1.0 INTRODUCTION

This Technical Memorandum for Oversight of the Phase 1A-B Remedial Investigation (Technical Memorandum) summarizes the U.S. Environmental Protection Agency, Region 8 (EPA), and EPA's contractor, Pacific Western Technologies, Ltd. (PWT), split sampling and field oversight activities conducted during Phase 1A-B of the Remedial Investigation (RI) at the US Magnesium National Priority List Site in Tooele County, Utah (Site) (Figure 1). The oversight activities were conducted to ensure that the Responsible Party, US Magnesium, and US Magnesium's contractor, ERM-West, Inc. (ERM), were implementing the Phase 1A-B RI in accordance with the *Phase 1A-B Remedial Investigation Sampling and Analysis Plan for: 1) Chemicals of Potential Concern in Soil, Sediment, and Solid Wastes in PRI Areas 1 and 3 through 7; 2) Preliminary Site Characterization Mapping of PRI Areas 1 and 3 through 7; and 3) Background Chemical Assessment of Biotic Reference Areas for Sitewide Ecological Risk Assessment* (Phase 1A-B RI SAP) (ERM 2015).

The Phase 1A-B RI SAP presents the objectives, approach, evaluation criteria, and scope of work to be conducted by US Magnesium/ERM for Phase 1A-B of the RI for the Site. Phase 1A-B of the RI includes the sampling of solid and aqueous media to fully characterize contaminant types in order to select contaminants of potential concern (COPC) and evaluate the nature and extent of contaminants in the Inner preliminary remedial investigation (PRI) areas, and to obtain preliminary data to support initial risk characterization. The Phase 1A-B of the RI also includes a background study to collect data beyond the RI Study Area to compare naturally occurring chemicals of concern to contaminants within the RI Study Area, and to identify non-impacted areas suitable for biota sampling.

The Phase 1A-B RI field activities were completed by ERM between September and December 2015. Field activities conducted during the Phase 1A-B RI included surface and subsurface solids sampling in PRI Areas 1, 3, 4, 5, 6, and 7, and background areas. PWT conducted oversight of all sampling activities and accepted split samples of solid media for independent laboratory analysis. Conduct of the EPA's oversight was performed by PWT (with support from PWT's subcontractor, EarthFax Engineering Group, LLC), under EPA Contract No. EP-W-06-006, Work Assignment No. 130-RDSB-08PU.

The analysis of the split samples, verification/validation of the split sample data, and management of the data/documentation are not discussed in this Technical Memorandum. This Technical Memorandum is limited to observations and findings made during field activities and is not intended to address the reproducibility of analytical results and/or limitations in analytical and data management protocol-related objectives stated in the *Phase 1 Remedial Investigation Oversight Quality Assurance Project Plan* (Phase 1 OS QAPP) (EPA 2015). If directed by the EPA, PWT will prepare a separate oversight split sampling report to include analytical data from split samples, address the reproducibility of analytical results, and discuss limitations in analytical and data management protocols regarding the objectives stated in the Phase 1 OS QAPP.

1.1 PHASE 1A-B RI GENERAL SPLIT SAMPLING AND OVERSIGHT APPROACH

Split sampling and oversight of US Magnesium/ERM's field activities during the Phase 1A-B RI was conducted by EPA/PWT in accordance with the Phase 1 OS QAPP. The overall objectives for the Phase 1A-B RI oversight and split sampling program were to substantively oversee US Magnesium/ERM's field activities and collect splits of the solids samples collected by US Magnesium/ERM. The objective of the EPA/PWT field oversight program was to confirm that US Magnesium/ERM implemented the field activities pursuant to the EPA-approved plans. The objective of the EPA/PWT split sampling program is to confirm that the US Magnesium/ERM sample analytical results are reproducible. In order to produce results that can be used to evaluate reproducibility, the EPA/PWT oversight verified the sampling strategy performed by US Magnesium/ERM was conducted so that:

- Samples were collected from specified media and sampling horizons at required sampling locations using EPA-approved Standard Operating Procedures (SOPs);
- Sufficient sample volume was collected such that investigative, quality control (QC), and split samples were obtained from each location;
- Sample processing in the field provides representative samples; and
- Split samples provided to the EPA/PWT are representative of US Magnesium/ERM samples.

The following is a list of oversight tasks conducted by PWT during the Phase 1A-B RI:

- Oversee field activities for adherence to EPA-approved project planning documents;
- Approve any minor modifications of the sampling locations;
- Observe and document ERM sample collection and processing activities;
- Oversee drilling and borehole logging activities;
- Accept split samples of surface and subsurface solids;
- Oversee sample labeling and sample location documentation;
- Collect oversight photographic documentation;
- Consult with ERM field staff regarding potential field modifications that ERM may seek from the EPA/PWT, in order for PWT to advise the EPA regarding actions on such requests;
- Consult with and advise the EPA regarding field/Site situations that may warrant the EPA considerations for issuing appropriate Phase 1A-B RI SAP and/or Phase 1 OS QAPP modification(s);
- Conduct chemical analysis of split samples;
- Verify and validate split sample analytical data; and
- Manage split sample data and the associated documentation.

The analysis of the split samples, verification/validation of the split sample data, and management of the data/documentation are not discussed in this Technical Memorandum.

1.2 SUMMARY OF FIELD OVERSIGHT ACTIVITIES AND SPLIT SAMPLE COLLECTION

During the Phase 1A-B RI, ERM collected 159 surface solids samples from 159 locations and 61 subsurface solids samples from 18 locations; however, as discussed in Section 2.0, only 46 subsurface solids samples collected were analyzed. Phase 1A-B RI field activities were conducted in 6 of the 17 PRI areas and in each of the background areas:

- PRI Area 1 – Ditches
- PRI Area 3 – Sanitary Lagoon
- PRI Area 4 – Gypsum Pile
- PRI Area 5 – Southeast Ponded Waste Lagoon
- PRI Area 6 – Northwest Ponded Waste Lagoon
- PRI Area 7 – Northeast Ponded Waste Lagoon
- Background Sampling Areas:
 - Upland North
 - Upland South
 - Upland Southeast
 - Lakebed North
 - Lakebed Southeast
 - Lakebed Southeast at Badger Island
 - Bear River Migratory Bird Refuge

ERM completed the Phase 1A-B RI field activities each day with one field team. The ERM field team generally consisted of two to three ERM personnel. During Phase 1A-B of the RI, PWT had one oversight person on site every day of sampling and provided oversight for as much of the field activities as practical. Mr. Aaron Baird, PWT Field Team Leader, performed the EPA field oversight with support from Mr. Tim Jimenez of EarthFax Engineering Group, LLC. The specific oversight activities conducted by PWT during the Phase 1A-B RI are summarized below.

PWT accepted a minimum of two split samples of surface solids from each PRI area and background area to assess reproducibility, with the exception of the Bear River Migratory Bird Refuge background area where a reduced number of samples were collected and only one split sample was accepted. PWT also accepted one subsurface solids split sample from each subsurface boring. This resulted in 33 split samples of surface solids and 19 split samples of subsurface solids; however, as discussed in Section 2.0, only 15 subsurface solids split samples were analyzed. Table 1 details information regarding each sample and split sample accepted; including location identification, media, number of samples, rationale, split sample number and date of sample collection. Table 2 provides the tally and percent calculations for the split and QC samples analyzed and reported by PWT. Figures 2 and 3 present the locations of the split samples accepted by PWT: Figure 2 – Solids Split Sample Locations - PRI Areas 1 and 3 through 7; and Figure 3 – Solids Split Sample Locations - Background. The field activities specific to each sample location, PRI area, or background area are discussed in Section 2.0 and the common field activities are discussed below.

PWT primarily selected locations for surface solids split samples randomly; however, used professional judgment considering one or more of the following factors in certain cases: (1) target sample locations in analytical groups that have the most analyses; (2) target sample locations in different areas or surface soil types within the PRI/background area; and (3) obtain split samples from the high or low end of the concentration range using whatever information was available to suggest the level of contamination. For subsurface solids split samples, the specific sampling interval within each boring was primarily selected randomly; however, anomalous layers were targeted in some instances. Field duplicate locations were selected randomly. One matrix spike/matrix spike duplicate (MS/MSD) volume was collected for each analysis for each matrix, and one trip blank was included in each volatile organic compound (VOC) analysis sample shipment container. The location identification numbers were assigned based on the PRI/background area and the sample matrix type (ERM 2015).

Surface solids samples in PRI areas were collected from 0 to 6 inches from typically 5 grab sample aliquots using a hand auger with a 6-inch by 3.5-inch auger bucket; however, a Ponar sampler was used at sample locations with access issues. Subsurface solids samples in PRI areas were collected using a sonic drill rig to collect samples of 2-foot maximum sample intervals from 6 inches below ground surface (bgs) to 2 feet below the waste/native soil interface; however, Lexan™ tube coring was used at sample locations where sonic drilling was not successful. Surface solids samples in background areas were collected from 0 to 2 inches from typically 5 grab sample aliquots using a 4-inch by 4-inch flat-bottom scoop. Subsurface solids samples in background areas were collected from 2 inches to 3 feet bgs in a single borehole using a hand auger with a 6-inch by 3.5-inch auger bucket; however, at one location a post hole digger was used. PWT concurred with ERM on the lithologic interpretations of the subsurface cores and the selection of sample intervals. PWT reviewed the majority of ERM's boring logs in the field.

Solids samples witnessed by PWT were sieved, homogenized, and processed by ERM in accordance with the procedures identified in the Phase 1A-B RI SAP and SOP USM-01. ERM submitted Field Modification No. 7 requesting to modify the procedure in SOP USM-09 for sieving subsurface solids samples to make consistent with the procedure used for surface solids samples in SOP USM-01, which was approved by EPA on 4 November 2015. In accordance with the Data Quality Objectives, split solids samples were obtained by providing a sample container to ERM and having them fill the container after

all field sample processing had been completed. PWT accepted split solids samples in the field from the post-processed sample volume; however, the split solids samples for VOCs were collected by ERM at the point of sample collection. ERM and EPA-split sample aliquots were generally filled concurrently to the extent possible. PWT classified and logged all split solids samples according to the Unified Soil Classification System.

In PRI areas where waste was present in the surface solids sample aliquots, the thickness of the waste layer was measured using a hand auger, with the exception of location 1-06 which was measured using a LexanTM tube. The hand auger was advanced at 6-inch intervals to the bottom of the waste layer or to 5 feet bgs, whichever was shallower, in accordance with SOP USM-01.

PWT used field log books (Appendix A), split sampling data sheets (Appendix B), photographs (Appendix C), and Site maps to document sample and split sample locations, field observations, air monitoring results, events that occurred during field activities, and deviations from the Phase 1A-B RI SAP. A split sampling field data sheet was completed for each sample collected by PWT (Appendix B). Numerous photographs and videos were taken by PWT to document Phase 1A-B RI field activities and observations. Only photographs pertinent to this report are presented in Appendix C; additional photographs and/or videos will be provided upon request. Sampling Field Data Sheets, photographs, chains-of-custody, and log book entries were managed according to the Phase 1 OS QAPP. A Scribe database project was established to track sample collection, generate chains-of-custody, and receive data from the laboratories.

The ERM samples were shipped to the TestAmerica laboratory located in Sacramento, California. The EPA split samples were submitted to ALS Environmental laboratory located in Salt Lake City, Utah, with polychlorinated biphenyls (PCBs) and dioxins/furans analyses sent to the ALS Environmental laboratory located in Houston, Texas. Analyses performed by the laboratories included the full suites of target analytes by the standard methods that were identified for the Phase 1A-B RI.

1.3 DEVIATIONS FROM GOVERNING DOCUMENTS

During the Phase 1A-B RI, ten field modifications (No. 1 through 10) and three Record of SAP Modifications (No. 01, 02, and 03) were proposed by ERM, EPA, or PWT and approved by the EPA. Both the field and SAP modifications are summarized in Table 3 and the Record of SAP Modifications are included in Attachment 17B of the Phase 1A-B RI SAP. During Phase 1A-B, no Phase 1 OS QAPP modifications were proposed. The field and SAP modifications are discussed where applicable throughout this Technical Memorandum, with the exception of Record of SAP Modification No. 01, which was not associated with the field oversight or split sampling. ERM requested Record of SAP Modification No. 01 to include correct control limits for VOCs, semi-volatile organic compounds (SVOCs), and polynuclear aromatic hydrocarbons (PAHs) in Worksheet #24 of the Phase 1A-B RI SAP, which was approved by EPA on 26 October 2015.

2.0 PHASE 1A-B REMEDIAL INVESTIGATION FIELD OBSERVATIONS

During oversight of the Phase 1A-B RI sampling activities, observations were made regarding the plant stack emissions, wildlife, and other field activities. These observations are summarized in the following sections.

2.1 WIND AND STACK EMISSIONS OBSERVATIONS

Wind conditions at the Site were highly variable; it was not uncommon for the wind direction to fluctuate 360 degrees throughout the day. The stack behavior changed significantly based on wind and weather

conditions. Visible dissipation of the stack plume was observed to range from approximately one mile downwind under windy conditions to over 20 miles under calm conditions. During easterly winds, the stack plume was also observed spreading out and settling into the valleys of the Lakeside Mountains (Photo 1, Appendix C). Chlorine gas readings from the stack plume were encountered on the gypsum pile. At times, the stack plume exhibited “looping” behavior whereby the plume reaches the ground relatively near the stack (Photo 2, Appendix C) and on occasion, chlorine gas was observed falling straight down from the stack (Photo 3, Appendix C).

2.2 WILDLIFE OBSERVATIONS

Different wildlife species were observed in and around the US Magnesium facility as well as signs such as tracks, scat, burrows, nests, etc. Significant observations are described here. Golden Eagles were observed regularly perched on top of the electrical poles that parallel Rowley Road south of the plant. On 19 October 2015 a coyote was observed walking in the northwest area of the Gypsum Pile where standing water was present (Photo 4, Appendix C) and a pelican carcass was observed on the Gypsum Pile approximately 100 feet southeast of sample location 4-01 (Photo 5, Appendix C). Animal burrows were observed in the gypsum waste on the southeast side of the Gypsum Pile (Photo 6, Appendix C). Animal tracks were observed in the saturated waste material in the former wastewater diversion ditch. Cattle and antelope were observed grazing in PRI Areas 15 and 16. A cow carcass was observed in PRI Area 16, on the west side of the road at the base of the Lakeside Mountains.

2.3 FIELD INSTRUMENT CALIBRATION

The only field instrument used by ERM during the Phase 1A-B sampling activities that required calibration in the field was a photoionization detector (PID). Calibration of the PID was to be performed daily prior to use in accordance with Worksheet #22 of the Phase 1A-B RI SAP. PWT did not observe ERM calibrating the PID but it was reportedly performed as required.

2.4 FIELD SAMPLING EQUIPMENT DECONTAMINATION

Field sampling equipment and drilling equipment witnessed by PWT was decontaminated in general accordance with SOP USM-03. ERM set up a decontamination station in the lavatory facilities of the on-site office trailer. The lavatory facilities were dedicated for decontamination purposes only and not used for personal sanitation. In general, all non-disposable sampling equipment was decontaminated at the office trailer before and after sampling at each field location. A pressure washer was frequently used at or near the sampling location to remove solids from the sampling equipment prior to transporting to the office trailer. Down-hole metal drilling equipment was steam cleaned with a pressure washer and hot tap water. Sampling tools were decontaminated by scrubbing in a solution of potable water and non-phosphate detergent (Liquinox®). The tools were then rinsed with potable water, rinsed with isopropyl alcohol, and finally rinsed with deionized water. Sampling tools not used immediately after decontamination were allowed to air dry on metal racks in the office trailer. Clean equipment was then placed in plastic bags. No sampling supplies/equipment was dedicated at any of the sampling locations.

On 6 November 2015, PWT witnessed the collection of an equipment blank from a sample processing equipment set (stainless steel spoon, sieve, and tray). The decontaminated stainless steel spoon and sieve was placed on the tray and deionized water was poured over all the equipment at the same time and a plastic funnel was used to capture the water dripping from the corner of the tray to fill the sample bottles. The equipment blank collection procedures witnessed by PWT were conducted in accordance with SOP USM-03. The frequency of equipment blank collection was not verified.

2.5 MANAGEMENT OF INVESTIGATION-DERIVED WASTE

Investigation-derived waste (IDW), both solids and liquid, was generated during the Phase 1A-B activities. IDW witnessed by PWT was handled in accordance with Section 14.1.7 of the Phase 1A-B RI SAP and applicable SOPs. IDW was handled as follows:

- Used personal protective equipment (PPE) was disposed of in dumpsters at the US Magnesium facility;
- Excess soil from surface soil sample collection was left at the sample location;
- Excess soil from sonic drilling cores was placed in 55-gallon steel drums and left at the sample location; and
- Decontamination water was temporarily containerized in 5-gallon buckets and transferred to the Central Ditch.

2.6 FIELD DOCUMENTATION AND REPORTING

In accordance with Worksheet #14 of the Phase 1A-B RI SAP and SOP USM-06, ERM used field data sheets and log books to document field activities such as sample locations, sampling information, field observations, and significant events that occur during field activities. ERM provided daily progress reports at the end of each field day in accordance with Worksheet #33 of the Phase 1A-B RI SAP.

ERM collected sample location coordinates in the field using a Trimble Pro XH Global Positioning System (GPS). PWT did not witness all field GPS activities; however, the GPS field data collection procedures appear to have been conducted in accordance with SOP USM-11.

2.7 HEALTH AND SAFETY CONSIDERATIONS

2.7.1 General Health and Safety Approach

Health and safety considerations were taken into account at each sampling location and PRI-specific details are described in the sections below. The ERM field team held tailgate health and safety meetings at the start of each new task. PPE was worn at all sampling locations in accordance with the appropriate health and safety plans for each contractor. The minimum level of PPE donned was modified Level D and was frequently upgraded to Level C. All PWT site work was conducted in general accordance with PWT's and US Magnesium's respiratory protection programs.

For health and safety considerations, PWT field personnel kept a safe distance from low pH wastewater and ditch banks. Observations of sampling were sometimes made from the nearest and best observation point rather than accompanying ERM at the sample collection point.

Throughout the Phase 1A-B RI field activities, PWT field personnel conducted ambient air monitoring for VOCs, dust, chlorine gas, and hydrogen chloride (HCl) gas using a direct-reading real-time instrument. PWT used an Industrial Scientific iBRiD MX6 multi-gas meter with a PID and oxygen, carbon monoxide, HCl, and chlorine gas sensors and a DustTRACK2 monitor. Respiratory protection was upgraded as necessary depending on the presence of chlorine and/or HCl gas in the ambient air.

2.7.2 Health and Safety Issues Encountered

Weather conditions and facility process operations can significantly influence the potential for chlorine and other air borne contaminants to accumulate in the ambient air. Still air created air quality concerns because the chlorine and/or HCl gas would settle around the facility.

During the Phase 1A-B RI field activities, chlorine gas was measured with PWT field instruments in ambient air at concentrations up to 6.3 parts per million (ppm) and HCl gas was measured at concentrations up to 2.7 ppm. Elevated VOCs were not detected with the PID which measured VOCs in the ppm range. Respiratory protection was donned regularly due to the presence of chlorine gas and/or HCl gas.

Chlorine gas plumes originating from locations other than the facility stack were observed on multiple occasions. On 28 October 2015 a low-lying white haze (chlorine gas) was observed extending from the facility north into PRI Area 8 (Photo 7, Appendix C). The highest chlorine gas concentrations were encountered on the morning of 2 December 2015, when concentrations were sustained above 5 ppm while mobilizing to subsurface sample location 1-08 near the confluence of the Chlorine Ditch and Main Ditch. ERM's drilling subcontractor arrived at the location prior to the ERM/PWT field team and recorded chlorine concentrations up to 13 ppm with a personal gas meter. These were the highest chlorine readings ever recorded by the PWT or ERM field teams. For reference, the NIOSH Immediately Dangerous to Life or Health (IDLH) concentration for chlorine gas is 10 ppm. The response actions listed in ERM and PWT Health and Safety Plans were followed. The field team left the area and returned two hours later when chlorine gas was detected at less than 1 ppm; therefore, the field team donned respirators and completed the sampling at location 1-08. On 2 December 2015, the air was relatively still and additional discharge of chlorine gas was evident; there was a dense white haze encompassing the entire facility (Photo 8, Appendix C).

During the Phase 1A-B field activities, fugitive dust was not visible and the dust monitor did not detect significant levels of particulates in the air. However, dust was often generated while driving on dirt roads in and around the facility. PWT field vehicle windows were kept closed while driving to mitigate the dust inhalation hazard.

3.0 SPECIFIC FIELD ACTIVITIES AND OBSERVATIONS AT EACH PRI AREA

Field activities were conducted in PRI Areas 1, 3, 4, 5, 6, and 7. The PWT PRI area-specific observations for the field activities during the Phase 1A-B RI are reported below. PWT field notes and field data sheets are provided in Appendices A and B, respectively, and photographic documentation is provided in Appendix C. The following sections summarize observations of the Phase 1A-B RI field activities with sampling summaries and observations provided separately for surface and subsurface solids.

ERM contracted Cascade Drilling to provide the necessary equipment and personnel to drill the borings. The soil borings were advanced using a track-mounted, Roto Sonic drilling rig. Sonic drilling employs the use of high-frequency, resonant energy to advance a core barrel or casing into the subsurface; no air, mud, or water is used in the coring process. During drilling, each borehole was continuously cored for logging of subsurface lithology. The core barrel produces a continuous, relatively undisturbed core sample in a plastic liner. Core samples were extracted in 5-foot sections. After reaching total depth, each borehole was backfilled with dry 3/8-inch bentonite chips.

Figure 1 provides a general site location and features map, including identification of the PRI areas and US Magnesium facility features. Figures 2 and 3 show the locations of the split samples accepted by EPA/PWT: Figure 2 – Solids Split Sample Locations - PRI Areas 1 and 3 through 7; and Figure 3 – Solids Split Sample Locations - Background.

3.1 PRI AREA 1 – DITCHES

3.1.1 Sampling Requirement

The Phase 1A-B RI SAP identified collection of 14 surface solids samples (1-01 through 1-14) and subsurface solids samples from 5 locations (1-03, 1-07, 1-08, 1-13, and 1-14). The Phase 1 OS QAPP identified split samples from 2 of the 14 surface solids sample locations and 1 split sample from each of the 5 subsurface solids sample locations.

3.1.2 Surface Solids Sample Collection

The majority of the surface solids samples from PRI Area 1 were collected between 19 and 24 November 2015. The surface solids samples obtained using the Ponar sampler (1-03, 1-06, 1-07, and 1-08) were collected on 3 December 2015. PWT oversaw the collection of all surface solids samples in PRI Area 1 and accepted three split samples (1-04-SS-01-112415-ES01, 1-11-SS-01-112315-ES01, and 1-13-SS-01-112315-ES01). All sampling witnessed by PWT was conducted in general accordance with SOP USM-01, with the exception of the Ponar sampling discussed below. All split samples were collected from 5 to 7 grab sample aliquots using a hand auger, with the exception of location 1-04 which required 11 aliquots to accommodate for the split sample (this was the highest number of aliquots required for any sampling location during the Phase 1A-B RI).

Off-gassing or reactivity was not observed during sample collection or homogenization. ERM performed methanol testing at some of the locations where reactivity might be expected and no reactivity was observed in the methanol vials. All VOC analysis was performed using the En Core® samples.

The Phase 1A-B RI SAP locations for biased sample locations 1-04 and 1-12 were modified due to access limitations. The modified locations were in accordance with the rationale specified in Worksheet #18 of the Phase 1A-B RI SAP for the sample locations. ERM submitted Field Modification No. 9 for the change in sample locations, which was approved by EPA on 24 November 2015.

Due to access and health and safety issues, ERM submitted Record of SAP Modification No. 03, proposing an excavator-deployed Ponar sampler be used at locations 1-03, 1-06, 1-07, and 1-08 and EPA approved on 24 November 2015. The surface solids sampling at locations 1-03, 1-06, 1-07, and 1-08 using an excavator-deployed Ponar sampler (Photo 9, Appendix C) was completed on 3 December 2015. The Ponar sampler easily penetrated into the soft waste material and full or near full recovery in the Ponar bucket was achieved at each sample location (Photo 10, Appendix C); therefore, only one Ponar sample aliquot was required for each sample. The Ponar sampling witnessed by PWT was conducted in general accordance with SOP USM-12, with the exception of the Ponar deployment by excavator rather than helicopter.

3.1.3 Subsurface Solids Sample Collection

The subsurface solids samples obtained using the sonic drilling method were collected on 4, 5, and 10 November 2015 and the 1-08 samples obtained using the Lexan™ core method were collected on 2 December 2015. PWT oversaw all borehole drilling and subsurface solids sample collection in PRI Area 1 and accepted one split sample from each of the borings. All subsurface solids sampling witnessed by PWT was conducted in general accordance with SOP USM-09 (as modified to include core sampling devices per Record of SAP Modification Number 03). Subsurface sampling details for the subsurface borings in PRI Area 1 are discussed below.

Subsurface Solids Sampling at 1-03:

On 4 November 2015, the 1-03 boring was advanced to a depth of approximately 5.5 feet using a sonic drill rig with a 6-inch diameter core barrel. The boring was advanced at a 52 degree angle from the south bank of the east end of the Western Ditch just west of the road crossing. Following inspection of the core, ERM collected three samples:

- 0.5 to 1.5 feet at 52° angle / 0.39 to 1.2 feet bgs – 1-03-SB-01-0.5-1.5-110415
- 1.5 to 3.5 feet at 52° angle / 1.2 to 2.8 feet bgs – 1-03-SB-01-1.5-3.5-110415
- 3.5 to 5.5 feet at 52° angle / 2.8 to 4.3 feet bgs – 1-03-SB-01-3.5-5.5-110415

The native soil interface, observed to be dark gray sand, was encountered at approximately 3.5 feet bgs.

PWT accepted a split sample of native sand from:

- 3.5 to 5.5 feet at 52° angle / 2.8 to 4.3 feet bgs – 1-03-SB-01-3.5-5.5-110415-ES01

Subsurface Solids Sampling at 1-07:

On 4 November 2015, the 1-07 boring was advanced to a depth of approximately 7 feet using a sonic drill rig with a 6-inch diameter core barrel. The boring was advanced at a 45 degree angle from the east bank of the Chlorine Ditch just south of the road crossing. Following inspection of the core, ERM collected four samples:

- 0.5 to 1.5 feet at 45° angle / 0.35 to 1.1 feet bgs – 1-07-SB-01-0.5-1.5-110415
- 1.5 to 3 feet at 45° angle / 1.1 to 2.1 feet bgs – 1-07-SB-01-1.5-3-110415
- 3 to 5 feet at 45° angle / 2.1 to 3.5 feet bgs – 1-07-SB-01-3-5-110415 (*not analyzed*)
- 5 to 7 feet at 45° angle / 3.5 to 4.9 feet bgs – 1-07-SB-01-5-7-110415 (*not analyzed*)

PWT accepted a split sample of waste material from:

- 0.5 to 1.5 feet at 45° angle / 0.35 to 1.1 feet bgs – 1-07-SB-01-0.5-1.5-110415-ES01

During drilling the native soil interface, observed to be gray clay, was thought to be encountered at approximately 5 feet bgs; however, following sample collection ERM audited the subsurface samples submitted to the lab versus the lithology observed in the boring and determined that the sample from 1.5 to 3 feet bgs is native soil. ERM determined that the 3 to 5 feet bgs and 5 to 7 feet bgs samples were collected below the first native soil interval and canceled the analyses of those two samples.

Subsurface Solids Sampling at 1-08:

On 5 November 2015, the 1-08 boring was advanced to a depth of approximately 10 feet using a sonic drill rig with a 6-inch diameter core barrel. The boring was advanced at a 45 degree angle adjacent to the Main Ditch culvert on the west side of the road crossing (Photo 11, Appendix C), approximately 30 feet from the SAP location (SAP location was located on the southern bank of the ditch and was not accessible due to facility wastewater discharge piping). Sample recovery from within the upper zone was low due to compaction of the very soft and saturated materials encountered; 1 foot of material was recovered from 0.5 to 7 feet. Below 7 feet bgs, recovery was near 100 percent. Native sand was encountered below the waste material at approximately 6.0 feet bgs. Following inspection of the core, ERM collected three samples from the first core:

- 0.5 to 7 feet at 45° angle / 0.35 to 4.9 feet bgs – 1-08-SB-01-0.5-7-110515 (*not analyzed*)
- 7 to 8.5 feet at 45° angle / 4.9 to 6.0 feet bgs – 1-08-SB-01-7-8.5-110515 (*not analyzed*)
- 8.5 to 10 feet at 45° angle / 6.0 to 7.1 feet bgs – 1-08-SB-01-8.5-10-110515

EPA accepted a split sample from:

- 7 to 8.5 feet bgs – 1-08-SB-01-7-8.5-110515-ES01 (*not analyzed*)

Because sonic drilling did not produce a continuous core from 0.5 to 7 feet bgs, a Lexan™ tube coring method was used. On 2 December 2015, a 9-foot section of 4-inch diameter Lexan™ tube attached to the bucket of a long-reach excavator was advanced adjacent to the sonic boring location. The Lexan™ tubes were equipped with plastic liners, a suction ball at the top, and soil catchers at the bottom of the tube. The core was advanced to about 7 feet bgs and there was about 4 feet of recovery. ERM's coring subcontractor suspected that the loose saturated material near the surface fell down into the lower part of the core.

Since there was not full recovery in the first core, a second core was advanced in the center of the Main Ditch, approximately 15 feet west of the first core (Photo 12, Appendix C). The second core was advanced to 7 feet bgs and there was about 3 feet of recovery. What appeared to be black smut was observed in the bottom of the second core. A third core was advanced adjacent to the second core location, this time with no liner or soil catcher. The third core was advanced to 7 feet bgs and there was 6 feet of recovery. Black sandy gravel with a hydrocarbon odor was encountered from 5 to 6 feet bgs which was considered anomalous and therefore separated into its own sample interval. The top 1 foot of material in the core was stuck to the side of the Lexan™ tube and ERM was unable to recover it for sampling. Following inspection of the core, ERM collected three samples from the core:

- 1 to 3 feet bgs – 1-08-SB-01-1-3-120215
- 3 to 5 feet bgs – 1-08-SB-01-3-5-120215
- 5 to 6 feet bgs – 1-08-SB-01-5-6-120215

PWT did not accept any split samples from the 1-08 cores on 2 December 2015. ERM later notified EPA that the waste samples collected from 0.5 to 7 feet and 7 to 8.5 feet on 5 November 2015 would not be analyzed; therefore, PWT cancelled all analyses for split sample 1-08-SB-01-7-8.5-110515-ES01. ERM submitted Field Modification No. 10 proposing to analyze the waste samples from the Lexan™ core and to only analyze the native material sample from the sonic drilling on 5 November 2015, which EPA approved on 7 December 2015. All subsurface solids sampling witnessed by PWT was conducted in general accordance with SOP USM-09 (as modified to include core sampling devices per Record of SAP Modification Number 03).

Subsurface Solids Sampling at 1-13:

On 10 November 2015, the 1-13 boring was advanced to a depth of approximately 17 feet bgs using a sonic drill rig with a 6-inch diameter core barrel. The boring was advanced between the PRI Areas 5 and 7 wastewater ponds in the former wastewater diversion ditch. Following inspection of the core, ERM collected eight samples from the core:

- 0.5 to 4 feet bgs – 1-13-SB-01-0.5-4-111015
- 4 to 6 feet bgs – 1-13-SB-01-0.5-4-111015
- 6 to 8 feet bgs – 1-13-SB-01-0.5-4-111015
- 8 to 9 feet bgs – 1-13-SB-01-0.5-4-111015
- 9 to 11 feet bgs – 1-13-SB-01-0.5-4-111015
- 11 to 13 feet bgs – 1-13-SB-01-0.5-4-111015 (*not analyzed*)
- 13 to 15 feet bgs – 1-13-SB-01-15-17-111015 (*not analyzed*)
- 15 to 17 feet bgs – 1-13-SB-01-15-17-111015 (*not analyzed*)

EPA accepted a split sample from:

- 13 to 15 feet bgs – 1-13-SB-01-13-15-111015-ES01 (*not analyzed*)

At the time of drilling, there was some uncertainty as to the starting depth of native soil in the boring and therefore the boring was conservatively advanced to greater depths to ensure that native soil was sampled. Upon review of the boring logs from this location and other (historic) borings and test pits competed in the area, ERM determined that native soil was encountered at 9 feet bgs at location 1-13. Therefore, ERM did not analyze the 11 to 13 feet bgs, 13 to 15 feet bgs, and 15 to 17 feet bgs samples.

A zone of olive green silt was observed in the 1-13 boring at a depth of 13 to 15 feet bgs, and because this interval appeared anomalous (based on color), samples were collected from these specific intervals. This olive-green interval was observed in the 1-13/7-04SB area during the 1970 Dames & Moore test pit programs and therefore appears to be associated with the lake deposits and is not an “anomalous waste/sediment layer” that requires sampling. Therefore, ERM did not analyze samples from 13 to 15 feet bgs because the olive-green layer is from deeper than 2 feet below the waste/native soil interface and is associated with lake deposits that pre-date magnesium plant operations. Since the EPA split sample from the 1-13 boring was collected from the 13 to 15 feet bgs interval, all analyses that had not already been run were cancelled, including PCBs, dioxins/furans, SVOCs, PAHs, and total metals.

Subsurface Solids Sampling at 1-14:

On 3 November 2015, the 1-14 boring was advanced to a depth of approximately 11 feet bgs using a sonic drill rig with a 6-inch diameter core barrel. The boring was advanced between the Chlorine Ditch and Landfill in the Former Boron Ditch. At the time of drilling, there was some uncertainty as to the starting depth of native soil in the boring, however, due to time constraints for sample shipment, the boring was not advanced further and the drill rig was left on the hole. On 4 November 2015, the 1-14 boring was advanced to 17 feet bgs. There was approximately 2 feet of recovery from 11 to 15 feet bgs and a solid core recovery from 15 to 17 feet bgs; however, the plastic sample sleeve broke and the sample from 11 to 15 feet bgs was lost. A hydrocarbon odor was noted during the processing of the 15 to 17 feet bgs sample. Following inspection of the core, ERM collected eight samples:

- 0.5 to 2 feet bgs – 1-14-SB-01-0.5-2-110315
- 2 to 4 feet bgs – 1-14-SB-01-2-4-110315
- 4 to 6 feet bgs – 1-14-SB-01-4-6-110315
- 6 to 7 feet bgs – 1-14-SB-01-6-7-110315
- 7 to 8.5 feet bgs – 1-14-SB-01-7-8.5-110315
- 8.5 to 10 feet bgs – 1-14-SB-01-8.5-10-110315
- 10 to 11 feet bgs – 1-14-SB-01-10-11-110315 (*not analyzed*)
- 15 to 17 feet bgs – 1-14-SB-01-15-17-110415 (*not analyzed*)

EPA accepted a split sample of native sand from:

- 7 to 8.5 feet bgs – 1-14-SB-01-7-8.5-110315-ES01

Upon review of the boring logs from this location and other (historic) borings competed in the area, ERM determined that the sample from 8.5 to 10 feet bgs is native soil. Therefore, ERM did not analyze the 10 to 11 feet bgs and 15 to 17 feet bgs samples.

3.1.4 General Observations and Waste Thickness

The surface solids sample locations appear to be representative of the different areas/ditches within PRI Area 1 and the subsurface sample locations appear to be representative of the Main Ditch, Chlorine Ditch, and Former Boron Ditch; no subsurface sampling was conducted in the Central Ditch or the north/south trending portion of the Western Ditch. The Ponar sampler was an effective means of surface solids sample collection in the ditch waste/sediment and the Lexan™ tube coring method was more effective

than sonic drilling in recovering the soft saturated waste material. The reddish brown waste material was often smeared to varying degrees on the outside of the native material sample core and the waste smear was homogenized with the native interval sample.

The thickness of the waste material in PRI Area 1 varies greatly between each ditch. Waste thickness measured in the ditches were as follows.

- Western Ditch. Two surface samples were collected and no waste was reported for either sample.
- Central Ditch. Two surface samples were collected with no waste recorded at one location and a waste thickness in excess of 5 feet reported for the other location. The thickness was based on a hand auger boring at that location.
- Chlorine Ditch. Two surface samples were collected and one boring was advanced in the location of one of the surface samples. Waste was reported in the surface sample adjacent to the boring, but not in the other surface sample. Waste was not reported at depth in the boring.
- Former Boron Ditch. One surface sample and one boring was advanced in the ditch. Waste was reported for the surface sample with a thickness of 3 inches. Waste was encountered from 7 feet bgs to 8.5 feet bgs resulting in a thickness of 1.5 feet.
- Main Ditch. Waste thicknesses ranged from 0.5 inch at one surface sampling location to 4 feet (1 foot bgs to 5 feet bgs) at one borehole location to 1 foot (8 feet bgs to 9 feet bgs) at another borehole location.

The waste material is reddish brown silt-like material throughout all of the ditches. Due to access limitations, waste thickness at location 1-06 was measured using an excavator-deployed Lexan™ tube.

3.1.5 PRI Area 3 – Sanitary Lagoon

3.1.5.1 Sampling Requirement

The Phase 1A-B RI SAP identified collection of 14 surface solids samples (3-01 through 3-14) and subsurface samples from 1 location (3-14). The Phase 1 OS QAPP identified split samples from 3 of the 14 surface solids sample locations and 1 split sample from the subsurface solids sample location.

3.1.5.2 Surface Solids Sample Collection

The surface solids samples were collected on 16 through 19 November 2015. PWT oversaw the collection of all surface solids samples in PRI Area 3 and accepted three split samples (3-01-SS-01-111715-ES01, 3-04-SS-01-111715-ES01, and 3-14-SS-01-111715-ES01). All samples were collected from 5 to 6 grab sample aliquots using a hand auger. All sampling witnessed by PWT was conducted in general accordance with SOP USM-01. All surface solids samples were collected at the locations proposed in the Phase 1A-B RI SAP.

3.1.5.3 Subsurface Solids Sample Collection

Subsurface Solids Sampling at 3-14:

The borehole drilling and subsurface solids sampling in PRI Area 3 was conducted on 3 November 2015. PWT oversaw the drilling and subsurface sample collection from the 3-14 location and accepted one split subsurface solids sample. A ramp was constructed on the south side of the lagoon bank to allow drill rig access to the 3-14 location. The borehole was advanced to a depth of approximately 5 feet bgs using a sonic drill rig with a 6-inch diameter core barrel. There was approximately 3 feet of recovery in the core and it appeared the top 3.5 feet of saturated organic waste material compressed to about 10 inches of recovery. Native clayey sand was encountered at approximately 3.5 feet bgs. Since only 1.5 feet of native

was encountered and the requirement is for 2 feet into native, a second core was advanced to a depth of 10 feet bgs and native clay and oolitic sand were encountered. The 5 to 10 foot core was not sampled. Following inspection of the core, ERM collected two samples from the first core:

- 0.5 to 3.5 feet bgs – 3-14-SB-01-0.5-3.5-110315
- 3.5 to 5 feet bgs – 3-14-SB-01-3.5-5-110315

EPA accepted a split sample from:

- 3.5 to 5 feet bgs – 3-14-SB-01-3.5-5-110315-ES01

All subsurface solids sampling witnessed by PWT was conducted in general accordance with SOP USM-09 and the 3-14 samples were collected at the location proposed in the Phase 1A-B RI SAP.

3.1.5.4 General Observations and Waste Thickness

It appears that some of the material used to construct the banks of the Sanitary Lagoon is gypsum and the gypsum has eroded down into the lagoon. The wastewater outfall pipe was flowing continuously during the Phase 1A-B RI sampling in PRI Area 3 and there was surface water across the southern portion of the lagoon. The grid sample locations appear to represent each of the different areas within PRI Area 3.

The thickness of the waste material in PRI Area 3 varies from approximately 3 inches to 3.5 feet thick. The waste material is dark brown organic, clayey silt material.

3.1.6 PRI Area 4 – Gypsum Pile

3.1.6.1 Sampling Requirement

The Phase 1A-B RI SAP identified collection of 14 surface solids samples (4-01 through 4-14) and subsurface samples from 1 location (4-05). The Phase 1 OS QAPP identified split samples from 3 of the 14 surface solids sample locations and 1 split sample from the subsurface solids sample location.

3.1.6.2 Surface Solids Sample Collection

The surface solids samples from PRI Area 4 were collected between 19 and 29 October 2015. PWT oversaw the collection of all surface solids samples in PRI Area 4 and accepted three split samples (4-01-SS-01-102015-ES01, 4-05-SS-01-102015-ES01, and 4-06-SS-01-102015-ES01). All samples were collected from 6 to 7 grab sample aliquots using a hand auger. All sampling witnessed by PWT was conducted in general accordance with SOP USM-01. All surface solids samples were collected at the locations proposed in the Phase 1A-B RI SAP.

3.1.6.3 Subsurface Solids Sample Collection

Subsurface Solids Sampling at 4-05:

The borehole drilling and subsurface solids sampling was conducted on 9 November 2015. PWT oversaw the drilling and subsurface sample collection from the PRI Area 4 boring location 4-05 and accepted one split subsurface solids sample. The borehole was advanced to a depth of approximately 11 feet bgs using a sonic drill rig with a 6-inch diameter core barrel. There was approximately 6.5 feet of recovery in the core. Native sand and clayey silt was encountered below the gypsum waste at approximately 7 feet bgs. Since only 14 inches of native was encountered and the requirement is for 2 feet into native, a second core was advanced to a depth of 11 feet bgs. There was approximately 9.5 feet of recovery in the second core

and 4 feet of native material. Following inspection of the core, ERM collected four samples from the first core:

- 0.5 to 3 feet bgs – 4-05-SB-01-0.5-3-110915
- 3 to 5 feet bgs – 4-05-SB-01-3-5-110915
- 5 to 7 feet bgs – 4-05-SB-01-5-7-110915
- 7 to 9 feet bgs – 4-05-SB-01-7-9-110915

EPA accepted a split sample from:

- 7 to 9 feet bgs – 4-05-SB-01-7-9-110915-ES01

All subsurface solids sampling witnessed by PWT was conducted in general accordance with SOP USM-09 and the 4-05 samples were collected at the location proposed in the Phase 1A-B RI SAP.

3.1.6.4 General Observations and Waste Thickness

Gypsum slurry was discharged on the west-northwest side of the gypsum pile during the Phase 1A-B RI. Access across the saturated portions of the gypsum pile is challenging. The grid sample locations appear to represent each of the different areas within PRI Area 4. The thickness of the gypsum waste in PRI Area 4 ranged from 1 foot to 7 feet at the sample locations. The waste material is reddish brown gypsum; some thin layers of white material were also observed.

3.1.7 PRI Area 5 – Southeast Ponded Waste Lagoon

3.1.7.1 Sampling Requirement

The Phase 1A-B RI SAP identified collection of 20 surface solids samples (5-01 through 5-20) and subsurface samples from 2 locations (5-14 and 5-16). The Phase 1 OS QAPP identified split samples from 4 of the 20 surface solids sample locations and 1 split sample from each of the subsurface solids sample locations.

3.1.7.2 Surface Solids Sample Collection

The surface solids samples were collected between 17 and 25 September 2015 and on 15 and 27 October 2015. PWT oversaw the collection of all surface solids samples in PRI Area 5 and accepted four split samples (5-15-SS-01-091715-ES01, 5-17-SS-01-091815-ES01, 5-18-SS-01-091815-ES01, and 5-19-SS-01-091815-ES01). All sampling witnessed by PWT was conducted in general accordance with SOP USM-01, with the exception of the Ponar sampling discussed below. All surface solids samples were collected at the locations proposed in the Phase 1A-B RI SAP with the exception of 5-04 which was moved approximately 100 feet to the northeast due to SAP location being on the dirt road. ERM submitted Field Modification No. 1 for the change in sample location, which was approved by EPA on 25 September 2015.

Due to access and health and safety issues caused by the ponded wastewater, a helicopter-deployed Ponar sampler was used at locations 5-02, 5-07, 5-08, 5-11, 5-12, 5-13, and 5-14. The number of Ponar sample aliquots required for each sample ranged from one aliquot in the soft saturated waste material to four aliquots in the non-saturated sandy material, depending on depth of penetration (Photos 13 and 14, Appendix C). Locations 5-07, 5-08, and 5-12 did not get adequate penetration (greater than or equal to 4 inches bgs) with the Ponar sampler. ERM submitted Field Modification No. 5 for not meeting the penetration acceptability requirement and for compositing sample aliquots, which was approved verbally by EPA on 27 October 2015 and signed on 29 October 2015. A box core sampler was tested at 5-14 achieving 2 inches of penetration, compared to 6-inch penetration with the Ponar (Photos 15 and 16,

Appendix C). The Ponar sampling witnessed by PWT was conducted in general accordance with SOP USM-12.

3.1.7.3 Subsurface Solids Sample Collection

The 5-16 subsurface solids samples obtained using the sonic drilling method were collected on 5 November 2015 and the 5-16 samples obtained using the Lexan™ core method were collected on 2 December 2015. The subsurface solids samples from 5-14 were collected on 1 December 2015. PWT oversaw the drilling/coring and subsurface sample collection from the PRI Area 5 boring locations and accepted one split subsurface solids sample from each boring location.

Subsurface Solids Sampling at 5-14:

The Phase 1A-B RI SAP location for 5-14 was modified due to access limitations caused by acidic wastewater and soft saturated sediment. The subsurface solids sample location was moved west-northwest of the SAP location to the nearest location an excavator could access from the gypsum pile. Since the use of a sonic drill rig was not practical at this location, ERM proposed to use a core sampler deployed from a long-reach excavator. ERM submitted Record of SAP Modification No. 03, proposing a revised location and sampling method for the 5-14 location. Since the 5-14 sample location was a collocated surface and subsurface sample location and the surface sample had already been collected, ERM referred to the subsurface sample location as 5-14SB.

The 5-14SB samples were collected with using a 15-foot section of 4-inch diameter Lexan™ tube attached to the bucket of a long-reach excavator (Photo 17, Appendix C). The sample core was collected approximately 30 feet from the shore of the gypsum pile. The Lexan™ tubes were equipped with plastic liners, a suction ball at the top, and soil catchers at the bottom of the tube. The first core was advanced to about 8.7 feet bgs and there was about 6 feet of recovery; however, ERM was unable to remove the core liners. A second core was advanced to 6 feet bgs with full recovery; however the bottom of the core was waste material. A third core was advanced to 8 feet bgs and there was about 6 feet of recovery with about 1 inch of native sand at the bottom. Following inspection of the core, ERM collected three samples from the third core:

- 0 to 2 feet bgs – 5-14SB-SB-01-0-2-120115
- 2 to 4 feet bgs – 5-14SB-SB-01-2-4-120115
- 4 to 6 feet bgs – 5-14SB-SB-01-4-6-120115

EPA accepted a split sample from:

- 4 to 6 feet bgs – 5-14SB-SB-01-4-6-120115-ES01

Because the requirement to sample two feet into native material was not met with the third core, a fourth core was advanced to collect the native material sample interval. A shorter, 11-foot section of Lexan™ core was advanced to 10 feet bgs and there was about 8 feet of recovery. Native sand was encountered below the waste material at approximately 8 feet bgs. ERM collected a sample from the fourth core:

- 8 to 10 feet bgs – 5-14SB-SB-01-8-10-120115

The 6 to 8 foot interval was not sampled due to poor recovery. All subsurface solids sampling witnessed by PWT was conducted in general accordance with SOP USM-09 (as modified to include core sampling devices per Record of SAP Modification No. 03).

Subsurface Solids Sampling at 5-16:

On 5 November 2015 the 5-16 borehole was advanced with a sonic drill rig to a depth of approximately 10 feet bgs using a 6-inch diameter core barrel. Sample recovery from within the upper zone was low due to compaction of the very soft and saturated materials encountered; 1.5 feet of material was recovered from 0.5 to 6.5 feet bgs. The entire 1.5-foot interval of recovered material was homogenized/processed and sampled. Below 6.5 feet bgs, recovery was 100 percent. Following inspection of the core, ERM collected three samples from the first core:

- 0.5 to 6.5 feet bgs – 5-16-SB-01-0.5-6.5-110515 (*not analyzed*)
- 6.5 to 8 feet bgs – 5-16-SB-01-6.5-8-110515

8 to 10 feet bgs – 5-16-SB-01-8-10-110515 (*not analyzed*) EPA accepted a split sample from:

- 8 to 10 feet bgs – 5-16-SB-01-8-10-110515-ES01 (*not analyzed*)

ERM later notified EPA that the 8 to 10 foot sample would not be analyzed; therefore, PWT cancelled all analyses for split sample 5-16-SB-01-8-10-110515-ES01.

On 2 December 2015, the 5-16 subsurface solids samples were collected using a 9-foot section of 4-inch diameter Lexan™ tube attached to the bucket of a long-reach excavator (Photo 18, Appendix C). The Lexan™ tubes were equipped with plastic liners, a suction ball at the top, and soil catchers at the bottom of the tube. The core was advanced to about 7 feet bgs and there was 100 percent recovery. Native clay was encountered below the waste material at approximately 5 feet bgs. Following inspection of the core, ERM collected three samples from the core:

- 0.5 to 2 feet bgs – 5-16-SB-01-0.5-2-120215
- 2 to 4 feet bgs – 5-16-SB-01-2-4-120215
- 4 to 5 feet bgs – 5-16-SB-01-4-5-120215

All subsurface solids sampling witnessed by PWT was conducted in general accordance with SOP USM-09 (as modified to include core sampling devices per Record of SAP Modification Number 03).

3.1.7.4 General Observations and Waste Thickness

The grid and biased sample locations appear to represent each of the different areas within PRI Area 5 with the exception of a rectangular area on the west side of PRI Area 5 where reddish brown solids had been stockpiled in the past. An earthen dam was constructed in the Skull Creek Diversion Ditch at the southeast corner of PRI Area 5 (Photo 19, Appendix C). The waste at the 5-14SB boring location, located at the outlet of the Main Ditch into the Southeast Ponded Waste Lagoon, was approximately 8 feet thick. The waste in the former diversion ditch at the 5-16 boring location was approximately 5 feet thick. The waste material is reddish brown silt-like material.

3.1.8 PRI Area 6 – Northwest Ponded Waste Lagoon

3.1.8.1 Sampling Requirement

The Phase 1A-B RI SAP identified collection of 16 surface solids samples (6-01 through 6-16) and subsurface samples from 1 location (6-16). The Phase 1 OS QAPP identified split samples from 3 of the 16 surface solids sample locations and 1 split sample from the subsurface solids sample location.

3.1.8.2 Surface Solids Sample Collection

The surface solids samples obtained using the hand auger method were collected on 16 and 17 September 2015 and 16 October 2015. The surface solids samples obtained using the Ponar sampler were collected on 28 October 2015. PWT oversaw the collection of all surface solids samples in PRI Area 6 and accepted three split samples (6-06-SS-01-091715-ES01, 6-14-SS-01-091615-ES01, and 6-15-SS-01-091615-ES01). All surface solids samples were collected at the locations proposed in the Phase 1A-B RI SAP. All sampling witnessed by PWT was conducted in general accordance with SOP USM-01, with the exception of the Ponar sampling discussed below.

Due to access and health and safety issues caused by the ponded wastewater, a helicopter-deployed Ponar sampler was used at locations 6-02, 6-05, 6-08, 6-09, 6-10, 6-11, 6-12, and 6-13. The number of Ponar sample aliquots required for each sample ranged from one to three aliquots depending on depth of penetration. Locations 6-09, 6-11, and 6-13 did not get adequate penetration (greater than or equal to 4 inches bgs) with the Ponar sampler. ERM submitted Field Modification No. 5 for not meeting the penetration acceptability requirement and for compositing sample aliquots, which was approved verbally by EPA on 27 October 2015 and signed on 29 October 2015. The Ponar sampling witnessed by PWT was conducted in general accordance with SOP USM-12.

3.1.8.3 Subsurface Solids Sample Collection

Subsurface Solids Sampling at 6-16:

The subsurface solids samples from the PRI Area 6 boring location, 6-16, were collected on 6 November 2015. PWT oversaw the drilling and subsurface sample collection from the 6-16 location and accepted one split subsurface solids sample. The 6-16 borehole was advanced at the location proposed in the Phase 1A-B RI SAP on the east side on the gypsum pile (Photo 20, Appendix C). The borehole was advanced to a depth of approximately 10 to 11 feet bgs using a sonic drill rig with a 6-inch diameter core barrel. There was only about 4.5 feet of recovery in the first core so a second core was advanced. Since there was only about 3 feet of recovery in the second core, a third core was advanced. There was about 9 feet of recovery in the third core and more than 2 feet of native material. Native sand was encountered below the gypsum waste at approximately 4.5 feet bgs. Following inspection of the core, ERM collected three samples from the third core:

- 0.5 to 3.5 feet bgs – 6-16-SB-01-0.5-3.5-110615
- 3.5 to 4.5 feet bgs – 6-16-SB-01-3.5-4.5-110615
- 4.5 to 6.5 feet bgs – 6-16-SB-01-4.5-6.5-110615

EPA accepted a split sample from:

- 3.5 to 4.5 feet bgs – 6-16-SB-01-3.5-4.5-110615-ES01

All subsurface solids sampling witnessed by PWT was conducted in general accordance with SOP USM-09.

3.1.8.4 General Observations and Waste Thickness

The grid and biased sample locations appear to represent each of the different areas within PRI Area 6. The gypsum waste at the 6-16 boring location was approximately 4.5 feet thick. The waste material is generally a reddish brown silt-like material though some white waste material was also observed (Photo 21, Appendix C). The wastewater from the Northwest Ponded Waste Lagoon continues to seep north through the berm road that separates PRI Area 6 from PRI Area 8.

3.1.9 PRI Area 7 – Northeast Ponded Waste Lagoon

3.1.9.1 Sampling Requirement

The Phase 1A-B RI SAP identified collection of 17 surface solids samples (7-01 through 7-17) and subsurface samples from 1 location (7-04). The Phase 1 OS QAPP identified split samples from 2 of the 17 surface solids sample locations and 1 split sample from the subsurface solids sample location.

3.1.9.2 Surface Solids Sample Collection

The surface solids samples were collected between 21 and 29 September 2015. PWT oversaw the collection of all surface solids samples in PRI Area 7 and accepted four split samples (7-11-SS-01-092115-ES01, 7-13-SS-01-092215-ES01, 7-14-SS-01-092215-ES01, and 7-15-SS-01-092215-ES01). All surface solids samples were collected at the locations proposed in the Phase 1A-B RI SAP. All sampling witnessed by PWT was conducted in general accordance with SOP USM-01.

3.1.9.3 Subsurface Solids Sample Collection

The subsurface solids samples obtained from location 7-04 using the sonic drilling method were collected on 10 November 2015 and the 7-04 samples obtained using the Lexan™ core method were collected on 10 December 2015. The Phase 1A-B RI SAP location for subsurface solids sampling at 7-04 was modified due to drill rig access limitations caused by the soft saturated sediment. The subsurface solids sample location was moved approximately 150 feet west-southwest of the SAP location to the nearest location the drill rig could access while meeting the objective for the samples. Since the 7-04 sample location was a collocated surface and subsurface sample location and the surface sample had already been collected, ERM referred to the subsurface sample location as 7-04SB. ERM submitted Field Modification No. 8 for the change in sample location and identification, which was approved verbally by EPA on 10 November 2015 and signed on 12 November 2015.

On 10 November 2015, the drillers constructed a plywood ramp out to the drilling location (Photo 22, Appendix C) and advanced the 7-04SB borehole to a depth of approximately 12.5 feet bgs using a sonic drill rig with a 6-inch diameter core barrel. There was no recovery from 0 to 2.5 feet bgs. Following inspection of the core, ERM collected five samples from the core:

- 2.5 to 4.5 feet bgs – 7-04-SB-01-2.5-4.5-111015
- 4.5 to 6.5 feet bgs – 7-04-SB-01-4.5-6.5-111015 (*not analyzed*)
- 6.5 to 8.5 feet bgs – 7-04-SB-01-6.5-8.5-111015 (*not analyzed*)
- 8.5 to 9.5 feet bgs – 7-04-SB-01-8.5-9.5-111015 (*not analyzed*)
- 9.5 to 11.5 feet bgs – 7-04-SB-01-9.5-11.5-111015 (*not analyzed*)

EPA accepted a split sample from:

- 8.5 to 9.5 feet bgs – 7-04-SB-01-8.5-9.5-111015-ES01 (*not analyzed*)

At the time of drilling there was some uncertainty as to the starting depth of native soil in the boring and therefore the boring was conservatively advanced to greater depths to ensure that native soil was sampled.

A zone of olive green silt was observed at 8.5 to 9.5 feet bgs at 7-04SB, and because this interval appeared anomalous (based on color), samples were collected from these specific intervals. This olive-green interval was observed in the 1-13/7-04SB area during the 1970 Dames & Moore test pit programs and therefore appears to be associated with the lake deposits and is not an “anomalous waste/sediment layer” that requires sampling. Therefore, ERM did not analyze samples from at 8.5 to 9.5 feet bgs at 7-04SB because the olive-green layer is from deeper than 2 feet below the waste/native soil interface and is

associated with lake deposits that pre-date magnesium plant operations. ERM determined that native soil was encountered at 2.5 feet bgs at location 7-04SB. Therefore, ERM only analyzed the 2.5 to 4.5 feet bgs sample. Since the EPA split sample from 7-04SB was collected from the 8.5 to 9.5 feet bgs interval, all analyses were cancelled.

Given that there was no recovery in the saturated waste material from 0.5 to 2.5 feet bgs, an alternate procedure was identified for obtaining a subsurface solids sample from the waste material at location 7-04SB. Pursuant to Record of SAP Modification No. 03, ERM used a 5-foot section of 4-inch diameter Lexan™ tube to collect one sample from the core (Photo 23, Appendix C):

- 0.5 to 2.5 feet bgs – 7-04-SB-01-0.5-2.5-121015

EPA accepted a split sample from:

- 0.5 to 2.5 feet bgs – 7-04-SB-01-0.5-2.5-121015-ES01

All subsurface solids sampling witnessed by PWT was conducted in general accordance with SOP USM-09 (as modified to include core sampling devices per Record of SAP Modification No. 03).

3.1.9.4 General Observations and Waste Thickness

The grid sample locations appear to represent each of the different areas within PRI Area 7. The wastewater from the Northwest and Southeast Ponded Waste Lagoons continues to seep east through the isthmus road that separates PRI Area 7 from PRI Areas 5 and 6. The Lexan™ tube coring method was more effective than sonic drilling in recovering the soft saturated waste material. No waste was identified in the only subsurface boring in PRI Area 7. A reddish brown silt-like material was noted in the surface samples.

3.2 SPECIFIC FIELD ACTIVITIES AND OBSERVATIONS AT EACH BACKGROUND AREA

The Phase 1A-B RI background sampling areas include three Upland areas (Upland North, Upland South and Upland Southeast), three Lakebed areas (Lakebed North, Lakebed Southeast, and Lakebed Southeast at Badger Island), and the Bear River Migratory Bird Refuge. The Phase 1A-B RI SAP identified collection of 65 background surface solids samples at 65 locations and one subsurface sample from each of the 7 background sampling areas (7 samples). The subsurface samples were collocated with a surface solids sample, near the center of each background sampling area (Photo 24, Appendix C). The Phase 1 OS QAPP identified split samples from 2 of the 10 surface solids sample locations in the Upland and Lakebed areas, from 1 of the 5 surface solids sample locations in the Bear River Migratory Bird Refuge area, and at least 1 split sample from each subsurface solids sample location, resulting in a total of 20 split samples.

The Phase 1A-B RI SAP (Section 11.3.7.5.2) states that the subsurface samples would be collected following SOP USM-09 using a portable flighted auger with soil sampling probe or a compressed-gas powered direct push corer. ERM brought a portable flighted auger with soil sampling probe on the first day of background sampling (1 October 2015); however, the portable flighted auger had a ½-inch diameter probe which could not produce the sample volume needed. Therefore, this equipment was not used and ERM collected subsurface samples with a hand auger. ERM submitted Record of SAP Modification No. 01 to modify the subsurface sample collection method for background areas and EPA approved on 7 October 2015. The SAP modification also addressed a minor revision to sample nomenclature. The Phase 1A-B RI SAP (Section 11.3.7.5.2) states that the sample identification depth interval will be in feet bgs; however, it was determined that inches would be used for the background area subsurface sample depth interval identifications (i.e. 2-36 rather than 0.17-3).

SOP USM-09, Section 6.5, states that boreholes will be abandoned using hydrated bentonite chips; however, ERM did not have bentonite chips on 1 October 2015. Therefore, ERM proposed to abandon boreholes in the background sampling areas with the remaining sample volume. ERM submitted Field Modification No. 2 for the change in borehole abandonment procedure, which was approved by EPA on 1 October 2015. This change was also documented in Record of SAP Modification No. 01.

All sampling witnessed by PWT was conducted in general accordance with the Phase 1A-B RI SAP (as modified per Record of SAP Modification Number 01). The PWT background sampling area-specific sampling summaries and observations for the field activities during the Phase 1A-B RI are reported below. Table 1 details information regarding each sample and split sample collected; including location identification, media, number of samples, rationale, split sample number and date of sample collection. Figure 3 shows the location of the split samples accepted by EPA/PWT from the background areas. PWT field notes and field data sheets are provided in Appendices A and B, respectively, and photographic documentation is provided in Appendix C.

3.2.1 Background Sampling Area Upland North

The Phase 1A-B RI SAP identified collection of 10 surface solids samples (UPN-1 through UPN-10) and a subsurface sample from 1 location (UPN-6). The surface and subsurface solids samples were collected on 14 October 2015. PWT oversaw the collection of all samples in the Upland North area and accepted two surface solids split samples (UPN-2-SS-01-101415-ES01 and UPN-10-SS-01-101415-ES01) and one subsurface solids split sample (UPN-6-SB-01-02-36-101415-ES01). The surface soil observed in the Upland North area was predominantly clayey silt with varying fractions of vegetation. All samples were collected at the locations proposed in the Phase 1A-B RI SAP. The grid sample locations appear to represent each of the different areas and different surface solids types within the Upland North area. Observations were consistent with those described in Attachment 11 of the Phase 1A-B RI SAP. More wildlife was observed in the Upland North area than the other background areas, with the exception of the Bear River Migratory Bird Refuge.

3.2.2 Background Sampling Area Upland South

The Phase 1A-B RI SAP identified collection of 10 surface solids samples (UPS-1 through UPS-10) and subsurface samples from 1 location (UPS-6). The surface and subsurface solids samples were collected on 12 and 13 October 2015. PWT oversaw the collection of all samples in the Upland South area and accepted two surface solids split samples (UPS-1-SS-01-101215-ES01 and UPS-6-SS-01-101315-ES01) and one subsurface solids split sample (UPS-6-SB--02-36-01-101315-ES01). The surface soil observed in the Upland South area was predominantly clayey silt with varying fractions of vegetation. All samples were collected at the locations proposed in the Phase 1A-B RI SAP. The grid sample locations appear to represent each of the different areas and different surface solids types within the Upland South area. Observations were consistent with those described in Attachment 11 of the Phase 1A-B RI SAP.

3.2.3 Background Sampling Area Upland Southeast

The Phase 1A-B RI SAP identified collection of 10 surface solids samples (UPSE-1 through UPSE-10) and subsurface samples from 1 location (UPSE-5). The surface and subsurface solids samples were collected on 30 September and 1 October 2015. PWT oversaw the collection of all samples in the Upland Southeast area and accepted two surface solids split samples (UPSE-1-SS-01-100115-ES01 and UPSE-3-SS-01-100115-ES01) and one subsurface solids split sample (UPSE-5-SB-01-02-36-100115-ES01). The surface soil observed in the Upland Southeast area was predominantly sandy silt with varying fractions of vegetation. All samples were collected at the locations proposed in the Phase 1A-B RI SAP. The grid sample locations appear to represent each of the different areas and different surface solids types within

the Upland Southeast area. Observations were consistent with those described in Attachment 11 of the Phase 1A-B RI SAP.

3.2.4 Background Sampling Area Lakebed North

The Phase 1A-B RI SAP identified collection of 10 surface solids samples (LBN-1 through LBN-10) and subsurface samples from 1 location (LBN-6). The surface and subsurface solids samples were collected on 2 and 5 October 2015. PWT oversaw the collection of all samples in the Lakebed North area and accepted two surface solids split samples (LBN-6-SS-01-100515-ES01 and LBN-7-SS-01-100515-ES01) and one subsurface solids split sample (LBN-6-SB-01-02-36-100515-ES01). The surface soil observed in the Lakebed North area was predominantly silty clay with little vegetation. All samples were collected at the locations proposed in the Phase 1A-B RI SAP. The grid sample locations appear to represent each of the different areas and different surface solids types within the Lakebed North area. Observations were consistent with those described in Attachment 11 of the Phase 1A-B RI SAP.

3.2.5 Background Sampling Area Lakebed Southeast

The Phase 1A-B RI SAP identified collection of 10 surface solids samples (LBSE-1 through LBSE-10) and subsurface samples from 1 location (LBSE-7). The surface and subsurface solids samples were collected on 6 and 7 October 2015. PWT oversaw the collection of all samples in the Lakebed Southeast area and accepted two surface solids split samples (LBSE-3-SS-01-100615-ES01 and LBSE-5-SS-01-100615-ES01) and one subsurface solids split sample (LBSE-7-SB-01-02-36-100715-ES01). The surface soil observed in the Lakebed Southeast area was primarily sand with varying fractions of silt, clay, and vegetation.

All samples were collected at the locations proposed in the Phase 1A-B RI SAP, with the exception of the location for sample LBSE-10. The surface material at the SAP location for LBSE-10 was firm salt; therefore, ERM requested to move the location 25 feet to the north into soil. ERM submitted Field Modification No. 3 for the change in the LBSE-10 sample location, which was approved verbally by EPA on 7 October 2015 and signed on 9 October 2015. The grid sample locations appear to represent each of the different areas and different surface solids types within the Lakebed Southeast area. Observations were consistent with those described in Attachment 11 of the Phase 1A-B RI SAP.

3.2.6 Background Sampling Area Lakebed Southeast at Badger Island

The Phase 1A-B RI SAP identified collection of 10 surface solids samples (LBB-1 through LBB-10) and subsurface samples from 1 location (LBB-7). The surface and subsurface solids samples were collected on 8 and 9 October 2015. PWT oversaw the collection of all samples in the Lakebed Southeast at Badger Island area and accepted two surface solids split samples (LBB-9-SS-01-100815-ES01 and LBB-10-SS-01-100815-ES01) and one subsurface solids split sample (LBB-7-SB-01-02-36-100815-ES01). The surface soil observed in the Lakebed Southeast at Badger Island area was predominantly sand and silty sand with varying fractions of surface gravel and vegetation. All samples were collected at the locations proposed in the Phase 1A-B RI SAP. The grid sample locations appear to represent each of the different areas and different surface solids types within the Lakebed Southeast at Badger Island area. Observations were consistent with those described in Attachment 11 of the Phase 1A-B RI SAP. The area is heavily traversed by brine shrimpers.

3.2.7 Background Sampling Area Bear River Migratory Bird Refuge

The Phase 1A-B RI SAP identified collection of 5 surface solids samples (BR-1 through BR-5) and subsurface samples from 1 location (BR-3). The surface and subsurface solids samples were collected on 22 October 2015. PWT oversaw the collection of all samples in the Bear River Migratory Bird Refuge area and accepted one surface solids split sample (BR-3-SS-01-102215-ES01) and one subsurface solids split sample (BR-3-SB-01-02-36-102215-ES01). Subsurface solids samples were to be collected using a hand auger; however, a hand auger was not available to collect the subsurface sample at location BR-3. Therefore, ERM requested to use a post hole digger in place of a hand auger. ERM submitted Field Modification No. 4 for the change in subsurface solids sampling equipment and EPA approved on 23 October 2015. The surface soil observed in the Bear River Migratory Bird Refuge area was predominantly sand and silty sand with varying fractions of surface gravel and vegetation. All samples were collected at the locations proposed in the Phase 1A-B RI SAP. The grid sample locations appear to represent each of the different areas and different surface solids types within the Bear River Migratory Bird Refuge area. Observations were consistent with those described in Attachment 11 of the Phase 1A-B RI SAP.

4.0 CONCLUSIONS AND RECOMMENDATIONS

During the Phase 1A-B RI, ERM collected 159 surface solids samples from 159 locations and 61 subsurface solids samples from 18 locations. PWT provided oversight of the field activities and collected a total of 52 split samples; 4 of which were either not analyzed or only analyzed for some of the analytes. Split samples were collected from 33 of the surface solids samples and one subsurface solids sample was collected from each subsurface boring location, resulting in a total of 19 subsurface solids split samples of which only 15 were analyzed. Based on PWT field observations, ERM satisfactorily implemented the field activities pursuant to the EPA-approved plans. Overall there was consistency in the application of sampling protocols and documentation. The SOPs used during the Phase 1A-B RI were sufficient. Implementation of the Phase 1A-B RI solids sampling indicates the sampling methods used may be appropriate and successful for use during future phases of the RI.

Table 2
Split Sample and QC Sample Summary
US Magnesium NPL Site

Media	Number of Field Samples	Number of Split Samples	Percentage of Split Samples	Number of Split QC Samples	Percentage of Split QC Samples
Surface Solids	159	33	21	9	19
Subsurface Solids	46	15*	33**		

Notes:

* Split samples were accepted at locations 1-08, 1-13, 5-16, and 7-04; however, were not analyzed.

** A minimum of one solid split sample was accepted from each of the subsurface borings.

QC = quality control

Table 3
Summary of 2015 Phase 1A-B RI Field and SAP Modifications
US Magnesium NPL Site

Document Tracking Number	Brief Description of Modification	Date Prepared	Date Approved
Field Modifications			
14C-1-1	Authorized adjustment to the location of PRI5-04 off the road into native material.	25 Sep 2015	12 Oct 2015
14C-1-2	Authorized borehole abandonment due to hand augering in background locations with left over soil in lieu of bentonite chips.	1 Oct 2015	1 Oct 2015
14C-1-3	Authorized adjustment to the location of LBSE-10 off a salt hardpan into soil material.	7 Oct 2015	9 Oct 2015
14C-1-4	Authorize use of post hole digger instead of hand auger at location BR-3.	23 Oct 2015	23 Oct 2015
14C-1-5	Authorized composite of multiple aliquots for sample collection at locations 5-07, 5-08, 5-12, 6-09, 6-11 and 6-13 in order to meet acceptable volume criteria defined in SOP USM-12.	27, 28 Oct 2015	29 Oct 2015
14C-1-6	Authorized adjustment of the location of PRI4-14 due to location being inundated with waste water.	29 Oct 2015	30 Oct 2015
14C-1-7	Authorize sample processing during subsurface sampling.	4 Nov 2015	4 Nov 2015
14C-1-8	Authorize adjustment of the location of PRI7-04 (subsurface only) due to drill rig access limitations.	10 Nov 2015	12 Nov 2015
14C-1-9	Authorize adjustment of the location of PRI1-04 and PRI 1-12 due to the SAP locations not being accessible by foot.	24 Nov 2015	24 Nov 2015
14C-1-10	Authorize characterization of shallow/waste and native material intervals for PRI1-08 and PRI5-16 on two separate dates (11/5/2015 and 12/2/2015).	7 Dec 2015	7 Dec 2015
SAP Modifications			
14C-2-1	Worksheet 11, Section 11.3.7.5.2, Subsurface Soil Sampling and Analysis—Specifies sample depth. Worksheet 14, Section 14.1.614.1.6, Subsurface Solids Sampling—Outlines how samples are to be collected and processed, and borehole backfilling. Worksheet 18, Notes—Outlines how samples are to be collected. Worksheet 27, Section 27.2—Footnote added specifying starting depth and ending depth of sample interval so as to provide adequate sample volume for analysis.	1 Oct 2015	7 Oct 2015

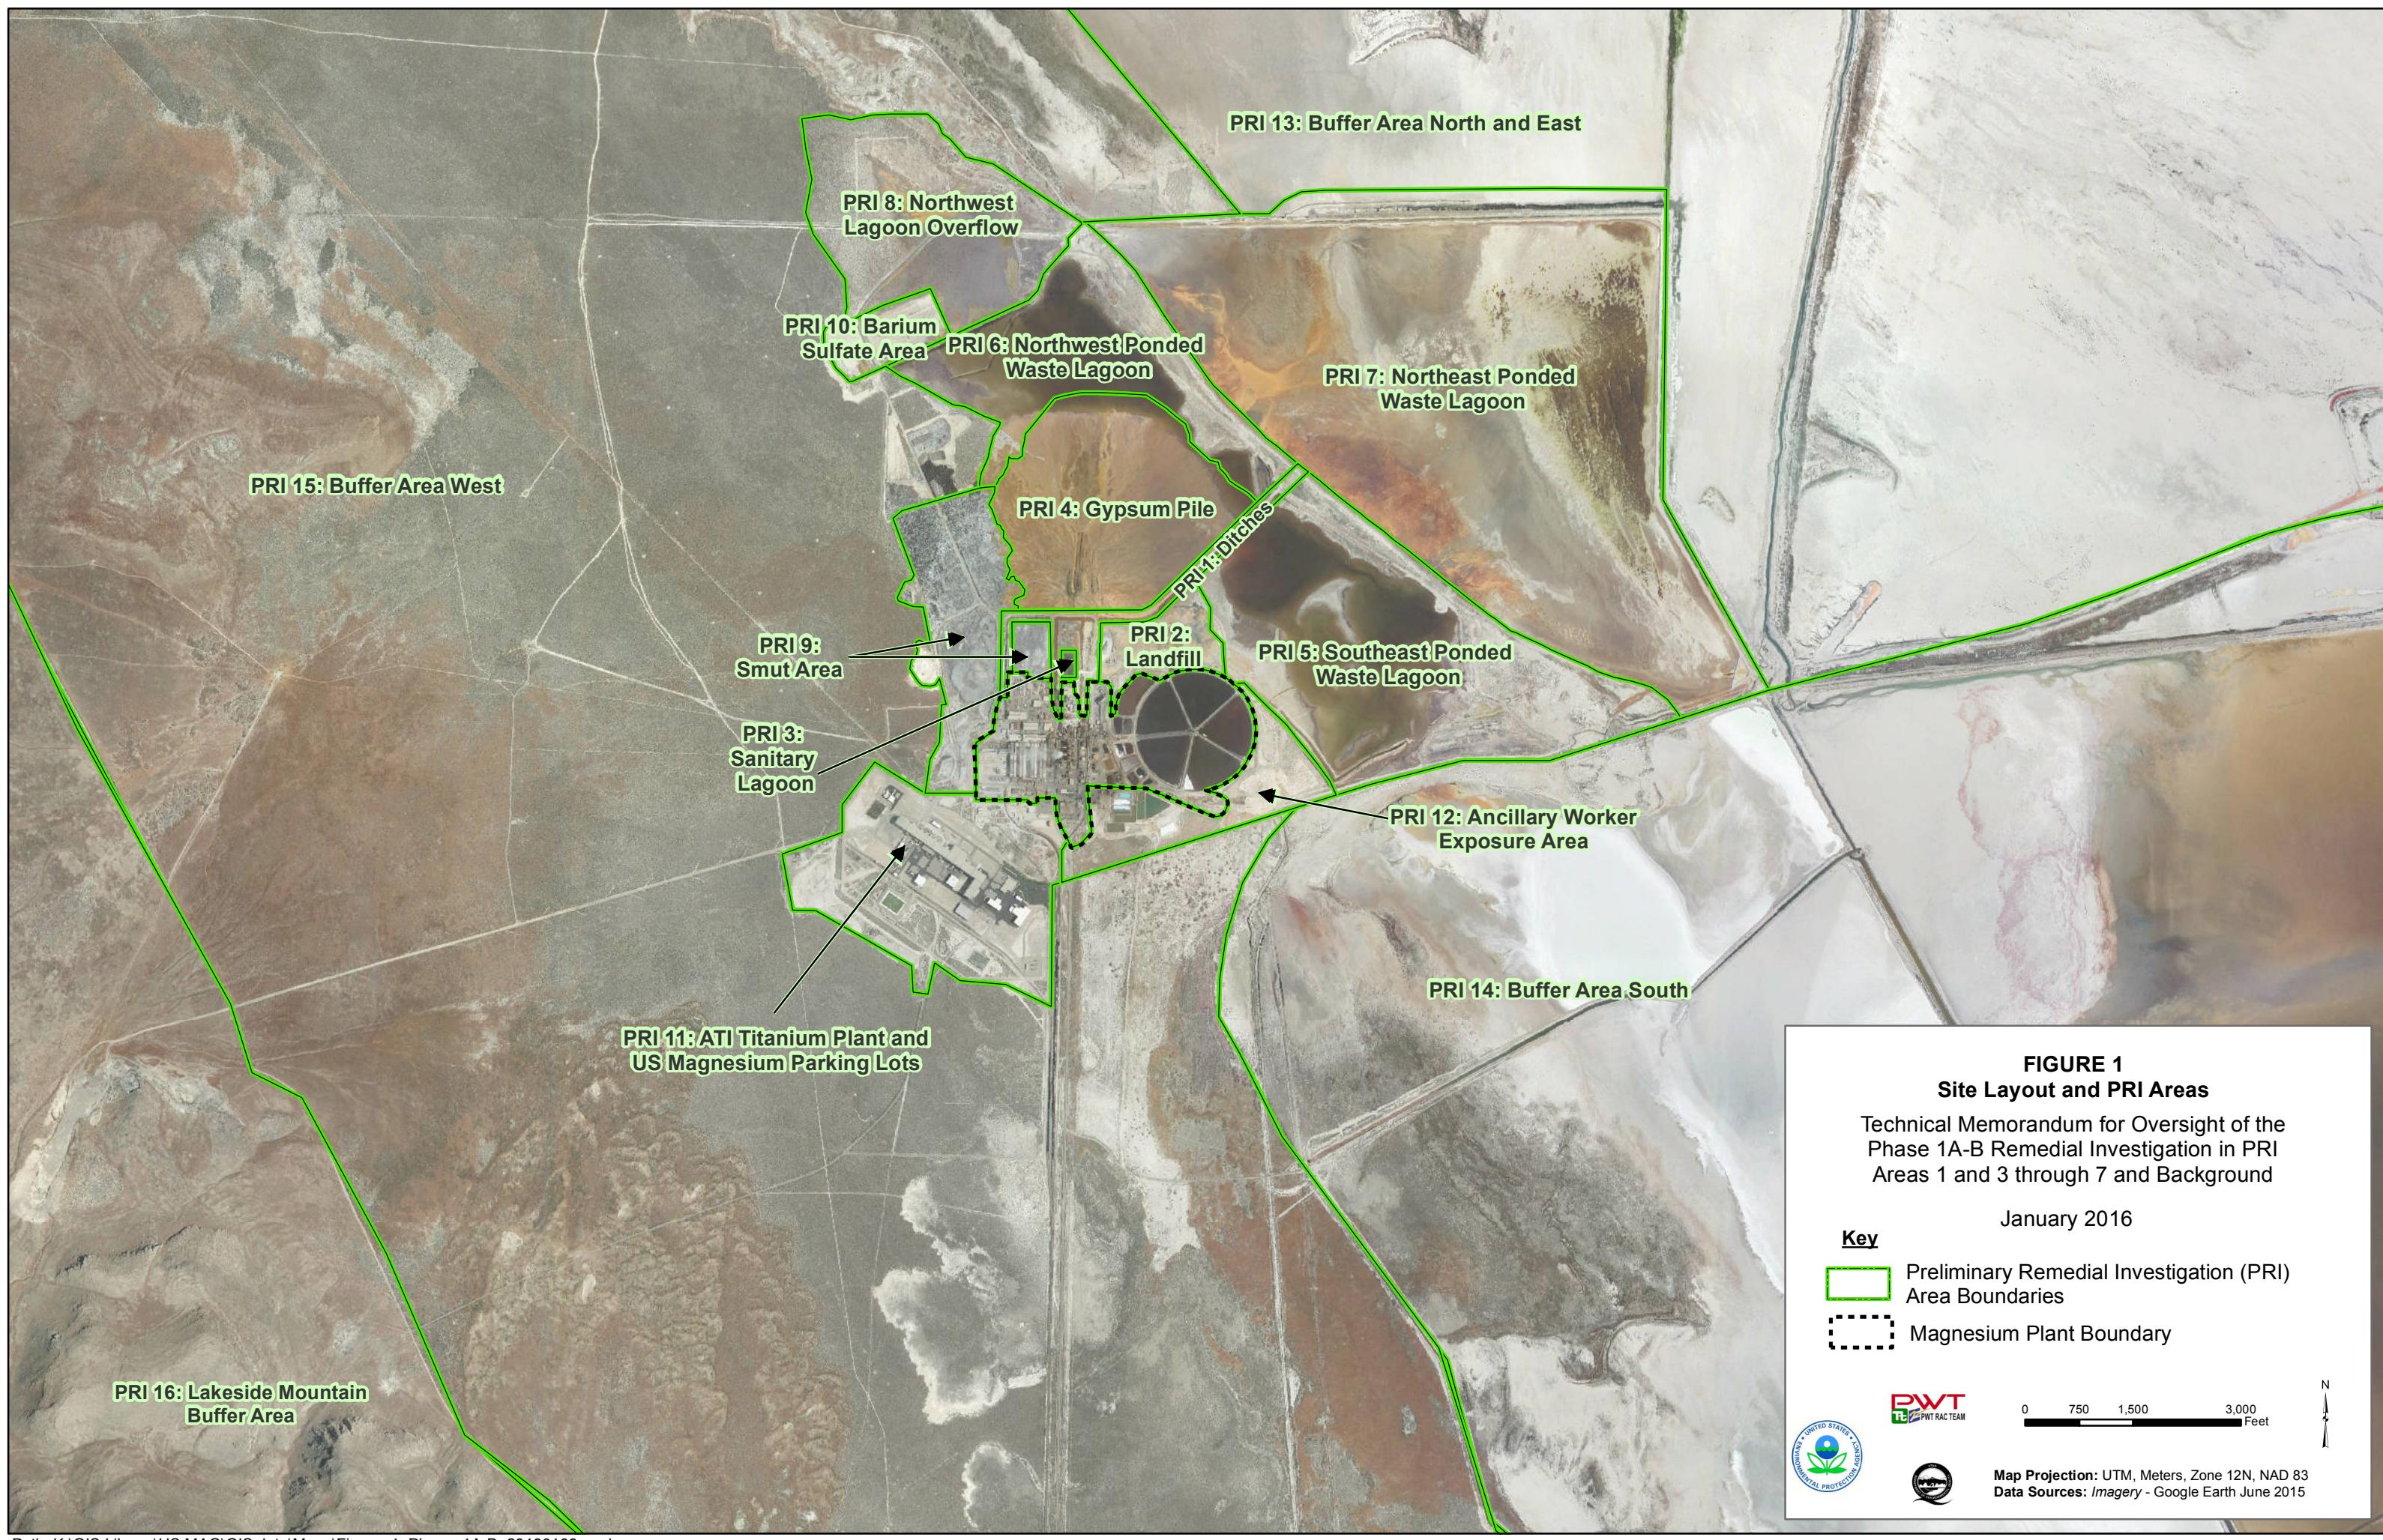

Table 3 (Cont.)
Summary of 2015 Phase 1A-B RI Field and SAP Modifications
US Magnesium NPL Site

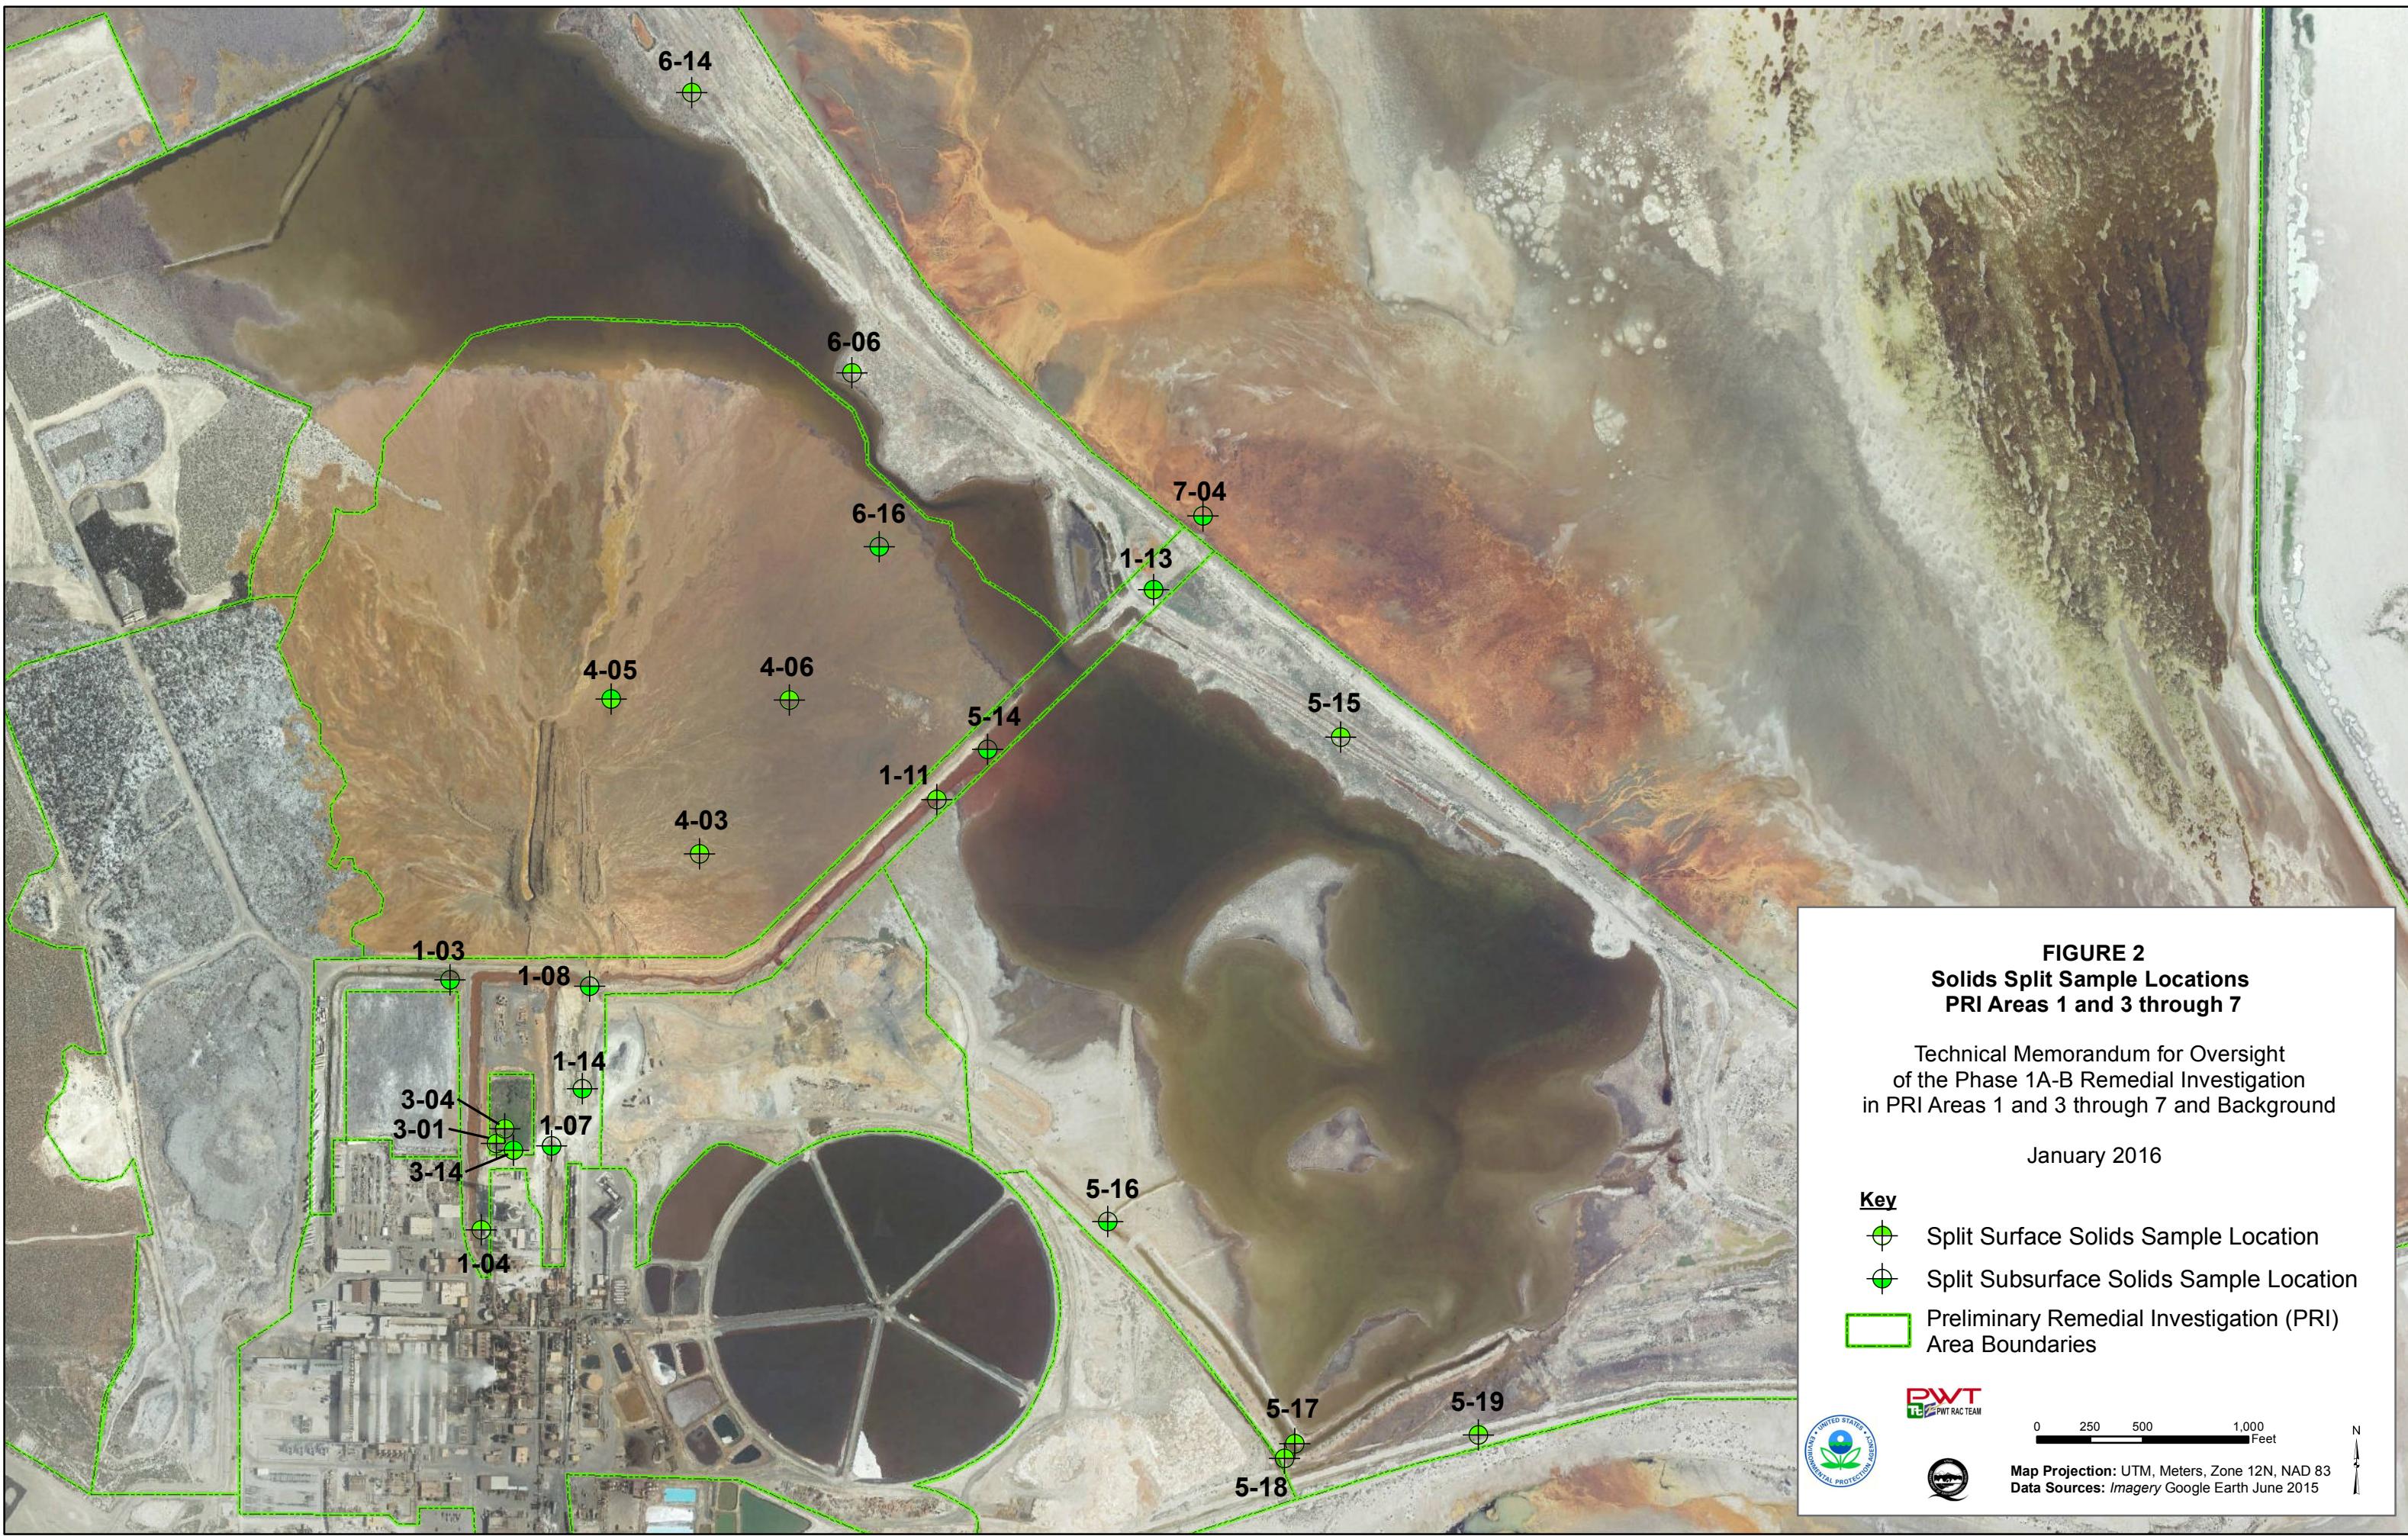

Document Tracking Number	Brief Description of Modification	Date Prepared	Date Approved
14C-2-2	Worksheet 24—Specifies correct control limits for VOCs, SVOCs, and PAHs	23 Oct 2015	26 Oct 2015
14C-2-3	Worksheet 11, Sections 11.2.4.1, 11.2.7.1, 11.2.7.2 and 11.2.7.3 Worksheet 14, Sections 14.1.5 and 14.1.6 Worksheet 18 Figures 5-1 and 11.5 Attachment 21, SOP USM-09 Re-locate the subsurface sampling location in the inlet area of PRI Area 5 closer to the Main Ditch outlet where a subsurface waste/sediment core can be obtained using a core sampler deployed from a long-reach excavator from the gypsum pile. The subsurface sampling SOP USM-09 has been modified to include core sampling devices, including vibracorer and core tub methods. This SAP modification also provides for the collection of surface samples from within active wastewater ditches using a Ponar or box corer sampler deployed by excavator, per SOP USM-12.	18 Nov 2015	24 Nov 2015

Notes:

NPL	National Priorities List
PAH	Polynuclear aromatic hydrocarbon
RI	Remedial investigation
SAP	Sampling and Analysis Plan
SOP	Standard operating procedure
SVOC	Semi-volatile organic compound
VOC	Volatile organic compound

US Mag 7/10/2015 RI/FS-1A/B

Tim Jimenez of EarthFax Engineering

Notes for 7/10/2015 sampling event

comprise pages 2-3 of this book.

07:15 Site arrival

Sampling personnel Lonnie Mercer of ERM

Adam Nagle of ERM

Site conditions at arrival Partly cloudy
with no breeze, approximately 60°F

Health and Safety meeting 07:50

PRI 6-008-SW01-071015

PRI 6-008-SW11-071015 09:30 for duplicate
gentle breeze from east. Sunny. 65°F

Sample time 08:45. HCL 0.0-0.5 ppm
water depth at sample location 1 foot.

Sample collected at 6 inches from surface,
water had light green color. Tygon was
used in pump. This is in SAP, however,
most locations were modified to use
silicon during this week. Adam Nagle collected
samples and Lonnie Mercer did chemistry
and documentation.

3

US Mag 7/10/2015 RI/FS-1A/B continued

PRI 6-002-SW01-071015

wind from SE, sunny, 70°F. water depth
at location 6 inches. Sample collected
at 3 inches. Sample time 10:45. water
was light green. Tygon was used in pump.

This is in SAP. However, most locations were
modified to use silicon during sampling
this week. Adam Nagle collected
samples and Lonnie Mercer did chemistry
and documentation. HCL 0.8-1.1 ppm
in air during sampling

PRI 6-006-SW01-071015

strong wind from south. Sunny. 65°F, water
depth at location 6 inches. Sample collected
at 3 inches. Sample time 12:40. water was
light green. Tygon was used in pump. This is
in SAP. However, most locations were modified
to use silicon during sampling this week. Adam
Nagle collected samples and Lonnie Mercer did
chemistry and documentation. HCL 0.9-1.8 ppm
in air during sampling. After sample collected
HCL spiked 2.3 ppm and respirators were
worn.

Rite in the Rain.

US Mag RI/FS 1A/B 7/13/15

Tim Jimenez of EarthFax Engineering

Comprise pages 4-5 of this book.

07:10 ERM personnel arrive on-site.

07:30 EarthFax personnel arrive on-site.

ERM personnel and samplers:

Lonnie Mercer

Adam Nagle

EarthFax personnel and observer:

Tim Jimenez

Health and Safety meeting. Weather when arrived sunny, gentle breeze from North,
65°F

-PRI5-010-SW01-071315

PRI5-010-SW11-071315 Duplicate time 10:00

Sample time 09:30. No breeze at sample time. sunny and 70°F. water was light green. HCl 0.0-0.3 ppm. Water depth at sample location 3 inches. Sample collected at 1.5 inches. Tygon tubing used in pump. prior week of sampling some sites had been modified to use silicon. Respirators worn for safety. Adam Nagle collected sample. Lonnie Mercer did chemistry and documentation.

US Mag RI/FS 1A/B 7/13/15 continued

-PRI5-017-SW01-071315

Sample time 11:00. Gentle breeze changing direction. partial cloud cover, 70°F. water was light green. HCl 0.5-3.8 ppm water depth 6 inches at sample location. Sample depth 3 inches.

Tygon tubing used in pump. Prior week of sampling some sites had been modified to use silicon. Adam Nagle collected sample. Lonnie Mercer did chemistry and documentation. Respirators worn after sample collected during chemistry and documentation due to 3.8 ppm HCl spike.

-PRI7-010-SW01-071315

Sample time 13:00. Gentle breeze changing direction. Partial cloud cover, 80°F. water depth 4 feet at sample location. Sample depth 2 feet. Tygon tubing used in pump. Prior week of sampling some sites had been modified to use silicon. Adam Nagle collected

sample. Lonnie Mercer did chemistry and documentation. Respirators worn.

HCl 1.6-5.0 ppm. water slightly turbid. ^{Rite in the Rain} light green.

US Mag RI/FS 2A/B 7/14/2015

Tim Jimenez of EarthFax Engineering

Notes for 7/14/2015 sampling event comprise
pages 6-7 of this book.

07:10 ERM personnel arrive on-site

07:30 EarthFax personnel arrive on-site,
ERM personnel and samples:

Lonnie Mercer and Adam Nagle.

Earth Fax personnel and observer; Tim Jimenez
Health and safety meeting. 70°F, partly cloudy
with wind from North at time of arrival.

-PRI 2-007-sw01-071415

Sample time 09:00. Strong gusts from north.

Sunny and 75°F, water was very light green.

HCL ^{not recorded} ppm. Water depth at sample
location 6 inches. Sample collected at 3 inches.
Tygon tubing was used in pump. CL₂^(personal) meters
would alarm when water surface was
disturbed. Adam Nagle collected sample.

Lonnie Mercer did chemistry and documentation.

-PRI 2-014-sw01-071415

Sample time 10:15, wind from north. Sunny.

US Mag RI/Fs 1A/B 11/19/2015 continued

-1-14-ss-01-111915 ERM sample, 40's, cloudy, no wind. top" brown Sand and clay with some road base. Bottom 3" red waste material. Dry sample. Due to loose nature of material each hole took two aliquots. 5 holes took ten aliquots. The VOC's (encores) were collected from the bottom of a second aliquot representing the bottom of a hole to be consistent with the other VOC (encore) samples we collected. All aliquots were sieved due to gravel in road base material. Respirators were donned due to Cl₂ 0.1 - 0.7 ppm, HCl read 0.0 - 0.1 ppm. Sample time 11:15.

-1-01-ss-01-111915 ERM sample, 40's, cloudy, no wind. Sample was ditch bottom next to flowing water. Sand, clay, and gravel appeared to be native. Material was saturated. HCl read 0.0-0.3 ppm. Cl₂ read 0.0-0.1 ppm. All aliquots sieved due to gravel. Sample time 11:50
11/19/2015 notes continue on next page —

US Mag RI/Fs 1A/B 11/19/2015 continued

-1-02-ss-01-111915 ERM sample, 40's, cloudy, no wind. Sample was taken in approx. 1" of water. Material was saturated and difficult to recover. Clay, sand, gravel with heavy vegetation. Same silver sheen when sediment disturbed. Sheen reformed after being disturbed and is likely oil base and not natural. HCl read 0.0-0.3 ppm and Cl₂ read 0.0-0.1 ppm. Sample time 12:40. Clay was at bottom of aliquots and likely native. All aliquots sieved due to gravel and vegetation.

-1-05-ss-01-111915 ERM sample, 30's, cloudy, no wind. Sample was taken in approx. 1" of water. Recyclable material with a little gray clay at bottom of aliquot. Clay appeared native. VOCs were collected with both Encores and methyl VOCs (EPA 5035). All aliquots sieved due to some gravel. Respirators held to face but not fully donned. Cl₂ read 0.6 ppm for few seconds and remained under 0.4 ppm for rest of sampling. HCl read 0.0-0.1 ppm. Sample time 13:25. Material was saturated. End of 11/19/2015 notes —

Tim Jimenez of EarthFax Engineering
Lonnie Mucci of ERM
Trent Hamada of ERM

EarthFax arrived on-site at 08:15 and had safety tail gate on cold weather. Weather at time of arrival, sunny, cold, no wind. ERM arrived on-site 08:45. MX6 monitor zeroed at 08:00 at USFS Muskrat station. O₂ read 20.8% all other sensors read 0.0 ppm.

-1-13-ss-01-112315 ERM sample and a split
1-13-ss-01-112315-ES01. Sample time 09:30. Sunny, cold, no wind. Flat lightly vegetated area near roadway. Material was sandy silt with gravel. moist, with no trace vegetation or foreign material. Material appeared native. All aliquots sieved due to gravel. 5 aliquots collected. TB-21 was labeled at sample location. HCL and Cl₂ read 0.0 ppm during sampling.

-1-11-ss-01-112315 ERM sample and EPA split
1-11-ss-01-112315-ES01. sunny, cold, no wind east end of ditch approx. 3' from shore in approx. 2" of water. Sample was red waste material. HCL read 0.0-0.4 ppm notes continue next page →

²³
US Mag RI/FS 1A/13 11/23/2015 continued

Cl₂ read 0.1-6.0 ppm. during sample Cl₂ read 0.1-0.8 ppm. When waste material depth was being established Cl₂ started to climb. ERM/EarthFax backed away from site and did not continue and augering to find depth. 6 ppm is well above 2.0 ppm action level. Crews did not stay in area when 2.0 ppm was reached. Cl₂ levels rose faster than crews could move out of area. once Cl₂ levels were below 0.5 ppm crews finished putting samples in jars. Sample time was 11:00. Respirators worn the entire time.

-1-10-ss-01-112315 ERM sample and ERM dup. sunny, no wind, cold. In ditch, along a flat area that appears to have been flooded in past. Approx 5' from banked sides and approx. 20' from water. Sample location appeared to be approx. 2" above water. Red waste material. Sample time 11:55. Respirators worn as precaution.

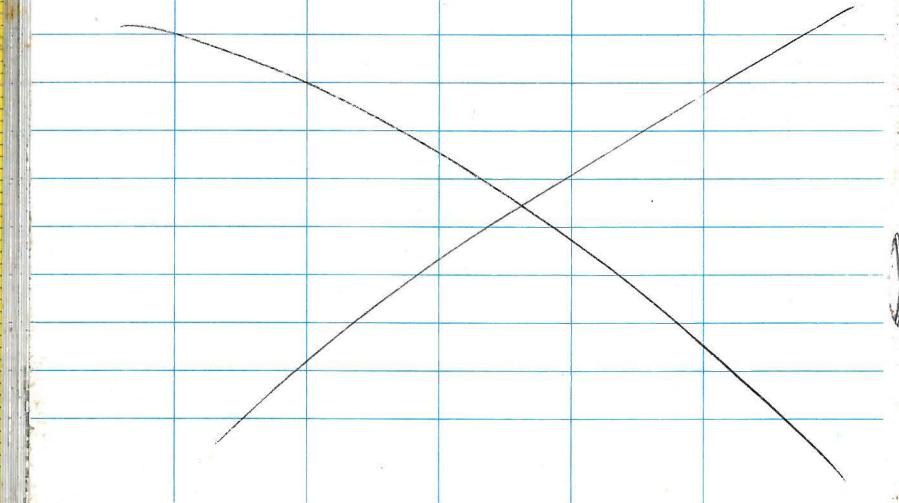

Notes continue on next page →

US May RI/FS 1A/B 11/23/2015 continued

Gray clay encountered at 5'. HCl read 0.0-0.6 ppm and CL₂ read 0.0-0.3 ppm during sampling. Gray clay appeared to be native. All of first aliquot passed sieve. Remaining aliquots not sieved.

-1-09-ss-01-112315 ERM sample, partly cloudy, no wind, cold. South side of ditch approx 8' from bank. Approx 4' from marker in flat shale area that appears to be flooded some parts of year. First aliquot passed sieve 100%. Remaining aliquots not sieved, red waste material with intermixed white waste material.

No modification or variations from SAPP. End of 11/23/2015 notes

Split Sampling Field Logbook

Aaron Baird

September 30, 2015

thru

December 10, 2015

Phase 1A-B Background Sampling 9/30/15

Went to office trailer to pick up sampling supplies.

Arrived onsite at ERM trailer at 0830.
Kris and Trent from ERM arrived at 0900.
ELM utility locating services also onsite.
ERM conducting utility clearance of sub-surface soil sampling / boring locations UPN-6 and UPS-6.

Drove to Upland North boring location UPN-6. High pressure gas line nearby but location was clear of utilities.

Cow carcass observed in PRI-16 and tarantula observed near UPN-6 - see photos.

Drove to Upland South boring location UPS-6. Location was clear of utilities.

1100 - returned to ERM trailer to prep. for surface soil sampling.

Drove to Stansbury Island, Upland Southeast, to collect background soil samples.

Many shrimpers observed on drive.

ERM collected 5 surface soil samples:

- VPSE-7-SS-01-09301S
- VPSE-10-SS-01-09301S
- VPSE-8-SS-01-09301S
- VPSE-9-SS-01-09301S
- VPSE-6-SS-01-09301S

All sampling procedures conducted according to SAP, and SOR USM-01 using flat-bottom scoop.

Sandy silt encountered at all locations.

Recovery was 98% + and material easily passed

9/30/15

through the $\frac{1}{4}$ " sieve. Soil was very dry.
ERM returning to trailer to decon sampling
equip.

Departed site at 1350.

Chesapeake
Bayside

Phase 1A-B Background Sampling

10/1/15
Went to office trailer to pick up sampling
supplies.

Arrived on site at 0830.

Weather is partly cloudy, temp. ~70°F, no wind.
Met ERM at office trailer at 0900. Trent
and Suzie onsite for ERM.

Drove to Stansbury Island, Upland Southeast,
to collect remaining background soil
samples.

ERM collected surface soil sample at UPSE-S
then collected ~~subsurface~~ ^{-02-36-AB} soil sample
(UPSE-S-SS-01⁻⁰²⁻³⁶⁻100115 and UPSE-S-SB-01⁻⁰²⁻³⁶⁻100115).

I collected split sample from the subsurface
sample - UPSE-S-SB-01⁻⁰²⁻³⁶⁻100115-ES01.

SAP WS#11, Sec. 11.3.7.S.2 states that
subsurface soil samples will be collected
using a portable flighted auger with soil sampling
probe or a compressed-gas powered direct push
corer. The portable flighted auger ERM had
came with a very small diameter probe - $\frac{1}{2}$ "
, which could not produce the sample volume
needed. Therefore, ERM requested to use
a hand auger. I contacted Ken W. and
he verbally approved SAP mod. ERM to
prepare SAP mod. when they return to the
office.

USM-09 Subsurface sampling SOP, Sec. 6.S,
calls for borehole abandonment using hydrated
bentonite chips. ERM did not have bentonite
therefore, they requested to backfill borehole

10/1/15

using remaining soil sample volume. I NM prepared a field mod. for this change and I signed it.

ERM collected soil sample UPSE-4-SS-01-100115.

ERM collected soil sample UPSE-3-SS-01-100115 and I collected split sample with dup.

UPSE-3-SS-01-100115-ES01 & ES02.

ERM collected soil sample UPSE-2-SS-01-100115.

ERM collected soil sample UPSE-1-SS-01-100115 and I collected split sample - UPSE-1-SS-01-100115-ES01. See field data sheet.

All background soil sampling in Upland SE area now complete.

Similar areas and soil type were encountered at all UPSE locations.

Wild life encountered included lizards, ants, beetles, flies, and mosquitos.

Dropped split samples off at ALS-SLC for Metals, SVOCs, TOC, and pH analyses and shipped samples to ALS-Houston for PCBs and PCDD/PCDF analyses.

Spoke to K. Landmark and confirmed that CN was not included in metals analysis for background samples, but Hg and Mo were.

Phase 1A-B Background Sampling

Arrived on site at 0830.

I NM, Kris and Sazie, arrived at 0845.

Weather is cloudy with scattered rain and NW wind with temps in mid 60°F.

I RM planning to collect surface soil samples in the Lakebed North background sample area.

Drove to Lakebed North area.

ERM collected 5 surface soil samples:

- LBN-1-SS-01-100215
- LBN-2-SS-01-100215
- LBN-3-SS-01-100215
- LBN-4-SS-01-100215
- LBN-5-SS-01-100215

All sampling procedures conducted according to SAP and SOP USM-1 using flat bottom scoop.

Silty clay encountered at all locations.

Soil was very moist at all locations but -S which was much more dry. Little vegetation.

Recovery was 100% at all locations.

ERM returning to trailer to decon sampling equip.

Departed Lakebed North area at 1120.

10/2/15

10/8/15 Phase 1A-B Background Sampling.

10/8/15

Arrived on site at 8:30 am.

Weather is partly cloudy, temp. ~60°, light NE wind.

US Mag stack plume settling in Lakeside Mountains - PRI 16.

ERM arrived on site at office trailer at 0900. Trent and Kris onsite for ERM.

ERM planning to collect soil samples at the Lakebed Southeast at Badger Island area.

Drove to Badger Island to LBB-10 location.

ERM collected surface soil sample LBB-10-SS-01-100815 at 10:15.

I collected split sample LBB-10-SS-01-100815-ES01 and duplicate -ES02 - see field data sheet.

ERM collected surface soil sample LBB-09-SS-01-100815 at 10:30.

I collected split sample LBB-09-SS-01-100815-ES01. See field data sheet.

ERM collected surface soil sample LBB-08-SS-01-100815.

ERM collected surface soil sample LBB-07-SS-01-100815 then cleared top 2" at center of LBB-07-SS aliquots and used hand auger to collect subsurface soil sample LBB-7-SB-01-02-36-100815 at 11:10.

I collected split sample LBB-7-SB-01-02-36-100815-ES01. See field data sheet.

ERM returning to trailer to decon sampling equip. Departed sampling area at 1200.

All sampling procedures conducted according to :AP and SOP USM-01.

No wildlife encountered in sampling area.

Kept split samples off at ALS-SLC for metals, SVOCs, TOC, and pH analyses, and shipped samples to ALS-Houston for PCBs and PCDD/PCDF analyses.

Badger
Island
Soil

10/9/15 Phase 1A-B Background Sampling

Arrived on site at 8:30.

Weather is clear with light E wind and temp. ~60°F.

There is an inversion and the stack plume is thick towards the Lakeside Mountains.

ERM arrived on site around 9:00.

ERM, Trent and Suzie, planning to finish surface soil sampling in Lakebed South area of Badger Island area.

ERM collected:

LBB-5-SS-01-100915 at 0957

LBB-4-SS-01-100915 at 1010

LBB-3-SS-01-100915 at 1022

LBB-2-SS-01-100915 at 1035

LBB-2-SS-11-100915 (Dup)

LBB-1-SS-01-100915 at 1044

All areas were similar with silty sand, dry, and varying degrees of vegetation and surface gravel. Approx. 98% of material passing through $\frac{1}{4}$ " sieve. All samples were 5 aliquots from 0-2". All locations were as stated in SAP and all sampling procedures were conducted in accordance with SAP and SOP USM-01.

Signed Field Mod. from 10/7/15 to move

LBSE-10 sample loc. 25' to the north.

Departed LBB area at 1110. No split samples collected.

SCAT Pond Inspection

Arrived on site at 0830.

Lorrin with ERM on site at 0845

Weather is clear with light S wind and temp ~55°F.

Visible haze around facility. Strong odor at ERM trailer - HCl at 0.2 ppm Cl² at 0.1 ppm.

Kris and Kevin with ERM conducting background sampling in Upland South area. Tim with Earthfax on site to oversee background sampling.

I went with Lorrin to oversee SCAT pond inspection (post evaporative season).

Lorrin reporting that last brine pumping into SCAT occurred in early August.

HCl up to 0.7 ppm and Cl² at 0.1 ppm at SCAT pond.

There is no brine in pond - completely dry. There are salt spires formed on the perimeter and mounds in center.

ERM drove stake in center of pond near topographical low then used slide hammer to core. ~25% recovery in 1st core, all salt. ~50% recovery in 2nd core.

Salt is brittle and full core appears challenging. Serrated core with twisting motion attempted but was unsuccessful and could not effectively penetrate firm salt cap.

1/2" diameter core also attempted but had

10/12/15

10/14/15 Phase 1A-B Background Sampling

Arrived on site at 0840.

Kris and Adam on site for ERM.

Weather is clear, no wind, and temp ~60°F.
ERM planning to conduct background soil
sampling in the Upland North area.

ERM collected: UPN-1-SS-01-101415 at 0945

UPN-2-SS-01-101415 at 1010

UPN-2-SS-11-101415 (Dup)

UPN-3-SS-01-101415 at 1030

UPN-4-SS-01-101415 at 1045

UPN-5-SS-01-101415 at 1100

UPN-6-SS-01-101415 at 1120

UPN-6-SB-01-02-36-101415 at 1130

UPN-7-SS-01-101415 at 1155

UPN-8-SS-01-101415 at 1205

UPN-9-SS-01-101415 at 1220

UPN-10-SS-01-101415 at 1235

I collected split samples at:

UPN-2-SS-01-101415-ES01

UPN-6-SB-01-02-36-101415-ES01

UPN-10-SS-01-101415-ES01

MS/MSD volume collected at UPN-6 loc.

See field data sheets for sample info.

All areas were similar with clayey silt, dry,
and varying degrees of vegetation. All samples
were 5 aliquots from 0-2". All loc. were as
stated in SAP and all sampling procedures were
conducted in accordance with SAP and SOP USM-01.

Departed site at 1320.

Dropped samples off at AHS-SLC.

Phase 1A-B Sampling - PRI 5

10/15/15

Arrived on site at 0845.

Adam and Suzie on site for ERM.

Weather is clear, light E wind, temp. ~60°F.
ERM planning to finish accessible surface
soil sampling locations in PRI Area 5.

ERM collected soil sample 5-01-SS-01-101515
at 100S. Soil is a moist sandy clay with
iron modeling in top 1-2". Wastewater
shoreline is ~100' E of location. In area
previously inundated with wastewater.

ERM collected soil sample 5-16-SS-01-101515
at 1040. Soil is a saturated silty clay to 3"
and gravelly sand 3-6". Due to the high
saturation, ERM collected an additional
6th, aliquot. No standing water in this
portion of the former Wastewater Div. Ditch.

HCl reading between 1.5 and 1.7 ppm. No Cl²

ERM collected soil sample 5-06-SS-01-101515 at
1110. Soil is a moist sandy clay with iron
modeling in top 2". Wastewater shoreline is
~150' E of location. In area previously
inundated with wastewater.

Went to look at 5-11 location and it is in
wastewater.

HCl up to 2.6 and Cl² up to 0.5 while accessing
5-11 location - field team in respirators.

ERM collected soil sample 5-10-SS-01-101515 at 1300.
Soil is a dry silty sand. PRI-7 former wastewater
shoreline is ~50' E. Dry vegetation at location.
Also collected dup. 5-10-SS-11-101515. 6 aliquots collected.

10/15/15

Surface soil sampling in PRI 5 is now complete with the exception of the samples in wastewater to be collected by helicopter.

ERM returning to trailer to decon. equip. and process samples.

No split samples collected today.

Departed site at 1340.

Phase 1A-B Sampling - PRI 4

Arrived on site at 0845.

Tri. and Garrett onsite for ERM.

1 KM planning to collect surface soil samples from the Gypsum Pile, PRI 4.

Weather is partly cloudy, light SW wind and temp is ~58°F.

ERM collected surface soil sample 4-01-SS-01-101915 at 1020. 7 hand auger aliquots collected. Collected duplicate sample 4-01-SS-11-101915.

I suggested that top of auger soil was broken up and volatilized so ERM decided to collect VOCs aliquots from bottom of 7th auger.

Dead bird, looked like pelican, was observed on Gyp. Pile approx. 100 SE of 4-01 location.

ERM collected surface soil sample 4-02-SS-01-101915 at 1100. Also collected dup. 4-02-SS-11-101915. 6 aliquots collected. Location is on bank of current slurry canal.

Coyote observed walking on NW area of Gyp. Pile where standing water was present.

Cl² readings up to 0.1 ppm and HCl up to 0.7 ppm.

Gypsum waste thickness measured at 15" at 4-01.

Smut encountered at base of gypsum. ~2" lens of smut. Continue augering and gypsum waste was greater than 5' deep (length of auger).

Gypsum waste thickness at 4-02 measured at > 5'.

4-02 is located on raised portion of Gypsum pile.

ERM returning to trailer to decon. equip. and process samples.

No split samples collected today. Departed site at 1230.

10/19/15

10/20/15 Phase 1A-B Sampling - Helicopter 10/27/15
Arrived on side at 0840.
Kris and Tress on site for ERM
ERM planning to continue surface soil sampling
in the gypsum pile, PR1 4.
Wetlands is partly cloudy with scattered
showers, NW wind ~8 mph, and temps in 50's.
ERM collected sample 4-03-SS-01-102015
and I collected sample 4-03-SS-01-102015
102015-ES01 at 1010 - see field data sheet.
ERM collected sample 4-03-SS-01-102015
and I collected sample 4-03-SS-01-102015
01-102015-ES01 at 1050 - see field data sheet.
ERM collected sample 4-06-SS01-102015
and I collected sample 4-06-SS-01-102015
102015-ES01 at 1115 and duplicate sample 4-06-SS-01-
and I collected sample 4-06-SS-01-102015
04-06-SS-01-102015-ES02 at 1155 - see
field data sheet.
Sample was saturated. Waste thickness
>5'.
ERM collected sample 4-07-SS-01-102015
C12 readings at 0.1 ppm and HCl up to 0.8 ppm.
ERM retitrating to trailer to decom equipment.
West to office trailer to process samples.
Dropped samples off at ALS - SLC.

1130 ERM collected first aliquot at loc. 5-08.
PR1 5.
is same as that encountered on W shore of
much less volume than 1st & 2nd. Material
aliquots had only 1" particle size and
saturated. Similar results for 7th. 3rd &
waste pond. Medium has moved but no
5-07 is located on island in middle of
5-07. Depth of penetration depth 1-2".
1055 ERM collected first aliquot at loc.
and porous sample algaes.
on both aliquots. Shallow water is
slightly sand. Depth of penetration depth 1-4"
is homogeneous waste material, surface
an additional aliquot aliquot. ERM decided to collect
a aliquot however ERM decided to collect
was soft, sticky sample volume in first
5-02 using the porous sampler. These
1130 ERM collected first aliquot at loc.
1155 like under pond.
sampled with a helicopfer in PR1 5.
1151 plowing to conduct + surface soils
on site at 0830.
1151 W. of EPA and Michael S. of UDEQ
1151 and Chris on site for ERM.
Phase 1A-B Sampling - Helicopter 10/27/15

1130 ERM collected first aliquot at loc. 5-08.
was 2.5". 3rd aliquot penetration was 3";
Depth of penetration 3" and aliquot produced
sample material appears to be mostly sand!
no waste.

10/27/15

1218 ERM collected first aliquot at loc. S-11. 2.5" recovery/penetration. Material is saturated sand with ~0.1" of waste material on surface. Evidence of washout. S-11 is located near shoreline. 4" penetration on 2nd aliquot. Trace waste on surface.

1315 ERM collected aliquot at loc. 5-14. 6" (full Ponar) recovery/penetration. Material is saturated waste with small portion of gray sediment that could be native. Some off-gassing observed following homogenization. ERM used/tested Box Core sampler at S-14. ~2" depth penetration. Depositional layering observed in cross section.

1350 ERM collected aliquot at loc. 5-13. 4+ " of penetration. Material is native sand with some waste on surface. ERM collected aliquot at loc. 5-12. 3 total aliquots collected. Depth of penetration was 2-2.5"

Went to gypsum pile to take a look at sample locations 4-12, 4-13, and 4-14. David A. (ERM) and Ken agreed to sample 4-12 & 4-13 at SAP location and to move 4-14 out of wastewater at a distance from the shore comparable to 4-13.

Went to PRI 1 to look at 1-12 sample loc. which is in wastewater. Ken agreed to allow ERM to move it to the nearest shoreline to the N.

10/27/15

H11 readings up to 1.0 ppm and C12 readings up to 0.5. Had to don respirator in short period of time in the morning when a chlorine cloud blew through PKI S. Dust readings up to 0.05 mg/m³.

1 NM collected the following samples today:

- 5-02-SS-01-102715
- 5-07-SS-01-102715
- 5-08-SS-01-102715
- 5-11-SS-01-102715
- 5-14-SS-01-102715
- 5-13-SS-01-102715
- 5-12-SS-01-102715

All procedures conducted in accordance with SAP and SOP USM-12 with the exception of 5-02 and 5-08 and 5-12 samples which did not get sampler penetration greater than or equal to 4 inches. Ken verbally approved field mod.

Departed site at 1710.

R. T. Smith

10/28/15 Phase 1A-B Sampling - Helicopter.

Arrived on site at 0845.

Lonnies, Kkis, and Garrett on site for ERM
ERM planning to collect surface solids

samples from PRI 6 pond using a helicopter.
Staging/sample receiving area set up
on northern point of PRI 6 wastewater
pond.

Thick chlorine plume extending N from
facility into N end of PRI 8.

Weather is partly cloudy, nowInd, temp. 38°.
0930 ERM collected first aliquot at loc. 6-02.
Depth of penetration was 4". Material is
sand; no waste. Some standing water in Ponar.
Collected sample 6-02-SS-01-102815.

0950 ERM collected first aliquot at loc. 6-05.
Depth of penetration was 3.5". Material is
~90% waste, some sand. 3.5" penetration on
2nd aliquot. 4" penetration on 3rd. 3rd
aliquot used for sample. Collected sample
6-05-SS-01-102815.

1020 ERM collected first aliquot at loc. 6-08.
Depth of penetration was 2.5". 2nd aliquot
had 5.5" penetration so that was used for
sample 6-08-SS-01-102815. Sample was ~2"
of waste and 3.5" sand.

1040 ERM collected first aliquot at loc. 6-09
but Ponar did not deploy. 1115 second attempt
the Ponar deployed and penetration was 1-2".
2nd aliquot appeared to get 4" penetration
but there was a lot of washout and only 2-3"

10/28/15

i. Ponar. 3rd aliquot had 3" penetration.
6-11 will need to be added to field mod. for
lack of 4" penetration.

6-11 material was mostly sand with thin waste
layer on surface. ERM collected sample
6-11-SS-01-102815 from all 3 aliquots.

1115 aliquots being collected from last sample aliquot.
6-11 first aliquot had 4" penetration. Material
was sand with thin waste layer on surface.
ERM collected 6-10-SS-01-102815 sample.

1115 ERM collected first aliquot at loc. 6-11.
Depth of penetration was 3". 2nd & 3rd aliquots
also had 3" penetration. 6-11 will need to be
added to field mod. for lack of 4" penetration.
Material was sand with no waste. ERM collected
sample 6-11-SS-01-102815.

1220 ERM collected first aliquot at loc. 6-12.
Depth of penetration was 4". Material
was sand, trace waste. ERM collected
sample 6-12-SS-01-102815. Encores filled
by small scrapes across surface of soil and
using finger rather than a vertical plug.

1235 ERM collected first aliquot at loc. 6-13.
Depth of penetration was 3". 2nd aliquot had
2" penetration and 3rd had 1-2" penetration.
6-13 will need to be added to field mod. for
lack of 4" penetration. Material was sand,
no waste.

1300 ERM done sampling and decor. equipment.
1320 Departed site. No split samples today.

Phase 1A-B

11/3/15 Subsurface Solids Sampling

Arrived onsite at 7:30 am.

Met with Jason and Suzie of ERM
Cascade Drilling on site with track-mounted
sonic drill rig.

Had H&S tailgate meeting.

Went to the Sanitary Lagoon, PRI 3, to
drill boring loc. 3-14.

Weather is cool, windy, with scattered rain.
ERM drilled 3-14 boring and collected 2
soil samples: 3-14-SB-01-0.5-3.5-110315
3-14-SB-01-3.5-5-110315

I collected split sample from 3.5-5' interval
3-14-SB-01-3.5-5-110315-ES01 - see field data sheet.
Went with Ken and Jason to take a look at
proposed loc. for 1-08. ERM proposing to
angle drill from northern bank on west side
of road crossing. Ken approved change to
location.

1130 ERM began drilling boring 1-14. ERM
drilled to 11' and native soil not confirmed.
Cascade left drill rig on the hole and will advance
deeper tomorrow.

I collected split sample from 7-8.5' interval,
which is first sign of waste material.

1-14-SB-01-7-8.5-110315-ES01 - see field data
sheet. Strong hydrocarbon odor.

Dropped samples off at lab at 4:45 pm.

Phase 1A-B

Subsurface Solids Sampling

11/4/15

Arrived on site 0715. Ken with EPA on site.

Met with Jason and Suzie of ERM.

1 am. Drilling on site for sonic drilling.

1.5' borehole depth tagged at 10.5' bgs.

Weather is cold, windy, with scattered rain.

Advanced 1-14 to 17', about 2' of recovery
1.5 m. 11-15' but bag broke and sample fell
on ground. Solid core from 15-17'.

Water flowing out of casing. 15-17' interval
is sand varying from white oolitic to black
fine-grained sand. Sand at 15' is native
and boring not advanced further. ERM
homogenizing and sampling 15-17' interval.
Sample is saturated. Strong hydrocarbon
odor.

1030 Held meeting to discuss 1-8 drilling access.
ERM planning to angle drill from ditch road
crossing.

045 ERM setting up at 1-3 drilling location. Boring
being angled into ditch from SAP location.
Boring advanced to 5.5' bgs, native encountered
at 3.5'.

I collected split sample from 3.5-5.5'
1-3-SB-01-3.5-5.5-110415-ES01. See field data sheet.

1330 ERM setting up at 1-7 drilling location. Boring
being angled into ditch from SAP location.

ERM having to evac. area due to sustained C12
readings > 2 ppm. Field team in respirators.

1-7 boring advanced to 7' bgs, native encountered
around 5' bgs.

11/4/15

departed site at 4:25 pm.

I collected soil samples from 0.5 to 1.5 ft depths.
1-07-SB401-0.5-1.5-110415-ES01. - see field sheet.

HCl readings up to 0.3 ppm.

CIR readings varying between 0.0 and 0.6 ppm.
Alkalinity on site at 0800.

" " HCl drilling subs. Cuscalde Drilling
1. HCl polarizing to sand subsurface soils.
" " 1 liter drilling loc. 1-08.

Weathers is mostly cloudy, temps in high 30's F.
" Field is wet ~5 mph.

M061126d to 1-08 boring loc. and CIR

Due to H₃BO₃ concn., ERM decided to move

Wardings were suspended between 2 - 6 ppm.
A 1/2 inch core was taken on next side. Drill had

EKM collected samples from 0.5-6.5, 6.5-18;
boring 5-16 to 10, 695, white encumbered at 6.5, 695.

I accepted split sample from 8-10, 695:

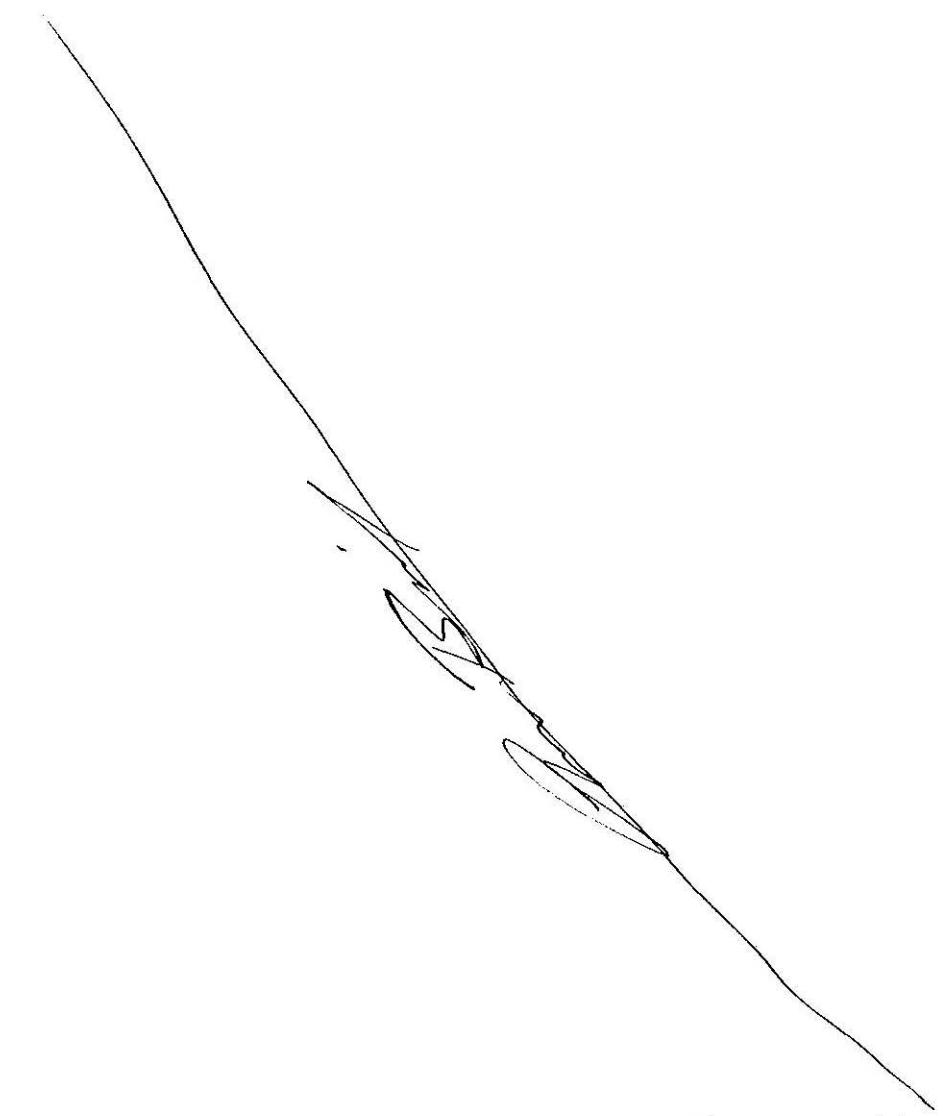

S-16-SB-10-8-10-110515-ES01. - see field data sheet.

S-16 0-6.5, is very soft and resembled in a ft

full core in that interval so no additional samples were made.
However, there were some black homogeneous,

rust-colored sediments, and thin sand shinglers
in bottom portion of interval, just above where clay
drilling, industry continuing conditions.

Slow flow of water out of borehole when done
M061126d to 1-08 boring loc. CIR readings spiking
to 6+ ppm. Field turn in respiration.

11/5/15

11/5/15

Drilled boring 1-08 approx. 20' NE of SAP loc.
Note that on SAP Figure 11-2 loc. 1-08 approx.
to be on E side of road crossing; however, I NPI
staked the loc. on W side of road crossing.

First push for boring 1-08 was advanced at 4.5"
angle 12 feet below the surface (12' of casing, not 10')
Some sediment fell out of casing during retraction
and was estimated by ERM to be ~2' of sand.
So bottom of 4.5' of recovery determined to
be 10' with 1.5' native sand at bottom, which
didn't meet spec. for min. 2' into native.

Second push advanced 17' of casing below grade
and used a soil catcher tip. ~6'-5' of recovery
in second core, all native sand. Since 1.5'
of native sand in 1st core, decided not to
sample second core.

Encountered similar conditions at 1-08 to that
at 5-16, in that very soft material on top
was compacted - 0-7' resulted in ~1.5' of
recovery. ERM to include 1-08 in field mod.

ERM collected samples from 0.5-7', 7-8.5', & 8.5-10'
foot intervals. Note that depths are at 45° angle
and recovery/compaction makes depths
uncertain.

I collected split samples from 7-8.5' interval -
1-08-SB-01-7-8.5-110515-ES01. See field data sheet.
Dropped samples off at ALS-SLC.

Phase 1A-B

Subsurface Solids Sampling

Arrived on site at 0715.

Anna, Kris, and Suzie on site for ERM,
along with drilling sub. Cascade Drilling.
I NPI planning to start subsurface solids
sampling at loc. 6-16, loc. on Gypsum Pile.
Weather is partly cloudy, temps in high 30'sF,
wind is SW at ~5 mph.

Mobilized to Gypsum Pile and boring 6-16.
First push advanced to 10' bgs with 4.5' recovery
and 2' of native sand at bottom. Water table
is ~6" below grade.

Second push advanced to 10' bgs with flapper
tip and ~3' recovery with 1' native sand at
bottom.

Third push advanced to 11' bgs with ~9' recovery.
Third push core used for sample.

6-16 sample intervals set at 0.5-3.5 (2' recovery),
gypsum, 3.5-4.5, native interface with layers of
white (salts?), dark brown, and tan, and 4.5-6.5'
which includes native sand, "6", sand with organics, "6",
and clay, 1'. Oolitic sand below clay.

Collected split sample from 3.5-4.5' interval -
6-16-SB-01-3.5-4.5-110615-ES01 - see field
data sheet.

1215 Mobilized back to ERM trailer.

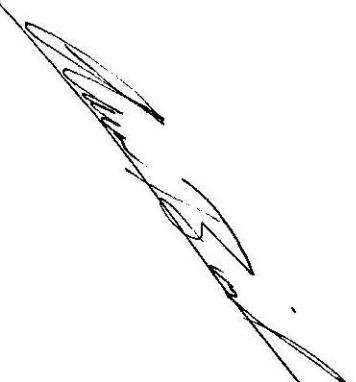

1300 Went with ERM and drillers to look at boring
locations 1-13 and 7-04. Drillers said they
could not access 7-04. Surface is saturated
and too soft, drill rig would get stuck.

Returned to ERM trailer and observed

11/6/15

11/6/15

collection of an equipment blank from sieve pan, and spoon (soil sample process equip.). Departed site at 1340. Dropped samples off at ALS-SLC at 1520.

Phase 1A-B

Surface Solids Sampling

11/9/15

Arrived on site at 0730.

Lonnie and Kris onsite for ERM along with drilling subcontractor Cascade Drilling. Weather is mostly cloudy, temp. 49°F, and wind at ~7 mph.

ERM planning to conduct subsurface solids sampling on the Gypsum Pile at loc. 4-05.

0830 Mobilized to Gypsum Pile.

Drilled boring 4-05 to 11'. Native soil encountered at ~7' bgs. Sample intervals set at 0.5-3, 3-5, 5-7, and 7-9'. I collected split sample from the native interval, 7-9':

4-05-SB-01-7-9-110915-ES01 - see field data sheet.

11' core from 4-05 boring resulted in ~9.5' of recovery. Compaction assumed in top interval so top interval extended beyond 2', to 0.5-3'. Depth of water table not obvious in core but most saturated portion of core was in gypsum waste just above the gypsum/native interface at ~6.5-7'.

1315 Drillers unable to start drill rig to mob. to boring loc. 1-13 - dead battery.

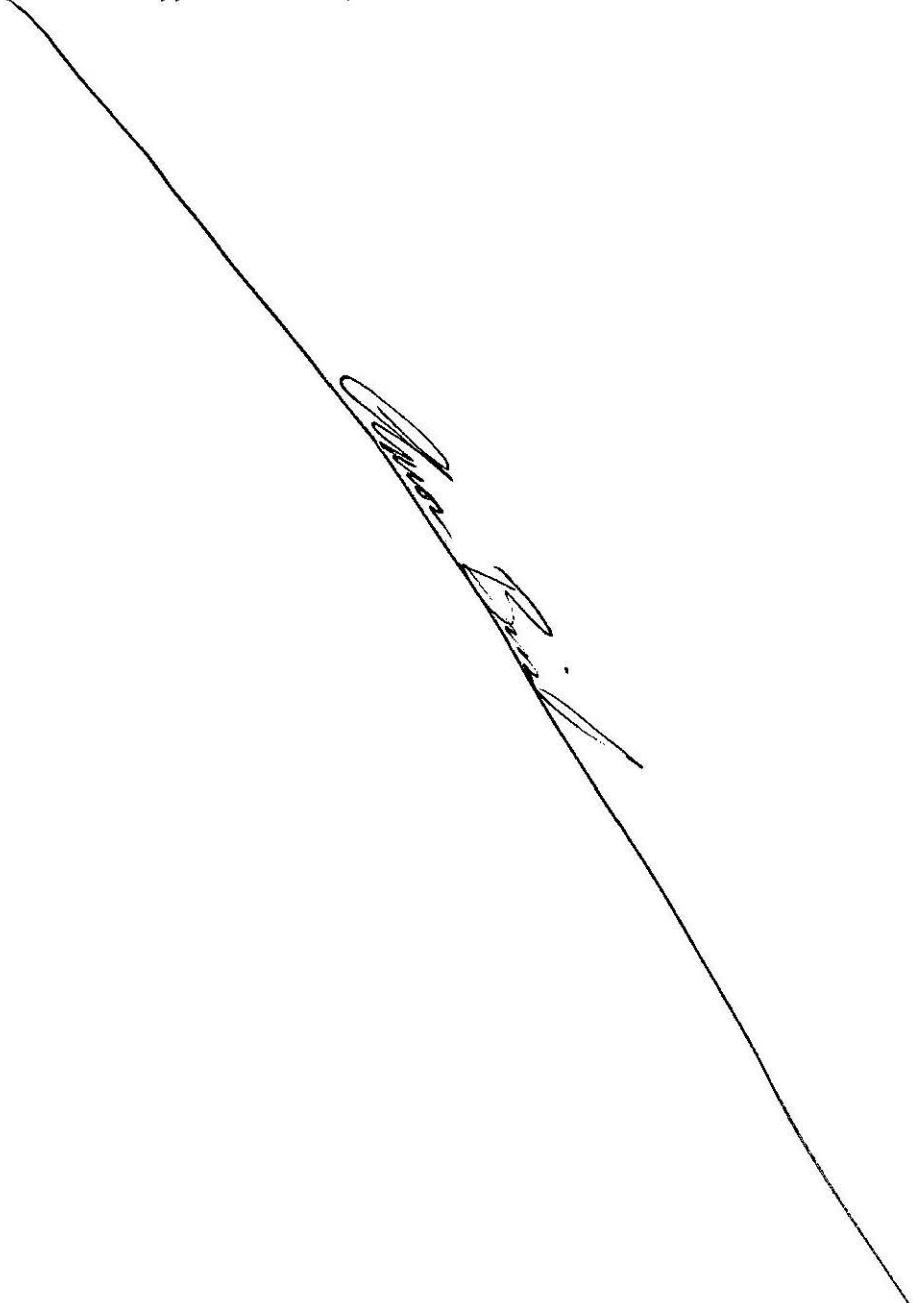

Went with Lonnie to boring loc. 7-04.

Lonnie hand augered 3 holes to ~3' bgs to confirm depth to native. Iron crust top ~6", ~6"-2.5' very soft, saturated silt; ~2.5' native oolitic sand. Likely that 5' boring would accomplish sampling objective - 2' into native.

11/9/15

1420 Departed site.

1530 Dropped samples off at ALS-SLC.

Phase 1A-B.

Subsurface Solids Sampling

11/10/15

Arrived on site at 0730.

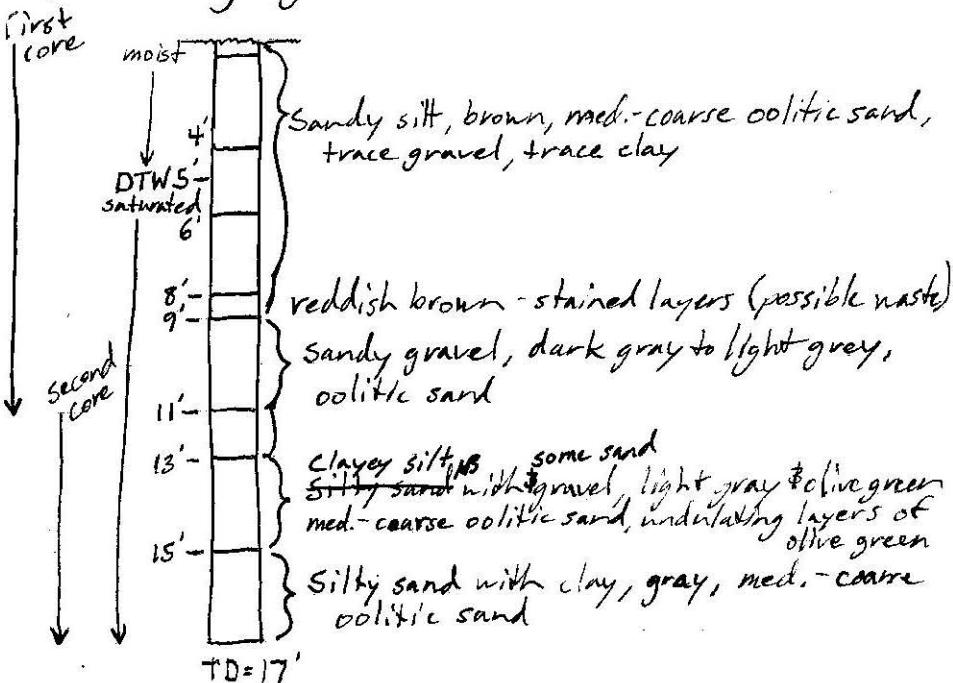

Ivanie and Suzie on site for ERM along
11' W. drilling sub. Cascade Drilling.

Mobilized to boring loc. 1-13.

Milled boring 1-13 to 17' bgs. Native
encountered at ~15'. Sample intervals
set at 0.5-4, 4-6, 6-8, 8-9, 9-11, 11-13, 13-15,
and 15-17'. 0-4' interval either compressed
in 2' or got 50% recovery. 8-9' interval
broken out due to iron staining (possible waste).
Olive layer with olive green layering observed
just above native, from ~13-15'.

I collected split sample from the 13-15'
interval: 1-13-SB-01-13-15-110015-ES01 - see
field data sheet.

1-13 boring log:

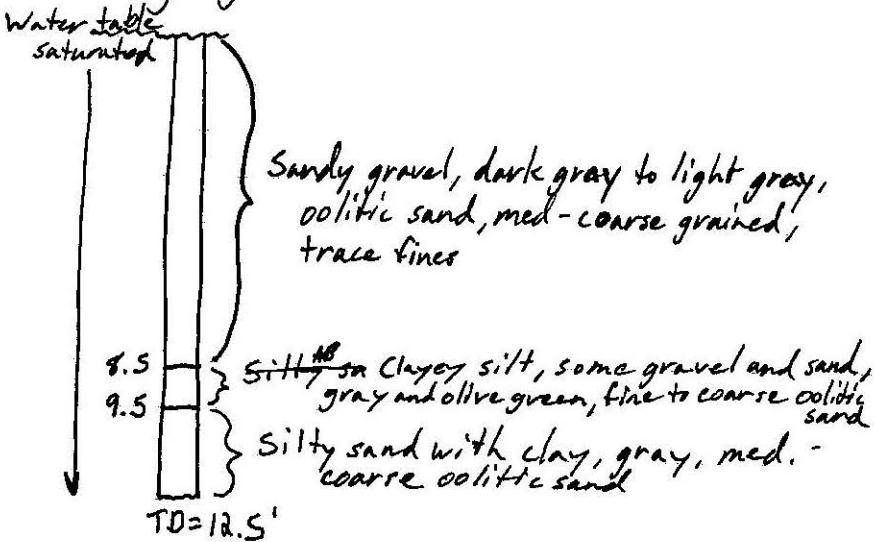

11/10/15

Drillers using plywood sheets to access 7-04 boring loc. Ran out of plywood approx. 100 ft from shoreline of former waste lagoon, which leaves at least another 160 ft to 7-04 SAR location.

1330 Spoke to Ken W. about moving 7-04 loc. and he agreed to allow ERM to move the location and gave me permission to approve a field modification.

Drilled boring 7-04 to 12.5' bgs. Native encountered at ~9.5' bgs. Sample intervals set at 2.5-4.5, 4.5-6.5, 6.5-8.5, 8.5-9.5, and 9.5-11.5'. No recovery of saturated fines in upper 2.5' of boring. Similar lithology to 1-13, same olive green layer just above native, from 8.5-9.5'. I collected split from 8.5-9.5' layer/internal - 7-04-SB-01-8.5-9.5-111015-ES01 - see field data sheet.

7-04 boring log:

11/10/15

ERM did not have Trimble GPS unit so they are planning to return at a later date to survey 7-04 location.

ERM planning to submit field mod. for 7-04 location tomorrow.

Hg1 readings up to 0.2 ppm and C12 up to 0.1 ppm.

1610 Departed site.

1115 Dropped samples off at ALS-SLC

11/17/15 Phase 1A-B Sampling - PRI 3

Arrived on site at 8:45 am.

Kris, Suzie, and Trent on site for ERM.

ERM planning to continue surface solids

sampling in PRI Area 3, the Sanitary Lagoon.

Weather is mostly cloudy, south wind, temp 18°
C. ERM collected surface solids sample 3-01-SS-

01-111715 at 0945 and I collected split sample
3-01-SS-01-111715-ES01 - see field
data sheet.

Waste thickness measured at 14" below grade.

Waste was reddish brown/rust color and clay
was encountered below the waste.

ERM collected surface solids sample 3-14-SS-

01-111715 at 1020 and I collected split sample
3-14-SS-01-111715-ES01 - see field data sheet.

Waste thickness measured at 10" below grade.

Waste material is dark brown organic matter. Clay
encountered below waste.

ERM collected surface solids sample 3-04-SS-

01-111715 at 1058 and I collected split sample
3-04-SS-01-111715-ES01 and duplicate - ES02.

Waste thickness measured at 3" below grade.

Waste material is dark brown organic matter. Clay
was encountered below waste.

ERM collected surface solids sample 3-05-SS-

01-111715 at 1145. Top 1" was dark brown organic matter
(waste thickness = 1"), 1-6" was clay. Surface water
pond north of sample loc.

ERM collected surface solids sample 3-06-SS-

01-111715 at 1230. Sample material was clayey silt,

11/17/15

reddish brown material; no dark brown organic
matter at 3-06 loc. Waste thickness
measured at 12" below grade. Clay encountered
below reddish brown waste.

* * is ~ 6' E of lagoon bank and bank/berm
** is ~ 10' S of same reddish brown material.
I AM done sampling for the day.

Reported site and dropped samples
off at ALS-SLC.

11/24/15 Phase 1A-B Sampling - PRI 1

Arrived on site at 0845.

Trent and Lonnie on site for ERM.

Weather is mostly cloudy, light N wind,
and temps in the 30's F.

ERM planning to conduct surface solids
sampling in PRI 1, the Ditches.

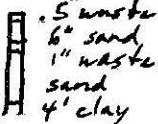

Mobilized to sample loc. PRI 1-12 at the
E end of the Main Ditch.

N4531751 E354707 - coords. of actual PRI 1-12
sample location. SAP loc. is in PRI 5 wastewater
lagoon so ERM requested to move it to the
ditch/gyp pile shoreline. The shoreline closest
to 1-12 SAP locations had 2-3 bank and ERM
was concerned about access and H35, plus
the location appeared setback, farther N, than
the orig. Main Ditch, so ERM proposed loc.
further W where access was better and where
the bank stuck out further into Main Ditch.
I approved revised loc. and ERM will prepare
a field mod. for the change in loc.

ERM collected sample 1-12-SS-01-11245 at 1000.

Top ~.5" of sample was waste material, the rest
was gray sand (likely eroded bank sediments).

Hand auger waste profile:

Cl² readings at 0.1 ppm, HCl at 0.2 ppm.

Mobilized to sample loc. PRI 1-04 at the head
of the Central Ditch.

The banks of the ditch at the 1-04 SAP

11/24/15

locations are 6+ ' high and steep with loose
material so ERM did not feel comfortable
arriving 1-4 at SAP loc. ERM proposed
to move ~50' north to accessible loc. I
approved revised loc. and ERM will prepare
a field mod. for the change in loc.

I NAI collected sample 1-04-SS-01-112415 at
1130 and I collected split sample
1-04-SS-01-112415-E501 plus MS/MSD
volume and duplicate sample 1-04-SS-01-112415
-E502 - see field data sheet.

Waste thickness at 1-04 is > 5'.

ERM prepared field mod. for change in
location for 1-12 and 1-04 sample locs.,
and I signed.

Departed site at 1330.

Dropped samples off at ALS-SLC.

Change in loc.

Phase 1A-B

12/1/15 Subsurface Solids Sampling - PRI 5

0945 Arrived on site

Met with Lorrie and Suzie of ERM
ERM sub., DPS, on site to operate excavator
and Gravity Consultants on site to conduct
the core sampling.

1000 Ken with EPA on site.

1015 Mobilized to S-14SB sample loc.

1045 Long-reach excavator delivered to the
gypsum pile.

Weather is clear, temp is 16°F and light wind
HCl readings at 0.3 ppm and Cl² at 0.0 ppm.

S-14SB loc. is ~50' W of revised loc. PRIL-12.
ERM using 4" dia, 15' long, Lexan tubes with plastic
liner and soil catcher. Suction ball at top.

Long-reach excavator has 40' reach.

1st attempt to collect subsurface solids samples
at S-14SB the core was advanced to ~8.7'
(mud line on tube) and there was ~6' recovery.
ERM unable to remove core liner. Bottom ~3'

was native oolitic sand and above that was
interbedded gray sand and reddish-brown waste.

Core collected ~30's of shoreline.

2nd attempt with 4" Lexan core advanced 6' below
grade. Full recovery. Bottom of core is waste.

Wastewater depth is ~6" at sample loc.

3rd attempt with 4" Lexan core advanced 8' below
grade to top of native interface, so waste thickness
is ~8' below grade. 6' of recovery. Bottom 1"
is native sand. ERM planning to sample 3rd core.
Sample intervals set at 0-2', 2-4', and 4-6'.

12/1/15

IAN collected the following samples:

- 14SB-SB-01-2-2-120115
- 14SB-SB-01-2-4-120115
- 14SB-SB-01-4-6-120115

Note that 8' core produced 6' of recovery, so
sample intervals may not represent actual
depth below grade.

I received split sample from 4-6' interval:

• 14SB-SB-01-4-6-120115-ES01 at 1400. See field data sheet.
sample intervals were all waste material.

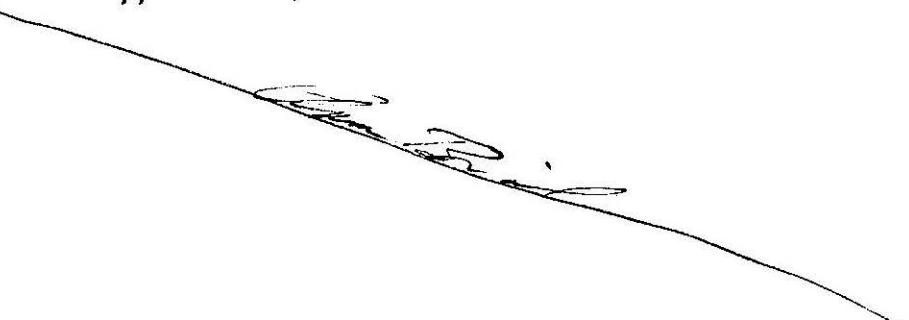

4th attempt with 4" Lexan core used at 11' section
to try to advance 2' into native (others used 15' section).
Core advanced 10' below grade. Soil catcher broke
off into core barrel at native interface. Core
liner would not pull out. Gray native material in
bottom of barrel measured at 1.4'. 8' of recovery.
6-8' interval not sampled due to poor recovery.
8-10' interval of native sampled:

5-14SB-SB-01-8-10-120115

Cl² readings up to 0.7 ppm during sampling
on ERM meters, field team in and out of
respirators all day at S-14SB loc.

1600 Departed site.

1700 Dropped sample off at ALS-SLC.

Phase 1A-B

12/2/15 Subsurface Solids Sampling

0800 Arrived on site. Met with Lonnies and Suzie of ERM. ERM sub. DPS on site to operate excavator and Gravity Consult on site to conduct core sampling.

0900 Went to ditch boring loc. 1-08.

Area was hazy and C₁₂ concentrations were high. I did not exit my vehicle.

ERM sub. Gravity reported C₁₂ concentrations as high as 13 ppm on personal gas meter.

0920 Field team left area and went to boring loc. 5-16.

Weather is clear, temp is 8°F, no wind.

0940 ERM used 9' section of 4" dia. Lexan core with plastic liner and soil catcher to core 5-16 borehole to ~7' below grade. Full recovery in core. Native clay encountered at 5' and at ~6.5 gray oolitic sand encountered. 0-5' was reddish brown waste material.

Sample intervals set at 0.5-2', 2-4', and 4-5'.

Note that during sonic drilling of 5-16 on 11/5/15 native clay was reported at 6.5' below grade.

ERM collected the following subsurface solids samples: 5-16-SB-01-0.5-2-120215

5-16-SB-01-2-4-120215

5-16-SB-01-4-5-120215

HCl up to 0.3 ppm and no C₁₂ at 5-16.

1100 Mobilized to ditch boring loc. 1-08.

ERM used 9' section of 4" dia. Lexan core with plastic liner and soil catcher to core 1-08 borehole to ~7' below grade in ~6" of water. Refusal at 7'.

12/2/15

• 4' of recovery in 1-08 core. Theory is loose saturated material near the surface is falling down into the lower part of the core.
1-08 core advanced at same loc. as 11/5/15 1-08 boring.

Since there was not full recovery in 1st core, a second core was advanced ~15' W of 1st core, in center of ditch that was not submerged. 2nd core was to 7' below grade. Refusal at 7'. Bottom of core material appears to be black smut with white specs. Soil catcher pushed up into core barrel but material in core held. ~3' of recovery. Smut material appears to have plugged core.

3rd core advanced at 2nd core loc. No liner or soil catcher used. Drove core to 7' and got 6' of recovery. Black sandy gravel encountered from 5-6' with hydrocarbon odor. 5-6' material considered anomalous so it was broken out for sampling. Top 1' was stuck to sides of core so not able to sample.

Sample intervals set from 1-3', 3-5', and 5-6'.

ERM collected the following subsurface solids samples:

1-08-SB-01-1-3-120215 - reddish brown waste

1-08-SB-01-3-5-120215 - reddish brown waste

1-08-SB-01-5-6-120215 - black sandy gravel

1400 Ken W. of EPA arrived on site

1415 Lonnies of ERM went with Gravity to look

at 7-04 loc. ERM going to sample 7-04 by hand.

1530 Went to head of Chlorine Ditch to core for waste thickness at 1-06 surface solids sample

12/2/15

location. Core met refusal at ~2' below grade at 2 locations within 10' of each other. Mud line on core barrel measured at 2.5'.
1600 ERM finished for the day. Departed site.

Phase 1A B Surface Solids Sampling 12/3/15

1100 Arrived on site. Met with Kris, Suzie, and Garrett of ERM.

1110 Planning to conduct surface solids sampling in PRI Area 1, the Ditches, using a linear sampler deployed from an excavator.

1110 Mobilized to sample loc. 1-03.

Weather is partly cloudy, temp. is 17°F, and light N wind.

1112 Excavator scraped ice from surface and deployed Ponar at 1-03 loc. Full recovery in Ponar. Material is all reddish brown waste material.

ERM collected sample 1-03-SS-01-120315 and duplicate 1-03-SS-11-120315.

1015 ERM collected sample 1-08-SS-01-120315 adjacent to the subsurface sample loc. on 12-02-15. Full recovery in Ponar. Material is all reddish brown waste material.

1100 ERM collected sample 1-07-SS-01-120315 adjacent to the subsurface sample boring loc. Full recovery in Ponar but ~ 1/3 was water which poured out during removal. Material was primarily reddish brown waste but there was also some gray fine-grained sand and white medium-grained particles.

1120 ERM collected sample 1-06-SS-01-120315 from ~8 N of the End of the Chlorine Ditch. Full recovery in Ponar. Material is ~80% gray fine-grained sand and ~20% reddish brown waste.

12/3/15

All VOC samples collected today were collected in Encore samplers, not methanol preserved vials. No reactivity observed.

Low (<0.3) HCl readings at all locations and Cl² up to 0.1 ppm.

114S Departed site.

Phase 1A-B

Subsurface Solids Sampling

12/10/15

114S Arrived on site.

Weather is partly cloudy with high winds, variable wind direction, and temp at 35°F.

114S 1 RM personnel, Kris and Trent, arrived on site.

Mobilized to subsurface solids sampling location 7-04SB.

1 RM used 5-ft section of 4" dia. Lexan tube to core sample from 0.5-2.5'. Flat-bottom scoop used to clear top 6" of iron crust sediment. Core advanced to 2.5' and capped before extracting. Full recovery in core. ~1" of native gray sand at bottom of core.

7-04SB boring log:

Water table
saturated ↓
0-6" Iron crust, dark reddish brown
6-7" Black silt just below iron crust
Reddish brown waste. 1/4" light gray silt
layer at ~1'
TDE=2.5'

ERM collected sample 7-04-SB-01-0.5-2.5 -12/10/15 and I accepted split sample 7-04-SB-01-0.5-2.5-12/10/15-ES01. See field data sheet.

The Lexan core was driven by pounding with hammer, by hand. Note that the SAP Mod. 3 revision to SOP USM-09 does not specify this method - SOP calls for core to be driven with an excavator. All other procedures in general accordance

12/10/15

with revised SOP USM-09.

ERM has now completed all Phase 1AB N1 sampling.

1330 Departed site and went to office trailer to process sample. BLM did not include our lock in the daisy-chain, so unable to access trailer.

Downloaded data from MX6 iBrid and shipped it back along with the DustTrain.

1650 Dropped samples off at ALS-SLC.

APPENDIX B
SPLIT SAMPLE FIELD DATA SHEETS
(provided as a separate file)

SOLIDS SPLIT SAMPLE FIELD DATA SHEET

 US Magnesium NPL Site
 Phase 1 Remedial Investigation

 Sample Location ID: 103 Date: 11/4/15 Sample Time: 12:20

 EPA Split Sample ID: 103-SB-01-3.5-5.5-110415-ES01

 US Mag Paired Sample ID: 103-SB-01-3.5-5.5-110415 Sample Interval: 3.5-5.5'

 Split Accepted By: Aaron Baird Split Accepted From: Jason Hilker (ERM)

 Sample GPS Coordinates: 4531398 N 353931 E

 Sample Matrix: Surface soil Surface sediment Subsurface soil/sed. Solid waste Saturated: Yes No

 Sampling Method: Sonic drilling at 52° angle w/ 6" core barrel

 Sampling Equipment Used: Hand auger Flat-bottom scoop Direct-push Shelby tube Box-core

 Sample Homogenizing Equipment Used: 1/4-in. sieve Steel bowls/trays Steel bowls/trays

 Surface Solids: # of Grab Aliquots: NA Sample Type: Grab Bulk Composite

 Subsurface Solids: Total Depth: 5.5 Sample Intervals: 0.5-1.5, 1.5-3.5, 3.5-5.5

 Sample Location Description: Ditches, PRI Area 1, eastern extent of Western Ditch, south bank

 Sample Observations: Sample Odor: No Odor Slight Odor Strong Odor Moisture Content: Dry Moist Wet

 Sample Color: dark gray Foreign Material Present: None Other: None

 Description: SAND, fine grained

Notes:

1st attempt advanced 5' core barrel to water surface and got 1-ft recovery, 0.5-1.5 ft entering water from bank in ~4" of water. Drillers let 6" core barrel fall back into the hole on second attempt. 0-1.5 is clay (first core), 1.5-3.5 is sand (sec. core) hole is staying open. 3.5-5.5 is sand (3rd core)

US Mag Paired Sample ID: 3-14-SS-01-111715 Sample Interval: 0-6"

Split Accepted By: Aaron Baird Split Accepted From: Trent Hamada (ERM)

Sample GPS Coordinates: NA - not SAP location

Sample Matrix: Surface soil Surface sediment Subsurface soil/sed. Solid waste Saturated: Yes No

Sampling Method: Hand auger

Sampling Equipment Used: Hand auger Flat-bottom scoop Direct-push Shelby tube Box-core

Sample Homogenizing Equipment Used: ¼-in. sieve Steel bowls/trays Steel bowls/trays ^{spoon/travel}

Surface Solids: # of Grab Aliquots: 5 Sample Type: Grab Bulk Composite

Subsurface Solids: Total Depth: NA Sample Intervals: NA

Sample Location Description: Sanitary Lagoon, south central area of lagoon, base of ramp built for collocated subsurface sample boring, vegetated cover, standing water

Sample Observations: Sample Odor: No Odor Slight Odor Strong Odor Moisture Content: Dry Moist Wet

Sample Color: Dark brown Foreign Material Present: None Other: None

Description: Clayey silt, organic matter

Notes:

 Sample Interval: 0'-2"

 Split Accepted By: Tim Jimenez

 Split Accepted From: Suzy Smith

 Sample GPS Coordinates: 4596193 m N, 387281 m E

 Sample Matrix: Surface soil Surface sediment Subsurface soil/sed. Solid waste Saturated: Yes No

 Sampling Method: Flat bottom scoop into steel pan and composited by hand

 Sampling Equipment Used: Hand auger Flat-bottom scoop Direct-push Shelby tube Box-core

 Sample Homogenizing Equipment Used: 1/4-in. sieve Spoon/trowel Steel bowls/trays

 Surface Solids: # of Grab Aliquots: 5 Sample Type: Grab Bulk Composite

 Subsurface Solids: Total Depth: NA Sample Intervals: NA

 Sample Location Description: Flat area with no vegetation, appears to be flooded during parts of the year. Bear River 3

 Sample Observations: Sample Odor: No Odor Slight Odor Strong Odor Moisture Content: Dry Moist Wet

 Sample Color: Brown Foreign Material Present: None Other: None

 Description: Silty-clay

Notes: First sieve passed 100%. Remaining aliquots not sieved. Sample collected according to SAP/QAPP. No modifications.

US Mag Paired Sample ID: UPN-10-SS-01-101415 Sample Interval: 0 - 2"

Split Accepted By: Aaron Baird Split Accepted From: Kris Benson (ERM)

Sample GPS Coordinates: 4539418 N 344653 E

Sample Matrix: Surface soil Surface sediment Subsurface soil/sed. Solid waste Saturated: Yes No

Sampling Method: Scoop

Sampling Equipment Used: Hand auger Flat-bottom scoop Direct-push Shelby tube Box-core

Sample Homogenizing Equipment Used: ¼-in. sieve Steel bowls/trays Steel bowls/trays ^{spoon travel}

Surface Solids: # of Grab Aliquots: 5 Sample Type: Grab Bulk Composite

Subsurface Solids: Total Depth: NA Sample Intervals: NA

Sample Location Description: Upland North, east side of access road, greasewood flatland, undisturbed

Sample Observations: Sample Odor: No Odor Slight Odor Strong Odor Moisture Content: Dry Moist Wet

Sample Color: Brown Foreign Material Present: None Other: None

Description: CLAYEY SILT

Notes: 100% passed through ¼" sieve
