SUPERFUND RECORDS

INTRODUCTION:

On July 18, 1989, the Ecology and Environment, Inc., Technical Assistance Team (E & E/TAT) was tasked by the U.S. Environmental Protection Agency (EPA) Emergency Planning and Response (EP&R) group to assist with removal activities at Chemical Commodities, Inc., 320 South Blake St., Olathe, Kansas. E & E/TAT was to obtain a complete inventory of chemical products at the facility, collect samples of unknown materials, conduct field screening of the unknown products, and insure proper segregation of chemicals according to their hazardous characteristics. In addition, documentation of all site activities was to be recorded on a daily basis.

BACKGROUND:

Chemical Commodities, Inc., (CCI) is a company that operated as a chemical broker which has purchased and resold a variety of chemical products over the last several years. On December 6, 1988, a CCI truck caught fire while transporting over 3000 pounds of potentially explosive ammonium perchlorate to a CCI warehouse in Shawnee, Kansas. Several violations were cited in the incident, resulting in subsequent investigations of regional CCI facilities.

A site assessment of the CCI warehouse in Olathe was conducted by E & E/TAT, December 20-27, 1988 (see site assessment, TDD#: T07-8812-015A), resulting in the discovery of several hazardous conditions. Many incompatible chemicals were being stored together, extensive product leakage was occurring from numerous containers, severe water damage of chemical containers was observed due to leaking roofs, and many poorly labeled or unlabeled chemicals were present throughout the site. Several shock/heat sensitive chemicals were also being stored in the warehouse, producing a potentially explosive condition.

Four groundwater monitoring wells were installed immediately around the perimeter of the facility by the Kansas Department of Health and Environment (KDHE). Analytical results of samples collected from these wells by KDHE personnel on January 6, 1989, indicated elevated levels of the following chlorinated solvents:

Tetrachloroethene
Trichloroethene
Dichloroethene
Tetrachloromethane
Trichloroethylene
Tetrachloroethylene

In addition, a significant concentration of chlorinated solvents was detected in groundwater which was previously sampled by KDHE from an on-site monitoring well installed by CCI.

As a result of these findings, E & E/TAT was tasked by the EPA to proceed with a detailed sampling plan, designed to further delineate the extent of soil and groundwater contamination originating from the site. Site activities were conducted February 10-24, 1989 (site assessment report, TDD#: T07-8902-02A), which resulted in the following confirmations and conclusions:

- * Elevated organic solvent levels exist in groundwater on-site and immediately off-site, with contaminant levels decreasing away from the site.
- * Elevated organic solvent levels exist in surface water on-site and immediately off-site, creating a significant potential for contaminated run-off from the site.
- * Significant concentrations of chlorobenzene and 2-butanone are present in surface soil near a bottle crusher.
- * Excessive levels of organic and chlorinated solvents are present in subsurface soil on-site and immediately off-site.
- * Numerous unmarked and/or unlabeled containers are being stored which contain chemicals potentially hazardous to the environment and human health.

Two additional monitoring wells were installed around the site perimeter EPA during this period.

On May 24, 1989, E & E/TAT responded to a reported explosion at the CCI site in Olathe. The incident occurred as an employee was dismantling a 10,000 gallon storage tank with a cutting torch, igniting residual vapors within the tank. Although no injuries were reported, the resulting explosion expelled the top of the tank, leaving it suspended from one side.

The compilation and nature of these events resulted in the initiation of an Action Memorandum to perform site cleanup at Chemical Commodities, Inc. Authorization was given to the ERCS contractor (Riedel Environmental Services, Inc.) and E & E/TAT to begin activities pertaining to the removal funded action on July 19, 1989. The first phase of this project (tasked by this TDD) would entail compiling an inventory of all chemical products on-site, conducting chemical screening of unknown and/or unlabeled materials to detect any hazardous characteristics, and segregation of chemicals by hazard class into proper storage facilities.

SITE ACTIVITIES (July 19 - August 16, 1989):

E & E/TAT arrived on-site July 19, 1989, where they were met by EPA/OSC George Hess, employees of Riedel Environmental Services, Inc., and representatives from the U.S. Coast Guard Atlantic Strike Force. An assessment was conducted of the entire site, including air monitoring for organic vapors, explosive atmospheres, and oxygen deficient environments in the chemical storage areas. Radiation levels were also measured throughout the site. No organic vapors above background were detected in the breathing zone by an HNU, with the exception of 0.5 ppm in shed B. All areas of the site exhibited 0% LEL, 21.5% O₂, and no radiation levels above background were detected. As a result of a reported mercury spill in the main warehouse, the mercury vapor concentration was also measured in this facility during the site inspection. A level of 0.003₃ mg/m³ was detected in the warehouse, well below the TLV-TWA of 0.05 mg/m³.

Alphabetical labels were assigned to each area of the site where chemicals were being stored, to aid in the organization of a work plan (see site map). The inventory process began north of the CCI business office, in sheds J, K, and L, as E & E/TAT labeled the chemical containers (crates, boxes, drums, bottles, etc.) with consecutive numbers specific to each shed (J-001, J-002..., K-001, K-002..., etc.). In addition, a documentation form was completed for each item, providing information on the chemical's quantity, container type and condition, manufacturer, hazardous properties, and chemical name, if available. This information was entered into a chemical database (see attached Inventory of Chemical Products). Chemical containers which were leaking or structurally unsound were overpacked or repackaged to prevent additional release to the environment, and to facilitate relocation of the materials.

Unknown and/or unlabeled chemical products were sampled and analyzed by field screening techniques to determine any hazardous characteristics. Results of these tests were also included on the documentation forms. Shed D was initially utilized as an on-site laboratory for this purpose, although collected samples were later transported to the EPA lab, 25 Funston Rd., Kansas City, Missouri, for analysis by E & E/TAT personnel. In accordance with the site safety plan, all solid unknowns were collected in level C protection, and liquid unknowns were collected in level B protective gear. After analysis, the remaining sample material was returned to the site and stored in shed E.

After the inventory and sampling in these three sheds was completed (July 28, 1989), all chemicals were temporarily relocated to other areas on-site, until space became available to designate storage areas for the various hazard classes. Sheds J, K, and L were then released to Jerald Gershon, president and owner of CCI, with the understanding that they were to be demolished, and disposed of in a sanitary landfill as solid waste. Mr. Gershon was also restricted from any further unauthorized removal of chemicals from the site while cleanup activities were being conducted.

The contents of the remaining sheds and trailers on-site (A,B,C,E,F,G,H,I, and O) were documented and sampled in a similar manner. Many of these sheds and trailers, which had been utilized by CCI for chemical storage, were without any type of lighting, contained evidence of water damage, and were not adequately secured. Numerous corroded, broken, and leaking containers were discovered in the facilities which required repackaging or overpacking. Once this task was completed (August 15, 1989), materials began to be moved into structures which were designated to serve as storage areas for the various hazard classes of chemicals.

The matter of assigning the chemicals to hazard classes was performed by Steve Dunaway, ERCS/Chemist. A material was considered to be a "regulated" product if it fell under FIFRA, TSCA, RCRA, CWA, or FDA control. In addition, if the total chemical volume exceeded the reportable quantity by CERCLA guidelines, it was also classified as a regulated material. The ERCS team was instructed to weigh all containers of regulated chemicals (unless total weight was known) before being moved to their respective areas, to determine the exact quantity of material present. The storage areas for these materials, along with their corresponding hazard classes, are as follows:

<u>Shed or Trailer</u>	<u>Hazard Class</u>
C-A (south room of C)	Acids
C-B (north room of C)	Caustics
E	ORM-A, ORM-B, ORM-E
F	Flammables & Combustibles
G	Reactives
H	Poisons, ORM-A, ORM-B, ORM-E
I	Oxidizers
O	Regulated Drugs, Oxidizers

Organic peroxides and other potentially explosive materials were temporarily stored in a room adjacent to area S, inside the main warehouse. The majority of these items were subsequently transported to a nearby quarry for detonation. Explosives which were manufactured for military use were removed from the site by U.S. Army representatives from Fort Riley, Kansas. The remaining potentially explosive materials were detonated on site.

Unlabeled items, and chemicals of unknown hazard class, were temporarily placed in two areas of the site until additional information could be obtained from the manufacturers, or until sample analysis

results were received. These two areas consisted of a "Central Staging Area" located west of shed E, and an additional staging area south of shed B. Unregulated products were relocated to an area east of sheds A and B. A gated fence was later constructed between the CCI business office and shed B to provide a secure barrier between regulated and unregulated goods.

Items which were discovered outside of sheds, trailers, or the main warehouse were assigned to area "T". These containers, consisting primarily of 30-55 gallon drums, were inventoried on August 16, 1989, and moved to appropriate storage facilities.

SITE ACTIVITIES (August 17 - September 13, 1989):

The main warehouse was subdivided into six areas (N,P,Q,R,S,W), each containing a wide assortment of chemicals, and unique obstacles. The assemblage of a chemical inventory in these areas began August 17, 1989, and extended through September 13, 1989, along with the removal of regulated materials. Unregulated goods were left in place. Air monitoring for organic vapors and mercury was repeated in the warehouse prior to these tasks performed within the structure. This monitoring indicated organic vapor levels at <2 ppm, and Hg vapor concentrations at .001-.011 mg/m³ throughout the building. Characteristics which were of particular interest in the main warehouse are as follows:

Room N contained an abundance of pharmaceutical products, many of which had exceeded their recommended shelf life by many years. A number of shock/heat sensitive products were also discovered, including aged items which had potential for forming explosive peroxides. Many miscellaneous, unlabeled bottles were also inventoried. The discovery of a container of uranium acetate in room N created a concern for the level of emitted radiation. Radioactivity from the substance was measured at 0.8 mR/hr (800-1000 CPM) with a Rad-Mini, well below the allowable occupational level of 2.0 mR/hr.

Area R consisted of a small room on the east wall of the warehouse, along with a platform located above it, accessible by an adjacent stairway. This area was dominated by unlabeled, rusty, metal buckets and cans strewn about in disarray, intermixed with metal tanks and other debris, apparently serving as a dumping location for discarded items. A majority of the contents appeared to be hardened paints and epoxy-like materials. The warehouse in this area was structurally inadequate, resulting in water damaged chemical containers after any significant rainfall.

Elevated flooring in area S contained sections of rotten and missing planks, creating a physical hazard, as well as an unsafe walkway. Commercial hypodermic needles were scattered about the floor, adding to the precarious working conditions.

Area W included a majority of the ground floor in the main warehouse. A large portion of chemicals in the area were being stored on shelves in alphabetical order, with no regard for compatibility of adjacent materials. This area appeared to be the most frequently utilized part of the facility, based on the overall order in relation to the remainder of the site.

Fire and smoke alarms were installed by Riedel Environmental Services, Inc., September 1-9, 1989, at the following locations throughout the site:

Shed F (2)
Trailer O
Trailer H
Trailer I
Trailer G

The system was subsequently tested, and determined to be in proper working order.

Four 5000-10000 gallon storage tanks are located south of the main warehouse. Although the tanks were nearly empty of pure chemical product, several gallons of liquid and sediment remained. After the tanks were purged with nitrogen to provide an inert atmosphere, rectangular openings were cut into the tanks by Riedel Environmental Services, Inc., to allow removal of the residual material (September 5-9, 1989). The two-phase contents of tank #2 (second from east) were sampled and submitted for laboratory analysis (#TIXL3009 & #TIXL3010). Both phases contained high levels (>100000 ug/l) of trichloroethene, tetrachloroethene, acetone, xylene, and toluene. In addition, the top layer contained high concentrations of benzene and ethylbenzene. Complete results of these analyses are attached to the end of this report. The material was solidified as needed with vermiculite, drummed, and transported to the appropriate hazard class storage area.

SITE ACTIVITIES (September 14-29, 1989):

On September 14, 1989, E & E/TAT assisted EPA/ERT with the collection of two subsurface soil samples directly northwest of the site, to determine the present state of off-site contamination. These samples were collected in Shelby Tubes which were manipulated by a Geoprobe hydraulic drill. EPA/ERT subsequently submitted these soils to be analyzed for volatile organic compounds. Results of these analyses may be found in an EPA/ERT report tasked under EPA work assignment #1-288, titled "Extent of Contamination Determination, Building Decontamination Guidelines, and Bench-scale Remedial Tests for the Chemical Commodities Inc., Site, Olathe, Kansas".

As the chemical inventory was being completed, a number of items were labeled only with trade names, along with the manufacturer's identification. The producers of these materials were contacted, and requested to send Material Safety Data Sheets (MSDSs) for the designated

items, to provide information on their chemical constituents. Products for which no MSDSs were received, were sampled and analyzed September 15-29, 1989, and subsequently moved to designated storage areas, if hazardous characteristics were detected. The total number of regulated and unregulated chemicals inventoried in each area is as follows:

STORAGE AREA	REGULATED	UNREGULATED
A	9	13
B	130	140
C	138	48
E	32	23
F	29	13
G	27	7
I	4	0
J	38	46
K	30	33
L	6	5
N	630	620
O	34	37
P	11	11
Q	94	129
R	159	47
S	178	150
T	102	3
W	299	682
TOTAL	1950	2007

The number of chemicals in the above table are subject to change due to removal and updating of the inventory.

An open pit, approximately 10'X10', exists north of the CCI business office, resulting from the removal of a leaking underground storage tank. On September 18, 1989, a small berm was constructed around the pit to prevent flooding of potentially contaminated runoff in case of excessive rainfall. In addition, a flat, wooden roof was constructed by Riedel Environmental Services, Inc., to shed rainwater, and prevent accidental falls into the pit.

Metal gates were installed on sheds C, E, and F, September 21-26, 1989, to secure the regulated materials which they contained. These gates, along with all other storage facilities, were kept padlocked during hours when no work was being conducted on-site. Security guards were also positioned at both site entrances during non-working hours to ensure that no unauthorized trespassing occurred.

On September 27, 1989, E & E/TAT collected samples (#TIXL3015 - #TIXL3021) from three monitoring wells, sediment from two of the storage tanks south of the warehouse, and water and sediment from the pit to be submitted for Volatile Organic Analysis (VOA). The pit samples contained minimal VOA concentrations, however, the monitoring well samples (collected immediately off-site, east of the warehouse) verified

significant off-site groundwater contamination with chlorinated solvents. Sediment from storage tank #1 contained moderate levels of ethyl benzene and xylene, while material in tank #3 contained trichloroethylene. The sediment from the pit was also analyzed for Base-Neutral-Acids (BNA), although none of these compounds were detected in the sample. Complete results of these analyses are included at the end of this report. Distance from the surface to water level from these 3 monitoring wells were measured at the time of collection, and again on September 29, 1989 (along with nine other wells). Results of these depths are as follows:

LOCATION	DEPTH TO WATER LEVEL	
	09/27/89	09/29/89
KDHE #1	4.42'	5.21'
KDHE #2		11.94'
KDHE #3		9.37'
KDHE #4		8.19'
EPA #1		14.16'
EPA #2		14.20'
ERT #1		10.42'
ERT #2		7.95'
ERT #33	8.40'	4.78'
ERT #34	15.45'	14.34'
CCI #101		10.43'
PIT	3.42'	3.44'

All sheds and trailers housing regulated materials were labeled with appropriate placards, identifying their contents by hazard classification. Once all identified materials had been moved to their proper storage areas, containers in these facilities were arranged in an orderly fashion to provide a stable, space-efficient environment, prior to their removal from the site (projected to be January-March, 1990). All walkways in the storage areas and throughout the site were cleared of any remaining rubble or debris to allow unobstructed access to all locations.

On September 28, 1989, two trailers which had been serving as the site Command Post and the storage facility for Riedel Environmental Services, Inc., were removed from their location southwest of the site. A small replacement trailer was installed near the CCI business office at the northeast corner of the site, to be utilized by E & E/TAT and Pinkerton's Security Guard Service to monitor on-site activities until further removal actions commence. A letter report on this continuing operation will be submitted to EPA upon completion (tasked by TDD# T07-8910-010).

SUMMARY:

On July 19, 1989, following approval of an Action Memorandum signed by Morris Kay, EPA Region 7 Administrator, site removal activities commenced at Chemical Commodities, Inc., 320 South Blake St., Olathe, Kansas. Projected removal operations were divided into three phases as follows:

Phase I) Accumulation of an inventory list of all chemical materials on-site, with subsequent segregation of regulated goods according to hazard classification. Also, soil and water sampling to determine the extent of on and off site contamination.

Phase II) Assessment of the site to determine the most practical cleanup procedures. Removal and proper disposal of all regulated chemicals.

Phase III) Decontamination and/or removal of soil and structures on-site.

This letter report includes details of Phase I activities, conducted July 19 - September 29, 1989.

E & E/TAT was assisted by the ERCS contractor (Riedel Environmental Services, Inc.) in on-site activities. These activities included the collection of a complete inventory of all chemicals, sampling and field screening of unknown products for hazardous characteristics, and segregation of chemicals according to hazard class. Safety and security of the site was also upgraded with the installation of fire and smoke alarms, new fences, and padlocked gates on storage sheds.

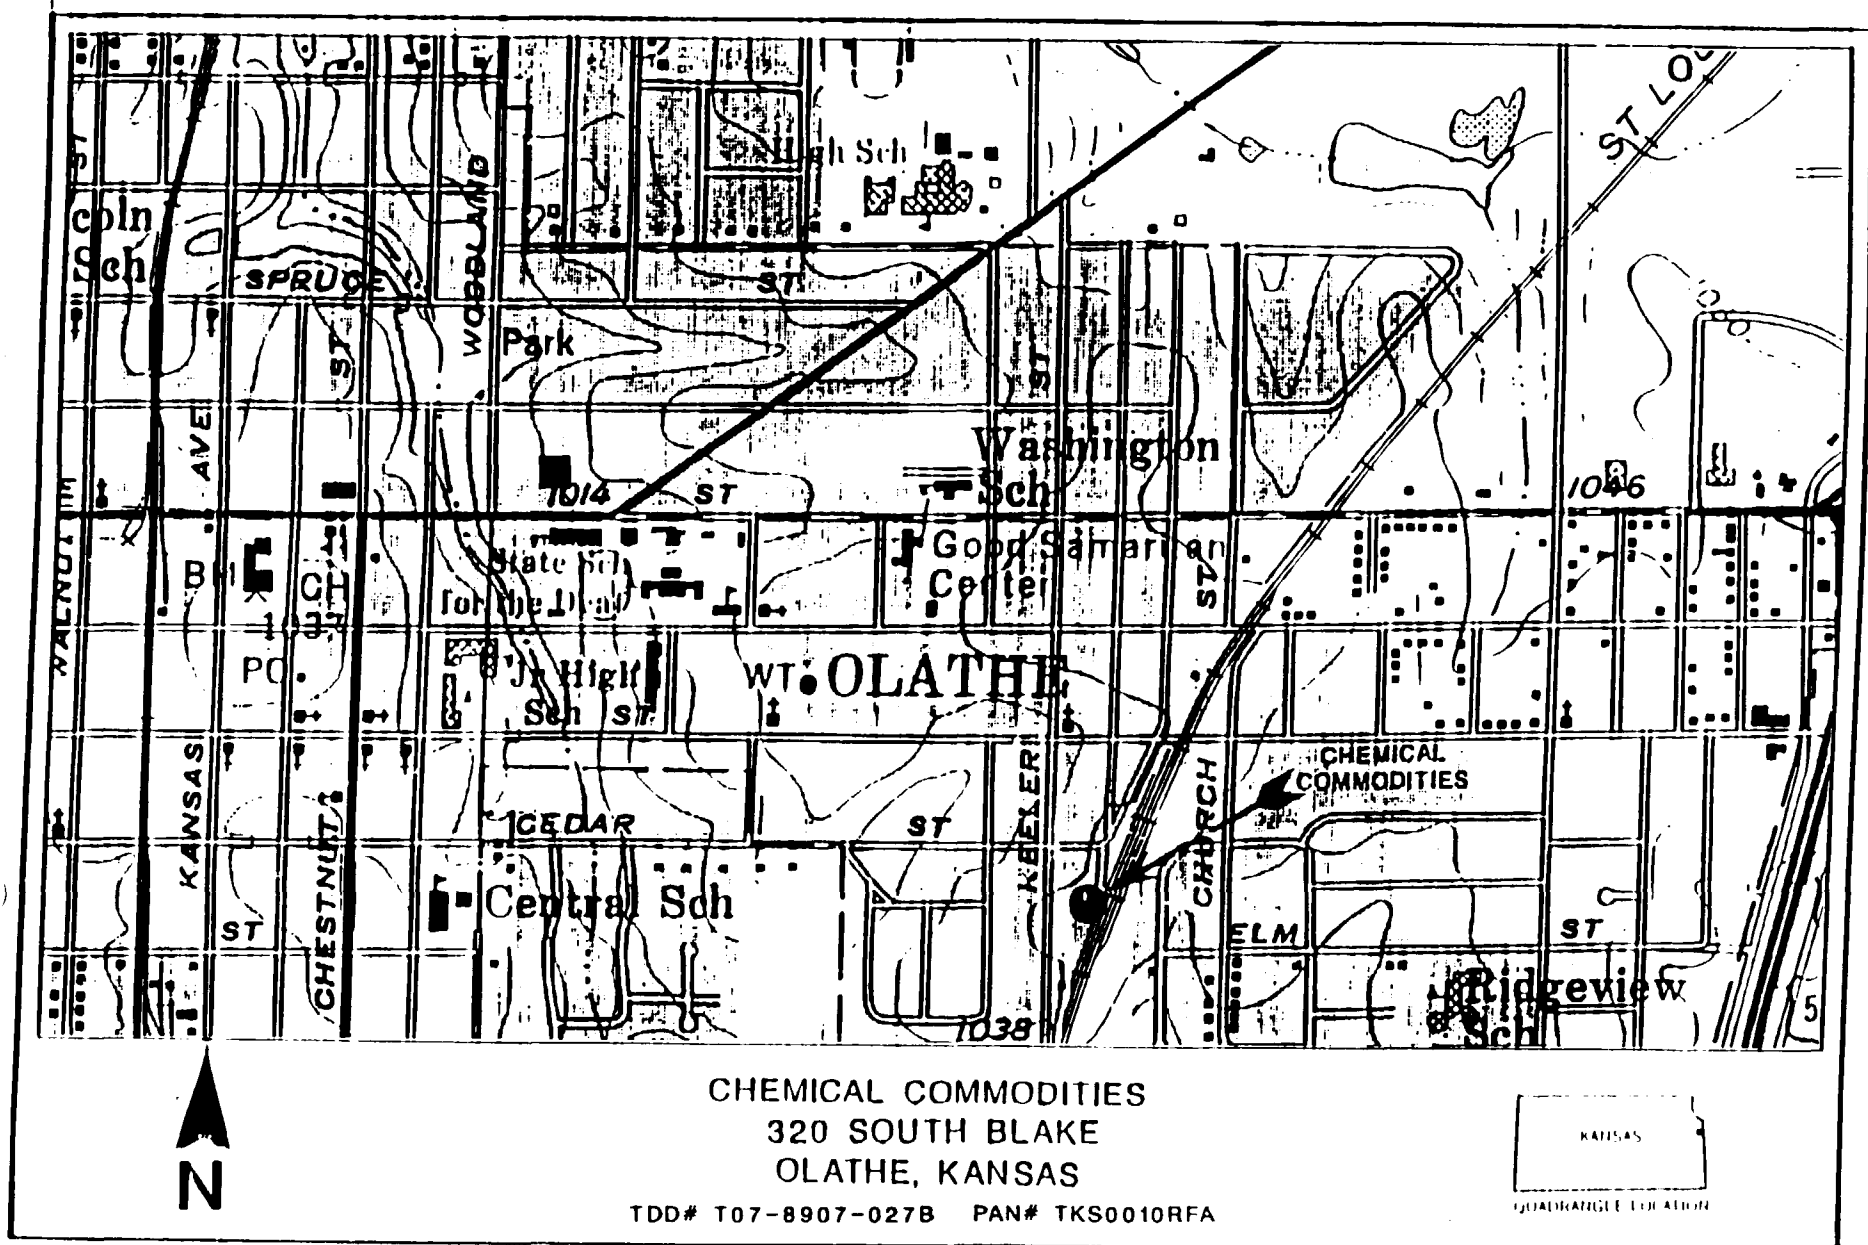

A total of 3957 items were inventoried during this investigation, after which chemical materials were classified as "regulated" or "unregulated", based on their hazardous characteristics. Regulated materials were subdivided into hazard classes, and stored in adequate facilities which were properly placarded and secured. Unregulated materials were conditionally released to Jerald Gershon, president and owner of Chemical Commodities, Inc.

Following the completion of these activities, E & E/TAT was tasked by EPA (TDD# T07-8910-010) to monitor on-site activities, maintain site security, and conduct routine site inspections until further removal actions commence. A letter report on these activities will be submitted to EPA upon completion of the project.

FRI 11:47 WILSON AND GALL

WILSON LABORATORIES

525 NORTH EIGHTH STREET - P.O. BOX 1820 - SALINA, KANSAS 67402-1820
(913)825-7186

The following is a list of flags that Wilson Laboratories frequently uses on our analytical reports. All flags may not be applicable for the enclosed reports.

- ND() - Indicates none detected with the detection limit in parentheses.
- B - Compound present in associated blank.
- E - Compounds coelute; value reported is total for both isomers.
- T - Value is estimated; tentatively identified compound; no standard was run.
- H - Detection limits are higher than normal; sample required dilution due to matrix interference.
- G - Compound coelutes with cis-1,2-dichloroethene; value reported is total for both isomers.
- D - Value reported is from a separate diluted run.

COMMENTS OF FIELD PERSONNEL

Site Description: Water sample taken from pipe # 33.

The water was collected via Teflon bucket and fire hot condensed

by selling. The vat was approx $\frac{1}{2}$ full of lard

between 1 1/2' & 8.40' from center to top of casing

15. 2 FT pipe section hole w/ 0.2 FT sticking above ground

(Sample Taken From Bottom AT 150 FT)

COMMENTS OF FIELD PERSONNEL

Site Description: water sample taken with glass liner.

Four 16 oz jars were filled and allowed to settle

for approximately $\frac{1}{2}$ hr prior to decanting the water and

proving the settled matter of interest used sample taken from

near ERT #1. 12.15' from water to top of casing.
