Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness.
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

General Statistics

Total Number of Observations	8	Number of Distinct Observations	8
Number of Detects	4	Number of Non-Detects	4
Number of Distinct Detects	4	Number of Distinct Non-Detects	4
Minimum Detect	0.36	Minimum Non-Detect	0.39
Maximum Detect	0.78	Maximum Non-Detect	4.6
Variance Detects	0.0343	Percent Non-Detects	50%
Mean Detects	0.51	SD Detects	0.185
Median Detects	0.45	CV Detects	0.363
Skewness Detects	1.665	Kurtosis Detects	3.11
Mean of Logged Detects	-0.717	SD of Logged Detects	0.33

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.
For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).
Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test on Detects Only

UCL Statistics for Data Sets with Non-Detects

User Selected Options	
Date/Time of Computation	ProUCL 5.15/10/2021 10:57:35 AM
From File	OU3 ProUCL Input 05.07.2021.xls
Full Precision	OFF
Confidence Coefficient	95%
Number of Bootstrap Operations	2000

Copper (atmw6)

General Statistics

Total Number of Observations	9	Number of Distinct Observations	8
		Number of Missing Observations	0
Minimum	1.7	Mean	4.911
Maximum	10.8	Median	4.5
SD	2.654	Std. Error of Mean	0.885
Coefficient of Variation	0.54	Skewness	1.374

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest. For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012). Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

Shapiro Wilk Test Statistic	0.892	**Shapiro Wilk GOF Test**
5% Shapiro Wilk Critical Value	0.829	Data appear Normal at 5% Significance Level
Lilliefors Test Statistic	0.228	**Lilliefors GOF Test**
5% Lilliefors Critical Value	0.274	Data appear Normal at 5% Significance Level

Data appear Normal at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	6.556	95% Adjusted-CLT UCL (Chen-1995)	6.799
		95% Modified-t UCL (Johnson-1978)	6.624

Gamma GOF Test

A-D Test Statistic	0.244	**Anderson-Darling Gamma GOF Test**
5% A-D Critical Value	0.725	Detected data appear Gamma Distributed at 5% Significance Level
K-S Test Statistic	0.171	**Kolmogorov-Smirnov Gamma GOF Test**
5% K-S Critical Value	0.28	Detected data appear Gamma Distributed at 5% Significance Level

Detected data appear Gamma Distributed at 5% Significance Level

Gamma Statistics

k hat (MLE)	4.202	k star (bias corrected MLE)	2.875
Theta hat (MLE)	1.169	Theta star (bias corrected MLE)	1.708

3447	**Gamma ROS Statistics using Imputed Non-Detects**											
3448	GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs											
3449	GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)											
3450	For such situations, GROS method may yield incorrect values of UCLs and BTVs											
3451	This is especially true when the sample size is small.											
3452	For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates											
3453					Minimum	0.79	Mean	2.037

3524	**Warning: This data set only has 1 observations!**											
3525	**Data set is too small to compute reliable and meaningful statistics and estimates!**											
3526	**The data set for variable Copper (waste water clarifier well) was not processed!**											
3527												
3528	**It is suggested to collect at least 8 to 10 observations before using these statistical methods!**											
3529	**If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.**											

UCL Statistics for Data Sets with Non-Detects

User Selected Options	
Date/Time of Computation	ProUCL 5.15/10/2021 11:00:37 AM
From File	OU3 ProUCL Input 05.07.2021.xls
Full Precision	OFF
Confidence Coefficient	95%
Number of Bootstrap Operations	2000

Iron (atmw6)

General Statistics

Total Number of Observations	9	Number of Distinct Observations	9
		Number of Missing Observations	0
Minimum	2530	Mean	3169
Maximum	4920	Median	2840
SD	869.5	Std. Error of Mean	289.8
Coefficient of Variation	0.274	Skewness	1.615

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest. For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012). Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

Shapiro Wilk Test Statistic	0.701	**Shapiro Wilk GOF Test**
5% Shapiro Wilk Critical Value	0.829	Data Not Normal at 5% Significance Level
Lilliefors Test Statistic	0.39	**Lilliefors GOF Test**
5% Lilliefors Critical Value	0.274	Data Not Normal at 5% Significance Level

Data Not Normal at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	3708	95% Adjusted-CLT UCL (Chen-1995)	3812
		95% Modified-t UCL (Johnson-1978)	3734

2642												
2643	**Gamma ROS Statistics using Imputed Non-Detects**											
2644	GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs											
2645	GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)											
2646	For such situations, GROS method may yield incorrect values of UCLs and BTVs											
2647	This is especially true when the sample size is small.											
2648	For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates											
2649				Minimum	1.936					Mean	31.17

84	95% Student's-t UCL					3167						
85												
86	Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.											
87	Recommendations are based upon data size, data distribution, and skewness.											
88	These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).											
89	However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

UCL Statistics for Data Sets with Non-Detects

User Selected Options	
Date/Time of Computation	ProUCL 5.15/10/2021 11:04:46 AM
From File	OU3 ProUCL Input 05.07.2021.xls
Full Precision	OFF
Confidence Coefficient	95%
Number of Bootstrap Operations	2000

Nickel (atmw6)

General Statistics

Total Number of Observations	9	Number of Distinct Observations	8
		Number of Missing Observations	0
Minimum	0.5	Mean	1.018
Maximum	1.5	Median	1.1
SD	0.318	Std. Error of Mean	0.106
Coefficient of Variation	0.312	Skewness	-0.293

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest. For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012). Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

Shapiro Wilk Test Statistic	0.973	**Shapiro Wilk GOF Test**
5% Shapiro Wilk Critical Value	0.829	Data appear Normal at 5% Significance Level
Lilliefors Test Statistic	0.158	**Lilliefors GOF Test**
5% Lilliefors Critical Value	0.274	Data appear Normal at 5% Significance Level

Data appear Normal at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	1.215	95% Adjusted-CLT UCL (Chen-1995)	1.181
		95% Modified-t UCL (Johnson-1978)	1.213

Gamma GOF Test

A-D Test Statistic	0.303	**Anderson-Darling Gamma GOF Test**
5% A-D Critical Value	0.722	Detected data appear Gamma Distributed at 5% Significance Level
K-S Test Statistic	0.194	**Kolmogorov-Smirnov Gamma GOF Test**
5% K-S Critical Value	0.279	Detected data appear Gamma Distributed at 5% Significance Level

Detected data appear Gamma Distributed at 5% Significance Level

UCL Statistics for Data Sets with Non-Detects

User Selected Options	
Date/Time of Computation	ProUCL 5.15/10/2021 11:07:22 AM
From File	OU3 ProUCL Input 05.07.2021.xls
Full Precision	OFF
Confidence Coefficient	95%
Number of Bootstrap Operations	2000

Thallium (atmw6)

General Statistics

Total Number of Observations	9	Number of Distinct Observations	6
Number of Detects	0	Number of Non-Detects	9
Number of Distinct Detects	0	Number of Distinct Non-Detects	6

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!

Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!

The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Thallium (atmw6) was not processed!

Thallium (nfmw10)

General Statistics

Total Number of Observations	8	Number of Distinct Observations	6
Number of Detects	0	Number of Non-Detects	8
Number of Distinct Detects	0	Number of Distinct Non-Detects	6

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!

Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!

The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Thallium (nfmw10) was not processed!

Thallium (nfmw11)

General Statistics

Total Number of Observations	8	Number of Distinct Observations	4
Number of Detects	0	Number of Non-Detects	8
Number of Distinct Detects	0	Number of Distinct Non-Detects	4

Warning: All observations are Non-Detects (NDs), therefore all statistics and estimates should also be NDs!

Specifically, sample mean, UCLs, UPLs, and other statistics are also NDs lying below the largest detection limit!

The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable Thallium (nfmw11) was not processed!

Thallium (nfmw12)

Number of Bootstrap Operations	2000

Vanadium (atmw6)

General Statistics

Total Number of Observations	9	Number of Distinct Observations	9
		Number of Missing Observations	0
Minimum	4.2	Mean	9.344
Maximum	17	Median	8.8
SD	4.247	Std. Error of Mean	1.416
Coefficient of Variation	0.454	Skewness	0.612

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest. For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012). Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test

Shapiro Wilk Test Statistic	0.947	**Shapiro Wilk GOF Test**
5% Shapiro Wilk Critical Value	0.829	Data appear Normal at 5% Significance Level
Lilliefors Test Statistic	0.144	**Lilliefors GOF Test**
5% Lilliefors Critical Value	0.274	Data appear Normal at 5% Significance Level

Data appear Normal at 5% Significance Level

Assuming Normal Distribution

95% Normal UCL		**95% UCLs (Adjusted for Skewness)**	
95% Student's-t UCL	11.98	95% Adjusted-CLT UCL (Chen-1995)	11.98
		95% Modified-t UCL (Johnson-1978)	12.02

Gamma GOF Test

A-D Test Statistic	0.204	**Anderson-Darling Gamma GOF Test**
5% A-D Critical Value	0.723	Detected data appear Gamma Distributed at 5% Significance Level
K-S Test Statistic	0.163	**Kolmogorov-Smirnov Gamma GOF Test**
5% K-S Critical Value	0.28	Detected data appear Gamma Distributed at 5% Significance Level

Detected data appear Gamma Distributed at 5% Significance Level

Number of Distinct Detects	6	Number of Distinct Non-Detects	2
Minimum Detect	0.56	Minimum Non-Detect	0.89
Maximum Detect	7.2	Maximum Non-Detect	5.3
Variance Detects	6.498	Percent Non-Detects	33.33%
Mean Detects	2.02	SD Detects	2.549
Median Detects	1.045	CV Detects	1.262
Skewness Detects	2.399	Kurtosis Detects	5.815
Mean of Logged Detects	0.285	SD of Logged Detects	0.875

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest. For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012). Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test on Detects Only

Shapiro Wilk Test Statistic	0.588	**Shapiro Wilk GOF Test**	
5% Shapiro Wilk Critical Value	0.788	Detected Data Not Normal at 5% Significance Level

k hat (MLE)	1.339	k star (bias corrected MLE)	0.78
Theta hat (MLE)	1.509	Theta star (bias corrected MLE)	2.588
nu hat (MLE)	16.06	nu star (bias corrected)	9.366
Mean (detects)	2.02		

729	**Gamma ROS Statistics using Imputed Non-Detects**											
730	GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs											
731	GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)											
732	For such situations, GROS method may yield incorrect values of UCLs and BTVs											
733	This is especially true when the sample size is small.											
734	For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

3264					95% KM Adjusted Gamma UCL	2.509	95% GROS Adjusted Gamma UCL	2.904				
3265												
3266	When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test											
3267	When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL											
3268												
3269	Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.											
3270	Recommendations are based upon data size, data distribution, and skewness.											
3271	These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).											
3272	However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.											
3273												
3274												
3275	**Vanadium (waste water clarifier well)**

	A	B	C	D	E	F	G	H	I	J	K	L
3277	**General Statistics**											
3278					Total Number of Observations	1				Number of Distinct Observations		1
3279										Number of Missing Observations		0
3280					Minimum	15.8				Mean		15.8
3281					Maximum	15.8				Median		15.8
3282												
3283	**Warning: This data set only has 1 observations!**											
3284	**Data set is too small to compute reliable and meaningful statistics and estimates!**											
3285	**The data set for variable Vanadium (waste water clarifier well) was not processed!**											
3286												
3287	**It is suggested to collect at least 8 to 10 observations before using these statistical methods!**											
3288	**If possible, compute and collect Data Quality Objectives (DQO) based sample size and analytical results.**											
3289												

APPENDIX D

DETAILED RISK CALCULATIONS

OU3 Smurfit-Stone/Frenchtown Mill Site
Human Health Risk Assessment

Appendix D Notes

CFR	Clark Fork River
COPC	Contaminant of Potential Concern
CTE	Central Tendency Estimate
DI	Daily Intake
DL	Detection Limit
EPC	Exposure Point Concentration
HQ	Hazard Quotient
IR	Ingestion Rate
ND	Non-detect
oSF	Oral Slope Factor
PCB	Polychlorinated Biphenyl
RfD	Reference Dose
RME	Reasonable Maximum Exposure
TEQ	Toxicity Equivalent
$TEQ_{D/F}$	Toxicity Equivalent for Dioxins and Furans
TEQ_{PCB}	Toxicity Equivalent for Dioxin-Like Polychlorinated Biphenyls
$TEQ_{D/F/PCB}$	Toxicity Equivalent for Dioxins, Furans, and Dioxin-like Polychlorinated Biphenyls

Orange highlight flags non-cancer hazards > 1E+00 and cancer risks≥ 1E-04.

Blue highlight flags cancer risks ≥ 1E-05.

APPENDIX D. SOIL RISK CALCULATIONS

Population **Hypothetical Future Residents**
Exposure Area **Random grids across OU3**
Medium **Surface Soil**
Exposure Route **Incidental Ingestion**

APPENDIX E

TRIBAL FISH CONSUMPTION RATE SUMMARY

Smurfit-Stone/Frenchtown Mill Site
OU3 Human Health Risk Assessment

The USEPA Exposure Factors Handbook (USEPA 2011) summarizes available data from several Native American studies including several tribes in Washington, 4 Columbia River Tribes in Oregon, and North Dakota (Table 10-6 of USEPA 2011). However, USEPA (2011) does not provide recommended values for Native American fish intake because available data are limited to certain geographic areas and/or tribes and cannot be readily generalized.

Recently, two fish consumption survey reports were published characterizing the current and heritage fish consumption rates of the Nez Perce Tribe (USEPA 2016a) and the Shoshone-Bannock Tribes (USEPA 2016b) in Idaho. In both reports, heritage rates were estimated based on a comprehensive review and evaluation of literature, including historical accounts and modern studies of heritage consumption. Current rates were calculated using survey data by two methods: 1) a food frequency questionnaire (FFQ) which involved questions about consumption over the past year to support fish consumption estimates, and 2) two 24-hour recall interviews which were used to calculate fish consumption estimates using the National Cancer Institute (NCI) method. Fish consumption rates for total consumers were higher based on the FFQ method compared to rates based on the NCI method (Table S3 in the fish survey reports). For both surveys, seven species groups were identified[1] (USEPA 2016a,b). Fish consumption rates based on the FFQ method were calculated for each of the individual species groups. Fish consumption rates calculated by the NCI method are available for groups 1 and 2. Group 1 included all finfish and shellfish. Group 2 included near coastal, estuarine, freshwater, and anadromous species. Fish consumption rates were not calculated using the NCI method for Groups 3 through 7. Group 2 is defined in the studies to include salmon and steelhead species (Group 3), resident trout (Group 4) and other freshwater finfish and shellfish (Group 5), as well as other freshwater and marine shellfish (e.g., lobster, crab, shrimp, oysters, scallops, etc). The study authors indicated that the marine species in Group 2 were considered likely to be near coastal or estuarine. For this memo, Group 2 was considered more representative of freshwater species likely consumed from Idaho waters than Group 1. The USEPA prefers the NCI method for estimating fish consumption rates when data are adequate because 24-hour recall data are generally more accurate and covariates can be used to improve estimates (USEPA 2016c). This is supported by the tribal fish survey study authors who asserted that the rates based on the NCI method are likely closer to the actual fish consumption rates of the individual populations due to less challenge to a respondent's memory (USEPA 2016a,b).

For the Nez Perce Tribe survey, 460 adult tribal members (age 18 or older) were interviewed and provided sufficient information to classify them as fish consumers or non-consumers. For the

[1]Group 1 = all finfish and shellfish (all species in groups 3-7); Group 2 = near coastal/estuarine/freshwater/ anadromous finfish and shellfish (includes all species in groups 3-5); Group 3 = all salmon and steelhead; Group 4 = resident trout; Group 5 = other freshwater finfish and shellfish; Group 6 = marine finfish and shellfish; Group 7 = unspecified finfish and shellfish.

Shoshone-Bannock Tribes survey, 257 adult tribal members (age 18 or older) were interviewed and provided sufficient information to classify them as fish consumers or non-consumers. Group 2 fish consumption rates calculated by the NCI method were reported for total consumers, as well as for consumers identified as fishers and non-fishers. These include fish consumed regardless of source. Each report provides estimated percentages of select species consumed from different sources including bought from a store or restaurant, and caught in waters within and outside of Idaho. However, Group 2 fish consumption rates are not reported specific to fish caught in Idaho waters. Although some respondents identified as "non-fishers" may actually participate in fishing activities (but whose names were not included in the Department of Fisheries Resources Management list), it is assumed that respondents identified as "fishers" likely best represent those individuals consuming fish caught from local waters. Thus, fish consumption rates calculated using the NCI method for Group 2 fishers were identified as the preferred rates for use in risk estimates in the OU3 HHRA.

Of the 446 Group 2 Nez Perce consumers, 138 were identified as fishers. Of the 225 Group 2 Shoshone-Bannock consumers, 134 were identified as fishers. Fish consumption rates calculated by the NCI method for "Group 2" consuming fishers are presented in the table below.

Tribe	Mean (g/d)	Percentiles (g/d)		
		50%	90%	95%
Nez Perce	98.4	55.2	238.6	345.0
Shoshone-Bannock	23.3	10.2	61.5	92.6

As reported in USEPA (2016a,b) Table S2 (raw weight, edible portion).

The study authors of the survey reports asserted that a likely reason for the NCI-based consumption rates being lower among the Shoshone-Bannock than among the Nez Perce are that the Shoshone-Bannock Tribes have less access to the more abundant fisheries than the Nez Perce Tribe (USEPA 2016a,b). The USEPA recommends using the 95th percentile fish consumption rate of 93 g/day and mean fish consumption rate of 23 g/day for the Shoshone-Bannock Tribes (calculated using the NCI method) for the adult/older child RME and CTE CSKT fishers, respectively. Although these values are lower than the consumption rates for the Nez Perce Tribe, the Shoshone-Bannock Tribe may better represent inland tribes with limited access to abundant fisheries as expected within the stretch of the CFR included in the OU3 study area. These fish consumption rates are roughly two times higher than that of the fish consumption rates assumed for the general recreational fisher being evaluated in the OU3 HHRA.

The fish surveys for the Nez Perce and Shoshone-Bannock Tribes were specific to adults. Data on the fish consumption rates of CSKT children are not available. The child fish consumption rate used in the OU3 HHRA was estimated by multiplying the adult fish consumption rate by a ratio of child-to-adult estimated energy requirements (EER) equal to 0.5. Values for EER were

calculated based on regression models reported in Institute of Medicine (IOM 2005). This methodology is described in detail in SRC (2019) provided as Attachment E-1.

Re: Proposed approach to calculate food consumption rates in children from adult consumption rates in the Upper Columbia River (UCR) Human Health Risk Assessment (HHRA)

Calculation of Food Consumption Rates in Children from Adult Consumption Rates

Food consumption rates for the Confederated Tribes of the Colville Reservation (CCT) exposure scenario in the Upper Columbia River (UCR) Human Health Risk Assessment (HHRA) were derived from a survey of CCT residents (the "Tribal Survey;" Westat, 2012). The survey included a 24-hour dietary recall and a food frequency questionnaire and was intended to yield estimates of consumption for children (ages 0-6 years) and other ages. For most foods, a sufficient number of adult subjects reported eating the food to provide a reliable estimate of adult consumption rates. However, for some foods, the number of children who consumed the food was insufficient for estimating consumption rates for children.

In the HHRA, if a rate of consumption of a specific food could not be estimated for children from the Tribal Survey (or other credible sources), consumption rates for children were calculated from the adult consumption rate using the following equation (Equation 1):

$$CR_{child} = CR_{adult} \cdot \frac{EER_{child}}{EER_{adult}} \qquad \text{Eq. (1)}$$

where CR is the consumption rate (grams [g]/day) for children or adults, and EER is the Estimated Energy Requirement for children and adults. Values for EER were calculated based on regression models for EER reported in IOM (2005). Based on the EERs calculated from IOM (2005), a value of 0.5 was used in Equation 1 to represent the EER_{child}/EER_{adult} ratio. The basis for this child/adult ratio of 0.5 is described below.

Calculation of Estimated Energy Requirement (EER) for children and adults:

Estimates of EER reported in IOM (2005) were based on clinical studies of clearance of doubly labeled water. Measurement of clearance of doubly labeled water provides an estimate of the metabolic production of carbon dioxide, from which estimates of oxygen consumption and energy expenditure can be derived. IOM (2005) reports values for the EER, which is the sum of basal energy expenditure, thermal effect of food (energy expended as a result of consumption of food), and energy expenditures from physical activity, thermal regulation and growth of tissue including pregnancy and production of milk (energy deposition). Doubly labeled water studies are cross-sectional measurements of energy expenditure and, therefore, do not measure energy deposition. Values for energy deposition reported in IOM (2005) were based on estimates of the energy content of protein and adipose added to body mass during growth. Energy deposition varies with age; being highest during infancy 175 kilocalories [kcal]/day at age ≤3 months) and decreasing to 20 kcal/day at age ≥13 months). After cessation of growth, total energy expenditure and EER converge (energy balance).

Values for EER for specific ages were estimated from regression equations reported in IOM (2005) that related EER to body size (body mass and length). The regression equations used to calculate EER within specific age ranges are described below.

EER for ages 1 – 35 months (Equation 2):

$$\mathrm{EER} = (89 \cdot \mathrm{BW} - 100) + \mathrm{ED} \qquad \text{Eq. (2)}$$

where EER is expressed in units of kcal/day, BW is body weight (kilograms [kg]) and ED is energy deposition (kcal/day). Age-range values for ED were as follows:

ED 0–3 months: 175 kcal

ED 4–6 months: 56 kcal

ED 7–12 months: 22 kcal

ED 13–36 months: 20 kcal

EER for ages 3-18 years (Equations 3 and 4):

$$\mathrm{EER(male)} = 88.5 - (61.9 \cdot \mathrm{age}) + \mathrm{PA} \cdot (26.7 \cdot \mathrm{BW} + 903 \cdot \mathrm{HT}) + \mathrm{ED} \qquad \text{Eq. (3)}$$

$$\mathrm{EER(female)} = 135.3 - (30.8 \cdot \mathrm{age}) + \mathrm{PA} \cdot (10.0 \cdot \mathrm{BW} + 934 \cdot \mathrm{HT}) + \mathrm{ED} \qquad \text{Eq. (4)}$$

where age is in years, PA is a physical activity coefficient and HT is body height (meters [m]). Age range values for ED were as follows:

ED ages 3-8 years: 20 kcal/day

ED for ages 9-18 years: 25 kcal/day

Values for PA used in the regression equations were as follows:

PA Level	Males	Females
sedentary	1.00	1.00
low active	1.13	1.16
active	1.26	1.31
very active	1.42	1.56

The bases for physical activity coefficients of children are described in detail in IOM (2005). Physical activity levels in children are approximately equivalent exertion from the following activities:

sedentary: lying awake, sitting

low active: walking at a pace of 2.5 miles/hour for 2 hours

active: walking at a pace of 2.5 miles/hour for 4 hours

very active: walking at a pace of 2.5 miles/hour for 6 hours

EER for ages 19 years and older (Equations 5 and 6):

$$\mathrm{EER(male)} = 662 - (9.53 \cdot \mathrm{age}) + \mathrm{PA} \cdot (15.91 \cdot \mathrm{BW} + 539.6 \cdot \mathrm{HT}) \qquad \text{Eq. (5)}$$

$$\mathrm{EER(female)} = 354 - (6.91 \cdot \mathrm{age}) + \mathrm{PA} \cdot (9.36 \cdot \mathrm{BW} + 726 \cdot \mathrm{HT}) \qquad \text{Eq. (6)}$$

Values for PA used in the adult regression equations were as follows:

PA Level	Males	Females
sedentary	1.00	1.00
low active	1.11	1.12
active	1.25	1.27
very active	1.48	1.45

The bases for physical activity coefficients for adults are described in detail in (IOM, 2005). Physical activity levels in adults are approximately equivalent to exertion from the following activities:

sedentary: physical activities required for independent living

low active: walking 2.2 miles/day at a rate of 3-4 miles/hour

active: walking 7 miles/day at a rate of 3-4 miles/hour

very active: walking 17 miles/day at a rate of 3-4 miles/hour

The above regression equations require values for body height and/or weight. Reference values for body weight and height used in the regression equations are presented in Table 1 (IOM, 2005).

Estimates of energy requirement in children and adults:

Figure 1 shows EERs calculated from regression equations and reference body weights and heights for children and adults. The EERs shown in Figure 1 are the average values for three physical activity categories: low active, active or very active (sedentary was not included in the average). The discontinuities in the age profiles shown in Figure 1 result from three different regression models for subjects in specific age ranges (i.e., 1-35 months, 3-18 years, ≥19 years). Table 2 summarizes EER estimates for adults and children (HHRA age range category 0-6 years) for the four physical activity levels represented in the IOM (2005) regression equations. Child/adult ratios (male female average) for EER ranged from 0.48 (very active) to 0.53 (sedentary). The average for the non-sedentary activity levels was 0.50. This value was selected for use in Equation 1 for calculating food consumption rates for children from adult consumption rates.
