Overview

The sample set for NASA Ames, SDG WG20002 consisted of twenty-eight (28) soil samples and one aqueous sample. All samples were analyzed for PFAS.

The samples were collected by Tetra Tech, Inc. on July 13, 2021 and analyzed by Pace Analytical. The analyses were conducted in compliance with Department of Defense (DoD)/Department of Energy (DOE) for Environmental Laboratories version 5.3 PFAS using LC/MS/MS (February 2018). The data contained in this SDG was validated via Stage 2B:

* • Data completeness
* • Hold times/Sample Preservation
* • Mass Calibration
* • LC/MS/MS System Tuning and Performance
* • Mass Spectral Acquisition Rate
* • Instrument Sensitivity Check
* • Ion Transition Check
* • Initial/Continuing Calibrations
• Laboratory Method/Preparation and Field Blank Results
* • Field Reagent Blank Results
• Extraction Internal Standard Recoveries

* • Injection Internal Standard Recoveries
* • Laboratory Control Sample Recoveries
* • Field Duplicate Precision
* • Compound Identification
* • Compound Quantitation
• Matrix spike/matrix spike duplicate recoveries

The symbol (*) indicates that all quality control criteria were met for this parameter. Qualified analytical results are presented in Appendix A, results as reported by the laboratory are presented in Appendix B, and documentation supporting these findings is presented in Appendix C.

PFAS

The matrix spike percent recovery 8:2FTS was poor (<10%) in sample AOPC2-SB03-0.5-2. The nondetected result was qualified (UX).

The matrix spike / matrix spike duplicate (MS/MSD) percent recoveries and relative percent difference (RPD) for 6:2FTS were outside the quality control limits for sample AOPC2-SB03-0-0.5. The nondetected results were qualified as (UJ).

The MS/MSD percent recovery and relative percent differences (RPD) PFOS outside the quality control limit for sample AOPC2-SB03-0-0.5. The detected results were qualified as (J).

Detected results reported below the limit of quantitation (LOQ) but above the Detection Limit (DL) were qualified as estimated (J).

Additional Comments

The following labeled extraction internal standard recovery 8:2 FTS was >150% quality control limit for sample AOPC1-SB02-0.0.5. No action was required because the aforementioned compound was nondetected.

The matrix spike / matrix spike duplicate (MS/MSD) percent recoveries PFNS and PFTeDA were >150% quality control limits for sample AOPC1-SB03-0.5-2. No validation because the sample results were nondetected.

Samples AOPC1-SB03-0-0.5, AOPC1-SB03-0.5-2, AOPC6-SB01-0.5-2, AOPC7-SB02-0-0.5 and AOPC7-SB02-0.5-2 were analyzed at a dilution 5x, 10x and 20x dilutions for PFOS.

Detected results reported below the LOQ but above the Detection Limit (DL) were qualified as estimated, (J).

Non-detected results were reported to the LOD.

Executive Summary

Laboratory Performance Issues:

Other Factors Affecting Data Quality: Detected results below the LOQ were estimated. A few matrix spike / matrix spike duplicate recoveries and relative percent differences (RPD) for PFOA, 8:2FTS and 6:2FTS were outside the quality control limits. The matrix spike 8:2FTS was not recovered in sample AOPC2-SB03-0.5-2

The data for these analyses were reviewed with reference to the Department of Defense (DOD) document entitled "Data Validation Guidelines Module 3: Data Validation Procedure for Per- and Polyfluoroalkyl Substances Analysis be QSM Table B15" (May 2020). The text of this report has been formulated to address only those areas affecting data quality.

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted detection limit.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the reporting limit).
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team, but exclusion of the data is recommended.

Case Narrative
Tetra Tech
Lot Number: WG20002

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.3 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples was in compliance with DOD QSM 5.3 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). For undiluted analysis. For undiluted analysis, the extract is prepared for injection by adding 182 uL of sample extract + 8 uL of reagent water + 10 uL of internal standard solution to a polypropylene autosampler vial. An extra correction factor of 0.91 (182 uL / 200 uL = 0.91) applies. The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1/0.91.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

The continuing calibration verification (CCV) associated with sample WG20002-029 for analyte: 8:2 FTS recovered above the upper control limit. The sample(s) associated with this CCV were non-detect for the affected analytes; therefore, the data has been reported.

Surrogate recovery for the following sample(s) was outside the upper control limit: WG20002-007. This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

The MS/MSD associated with samples WG20002-019, WG20002-020 had multiple analytes recovered outside of the acceptance limits. The LCS was recovered within the required acceptance limits; therefore, this demonstrates a matrix effect and data quality is not impacted.

Overview

The sample set for NASA-Ames, SDG WG20004, consisted of twenty (20) aqueous environmental samples and six (6) field blanks. All samples were analyzed for poly-and perfluoroalkyl substances (PFAS). One field duplicate pair was associated with this SDG: AOPC5-14D12A-071621/AOPC5-14D12A-071621-FD.

The samples were collected by Tetra Tech, Inc. on July 12-16, 2021 and analyzed by Pace Analytical Services. All analyses were conducted in accordance with Department of Defense ((DOD)/Department of Energy (DOE) Quality Systems Manual (QSM) for Environmental Laboratories, Version 5.3, PFAS using LC/MS/MS Appendix B Table B-15 (2019). The data contained in this SDG was validated via EPA Stage 4 with regard to the following parameters:

- Data completeness
- Hold times/Sample Preservation
* Mass Calibration
* LC/MS/MS System Tuning and Performance
* Mass Spectral Acquisition Rate
* Instrument Sensitivity Check
* Ion Transition Check
- Ion Ratios
- Initial/Continuing Calibrations
- Laboratory Instrument/Method and Field Blank Results
- Extraction Internal Standard Recoveries
- Laboratory Control Sample/Laboratory Control Sample Duplicate Results
- Matrix Spike/Matrix Spike Duplicate Results
* Laboratory Duplicate Precision
* Field Duplicate Precision
* Compound Identification

* • Compound Quantitation
* • Detection Limits

The symbol (*) indicates that all quality control criteria were met for this parameter. Qualified analytical results are presented in Appendix A, results as reported by the laboratory are presented in Appendix B, and documentation supporting these findings is presented in Appendix C.

INITIAL/CONTINUING CALIBRATIONS

The Continuing Calibration Verification (CCV) performed on 07/26/2021 @ 16:40 had a Percent Recovery (%R) for 8:2 fluorotelomer sulfonate (8:2FTS) which exceeded the 130% quality control limit. Samples AOPC18-11E02A-071221, AOPC18-WNB-7-071221, AOPC24-64A-071321, AOPC24-WU4-1-071321, AOPC25-15B10A-071321, AOPC25-15H12A-071321, AOPC5-WU4-19-071421, FB-05-071321, and FB04-071221 were affected. The non-detected results reported for 8:2FTS in the affected samples were qualified as estimated, (UJ).

ION RATIOS

The ion ratio %Rs for perfluorooctanesulfonic acid (PFOS) in samples AOPC8-W11-2-071221 and AOPC3-W19-2-071621 were outside the 50%-150% quality control limits. In addition, the ion ratio %R for 6:2FTS was outside the quality control limits in sample AOPC3-W19-2-071621. The detected results reported for these compounds in these samples were qualified as estimated, (J).

EXTRACTED INTERNAL STANDARD RECOVERIES

The %R for extracted internal standard compound, 13C2-4:2FTS, was above the 150% quality control limit in sample AOPC8-W11-2-071221. In addition, the %Rs for d5-N-ethylperfluorooctane sulfonamidoacetate (NEFOSA) and d3-N-methylperfluorooctane sulfonamidoacetate (NMFOSA) were below 50% but greater than 20%. This sample was not re-extracted/reanalyzed. No action was taken for 13C2-4:2FTS because the associated compound was not detected in this sample. The non-detected results reported for the compounds associated with d5-NEFOSA and d3-NMFOSA were qualified as estimated, (UJ).

The %R for the extracted internal standard compound, 13C2-perfluorotetradecanoic acid (PFTeA), was below the lower quality control limit in sample FB-07-071621. The sample was not re-extracted/reanalyzed. The non-detected result reported for the compound associated with this extracted internal standard was qualified as estimated, (UJ).

The %R for extracted internal standard compound, 13C2-4:2FTS, was above the 150% quality control limit in sample AOPC5-14039A-071421. In addition, the %Rs for 13C3-perfluorohexanesulfonic acid (PFHxS), 13C8-PFOS, and 13C9-perfluorononanoic acid (PFNA) were below 50% but greater than 20%. The sample was reanalyzed at a 100X dilution with acceptable extracted internal standard %Rs. No action was taken for the compound associated with 13C2-4:2FTS because this compound was not detected in this sample. No action was taken for affected compounds, PFHxS and PFOS, because these compounds were reported from the diluted analysis. The detected result reported the affected compound, PFNA, from the initial analysis was qualified as estimated with a high bias, (J+).

The %Rs for extracted internal standard compounds, 13C2-4:2FTS and 13C2-6:2FTS, were above the 150% quality control limit in sample AOPC3-W7-9-071421. The sample was re-extracted outside the 14-day holding time and reanalyzed with similar results. The results from the initial analysis were used in the data validation due to the missed holding time. No action was taken for the associated compound, 4:2FTS, because this compound was not detected in this sample. The detected result reported for the associated compound, 6:2FTS, was qualified as estimated with a low bias, (J-).

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

The Laboratory Control Sample (LCS) analysis associated with preparation batch #10188 had a %R for perfluoropentanesulfonic acid (PFPeS) which exceeded the upper quality control limit. The detected result reported for PFPeS in sample AOPC24-171A-071621 was qualified as estimated, (J), due to conflicting directional bias. No action was taken for samples AOPC5-14D12A-071621 and AOPC5-14D12A-071621-FD because these samples were reanalyzed for PFPeS in preparation batch #10648.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

The Matrix Spike/Matrix Spike Duplicate (MS/MSD) analyses of sample AOPC1,7-PZA1-5C-071521 had MSD %Rs for 8:2FTS, perfluorobutanesulfonic acid (PFBS), perfluorooctane sulfonamide (FOSA), and PFNA which exceeded the upper quality control limits. The detected result reported for PFBS in the parent sample was qualified as estimated with a high bias, (J+). The remaining compounds were not detected in the parent sample; therefore, no action was necessary.

Additional Comments

Sample FB-07-071621 was not listed on the sample Chain of Custody (COC) but was analyzed by the laboratory for PFAS.

PFOS was detected below the LOQ in laboratory method blank, WQ10113-001, associated with preparation batch #10113. No action was taken because the detected results reported for PFOS in the associated environmental samples were greater than the LOQ and 5X the concentration of the blank. No action was taken for the detected result reported in the associated field blank, FB-06-071421, because field blanks are not qualified for laboratory blank contamination.

6:2FTS was detected above the LOQ in the field blank, FB-07-071521. No action was taken because the detected result reported for this compound was either greater than the LOQ and 5X the concentration of the blank or not detected in the samples sampled on 07/15/2021.

The %R for the extracted internal standard compound, 13C2-6:2FTS, was above the upper quality control limit in sample FB-05-071321. No action was taken because the compound associated with extracted internal standard was not detected in this sample.

The MS analyses performed on sample AOPC24-171A-071621 had %Rs for perfluorodecanoic acid (PFDA), PFNA, and perfluoroundecanoic acid (PFUnA) above the upper quality control limits. No action was necessary because these compounds were not detected in the parent sample.

The Relative Percent Difference (RPD) for pentadecafluorooctanoic acid (PFOA) in the laboratory duplicate analysis of sample AOPC18-WNB-7-071221 exceeded the 20% quality control criterion. No action was taken because the detected results were below the LOQ.

Detected results reported below the limit of quantitation (LOQ) but above the Detection Limit (DL) were qualified as estimated, (J). Non-detected results were reported to the limit of detection (LOD).

Instances of manual integrations were present in this data package. All manual integrations were documented by the laboratory and are noted in the raw data of the original data package.

The following samples were analyzed at a dilution:

Sample	Dilution
AOPC1-11N21A1-071221	50X
AOPC6-WV4-18-071221	10X

The reporting limits of the non-detected results were elevated.

PFBS, PFHxA, PFHxS, PFPeS, and PFOS were reported from the 10X dilution of sample AOPC5-WU4-19-071421.

PFHxA, PFHxS, and PFOS exceeded the calibration range of the instrument in the initial analysis of sample AOPC5-14039A-071421. The sample was diluted 100X. The results from the dilution were used for these compounds in the data validation.

Executive Summary

Laboratory Performance Issues: A CCV had a %R above the quality control limit. Ion ratio %Rs were noncompliant in two samples. PFOS was detected in a laboratory method blank. Extracted internal standards were noncompliant. A LCS %R was high.

Other Factors Affecting Data Quality: The MS/MSD analyses had high %Rs. Some samples were diluted. Detected results below the LOQ were estimated.

The data for these analyses were reviewed with reference to the Department of Defense (DOD) document entitled "Data Validation Guidelines Module 3: Data Validation Procedure for Per- and Polyfluoroalkyl Substances Analysis be QSM Table B15" (May 1, 2020). The text of this report has been formulated to address only those areas affecting data quality.

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted detection limit.
J	The result is an estimated value with an unknown bias. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team, but exclusion of the data is recommended.

Case Narrative
Tetra Tech
Lot Number: WG20004

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the Pace Quality Assurance Management Plan (QAMP), applicable Shealy standard operating procedures (SOPs), the 2003 NELAC standard, and Shealy policies. Additionally, the DoD QSM version 5.3 has been followed for these samples, and specifically Table B-15 was followed for all PFAS samples. Any exceptions to the QAMP, SOPs, NELAC standards, the DoD QSM, or policies are qualified on the results page or discussed below.

All QC associated with these samples was in compliance with DOD QSM 5.3 table B-15 and our PFAS SOP.

Correction factors (CF) are used to calculate the original sample concentration. The CF is the inverse of the concentration factor (sample volume / extract final volume) times the dilution factor (DF). For undiluted analysis. For undiluted analysis, the extract is prepared for injection by adding 182 uL of sample extract + 8 uL of reagent water + 10 uL of internal standard solution to a polypropylene autosampler vial. An extra correction factor of 0.91 (182 uL / 200 uL = 0.91) applies. The CF is calculated as follows:

CF = DF * FV / Vo

FV is volume of extract (mL)
Vo is initial sample volume (mL)
DF is dilution factor. For undiluted analysis, DF = 1/0.91.

Sample concentration for aqueous samples:
Concentration (ng/L) = Cs*CF,

$$C_s = \frac{\left(\frac{(A_s x C_{is})}{A_{is}}\right) - B}{M1}$$

Where

C_s is on column concentration of target analyte in the sample (ng/L)
C_{is} is concentration of internal standard in the sample (ng/L)
A_s is peak response of target analyte in the sample
A_{is} is peak response of internal standard in the sample
M1 is the average RF from ICAL or the slope from linear regression ICAL
B is the y-intercept from the ICAL

Samples WG20004-004 required centrifugation prior to extraction, due to excessive solids present in the samples. Centrifugation was performed following the PFAS Aqueous Centrifuge Protocol; samples were spiked with Surrogate (SUR; Extracted Internal Standard/EIS) and shaken vigorously before being poured into a conical bottle and centrifuged. The centrifuged aqueous sample was decanted back into the original sample bottle, off of the condensed solids remaining in the centrifuge bottle. Original sample bottle was rinsed as normal and centrifuge bottle was rinsed with 4mL of MeOH. Centrifuge bottle rinsate was added to the elution. Samples concentrated to <10mL and reconstituted to 10mL using MeOH by transfer pipet.

The laboratory control sample (LCS) for analytical batch 10188 recovered outside acceptance criteria for PFPeS. For the following samples there was an insufficient amount to perform a re-extraction or re-analysis: WG20004-019, WG20004-022, WG20004-023, WG20004-024, WG20004-025. The data has been reported.

The continuing calibration verification (CCV) associated with sample WG20004-013 for analyte(s): GenX recovered above the upper control limit. The sample(s) associated with this CCV were non-detect for the affected analytes; therefore, the data has been reported.

The continuing calibration verification (CCV) associated with samples WG20004-001, WG20004-002, WG20004-006, WG20004-007, WG20004-008, WG20004-009, WG20004-010, WG20004-011, WG20004-012 for analyte: 8:2 FTS recovered above the upper control limit. The samples associated with this CCV were non-detect for the affected analytes; therefore, the data has been reported.

Surrogate recovery for the following sample(s) was outside control limits: WG20004-014. Re-extraction and/or re-analysis was performed with concurring results. Both sets of data have been reported.

Surrogate recovery for the following samplewas outside of acceptance limits: WG20004-026. There was insufficient sample to perform a re-extraction; therefore, the data have been reported.

Surrogate recovery for the following samples was outside control limits: WG20004-004, WG20004-013. Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Surrogate recovery for the following sample was outside the upper control limit: WG20004-011. This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

The MS/MSD associated with samples WG20004-001, WG20004-018, WG20004-024 had multiple analytes recovered outside of the acceptance limits. The LCS was recovered within the required acceptance limits; therefore, this demonstrates a matrix effect and data quality is not impacted.

The method blank associated with batches 10113, 10799 had PFOS detected at a concentration that was above the MDL but below ½ the PQL. All samples associated with this method blank that have detections for PFOS have been flagged with a "B".

Introduction 1

Note: For regulatory and safety information for the mass spectrometer, refer to the *System User Guide*.

The planned maintenance (PM) procedure is designed to help maintain overall system performance.

The PM is not intended to take the place of an Operational Qualification (OQ) nor is it intended to verify the instrument specifications. Separate Installation Qualification (IQ) and OQ services are available. Contact a SCIEX representative.

The procedure must be performed by a trained SCIEX Field Service Employee (FSE).

The procedure has been developed for the SCIEX Triple Quad™ 4500/4500MD System with the Turbo V™ Ion Source. It does not apply to any other products or processes.

The procedure does not address any customer-specific analytical protocol (performance qualification) or method validation.

Note: If an issue is identified and the system requires repair, then the customer is responsible for the repair at the expense of the customer, except to the extent that the system and the required repairs are covered by a SCIEX warranty or service contract. A separate repair service call must be opened and the repair hours must not be charged against this procedure.

Planned Maintenance Tasks 2

Note: Perform all procedures using the Turbo V™ Ion Source, unless otherwise specified.

Pre-Planned Maintenance

Inspect for Contamination A

Perform a Q1 and Q3 charging test to determine whether front end contamination is present.

1. Run the **Pos PPG** method for 10 minutes, monitoring the Total Ion Count (TIC) for degradation of the signal or a decrease in sensitivity.
2. Change the polarity to Negative, and then scan for one minute.
3. Change the polarity to Positive, and then make sure that the **IS** parameter returns to the original value.
4. Run the method.

   If the signal sensitivity is restored temporarily but the Total Ion Count (TIC) again degrades by more than 5% over a 10 minute run, then a possible front-end contamination is indicated.
5. Repeat the test in Negative polarity using the Q1 Neg PPG method.

Guidelines for Cleaning the Front End

If charging tests indicate that cleaning is necessary, then clean the front-end components, including the QJet® Ion Guide, IQ0 lens, Q0 quadrupole, and IQ1 lens.

Removing the ion optics is considered a repair activity. FSEs must open a separate service repair call.

Note: This procedure does not provide troubleshooting for all technical root causes of signal degradation or charging effect. Signal degradation might also result from a contaminated TurboIonSpray® Probe or electrode, method parameters that are not optimized, or other factors.

Introduction 1

Note: For regulatory and safety information for the mass spectrometer, refer to the *System User Guide*.

The planned maintenance (PM) procedure is designed to help maintain overall system performance.

The PM is not intended to take the place of an Operational Qualification (OQ) nor is it intended to verify the instrument specifications. Separate Installation Qualification (IQ) and OQ services are available. Contact a SCIEX representative.

The procedure must be performed by a trained SCIEX Field Service Employee (FSE).

The procedure has been developed for the SCIEX Triple Quad™ 4500/4500MD System with the Turbo V™ Ion Source. It does not apply to any other products or processes.

The procedure does not address any customer-specific analytical protocol (performance qualification) or method validation.

Note: If an issue is identified and the system requires repair, then the customer is responsible for the repair at the expense of the customer, except to the extent that the system and the required repairs are covered by a SCIEX warranty or service contract. A separate repair service call must be opened and the repair hours must not be charged against this procedure.

Planned Maintenance Tasks 2

Note: Perform all procedures using the Turbo V™ Ion Source, unless otherwise specified.

Inspect for Contamination A

Perform a Q1 and Q3 charging test to determine whether front end contamination is present.

1. Run the **Pos PPG** method for 10 minutes, monitoring the Total Ion Count (TIC) for degradation of the signal or a decrease in sensitivity.
2. Change the polarity to Negative, and then scan for one minute.
3. Change the polarity to Positive, and then make sure that the **IS** parameter returns to the original value.
4. Run the method.

   If the signal sensitivity is restored temporarily but the Total Ion Count (TIC) again degrades by more than 5% over a 10 minute run, then a possible front-end contamination is indicated.
5. Repeat the test in Negative polarity using the Q1 Neg PPG method.

Guidelines for Cleaning the Front End

If charging tests indicate that cleaning is necessary, then clean the front-end components, including the QJet® Ion Guide, IQ0 lens, Q0 quadrupole, and IQ1 lens.

Removing the ion optics is considered a repair activity. FSEs must open a separate service repair call.

Note: This procedure does not provide troubleshooting for all technical root causes of signal degradation or charging effect. Signal degradation might also result from a contaminated TurboIonSpray® Probe or electrode, method parameters that are not optimized, or other factors.

Overview

The sample set for NASA-Ames, SDG WG22011, consisted of seventeen (17) aqueous environmental samples, three (3) field blanks, and one (1) source water blank. All twenty-one (21) samples were analyzed for poly-and perfluoroalkyl substances (PFAS). One field duplicate pair was associated with this SDG: AOPC3-W7-3-071921/AOPC3-W7-3-071921-FD.

The samples were collected by Tetra Tech, Inc. on July 19-21, 2021 and analyzed by Pace Analytical Services. All analyses were conducted in accordance with Department of Defense ((DOD)/Department of Energy (DOE) Quality Systems Manual (QSM) for Environmental Laboratories, Version 5.3, PFAS using LC/MS/MS Appendix B Table B-15 (2019). The data contained in this SDG was validated via EPA Stage 4 with regard to the following parameters:

*	• Data completeness
*	• Hold times/Sample Preservation
*	• Mass Calibration
*	• LC/MS/MS System Tuning and Performance
*	• Mass Spectral Acquisition Rate
*	• Instrument Sensitivity Check
*	• Ion Transition Check
	• Ion Ratios
	• Initial/Continuing Calibrations
*	• Laboratory Instrument/Method and Field Blank Results
	• Extraction Internal Standard Recoveries
	• Laboratory Control Sample Results
	• Matrix Spike/Matrix Spike Duplicate Results
*	• Laboratory Duplicate Precision
	• Field Duplicate Precision
*	• Compound Identification
*	• Compound Quantitation

* • Detection Limits

The symbol (*) indicates that all quality control criteria were met for this parameter. Qualified analytical results are presented in Appendix A, results as reported by the laboratory are presented in Appendix B, and documentation supporting these findings is presented in Appendix C.

INITIAL/CONTINUING CALIBRATIONS

The Continuing Calibration Verification (CCV) performed on 07/30/2021 @ 18:32 had a Percent Recovery (%R) for N-methylperfluorooctane sulfonamidoacetate (NMFOSA) which exceeded the 130% quality control limit. Samples AOPC17,21-WU5-12-072021, AOPC21-W6-5-072021, AOPC9-W2-13-072021, and SWB-01-072021 were affected. The non-detected results reported for NMFOSA in the affected samples were qualified as estimated, (UJ).

ION RATIOS

The following compounds had ion ratio %Rs outside the 50%-150% quality control limits:

Sample	Compound
AOPC3-W7-3-071921	Perfluoropentanesulfonic acid (PFPeS)
AOPC03-W7-13-071921	Perfluorononanoic acid (PFNA)
AOPC03-UST-MW-02-071921	Perfluorododecanoic acid (PFDoA)
AOPC17,21-WU5-12-072021	Perfluorooctane sulfonamide (FOSA)

The detected results reported for these compounds in these samples were qualified as estimated, (J).

EXTRACTED INTERNAL STANDARD RECOVERIES

The %R for extracted internal standard compound, 13C2-4:2 fluorotelomer sulfonate (4:2FTS), was above the 150% quality control limit in samples AOPC10-WGC2-10-072121 and AOPC21-W4-14-071921. In addition, the %Rs for 13C2-perfluorododecaonoic acid (PFDoA), 13C2-perfluorotetradecanoic acid (PFTeA), and 13C9-perfluorobutanoic acid (PFBA) were below 50% but greater than 20% in sample AOPC10-WGC2-10-072121. The laboratory did not re-extract/reanalyze due to evidence of matrix interference. No action was taken for the compound associated with 13C2-4:2FTS because this compound was not detected in sample AOPC10-WGC2-10-072121 but was qualified in sample AOPC21-W4-14-071921 as estimated (J+). The detected result reported the affected compound, PFBA, was qualified as estimated with a high bias, (J+). The non-detected results reported for PFDoA and PFTeA were qualified as estimated, (UJ).

LABORATORY CONTROL SAMPLE RESULTS

The Laboratory Control Sample (LCS) analysis associated with preparation batch #10188 had a %R for perfluoropentanesulfonic acid (PFPeS) which exceeded the upper quality control limit. All samples, except samples AOPC21-W4-14-071921 and FB-09-071921 (due to insufficient volume), were re-extracted/reanalyzed. The samples reanalyzed in preparation batch #10675 had high %Rs for 6:2FTS and PFPeS, therefore, the initial analysis was used in the data validation. The detected result reported for PFPeS in sample AOPC03-W7-13-071921 was qualified as estimated, (J), due to conflicting directional bias. The detected results reported for PFPeS in samples AOPC03-UST-MW-02-071921, AOPC21-W4-14-071921, AOPC21-W6-6-071921, AOPC3-W7-11-071921, and AOPC3-W7-3-071921-FD were qualified as estimated with a high bias, (J+). No action was taken for sample FB-09-071921 because PFPeS was not detected in this sample. No action was taken for samples AOPC24-W89-1-071921 and AOPC3-W7-3-071921 because these samples were reanalyzed for PFPeS in preparation batch #10648 with an acceptable LCS %R for PFPeS.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

The Matrix Spike/Matrix Spike Duplicate (MS/MSD) analyses of sample AOPC17,21-WU5-12-072021 had MS %R for 6:2FTS and Relative Percent Difference (RPD) which exceeded the upper quality control limits.

The detected result reported for 6:2FTS in the parent sample was qualified as estimated, (J), due to conflicting directional bias.

FIELD DUPLICATE PRECISION

The RPD for 6:2FTS exceeded the 30% quality control limit in the field duplicate pair, AOPC3-W7-3-071921/AOPC3-W7-3-071921-FD. The detected results reported for this compound in the field duplicate pair were qualified as estimated, (J), due to field duplicate imprecision.

Additional Comments

The %Rs for the extracted internal standard compound, 13C2-4:2FTS, were above the upper quality control limit in samples AOPC03-W7-13-071921, AOPC03-UST-MW-02-071921, and AOPC17,21-WU5-12-072021. No action was taken because the compound associated with this extracted internal standard was not detected in these samples.

The %Rs for the extracted internal standard compounds, 13C2-4:2FTS and 13C2-8:2FTS, were above the upper quality control limit in sample AOPC21-W4-14-071921. No action was taken because the compounds associated with these extracted internal standards were not detected in this sample.

The RPD for PFHxS in the laboratory duplicate analysis of sample AOPC21-W4-14-071921 exceeded the 20% quality control criterion. No action was taken because the detected results were below the LOQ.

Detected results reported below the limit of quantitation (LOQ) but above the Detection Limit (DL) were qualified as estimated, (J). Non-detected results were reported to the limit of detection (LOD).

Instances of manual integrations were present in this data package. All manual integrations were documented by the laboratory and are noted in the raw data of the original data package.

Executive Summary

Laboratory Performance Issues: A CCV had a %R above the quality control limit. Ion ratio %Rs were noncompliant in some samples. Extracted internal standards were noncompliant. A LCS %R was high.

Other Factors Affecting Data Quality: The MS/MSD analyses had a high %R. Field duplicate imprecision was noted for one compound. Some samples were diluted. Detected results below the LOQ were estimated.

The data for these analyses were reviewed with reference to the Department of Defense (DOD) document entitled “Data Validation Guidelines Module 3: Data Validation Procedure for Per- and Polyfluoroalkyl Substances Analysis be QSM Table B15” (May 1, 2020). The text of this report has been formulated to address only those areas affecting data quality.

Data Qualifier Definitions

The following definitions provide brief explanations of the validation qualifiers assigned to results in the data review process.

U	The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted detection limit.
J	The result is an estimated value with an unknown bias. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for, but was not detected. The reported detection limit is approximate and may be inaccurate or imprecise.
NJ	The analyte has been “tentatively identified” or “presumptively” as present and the associated numerical value is the estimated concentration in the sample.
R	The sample result (detected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
UR	The sample result (nondetected) is unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team, but exclusion of the data is recommended.
