after expiration:**

## Case Narrative

**URS Corporation  
LMC Lindsay Monthly  
ARI Job No: HJ85  
8 December 2004**

### Volatile Organic Compounds by Method 8260B

The samples were received preserved with a pH < 2.0. The samples were analyzed on 2/2/05 within the method recommended holding time.

**Method Blank:** The method blank was free of analytes of interest.

**Surrogates:** All surrogate recoveries were in control.

**Samples:** There were no anomalies associated with these samples.

**LCS/LCSD:** The acetone RPD is above the 30% limit. As the individual percent recoveries were compliant, and acetone is not one of the 9 regulated compounds, no corrective action was taken.

### 1,4-Dioxane by Method 8270C

The samples were received extracted on 2/2/05 and analyzed on 2/6/05 within the method recommended holding time.

**Method Blank:** The method blank was free of analytes of interest.

**Surrogates:** All surrogate recoveries were in control.

**Samples:** There were no anomalies associated with these samples.

**LCS:** The percent recovery was within the advisory limits of 30% - 160%.

RPD calculated using sample concentrations per SW846.

LCS spike recovery is evaluated using only the nine regulated compounds noted in the ARI LQAP. The other LCS spike compound recoveries are advisory and used for analytical troubleshooting should any of the nine regulated compounds be out of control.

**RE: Client Project: Lindsay Groundwater, 807**  
**ARI Job Nos: HT46, HT50**

Dear Karen:

Please find enclosed the original chain of custody documentation and the final data package for the sample from the project referenced above. Analytical Resources, Inc. (ARI) received. Seventeen water samples and one trip blank were received on February 22, 2005. Sixteen water samples and one trip blank were received on February 23, 2005. All samples were received in tact. The samples were received at cooler temperatures of 4.4° and 5.0° Celsius.

The samples were analyzed for VOAs, 1,4-dioxane, total metals, pH and sulfate as requested.

Problems associated with this analysis are discussed in the case narrative.

A copy of this package will remain on file electronically with ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,

ANALYTICAL RESOURCES, INC.

**Limits of Liability:** ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the Invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, notwithstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

**Sample Retention Policy:** All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

## Case Narrative

**URS Corporation  
LMC Lindsay Monthly  
Water  
ARI Job Nos: HT46, HT50**

**16 March 2005**

### Volatile Organic Compounds by Method 8260B

These analyses proceeded without incident of note.

### 1,4-Dioxane by Method 8270C

This analysis proceeded without incident of note.

The default QC limits used for the LCS/LCSD associated with this analysis are 30-160%.

### Metals by Method 6010B

These analyses proceeded without incident of note.

### Conventionals by Methods 150.1 and 375.2

These analyses proceeded without incident of note.

Analyte	Spike LCS	Spike Added-LCS	LCS Recovery	Spike LCSD	Spike Added-LCSD	LCSD Recovery	RPD
---------	--------------	--------------------	-----------------	---------------	---------------------	------------------	-----

Results reported in  $\mu\text{g}/\text{L}$

RPD calculated using sample concentrations per SW846.

LCS spike recovery is evaluated using only the nine regulated compounds noted in the ARI LQAP. The other LCS spike compound recoveries are advisory and used for analytical troubleshooting should any of the nine regulated compounds be out of control.

---------	--------------	------------------	----------	---------------	--------------------	----------	-----

Results reported in  $\mu\text{g}/\text{L}$

RPD calculated using sample concentrations per SW846.

LCS spike recovery is evaluated using only the nine regulated compounds noted in the ARI LQAP. The other LCS spike compound recoveries are advisory and used for analytical troubleshooting should any of the nine regulated compounds be out of control.

Volatile Surrogate Recovery

	LCS	LCSD

Analyte	Spike LCS	LCS Added-LCS	Recovery	Spike LCSD	LCSD Added-LCSD	Recovery	RPD
---------	--------------	------------------	----------	---------------	--------------------	----------	-----

Results reported in  $\mu\text{g}/\text{L}$

RPD calculated using sample concentrations per SW846.

LCS spike recovery is evaluated using only the nine regulated compounds noted in the ARI LQAP. The other LCS spike compound recoveries are advisory and used for analytical troubleshooting should any of the nine regulated compounds be out of control.

Volatile Surrogate Recovery

Results reported in µg/L

NA-No recovery due to high concentration of analyte in original sample, or  
calculated negative recovery, or undetected spike.  
RPD calculated using sample concentrations per SW846.

Analyte	Spike LCS	LCS Added-LCS	Recovery	Spike LCSD	LCSD Added-LCSD	Recovery	RPD
---------	--------------	------------------	----------	---------------	--------------------	----------	-----

Results reported in  $\mu\text{g}/\text{L}$

RPD calculated using sample concentrations per SW846.

LCS spike recovery is evaluated using only the nine regulated compounds noted in the ARI LQAP. The other LCS spike compound recoveries are advisory and used for analytical troubleshooting should any of the nine regulated compounds be out of control.

Volatile Surrogate Recovery

	LCS	LCSD

Results reported in  $\mu\text{g}/\text{L}$

RPD calculated using sample concentrations per SW846.

LCS spike recovery is evaluated using only the nine regulated compounds noted in the ARI LQAP. The other LCS spike compound recoveries are advisory and used for analytical troubleshooting should any of the nine regulated compounds be out of control.

Results reported in  $\mu\text{g}/\text{L}$

RPD calculated using sample concentrations per SW846.

LCS spike recovery is evaluated using only the nine regulated compounds noted in the ARI LQAP. The other LCS spike compound recoveries are advisory and used for analytical troubleshooting should any of the nine regulated compounds be out of control.

**RE: Client Project: Lindsay Groundwater, 807**  
**ARI Job No: HT62**

Dear Karen:

Please find enclosed the original chain of custody documentation and the final data package for the sample from the project referenced above, Analytical Resources, Inc. (ARI) received. Ten water samples and one trip blank were received in good condition on February 24, 2005. It was noted upon sample receipt that the bottles for sample MW04-03(Baiter) were not received. The bottles for this sample were received under separate cover (HT97). The remaining samples were received intact and in good condition. The samples were received at a cooler temperature of 3.0° Celsius.

The samples were analyzed for VOAs, 1,4-dioxane, total metals, pH and sulfate as requested.

Problems associated with this analysis are discussed in the case narrative.

A copy of this package will remain on file electronically with ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,

**ANALYTICAL RESOURCES, INC.**

**Limits of Liability:** ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the Invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, notwithstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

**Sample Retention Policy:** All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

**RE: Client Project: Lindsay Groundwater, 807**  
**ARI Job No: HT97**

Dear Karen:

Please find enclosed the original chain of custody documentation and the final data package for the sample from the project referenced above. Analytical Resources, Inc. (ARI) received one water sample in good condition on March 1, 2005. The sample was received intact and in good condition. The samples were received at a cooler temperature of 5.4° Celsius.

The sample was analyzed for 1,4-dioxane as requested.

Problems associated with this analysis are discussed in the case narrative.

A copy of this package will remain on file electronically with ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,

**ANALYTICAL RESOURCES, INC.**

**Limits of Liability:** ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the Invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, notwithstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

**Sample Retention Policy:** All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.
